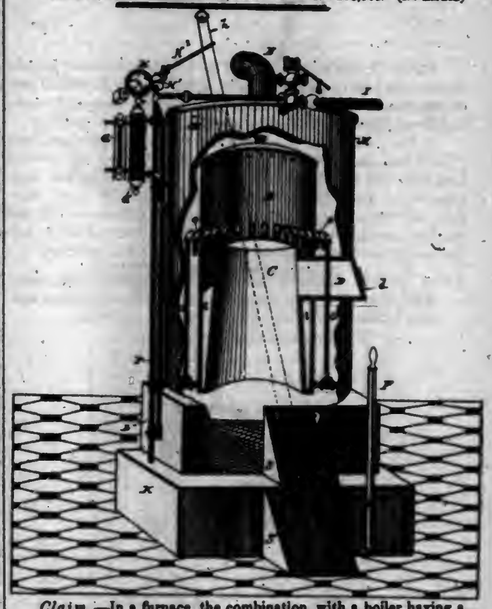
8. In a fence-making machine, the combination, with the frame X thereof, the main shaft A, journaled on said frame, the spur-wheel G, mounted upon said main shaft, the auxiliary shaft C, also journaled in said machine, the spur-wheel I, mounted upon said shaft C and meshing into the wheel G upon said main shaft, and the bevel-wheel L, mounted upon said shaft C, of the shaft M, journaled on said frame X at right angles to said shaft C, the bevel-wheel L', mounted upon said shaft M and meshing into the bevel-wheel L upon said shaft C, the disk-wheels *a* and *a*, having eccentric grooves in their faces, the oscillating frame *c d*, pivoted to said supporting-frame X and reaching over the top of said machine, the downwardly-projecting fingers *e*, fastened to the upper part of said oscillating frame *c d*, the bars *b*, connecting the said oscillating frame *c d* with the eccentric grooves of the disk-wheels *a*, the bevel-wheel L'', mounted upon the cross-shaft M, the inclined shaft M', journaled on said supporting-frame, the bevel-wheel L''', mounted upon said shaft M' and meshing into the bevel-wheel L'' upon the shaft M, the disk-wheel O, mounted upon said shaft M', the eccentric groove *h'* in the face of said wheel O, the pin and friction-roller *h''*, moving in said eccentric grooves, the slide *h*, moving in a groove in the top of said machine, the bar *f*, connecting said slide with said eccentric grooves, the pulley P upon the shaft M, connected to the pulley P' by the belt $P^{\times}$, the shafts N and N, journaled in said supporting-frame, the pulleys P' R R R and R, mounted upon said shafts N and N, the belts $R^{\times}$, connecting the pulleys R, the bevel-wheel $O^{\times}$, mounted upon the shaft N, the shaft Z, journaled in bearings on said frame, the bevel-wheel O', mounted upon said shaft Z and meshing into the bevel-wheel $O^{\times}$ on the shaft N, the pulley Z', mounted upon said shaft Z, the pulleys Z' Z'' $Z^{\times}$, mounted on bearing fastened in said frame, the belt *s*, connecting said pulleys Z' Z'' Z''' $Z^{\times}$, and the springs *s'*, fastened upon the said machine above said wheels Z'' and $Z^{\times}$ to afford facility for drawing a picket into said machine, all substantially as and for the purpose set forth.

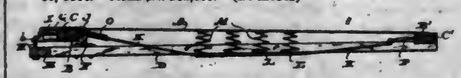
9. In a fence-making machine, the combination, with the supporting-frame X, the main shaft A, journaled in said frame, the pulley E, the spur-wheel G, and the bevel-wheel V, all mounted on said main shaft A, the shafts B B' B'', also journaled in said frame, the wheels H H' H'', mounted upon said shafts B B' B'', the spools D, upon which wire may be wound, mounted upon the same shafts, the shaft C, journaled in said frame, the spur-wheel I', mounted upon said shaft C and meshing into the wheel G, the disk-wheel K, mounted upon the shaft C, the segmental wheel $T^{\times}$, mounted upon the shaft T^{4}, the bar $K^{\times}$, connecting the disk-wheel K and the segmental wheel $T^{\times}$, the shaft T^{4}, mounted in bearings in said frame, the segmental wheel $S^{\times}$, mounted upon the lower end of the oscillating shaft S', the oscillating shaft S', mounted on the cross-shaft S'', the shaft S'', journaled in the main shaft A, and the short shaft T'', the bevel-wheel S, mounted upon the oscillating shaft S' and meshing into the wheel V, the bevel-wheel T, mounted upon the shaft T'' and meshing into the bevel-wheel S, the short shaft T'', journaled in the said frame opposite to and concentric with said main shaft A, the spur-wheel T', mounted upon said shaft T'', the wheel $U^{\times}$, mounted upon a bearing secured to the frame of said machine and meshing into the wheels U' and T', the spur-wheels U U' U'', meshing together and mounted on short shafts journaled in the frame of said machine, the said shafts, and twisting-fingers mounted thereon, of the shaft C, journaled in the frame of said machine, the spur-wheel I, mounted upon said shaft C and meshing into the wheel G upon said main shaft, the bevel-wheel L, mounted upon said shaft C, the shaft M, journaled in said frame X at right angles to said shaft C, the bevel-wheel L', mounted upon said shaft M and meshing into the wheel L upon the shaft C, the disk-wheels *a* and *a*, having eccentric grooves in their faces, the oscillating frame *c d*, pivoted to said supporting-frame X and reaching over the top of said machine, the downwardly-projecting fingers *e*, fastened to the upper part of said oscillating frame, the bars *b*, connecting the eccentric grooves of the said disk-wheels *a* with said oscillating frame, the bevel-wheel L'', mounted upon the cross-shaft M, the inclined shaft M', journaled on said supporting-frame, the bevel-wheel L''', mounted upon said shaft M' and meshing into the bevel-wheel L'' upon the shaft M, the disk-wheel Q, mounted upon said shaft M', the eccentric groove *h'* in the face of said wheel Q, the pin and friction-roller *h''*, moving in said eccentric groove, the slide *h*, moving in a groove in the top of said machine, the bar *f*, connecting said slide and said eccentric groove, the pulley P upon the shaft M, connected to the pulley P' by the belt $P^{\times}$, the shafts N and N, journaled in said supporting-frame, the pulleys P R R R and R, mounted upon said shafts N and N, the belts $R^{\times}$, connecting the pulleys R, the bevel-wheel $O^{\times}$, mounted upon the shaft N, the shaft Z, journaled in bearings in said frame, the bevel-wheel O', mounted upon said shaft Z and meshing into the bevel-wheel $O^{\times}$ on the shaft N, the pulley Z' mounted upon said shaft Z, the pulleys Z' Z'' $Z^{\times}$, mounted on bearings fastened on said supporting-frame, the belt *s*, connecting said pulleys Z' Z'' Z''' $Z^{\times}$, and the springs *s'*, fastened upon said machine above said wheels Z'' $Z^{\times}$, all in one machine, substantially as and for the purpose set forth.

401,299. PRESSURE-BAR FOR PLANING-MACHINES. George W. Fassel, Cincinnati, Ohio. Filed Nov. 26, 1887. Serial No. 256,232. (No model.)



Claim.—1. A pressure-bar for planing-machines, provided with an inclosed channel or channels open at one end to receive and at the other end to discharge chips, shavings, and like substances, substantially as described.

2. A pressure-bar for planing-machines, having an unbroken lower edge and a channel or channels for receiving and discharging chips, shavings, and like substances, substantially as described.

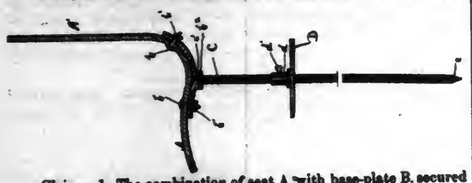


3. The combination, with a pressure-bar for planing-machines, of an elastic plate attached thereto, and an open channel or channels communicating with the space between such plate and the pressure-bar for the escape of chips, shavings, and like materials, substantially as described.

401,300. BOILER FOR HEATING PURPOSES. Isaac K Potts, Columbus, Ohio. Filed Nov. 22, 1888. Serial No. 291,563. (No model.)

Claim.—In a furnace, the combination, with a boiler having a cone-shaped magazine and tubes in direct contact with the gases, of an exterior metallic jacket having a non-conducting lining, the boiler-tubes being interposed directly between the boiler and jacket, as and for the purpose set forth.

401,301. WOVEN-WIRE MATTRESS. Rudolph Perus, Milwaukee, Wis., assignor of one-half to Fred Kunkel, same place. Filed Aug. 13, 1888. Serial No. 282,605. (No model.)



Claim.—1. In a woven-wire mattress, the woven-wire section and side rails, in combination with castings rigidly secured to the side rails, links pivoted at their inner ends to the castings for engagement with a cross-bar of said woven-wire section, and vertically-arranged set-screws passed through said side rails to engage the outer ends of the links, substantially as set forth.

2. In a woven-wire mattress, the woven-wire section and side rails, in combination with pivotally-adjustable links connected to the side rails to engage a cross-bar of said woven-wire section, screws passed through the cross-bar to have their bearings in the ends of the links, and nuts arranged on the screws between the inner side of said cross-bar and adjacent ends of said links, substantially as set forth.

3. In a woven-wire mattress, the woven-wire section and side rails, in combination with castings rigidly secured to the side rails, links pivoted at their inner ends to the castings for engagement with a cross-bar of said woven-wire section, set-screws passed through said side rails to engage the outer ends of the links, other screws passed through the cross-bar to have their bearings in both ends of said links, and nuts arranged on the latter screws to bear against the inner side of said cross-bar, substantially as set forth.

4. In a woven-wire mattress, the woven-wire section and side rails, in combination with castings rigidly secured to the side rails links pivoted at their inner ends to the castings for engagement with a cross-bar of said woven-wire section, vertically-arranged set-screws passed through said side rails to engage the outer ends of the links, a frame having a yielding connection with said cross-bars, and spiral springs arranged on the frame to impinge against the woven-wire section, substantially as set forth.

401,802. **HUNTER'S PORTABLE STOOL.** EDWARD G. PURDY, Michigan City, Ind. Filed Sept. 3, 1888. Serial No. 284,488. (No model.)

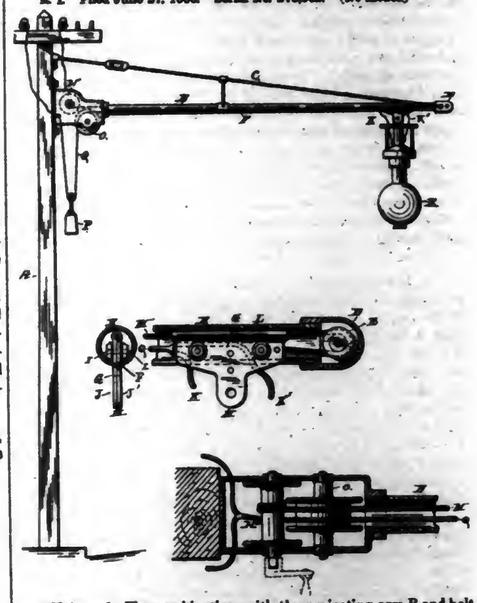
Claim.—1. The combination of seat A, with base-plate B, secured thereto, standard C, secured to said base-plate, and adjustable supporting-disk D, having hub *d* and set-screw *d'*, for securing the same in different positions to said standard C, substantially as specified

2. The combination of veneer-board seat A, having integral back A', with base-plate B, threaded bolts *b*, passing through said seat and base-plate, and furnished with thumb-nut *b'*, for securing said base-plate to said seat, standard C, secured at its upper end to said base-plate, and flat supporting-disk D, having hub *d* and set-screw *d'*, said standard passing through said hub, and said hub being fixed in position on the standard by said set-screw, substantially as specified.

401,803. **TRANSPARENT PICTURE.** WILLIAM READ, Jr., Boston, Mass., assignor, by mesne assignments, to Sarah Farrington Read, same place. Filed Jan. 23, 1888. Serial No. 261,591. (No model.)

Claim.—1. As an article of manufacture, a flexible transparent picture composed of superposed sheets, respectively, of gelatine and paper united by a transparent cement, the paper sheet having a print or picture thereon and being embossed in imitation of canvas on the front side, as set forth.

2. As an article of manufacture, a flexible transparent picture composed of superposed sheets, respectively, of paper having a print or picture and gelatine united by a transparent cement, the gelatine being protected from atmospheric action by a water-proof coating applied to the back of said gelatine sheet, as set forth.



3. The improved transparent picture sheet composed of superposed layers of paper and gelatine united by a transparent cement, the gelatine being protected from atmospheric action by a water-proof coating applied to its exposed surface, as set forth.

4. The improved flexible transparent picture composed of the front gelatine sheet, *a*, having a transparent water-proof coating on its outer surface, the back gelatine sheet, *a'*, and the interposed print *b*, secured to said sheets by transparent cement, as set forth.

5. The improved picture composed of a print, front and back gelatine sheets, *a a'*, to which the print is secured by a transparent cement, the front gelatine sheet having a transparent water-proof coating on its outer surface, the back gelatine sheet or sheets, *c*, having color laid upon them coinciding with the print, and the metal frame interposed between the sheets *a'* and *c* and forming a space, *s*, therebetween, as set forth.

6. The improved picture composed of a print, front and back gelatine sheets, *a a'*, to which the print is secured by a transparent cement, the front gelatine sheet having a transparent water-proof coating on its outer surface, the back gelatine sheet or sheets, *c*, having color laid upon them coinciding with the print, the metal frame interposed between the sheets *a'* and *c* and forming a space, *s*, therebetween, and a marginal binding securing all of said parts together, as set forth.

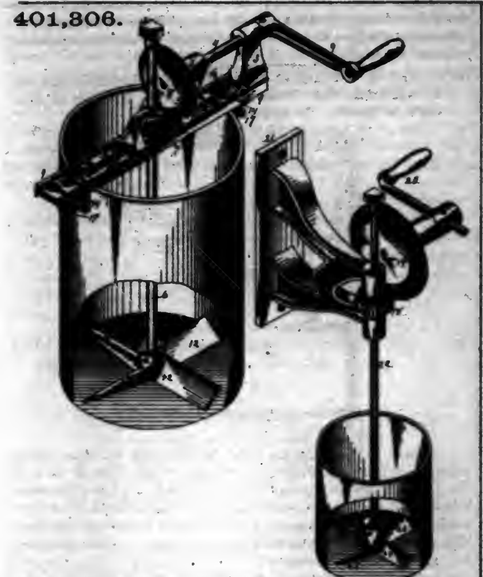
401,804. **DEVICE FOR SUPPORTING AND OPERATING ELECTRIC LIGHTS.** CHARLES W. RUSSELL and JOHN I. DRAKE, Providence, R. I. Filed June 27, 1888. Serial No. 278,262. (No model.)

Claim.—1. The combination, with the projecting arm B and belt M, of the carrier G, having a sleeve, L, for the passage of the belt.

2. The combination, with the projecting arm B and belt M, of the carrier G, having a sleeve, L, for the passage of the belt, and ways for the passage of the conducting-wires, as set forth.

3. The combination, with the hollow slotted projecting arm B of the belt M, supported on pulleys therein, and a carrier, G, having the sleeve L for the passage of the belt, and the inclined pulleys for riding in the arm B, as set forth.

401,805. **SNAP-HOOK.** JAMES R. RYAN, Sault Ste. Marie, Mich. Filed Aug. 2, 1888. Serial No. 281,906. (No model.)

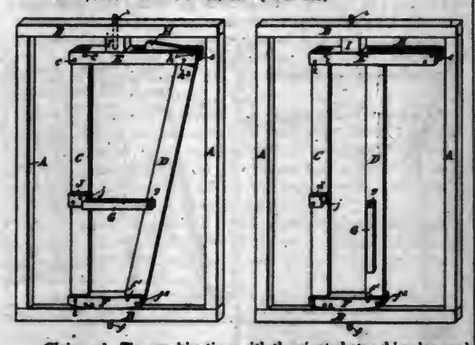


Claim.—As an improved article of manufacture, a snap-hook consisting of a single piece of wire to form the hook A, shank B, loop C, coils D D, and latch E, substantially as described.

401,806. **PAINT-MIXER.** GEORGE W. SCHOCK and WILLIAM H. WARNEROVER, South Bend, Ind. Filed May 3, 1888. Serial No. 272,707. (No model.)

Claim.—1. The combination, with a shaft carrying the mixing-blades and a receptacle to receive the blades, the said shaft having a free vertically-sliding adjusting movement, of a support to prevent the lateral displacement of the shaft and means for rotating the shaft, substantially as set forth.

2. The combination, with a shaft carrying the mixing-blades and a receptacle to receive the blades, the said shaft being provided with



401,806.

a longitudinal groove, of a support to prevent the lateral displacement of the shaft, a pinion through which the shaft may freely slide during its rotary movement, the pinion having a feather loosely engaging the longitudinal groove in the shaft, and driving-gear in engagement with the pinion, substantially as set forth.

3. The combination, with the shaft carrying the mixing-blades and a receptacle to receive the blades, of a support for the shaft-driving mechanism, the said support being provided with clamping-arms having a sliding movement toward and away from the vertical axis of the support, set-screws to hold the arms in the desired adjustment, and set-screws seated in the arms and adapted to impinge against the sides of the receptacle to prevent the support from shifting, substantially as set forth.

401,807. **STANCHION.** WALTER SCOTT, Hoosick Falls, N. Y. Filed Feb. 13, 1888. Serial No. 263,914. (No model.)

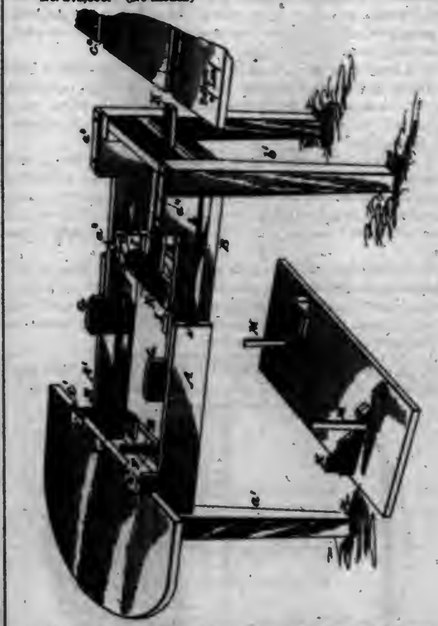
Claim.—1. The combination, with the pivoted stanchion-bar and a prop adapted to hold the said bar open against the action of a spring and to be swung downward by the animal to permit the spring to close said bar, of a locking device operated by the movement of the pivoted bar to hold the animal in the stanchion, substantially as and for the purpose specified.

2. The combination, with the elongated bar E, latch H, pivoted in the slot *e* and resting on the top of the pivoted bar D, of the prop G, and spring K, substantially as and for the purpose specified.

401,808. **NIPPERS.** SILAS E. SELLEW, Cold Spring, N. Y. Filed Aug. 13, 1888. Serial No. 283,092. (No model.)

Claim.—The pliers consisting of the casing or head, the apertured disks having, in addition to their registering wire-receiving apertures, a concaved notch or recess at each of their upper and lower ends, the pivoted handles having at their ends projections which engage with the lower end notches or recesses of the disks, and the

401,808.



gage having a bent arm pivoted to said casing or head, to the outer end of which arm is secured an upright on which fits a second arm registering with any one of the wire-receiving apertures of the disks and which aforesaid or bent arm is provided with an elongated slot receiving a projection on one of the handles, substantially as specified.

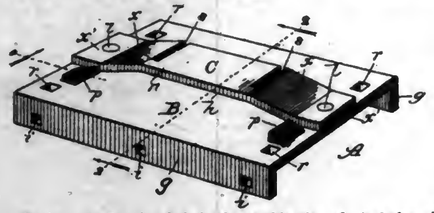
401,809. **KEY-LEVELING DEVICE FOR PIANOS.** CHARLES H. SMITH, Atlanta, Ga. Filed Mar. 12, 1888. Serial No. 267,043. (No model.)

Claim.—In the key of a musical instrument, the combination of the tongue *a* and the screw E, substantially as shown and described, and for the purpose specified.

401,810. **EXTENSION-TABLE.** ERNST H. W. STAHLHUTH and HENRY W. STAHLHUTH, Cincinnati, Ohio. Filed Apr. 27, 1888. Serial No. 272,039. (No model.)

Claim.—1. An extension-table having two dovetailed tenons, a^3, on one of its two sections, a correspondingly-grooved leaf, C', with the lip *c'*, a leaf, C^2, with subjacent hooks D, standards E, and riser G, arranged as shown and described, for the purpose set forth.

2. In extension-tables, the lever K and movable wedges I, the latter flexibly connected with one end of the T-head of said lever, in combination with wedges H H and leaf C^2, as and for the purpose specified.



401,811. **PREPARING SOLUBLE COCOA.** HEINRICH STOLLWERCK, Cologne-on-the-Rhine, Prussia, Germany, assignor to Gebr. Stollwerck, same place. Filed Sept. 26, 1887. Renewed Oct. 11, 1888. Serial No. 287,208. (No model.)

Claim.—1. The method set forth of preparing cocoa in solid plates or pieces readily soluble in boiling water, said method consisting in impregnating the powdered cocoa with a solvent of the fatty matter

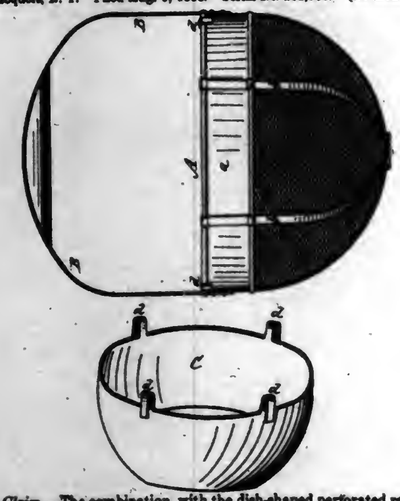
therein contained, and then pressing it in suitable molds, whereby the finished pieces are inclosed in an envelope of the hardened cocoa-butter, substantially as described.

2. The method set forth of preparing cocoa in solid plates or pieces readily soluble in boiling water, said method consisting in first impregnating the powdered cocoa with an alcoholic solvent, and then pressing the same in suitable heated molds, substantially as described.

401,812. SWITCH-RAIL CHAIR. AXEL A. STROM, Austin, assignor to the Strom Manufacturing Company, Chicago, Ill. Filed Nov. 23, 1888. Serial No. 291,641. (No model.)

Claim.—1. In a head-chair, the combination of a bed-plate, B, and a cross-bar, C, having slots *s*, and bent toward its opposite ends, thereby producing end portions, *x'*, and an intermediate housing, and secured to the bed-plate, substantially as described.

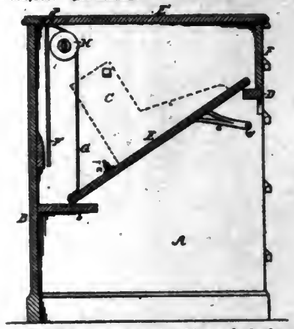
2. In a head-chair, the combination of a bed-plate, B, and a cross-bar, C, having slots *s*, and bent obliquely from near the opposite outer sides of the slots, and having horizontal end portions, *x'*, and an intermediate housing, *h*, and secured to the bed-plate, substantially as described.



3. A head-chair comprising, in combination, a bed-plate, A, and a cross-bar, C, formed of a slotted bar, *n*, having a flange, *m*, extending at opposite ends short of the ends of the said bar, and the cross-bar being bent toward its ends and secured thereat to the bed-plate, substantially as described.

4. A head-chair comprising, in combination, a bed-plate, A, and a cross-bar, C, formed of a slotted bar, *n*, having a flange, *m*, beveled at opposite ends toward the surface of the bar *n*, the cross-bar being bent toward its ends and secured thereat to the bed-plate, substantially as described.

5. A head-chair comprising, in combination, a bed-plate, A, and a cross-bar, C, formed of a slotted bar, *n*, having a flange, *m*, beveled at opposite ends toward the surface of the bar *n*, the cross-bar being bent toward its ends to conform to the surface of the bed-plate and welded and riveted thereto toward its bent ends, substantially as described.

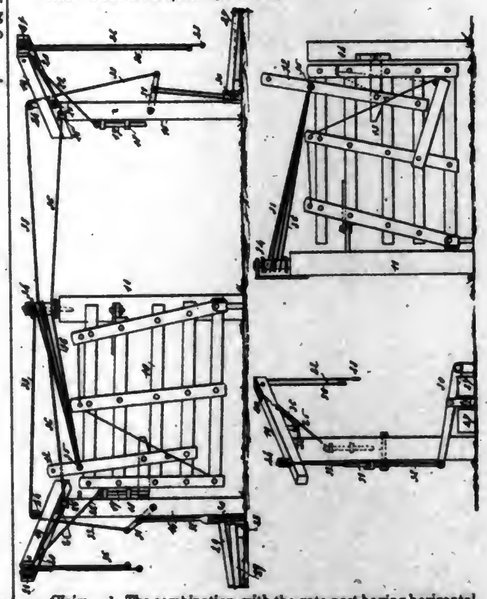


6. A head-chair comprising, in combination, a bed-plate, A, having lateral perforated flanges *g* and struck-up stops *p*, and a cross-bar, C, having slots *s*, and bent toward its opposite ends, thereby producing the end portions, *x'*, and an intermediate housing, *h*, and secured to the bed-plate, substantially as described.

401,813. POISONOUS-POWDER DUSTER. GEORGE B. TITUS, Irondequoit, N. Y. Filed Aug. 9, 1888. Serial No. 282,383. (No model.)

Claim.—The combination, with the dish-shaped perforated receptacle A, provided with the handle B, of the removable shield C, constructed with imperforate sides and an open bottom, and provided with hooks *d d*, by which it is suspended and held in the receptacle, as herein set forth.

401,814. DESK OR CABINET. WILLIAM H. TRAVIS, Philadelphia, Pa., assignor to James Densmore, Brooklyn, N. Y. Filed Apr. 20, 1888. Serial No. 162,803. (No model.)

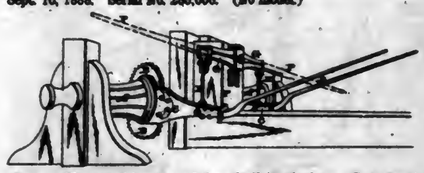


Claim.—1. The herein-described table or desk for type-writing purposes, said table having a movable top, which, when down, is at the proper height for use as an ordinary desk, and below the top a hinged shelf, which, when elevated, is at the proper height for a type-writing machine, and connecting devices between the top and shelf, whereby the moving of one out of position brings the other into position, all substantially as set forth.

2. The herein-described table or desk for type-writing purposes, said table having a movable top, which, when down, is at the proper height for use as an ordinary desk, and below the top a hinged shelf, which, when elevated, is at the proper height for a type-writing machine, the said shelf being hinged near its front, substantially as described, whereby the front edge of said shelf is moved forward toward the front of the desk as it is elevated, as and for the purpose described.

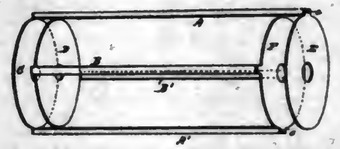
3. The herein-described table or desk for type-writing purposes, said table having a vertically-sliding folding top, which, when horizontal, is at the proper height for use as an ordinary desk, and below the top a hinged shelf, which, when elevated, is at the proper height for a type-writing machine, and chains, straps, or cords connecting the sliding top and hinged shelf, all substantially as specified.

4. The combination of the side and rear frames of a desk and cross-strips D with hinged shelf E and movable top E', having a flap, F, as described.



401,815. GATE. THOMAS TYSON, Mound City, Mo. Filed June 4, 1888. Serial No. 276,016. (No model.)

Claim.—1. The combination, with the gate-post having horizontal pulleys on its upper end and a gate pivoted to swing in opposite directions and having a latch and lever therefor, of standards 15 16 at opposite sides of the gate-post, having pulleys 24 on their upper ends, spaced inclined planes near each standard, a lever, 29, pivoted between each pair of said inclined planes parallel with the roadway, a second lever, 30, pivoted at right angles to each lever 29, and pivotally connected with said levers 29 at their adjacent or inner ends, levers 31, pivoted to the posts 15 16, rods 32, connecting levers 30 31, and a rope or chain leading from the latch-lever in opposite directions around the pulleys 34, thence over the pulleys 24 and down to the levers 31, substantially as set forth.



2. The combination, with the gate having a latch and side standards, 15 16, having cross-beams 19, extending toward the roadway, of the vertically-sliding latch-pin 17 on each post to engage the gate-latch, and ropes or chains leading from the upper end of said pins outward over pulleys on the outer ends of beams 19 and downwardly therefrom within reach of a pedestrian or driver, substantially as set forth.

401,816. WINDLASS. ADOLPH VOSS, Gloucester, Mass. Filed Sept. 10, 1888. Serial No. 285,006. (No model.)

Claim.—The combination of the windlass, the levers C, connected therewith and provided with dogs O, the lever G, placed at an angle to the levers C and connected thereto, and the hand-levers P, which are applied to the ends of the levers C G, substantially as shown and described.

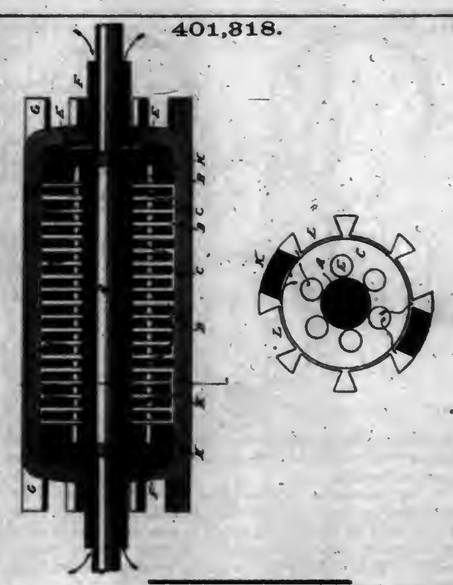
401,817. DYNAMO OR MAGNETO ELECTRIC MACHINE. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed May 31, 1881. Serial No. 34,506. (No model.)

Claim.—1. In an armature whose core is longitudinally wound with a continuous conducting coil or coils, substantially in the manner stated, a coil composed of longitudinal conducting-bars, combined with cross connecting disks or plates, substantially as hereinbefore set forth.

2. An armature-coil composed of longitudinal bars or strips, combined with cross connecting disks which at one end of the armature connect the two bars of one set and at the other end of the armature connect the terminal bar of one set with the initial bar of the next succeeding set, the latter disks being connected up with the commutator, substantially as hereinbefore set forth.

3. In a revolving armature, a conducting-coil whose longitudinal portions are united at the end or ends of the armature by a disk or plate connection, substantially as and for the purposes hereinbefore set forth.

4. The combination, in a revolving armature, of longitudinal conductors with end connecting-disks, substantially as hereinbefore set forth.



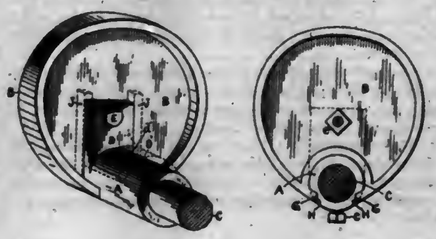
401,818. DYNAMO-ELECTRIC MACHINE. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Oct. 24, 1882. Serial No. 75,068. (No model.)

Claim.—1. The combination, with the armature-core of a dynamo-electric machine, of conductors raised from the body of the core, so as to leave air-spaces between the core and the conductors, as set forth.

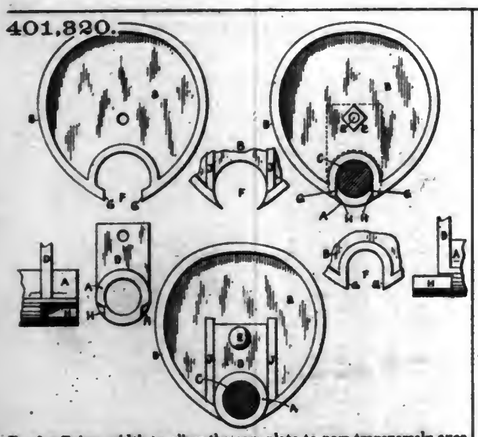
2. The combination, with the armature-core of a dynamo-electric machine, of conductors or coils and means for supporting each of the same so disposed that the said conductors are separated from the body of the core, a space being left entirely around them, as set forth.

3. The combination, with an armature-core having air-passages E E and spaces D D, of conductors or coils and means for supporting the same so disposed that the said conductors or coils are separated from the body of the core, as and for the purpose set forth.

401,818.



401,819. DOOR-SPRING. JOHN H. WILLIAMS, Waterloo, Iowa. Filed Dec. 26, 1888. Serial No. 294,579. (No model.)



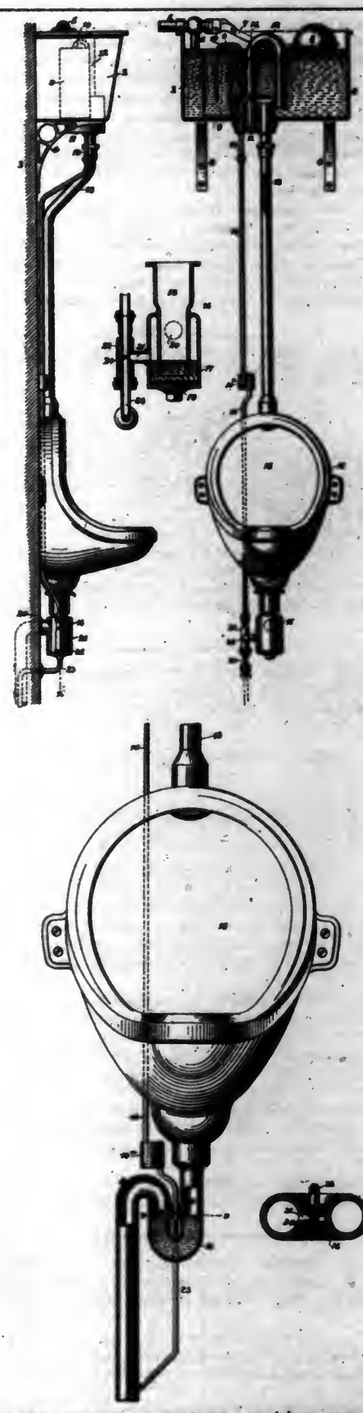
Claim.—In a door-closer, the combination of a bracket having a bearing therein, a drum-carrying frame swiveled in the bracket, a drum mounted in the frame, a ribbon, cord, or the like wound upon the drum, and a spring attached to the drum and frame, all substantially as set forth.

401,820. CAM. ALVIN D. WOODMANSEE, Natick, R. I. Filed Feb. 18, 1889. Serial No. 300,347. (No model.)

Claim.—1. The combination, with the hollow hub or sleeve of a cam, of a detachable cam-plate provided with a peripherical opening,

401,820.

F, of sufficient width to allow the cam-plate to pass transversely over a shaft to which the hub is to be attached, substantially as and for the purposes specified.



2. The combination, with the hollow hub or sleeve of a cam, of a detachable cam-plate provided with a peripherical opening, F, of sufficient width to allow the cam-plate to pass transversely over a shaft to which the hub is to be attached, the said cam-plate having shoulders or stops G G, and the hub having shoulders or stops H H, substantially as set forth.

3. The combination, with the hollow hub or sleeve of a cam having an arm, D, and shoulders H H, of a cam-plate detachably secured to said arm and having a peripherical opening, F, and shoulders G G to engage the shoulders H H, substantially as and for the purposes specified.

4. The combination, with the hub A, having the arm D and shoulders H H, of the cam-plate B, having the peripherical opening, F, shoulders G G, and ribs J J, substantially as and for the purposes specified.

401,821. APPARATUS FOR FLUSHING URINALS, &c. STRETTELL H. WRIGHT, Birkenhead, County of Chester, England, assignor to the Meyer-Sniffen Company, (Limited,) New York, N. Y. Filed Aug. 3, 1888. Serial No. 282,345. (No model.) Patented in England Jan. 26, 1887, No. 1,223; in France Nov. 10, 1887, No. 186,900, and in Belgium Nov. 12, 1887, No. 79,534.

401,821.

Claim.—1. The combination of a cistern, a urinal, a flushing-siphon, and a part-bore draw-pipe connecting with the urinal-outlet and with the flushing-siphon, substantially as described.

2. The combination of a cistern provided with two siphons communicating with each other, a urinal, and a part-bore draw-pipe connecting with the urinal-outlet and with the siphons, substantially as described.

3. The combination of a cistern provided with communicating siphons 10 and 12, the bend of the former being arranged below that of the latter, a urinal, and a draw-pipe connecting with the urinal-outlet and with the siphons, substantially as described.

4. The combination of a cistern provided with communicating siphons 10 and 12, the siphon 10 having a smaller bore above the point of connection with the siphon 12, a urinal, and a draw-pipe connecting with the urinal-outlet and with the siphons, substantially as described.

5. The combination of a cistern, two siphons connecting with each other, a well for one of the siphons, a urinal, and a draw-pipe connecting with the urinal and with the siphons, substantially as described.

6. The combination of a cistern, a flushing-siphon, a ball-cock, a urinal, and a part-bore draw-pipe connecting with the urinal-outlet and with the flushing-siphon, substantially as described.

7. The combination of a cistern, two siphons connecting with each other, a ball-cock, a well for one of said siphons, a urinal, and a draw-pipe connecting with the urinal and with the siphons, substantially as described.

8. The combination of a cistern, two siphons communicating with each other, a well for one of said siphons and a trap for the other, a supply-cock, a urinal, and a draw-pipe connecting with the urinal and with the siphons, substantially as described.

9. The combination of a cistern, two siphons communicating with each other, a well for one of said siphons and a trap for the other, a supply-cock, a pan or basin, a trap beneath the same, and a draw-pipe connecting with the urinal and with the siphons, substantially as described.

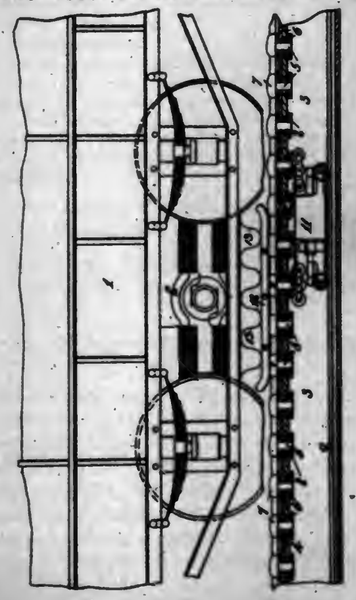
10. The combination of a cistern, two siphons communicating with each other, a well for one of said siphons and a trap for the other, a supply-cock, a draw-pipe, a pan or basin, and a trap beneath the same having two outlets, one to the draw-pipe and the other to the waste-pipe, substantially as described.

11. The combination of a cistern, two siphons communicating with each other, a well for one and a trap for the other, a supply-cock, a pan or basin, a trap beneath the same, and a part-bore-exhausting apparatus consisting of a draw-pipe, a surrounding chamber, and an inlet from the chamber to the draw-pipe.

12. The combination of a cistern, two siphons, 10 and 12, therein connecting with each other, a well for the siphon 10, a draw-pipe, and a supply-cock to the cistern, substantially as described.

13. The combination of a cistern, two siphons, 10 and 12, the shorter leg of the latter extending below that of the former, a well for the short leg of the siphon 10, a trap for the long leg of the siphon 12, a draw-pipe, and a supply-cock to the cistern, substantially as set forth.

14. The combination of a cistern, a flushing-siphon, a draw-pipe connected therewith, a urinal, a trap beneath the same, a waste-pipe from the trap, and a passage-way from the trap to the draw-pipe, substantially as described.

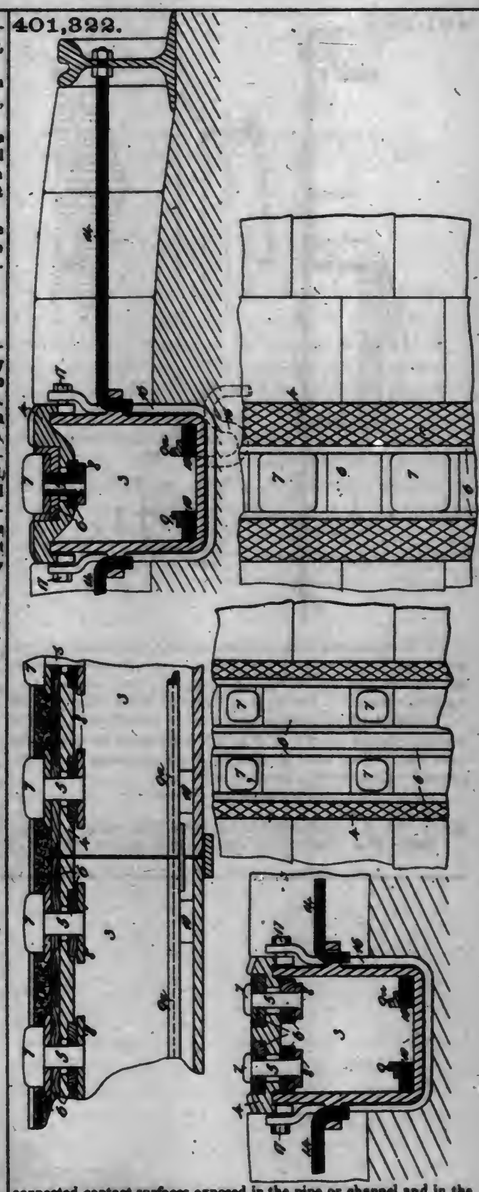


401,822. APPARATUS FOR THE APPLICATION OF ELECTRICITY TO PROPEL VEHICLES. FRANK WYNER, Westminster, County of Middlesex, England. Filed June 6, 1887. Serial No. 240,412. (No model.) Patented in England July 15, 1886, No. 9,215; in Germany Jan. 27, 1887, No. 41,326; in France Mar. 9, 1887, No. 182,077; in Belgium Sept. 2, 1887, No. 78,757, and in New South Wales Oct. 4, 1887, No. 226.

Claim.—1. In apparatus for the application of electricity to propel cars or vehicles, the combination, with a pipe or covered channel, of stationary insulated contact studs or rivets having parts 7, exposed in the road along which cars or vehicles are to be electrically propelled, and parts exposed in said channel, said contact studs or rivets being so arranged that said exposed parts 7 are short and frequent in the direction of said road but not in close proximity, substantially as herein described, for the purpose set forth.

2. In apparatus for the application of electricity to propel cars or vehicles, the combination of a covered channel, stationary insulated contact studs or rivets having parts exposed in said channel, and contact parts 7, exposed in the road along which cars or vehicles are to be propelled, and metallic connections between said contact studs or rivets and said contact parts 7, said exposed parts 7 being made short and frequent in the direction of said road but not in close proximity, substantially as herein described, for the purpose set forth.

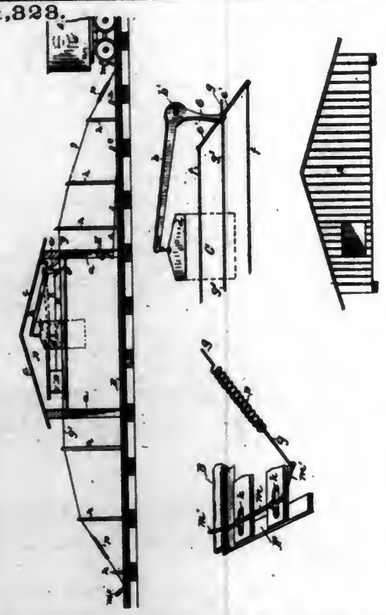
3. In apparatus for the application of electricity to propel cars or vehicles, the combination of a covered channel, stationary insulated contact studs or rivets arranged at frequent intervals apart and having parts exposed in said channel, metallic contact bars or plates 7, exposed in and arranged transversely to the road along which cars or vehicles are to be propelled, said exposed bars or plates 7 being made short and frequent in the direction of said road but not in close proximity, and metallic connections between said contact studs or rivets and said contact bars or plates 7, substantially as herein described, for the purpose set forth.



4. Apparatus for the application of electricity to propel cars or vehicles, comprising pipe or channel 3, contacts 5 5, with electrically-

connected contact-surfaces exposed in the pipe or channel and in the road on which the cars or vehicles are to be propelled, insulating material 6, strap-clips 19 and 20, rails or conductors 9 and 9*, and insulating-supports 10, all substantially as herein described, for the purpose specified.

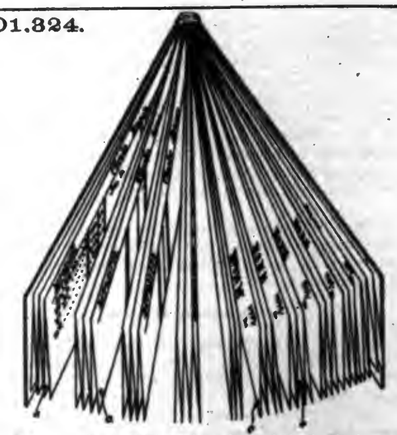
5. In apparatus for the application of electricity to propel cars or vehicles, the combination of lengths of pipe or channel 3, with removable cover 4, straps 16, and screws 17, said straps 16 adapted to hold said cover 4 in place and to close the joint between adjacent lengths of pipe or channel, substantially as herein described.



401,822.

401,823. RAILROAD-CROSSING SIGNAL. JACOB H. YOUNG, Lancaster, N. Y. Filed Oct. 26, 1888. Serial No. 288,139. (No model.)

Claim.—1. In combination with a railroad-crossing signal-stand, *a a*, having a roofed box, A *c*, the flag-arm *b*, pivoted at *b'*, with the flag C *d* depending from the outer end, the rod *e* of the arm *b*, having the cross-piece *e'*, the cables or wires *g g'*, connected to the rod *e* and attached to the bent levers *m m' m''*, adapted to be operated by wheels of passing trains, throwing the flag up or down, substantially as specified.



401,823.

2. In combination with a railroad-crossing signal-stand, *a a*, having the box A *c*, the flag-arm *b*, pivoted at *b'*, with the flag C *d* depending from the outer end, the rod *e*, forming part of the arm *b*, and having the cross-piece *e'*, with wires *g'*, connected to the rod *e*, and rods *f f*, connected to the cross-piece and to the slides D, the wires *g g'*, connected to bent levers *m m' m''* at both extremes of the wires at the track side, adapted to be operated by wheels of passing trains, substantially as and for the purpose specified.

401,824. POCKET-CHECK AND FORM BOOK. EUGENE FANNING, Newton, Mass. Filed Dec. 31, 1888. Serial No. 295,072. (No model.)

401,824.

Claim.—1. In a check-book, a sheet of check blanks or forms folded alternately back and forth, the printed blank forms of checks all facing one way when folded, but alternately in opposite directions when the sheet is spread out, substantially as described.

2. A sheet of printed forms folded back and forth similarly to the folds of a paper fan and printed on each side of the sheet on the alternate folds, a vacant fold of one side occupying the back of a printed form on the other, and attached within the covers of a book by the edge of one of the outer folds, all the printed forms on the sheet facing when so folded and attached in one uniform direction, substantially as described.

3. The combination of a block of printed forms in blank, constructed of a sheet folded back and forth, having the printed-form faces all in one direction when folded, and printed account-blanks having a number of spaces or lines suited to the number of forms in the blocks and bound within covers in book form, substantially as described.

4. The combination of book-covers, printed blank forms of account attached therein, a sheet of bank-check or other similar printed forms in blank folded back and forth, each alternate fold bearing upon the back of the alternate vacant space of the other side a check-form printed in blank, the forms all facing when so folded and attached in a uniform direction the account-forms, substantially as described.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

THE MORLEY SEWING MACHINE COMPANY *et al. v.* LANCASTER.

Decided February 4, 1889.

1. MORLEY—MACHINES FOR SEWING BUTTONS ON FABRICS, &c.

Letters Patent No. 236,350, granted January 4, 1881, to Joseph H. Morley, for a machine for sewing buttons on fabrics, &c., is entitled to receive a liberal construction in view of the fact that the inventor was a pioneer in the construction of an automatic button-sewing machine, and is not to be limited to the particular devices or instrumentalities described by him, used in the three main elements of his machine, which combine together to make it up.

2. INFRINGEMENT.

As thus construed the patent is infringed by defendant's machine manufactured under Letters Patent No. 268,369, granted November 28, 1882, to Joseph Mathison, for a machine for sewing on buttons, the means employed in which are substantially equivalents of those used in the Morley machine.

3. EQUIVALENTS.

The mechanical devices used by the defendant are known substitutes or equivalents for those employed in the Morley machine to effect the same results, and this is the proper meaning of the term "known equivalents," in reference to a pioneer machine, such as that of Morley.

4. USE OF PATENTED PROCESSES BY A SUBSEQUENT INVENTOR.

A person who subsequently discovers a new mode of carrying out a patented process is not entitled to use the process without the consent of the patentee.

5. IMPROVEMENT ON PIONEER MACHINES.

Where an invention is one of a primary character and the mechanical functions performed by the machines are as a whole entirely new all subsequent machines which employ substantially the same means to accomplish the same results are infringements, although the subsequent machines may contain improvements in the separate mechanisms which go to make up the machine.

APPEAL from the Circuit Court of the United States for the District of Massachusetts.

Mr. B. F. Thurston for the appellant.

Mr. J. E. Maynadier and *Mr. George E. Smith* for the appellee.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought November 6, 1882, in the Circuit Court of the United States for the District of Massachusetts, by the Morley Sewing Machine Company and the Morley Button Sewing Machine Company against Charles B. Lancaster, for the alleged infringement of Letters Patent No. 236,350, granted January 4, 1881, to James H. Morley, E. S. Fay, and Henry E. Wilkins, on the invention of said Morley, on an application filed June 23, 1880, for an improvement in machines for sewing buttons on fabrics. The machine of the defendant is constructed in accordance with the description contained in Letters Patent No. 268,369, granted November 28, 1882, to Joseph Mathison, William D. Allen, and C. B. Lancaster, on the invention of said Mathison, for improvements in machines for securing buttons to material, on an application filed August 1, 1882.

The specification of the Morley patent says:

My invention consists in mechanism for automatically sewing shank-buttons onto fabrics, shoes, &c.; and the objects of my invention are to form a double-threaded stitch on the top side of the material being sewed upon transversely to the direction of feed, and on the reverse side of the material two parallel lines of stitches at right angles to the first-named ones, to make alternately long and short stitches, and to so feed buttons to be sewed by said machines as to present them at the proper time and in the proper place to be operated upon.

The specification then describes, by reference to 21 figures of drawings, the mechanical means used by the patentee to perform the mechanical operations described. The specification then proceeds:

Having thus described the machine and constructions set forth in the drawings, I wish it to be understood that the same is only one of different mechanisms which I have contemplated, and which may be effectually employed for carrying out the main feature of my invention—to wit the automatic mechanical sewing of buttons to a fabric. Thus different means may be adopted for carrying the thread through the eye of the button into the fabric—as, for instance, passing the hooked needle through said eye to a position to seize the thread from the straight needle, or form a suitable carrier and then draw the loop down through the fabric to be secured beneath by a shuttle or needle thread, or the eye-pointed needle may be used in connection with a loop-spreader and shuttle for carrying a thread through the loop, a single thread or two threads being used. It will further be understood that wires may be sometimes substituted for threads and that other feed mechanisms may be employed, the needles moving with but not controlling the fabric, as in the construction described.

There are 18 claims in the patent, only 4 of which are relied upon by the plaintiffs, namely, claims 1, 2, 8, and 13, which are as follows:

1. The combination, in a machine for sewing shank-buttons to fabrics, of button-feeding mechanism, appliances for passing a thread through the eye of the buttons and locking the loop to the fabric, and feeding mechanism, substantially as set forth.

2. The combination, in a machine for sewing shank-buttons to fabrics, of a needle and operating mechanism, appliances for bringing the buttons successively to positions to permit the needle to pass through the eye of each button, and means for locking the loop of thread carried by the needle to secure the button to the fabric, substantially as set forth.

8. The combination, in a machine for sewing buttons to fabrics, of button feeding and sewing appliances, substantially as set forth, and feeding appliances and operating mechanism whereby the feeding devices are moved alternately different distances to alternate short button-stitches with long stitches between the buttons, as specified.

13. The combination, with button-sewing appliances, of a trough, appliances for carrying the buttons successively from the trough to the sewing devices, and mechanism for operating said appliances and sewing devices, as set forth.

The defendant's machine is known as the Lancaster machine.

The Morley machine contains and is made up of 3 main groups of instrumentalities: (1) mechanism for holding the buttons in mass, and delivering them separately, in proper position, over the fabric, so that they

may be attached to it by the sewing and stitching mechanism; (2) the stitching mechanism; (3) the mechanism for feeding the fabric along, so as to space the stitches and consequently the buttons when sewed on.

In the button-feeding mechanism there is a hopper containing the buttons in mass. The principal use of the machine is to sew buttons onto the uppers of buttoned boots, and the button designed to be used is one having a round ball affixed to a shank, which terminates in an eye. On the bottom of the hopper is a hopper-valve, which picks out the buttons one by one and delivers them into an inclined trough. This trough has a V-shaped groove along its bottom, midway between its sides, and the buttons enter the upper part of the trough with their shanks in all directions, and it becomes necessary to turn them over, so that the eyes will lie in the groove while the bodies of the buttons occupy the trough. The contrivance for accomplishing this consists of a flexible, corrugated strip of metal, lying over the top of the trough, and oscillated by proper machinery, which, by contact with the bodies of the buttons, will roll them over so that their eyes will lie in the groove. After the buttons are thus arranged, they slide down the trough, being aided to do so by a jarring motion imparted to the latter. When they arrive at its lower end, which is bent so as to be nearly vertical, they lie with their heads toward the front of the machine, that is, the side farthest from the driving-pulley. In one modification of the machine, the buttons are held in the trough by a button-wheel, which is mounted on a vertical axis, and is provided with pockets, each capable of receiving a button, and admits of being intermittently revolved at proper times. This button-wheel is used (1) to close the bottom of the trough; (2) to receive buttons into its pockets; and (3) by its own revolution, to turn the buttons around, so that their eyes will lie toward the front of the machine. In order to prevent the buttons from falling out of the pockets, the button-wheel rests upon a stationary table, which closes the bottoms of all of the pockets but one. When a button arrives over the notch in the table, it has been turned around, on a vertical axis, 180 degrees; but, as a plane passing through its eye is then vertical, it must be turned on a horizontal axis through 90 degrees, so that its eye may lie flat, in order that the needle, which ascends from beneath, may pass through the eye. Therefore, when a button arrives over the notch in the table, a plunger or punch descends into the pocket and drives the button into a button-carrier, which lies at that time immediately under the notch, and under the pocket into which the punch enters. When the button enters the carrier, a plane passing through its eye is still vertical, and the carrier therefore turns around on a horizontal axis 90 degrees, to bring the eye of the button into such a position that it can be entered by the needle; and, as the carrier turns, it retracts, so as to bring the eye into such a position that a plane passing through it will be horizontal, and the needle will readily enter it. The patent describes a modified form of the contrivances for bringing the button into a position for the needle to enter its eye, in which modification the button-wheel is dispensed with, and a light spring is applied to the bottom of the trough, to hold up the column of buttons, such spring operating as a spring-gate, opened at proper intervals by mechanism, and shutting itself automatically. This mechanism, which also receives the button and turns it around 90 degrees on a horizontal axis, and transfers it to the place where it is to be sewed, is a sort of spring-nippers, one of the jaws of which is split so as to receive the shank of the button.

The above contrivances constitute what is called in claim 1, "button-feeding mechanism;" in claim 2, "appliances for bringing the buttons successively to positions to permit the needle to pass through the eye of each button;" in claim 8, "button-feeding appliances;" and, in claim 13, "a trough, appliances for carrying the buttons successively from the trough to the sewing devices, and mechanism for operating said appliances."

In the Morley patent there is a contrivance for feeding the fabric so as to space the stitches, and consequently to space the buttons. The needles, while inserted in the fabric, move in the direction of the feed, carrying the fabric with them. The motion of the needles or feed is derived from revolving cams, and the two needles swing like an inverted pendulum. This kind of feed was well known in machines for sewing leather, prior to the date of the Morley patent. This feeding contrivance is what is called in claim 1, "feeding mechanism," and in claim 8, "feeding devices."

The Morley patent describes its stitch as being made by means of two needles, one eye-pointed, like the Howe needle, and the other a hooked or crochet needle, such as is used in machines for sewing leather. These needles are set at an inclination to each other, across the line of the seam, and enter the fabric from beneath, and, when they get above it, cross each other. The eye-pointed needle pierces the fabric and carries a bight of thread up above it, and then retreats a little to form a loop by causing the thread to expand away from the needle. During this time, the hooked needle has also penetrated the fabric from beneath, and, when the loop is formed, passes between the eye-pointed needle and the thread, and, as both needles descend, the hook catches the thread supplied by the eye-pointed needle, and carries a bight of thread across the fabric and down through it to the under side, thus forming the transverse stitches on the button side of the fabric, the eye-pointed needle being described as passing through the eye of the button, although it is stated that instead the hooked needle may pass through such eye. The passage of the needle through the eye, after it has passed through the fabric, holds the button upon the fabric. When the eye-pointed needle retracts and forms a loop above the eye of the button, a loop-spreader is employed to spread the loop, and a shuttle, carrying either one thread or two threads, is passed through the loop, the eye-pointed needle, in its retraction, carrying, by means of the loop, the thread or threads furnished by the shuttle, and the stitch being the ordinary lock-stitch. The stitch described in the Morley patent as made by eye-pointed and hooked needles, both operating from the lower side of the fabric, and making transverse stitches on its upper side and longitudinal stitches on its lower side, is a stitch known prior to the date of the Morley patent.

In the Lancaster machine there are found combined

together the same three main groups of instrumentalities above set forth as being found in the Morley patent. There is in the Lancaster machine a hopper containing the buttons in mass, and an inclined surface which supports a column of the buttons, the buttons lying with their shanks up and their bodies down. This hopper is provided with a reciprocating brush, which sweeps over the buttons and rolls them over so that their shanks, pointing upward, will fall into one or another of slits in a metal plate which covers the inclined flat surface. These slits all converge into a single slit, so that the buttons slide down the various slits and ultimately lie in a single column in the single slit, with their shanks upward, upon an inclined plane surface. This single slit, and the plane surface which it covers, are twisted at the end, in such a manner that a plane passing through the slit is nearly horizontal, and the surface which is in contact with the head of the button is nearly vertical. Consequently, when the buttons reach the bottom, they lie in such a position that a plane passing through the eye of the lowermost button is horizontal, or nearly so. The column of buttons is held up by a light spring, and this spring-gate is opened by the button itself, because the so-called "trough" holding the column of buttons vibrates sidewise, and a thread which passes through the eye of the lowermost button prevents that button from vibrating with the contrivance, and the button is pulled out by the thread, and, in being pulled out, overcomes the resistance of the spring. The eye of the lowermost button in the column lies directly under the needle, so that the needle enters it while it is still in the column. The contrivance containing the column then vibrates sidewise, so as to get out of the way of the needle in a subsequent feeding operation. The spring in the Lancaster machine, which holds up the column of buttons, was a common device in screw blank and eyelet machinery, to hold up a column of blanks and permit them to be removed one by one.

In the Lancaster machine there is a contrivance for feeding the fabric so as to space the stitches, and consequently to space the buttons, and the machine feeds by means of a single needle which reciprocates in a straight line, and, while it is inserted in the fabric, moves in the direction of the feed, carrying the fabric with it, the motion of the needle or feed being derived from revolving cams. The expert for the defendant says that he finds no substantial difference between the mechanism which feeds the fabric in the two machines.

As to the stitching mechanism of the Lancaster machine, the needle is on the upper side of the fabric, and descends through it. It is an ordinary crochet-needle, provided with a cast-off, both the needle and the cast-off being like those described in the Morley patent, and the same which had been used for many years in sewing leather. The machine is also provided with a thread-carrier beneath the fabric, like that used in machines for sewing leather. The eye of the button in the Lancaster machine makes a part of the stitch, and the stitch cannot be made unless a button is supplied at every alternate perforation of the needle. It is therefore necessary that the machine should have some contrivance for carrying some of the loops of the thread over the bodies of the buttons, so that the loop may be locked by the eye of the button. In making the stitch, the needle first passes down through the eye of the button, carrying its hook below the fabric. The thread-carrier beneath the fabric then puts a loop of thread into the hook, and the hook rises, pulling a loop of thread through the fabric and through the eye of the button. The needle then descends again, sliding through such loop and piercing the fabric, and leaving the loop on top of the fabric. The thread-carrier then again puts the thread into the hook of the needle, and the needle rises again, carrying another bight of the thread through the fabric and through the loop on top of the fabric, thus locking that loop. As the needle rises, a contrivance seizes both parts of the loop carried up through the second hole made by the needle, opens it wide and passes it over the body of the button, and the part of the loop which is over the button is then pulled down through the fabric, and consequently around the shank of the button, thus locking the stitch. A succession of these operations forms the stitch, and sews a row of buttons on the fabric, each alternate loop of the stitch being locked by the button itself. If the buttons were removed from the stitch, there would remain a succession of loops, and consequently no seam.

In the operation of the Lancaster machine, after the needle has passed through the eye of the button, the end of the so-called "trough" and the needle move together, while the needle is making its feeding motion. The so-called "trough" then stands still until the needle has ascended and pulled a loop of thread through the eye, and has again pierced the fabric. When the needle has got into the fabric the second time the button is pulled out of the end of the trough by the retreat of the trough toward the rear of the machine, and is so pulled out because at that time the fabric is standing still and the button is held to it by the loop of thread which is passed through the eye of the button. After the button is thus pulled out of the end of the trough, the trough stands still for a while, while a loop is passed over the body of the button, as above described, and the trough then returns again, so as to hold the eye of a second button in the path of the descending needle, the button being thus released, not by the motion of the fabric, but by the motion of the trough which carries the column of buttons.

It satisfactorily appears that the Morley machine was the first one which accomplished the result of automatically separating buttons which have a shank from a mass of the same, conveying them in order to a position where they can be selected by the machine, one after another, and, by sewing mechanism, coupled with suitable mechanism for feeding the fabric be sewed thereto at prescribed suitable distances apart from each other. The machine performs automatically these three functions of selecting, sewing, and spacing. The problem to be performed was to select from a mass of buttons, furnished with heads and with wire eyes projecting therefrom, single buttons, and to present them in succession to the needle of a sewing mechanism, so that the needle could pass through the eye and secure it to the fabric. Machinery existed before for selecting from a mass wood-screw blanks, horse-nails, and pins, and delivering them to other machinery; but, in such constructions,

the shank of the article being heavier than its head, the tendency was for the articles to arrange themselves in the way with the shanks downward, the heads being supported on the top surface of the way. With such buttons as are used in the two machines in controversy, as the heads are much heavier than the shanks and the eyes combined, the buttons will not naturally arrange themselves with their shanks downward. It is therefore necessary to have some means for turning each button into such a position that a plane passing through its eye shall be perpendicular to a plane passing through the long axis of the sewing-needle, so as to insure the passage of the needle through the eye. No machine existing prior to Morley's is shown to have accomplished that operation.

The substance of the defense in the case is that there are certain specific differences between the button-feeding mechanisms in the two machines, and also certain specific differences between their sewing mechanisms; and hence that there is no infringement. This was the view taken by the circuit court in its opinion, (23 Fed Rep., 344.)

Morley, having been the first person who succeeded in producing an automatic machine for sewing buttons of the kind in question upon fabrics, is entitled to a liberal construction of the claims of his patent. He was not a mere improver upon a prior machine which was capable of accomplishing the same general result; in which case, his claims would properly receive a narrower interpretation. This principle is well settled in the patent law, both in this country and in England. Where an invention is one of a primary character, and the mechanical functions performed by the machine are, as a whole, entirely new, all subsequent machines which employ substantially the same means to accomplish the same result are infringements, although the subsequent machine may contain improvements in the separate mechanisms which go to make up the machine.

In *McCormick* v. *Talcott*, (20 How., 402, 405,) the inquiry was, whether McCormick was the first person who invented, in a reaping-machine, the apparatus called a "divider," performing the required functions, or whether he had merely improved an existing apparatus, by a combination of mechanical devices which performed the same functions in a better manner. This Court, speaking by Mr. Justice Grier, said:

> If he [the patentee] be the original inventor of the device or machine called the "divider," he will have a right to treat as infringers all who make dividers operating on the same principle, and performing the same functions by analogus means or equivalent combinations, even though the infringing machine may be an improvement of the original, and patentable as such. But if the invention claimed be itself but an improvement on a known machine by a mere change of form or combination of parts, the patentee cannot treat another as an infringer who has improved the original machine by use of a different form or combination, performing the same functions. The inventor of the first improvement cannot invoke the doctrine of equivalents to suppress all other improvements which are not mere colorable invasions of the first.

So, also, in *Railway Co.* v. *Sayles*, (97 U. S., 554, 556,) this Court, speaking by Mr. Justice BRADLEY, said, in regard to brakes for eight-wheeled railroad-cars:

> Like almost all other inventions, that of double brakes came when, in the progress of mechanical improvement, it was needed; and being sought by many minds, it is not wonderful that it was developed in different and independent forms, all original, and yet all bearing a somewhat general resemblance to each other. In such cases, if one inventor precedes all the rest, and strikes out something which includes and underlies all that they produce, he acquires a monopoly, and subjects them to tribute. But if the advance toward the thing desired is gradual, and proceeds step by step, so that no one can claim the complete whole, then each is entitled only to the specific form of device which he produces, and every other inventor is entitled to his own specific form, so long as it differs from those of his competitors, and does not include theirs. These general principles are so obvious, that they need no argument or illustration to support them.

The same view was directly applied in *Clough* v. *Barker*, (106 U. S., 166, 177,) to the Clough patent for an improvement in gas-burners. The first claim of that patent was for—

> the bat-wing burner, perforated at the base, in combination with the surrounding tube, substantially as described.

The second claim read thus:

> In combination with the bat-wing burner, perforated at the base, and surrounding-tube, the tubular valve for regulating the supply of external gas to the burner, substantially as described.

It appeared that in no prior structure had a valve arrangement been applied to regulate the flow of gas in such a combination as that covered by the first claim of the patent. It was, therefore, held, that the patentee was entitled to the benefit of the doctrine of equivalents, as applied to the combination covered by the second claim. In the defendant's burner, the regulation was made by a tubular valve on the outside of the perforations, instead of on the inside, as in the patent, but performing its work by being screwed up or down, as in the patent. This Court said:

> Although in the Clough structure the burner and surrounding tube revolve together in adjusting their position in reference to that of the tubular valve, so as to let in or turn off the supply of gas through the perforations, and although in the Clough structure the flame revolves by the revolution of the burner, and although in the defendant's burners the revolution of the surrounding tube regulated the supply of gas through such perforations, and neither the burner nor the flame revolved, the defendant's valve arrangement must be held to have been an equivalent for that of Clough to the full extent to which that of Clough goes, involving, perhaps, patentable improvements, but still tributary or subject to the patent of Clough. It is true that that patent describes the tubular valve as being inside of the burner-tube. But Clough was the first person who applied a valve regulation of any kind to the combination to which he applied it, and the first person who made such combination; and he is entitled, under decisions heretofore made by this Court, to hold as infringements all valve regulations, applied to such a combination, which perform the same office in substantially the same way as, and were known equivalents for, his form of valve regulation. See, also, *Duff* v. *Sterling Pump Co.*, (107 U. S., 636, 639.)

The same doctrine was applied by this Court in *Consolidated Valve Co.* v. *Crosby Valve Co.*, (113 U. S., 157,) to the Richardson patent, the claim of which was—

> A safety-valve with the circular or annular flange or lip ee, constructed in the manner, or substantially in the manner, shown, so as to operate as and for the purpose herein described.

It appeared that Richardson was the first person who made a safety-valve which, while it automatically relieved the pressure of steam in the boiler, did not, in effecting that result, reduce the pressure to such an extent as to make the use of the relieving apparatus practically impossible, because of the expenditure of time and fuel necessary to bring up the steam again to the proper working standard; and that his valve was the first which had a strictured orifice leading from the huddling-chamber to the open air, to retard the escape of the steam, and to enable the valve to open with increasing power against the action of the spring, and to close suddenly, with small loss of pressure in the boiler. It was held, that that claim covered a valve in which were combined an initial area, an additional area, a huddling-chamber beneath the additional area, and a strictured orifice such as that above mentioned, the orifice being proportioned to the strength of the spring. It was also held, that, under the claim of a second patent, namely—

> the combination of the surface beyond the seat of the safety-valve, with the means herein described for regulating or adjusting the area of the passage for the escape of steam, substantially as and for the purpose described—

the patentee was entitled to cover the combination, with the surface of the huddling-chamber and the strictured orifice, of a screw-ring to be moved up or down to obstruct such orifice more or less, in the manner described. It was further held, that both of the patents were infringed by a valve which produced the same effects in operation by the means described in Richardson's claims, although the valve proper was an annulus, and the extended surface was a disk inside of the annulus, the Richardson valve proper being a disk and the extended surface an annulus surrounding the disk; and although the valve proper of the defendant had two ground joints, and only the steam which passed through one of them passed through the stricture, while, in the Richardson valve, all the steam which passed into the air passed through the stricture; and although in the defendant's valve the huddling-chamber was at the center, instead of at the circumference, and was in the seat of the valve, under the head, instead of in the head, and the stricture was at the circumference of the seat of the valve, instead of being at the circumference of the head. These conclusions were based on the fact, stated in the opinion of the Court, that no prior structure was known or recognized as producing any such result as that produced by Richardson's apparatus; that the prior structures never effected the kind of result attained by his apparatus, because they lacked the thing which gave success; and that, taught by Richardson, and by the use of his apparatus, it was not difficult for skilled mechanics to take the prior structures and so arrange and use them as to produce more or less of the beneficial results first made known by him. The doctrine thus applicable to a machine patent is of a kindred character with that applied, in this country and in England, to a patent for a process.

In *Tilghman* v. *Proctor*, (102 U. S., 707,) the claim of Tilghman's patent was for—

> The manufacturing of fat acids and glycerine from fatty bodies by the action of water at a high temperature and pressure.

In the opinion of this Court, delivered by Mr. Justice Bradley, the claim was sustained as a claim for a process, irrespective of the particular mode or form of apparatus for carrying it into effect, inasmuch as the patent described a practical and useful mode of carrying it into effect. It was said in the opinion, (p. 721:)

> Had the process been known and used before, and not been Tilghman's invention, he could not then have claimed anything more than the particular apparatus described in his patent; but being the inventor of the process, as we are satisfied was the fact, he was entitled to claim it in the manner he did.

It was also held that, in such a case, a person who subsequently discovers a new mode of carrying out the patented process is not entitled to use the process without the consent of the patentee.

Reference was made in the opinion in that case to the decision in *Neilson* v. *Harford*, (1 Webster Pat. Cas., 295,) which related to Neilson's patent for the process of applying a blast of heated air to anthracite coal in a smelting-furnace, by forcing such blast through a vessel situated between the blowing apparatus and the furnace, and heated to a red heat, the form of the heated vessel being stated by the patent to be immaterial. On this question this Court said:

> That a hot blast is better than a cold blast for smelting iron in a furnace, was the principle or scientific fact discovered by Neilson; and yet, being nothing but a principle, he could not have a patent for that. But having invented and practically exemplified a process for utilizing this principle, namely, that of heating the blast in a receptacle between the blowing apparatus and the furnace, he was entitled to a patent for that process, although he did not distinctly point out all the forms of apparatus by which the process might be applied, having, nevertheless, pointed out a particular apparatus for that purpose, and having thus shown that the process could be practically and usefully applied. Another person might invent a better apparatus for applying this process than that pointed out by Neilson, and might obtain a patent for such improved apparatus; but he could not use the process without a license from Neilson. His improved apparatus would, in this respect, stand in a relation to the process analogous to that which an improvement on a patented machine bears to the machine itself.

In regard to the case of *Neilson* v. *Harford*, this Court, speaking by Chief Justice Taney, in *O'Reilly* v. *Morse*, (15 How., 62, 115, 116,) said, in reference to the opinion of the court of exchequer in that case, delivered by Baron Parke:

> We see nothing in this opinion differing in any degree from the familiar principles of law applicable to patent cases. Neilson claimed no particular mode of constructing the receptacle, or of heating it. He pointed out the manner in which it might be done; but admitted that it might also be done in a variety of ways, and at a higher or lower temperature, and that all of them would produce the effect in a greater or less degree, provided the air was heated by passing through a heated receptacle. And hence it seems that the court at first doubted whether it was a patent for anything more than the discovery that hot air would promote the ignition of fuel better than cold. And if this had been the construction, the court, it appears, would have held his patent to be void, because the discovery of a principle in natural philosophy or physical science is not patentable. But after much consideration, it was finally decided that this principle must be regarded as well known, and that the plaintiff had invented a mechanical mode of applying it to furnaces; and that his invention consisted in interposing a heated receptacle between the blower and the furnace, and by this means heating the air after it left the blower, and before it was thrown into the fire. Whoever, therefore, used this method of throwing hot air into the furnace used the process he had invented, and thereby infringed his patent; although the form of the receptacle or the mechanical arrangements for heating it might be different from those described by the patentee. For, whatever form was adopted for the receptacle, or whatever mechanical arrangements were made for heating it, the effect would be produced in a greater or less degree, if the heated receptacle was placed between the blower and the furnace, and the current of air passed through it. Undoubtedly, the principle that hot air will promote the ignition of fuel better than cold, was embodied in this machine. But the patent was not supported because this principle was embodied in it. He would have been equally entitled to a patent if he had invented an improvement in the mechanical arrangements of the blowing apparatus, or in the furnace, while a cold current of air was still used. But his patent was supported because he had invented a mechanical apparatus by which a current of hot air, instead of cold, could be thrown in. And this new method was protected by his patent. The interposition of a heated receptacle, in any form, was the novelty he invented.

This Court also said, in *Tilghman* v. *Proctor*, (p. 728:)

> If the mode of applying the process is not obvious, then a description of a particular mode by which it may be applied is sufficient. There is, then, a description of the process and of one practical mode in which it may be applied. Perhaps the process is susceptible of being applied in many modes and by the use of many forms of apparatus. The inventor is not bound to describe them all, in order to secure to himself the exclusive right to the process, if he is really its inventor or discoverer. But he must describe some particular mode, or some apparatus, by which the process can be applied with at least some beneficial result, in order to show that it is capable of being exhibited and performed in actual experience.

The English doctrine is to the same effect. In the case of *Curtis* v. *Platt*, before Vice-Chancellor Wood, in 1863, reported in a note to *Adie* v. *Clark*, (3 Ch. Div., 134,) the Vice-Chancellor said, (p. 136,) in regard to a patent for an improvement in spinning-mules:

> When the thing is wholly novel, and one which has never been achieved before, the machine itself which is invented necessarily contains a great amount of novelty in all its parts; and one looks very narrowly and very jealously upon any other machines for effecting the same object, to see whether or not they are merely colorable contrivances for evading that which has been before done. When the object itself is one which is not new, but the means only are new, one is not inclined to say that a person who invents a particular means of doing something that has been known to all the world long before has a right to extend very largely the interpretation of those means which he has adopted for carrying it into effect.

In the same case, on appeal before the Lord Chancellor, (Lord Westbury,) (p. 138,) the views of Vice-Chancellor Wood were concurred in.

In *Badische Anilin und Soda Fabrik* v. *Levinstein*, (24 Ch. Div., 156, 171,) in regard to a patent for im-

provements in the production of coloring-matters for dyeing and printing, Mr. Justice Pearson said:

Where a patent is taken out for a process for arriving at a known result, (I mean, a result known before the patent is taken out for the process *simpliciter*,) any other person may take out a patent for another process, or may use another process without taking out a patent, without any infringement of the process first taken out. But when a patent is taken out for a new result not known before, and there is one process described in the patent which is effectual for the purpose of arriving at that new result at the time when the patent is taken out, the patentee is entitled to protection against all other processes for the same result; and no person can, without infringing upon his patent, adopt simply a different process for arriving at the same result.

As authority for this view, he cites the cases of *Jupe* v. *Pratt*, (1 Webster Pat. Cas., 146;) *Household Co.* v. *Neilson*, (Id. 685,) and *Curtis* v. *Platt*, (*ubi sup.*, and Goodeve Pat. Cas., 102.) He decided in favor of the plaintiff.

On appeal to the court of appeal, (29 Ch. Div., 366,) the decree was reversed, Lord Justices Bowen and Fry being in favor of a reversal, and Lord Justice Baggallay against it. On further appeal to the House of Lords, (12 App. Cas., 710,) the decision of the court of appeal was reversed, and the decision of Mr. Justice Pearson was restored, Lord Halsbury, (Lord Chancellor,) Lord Herschell, and Lord Macnaghten sitting in the case and concurring. In the judgment given by Lord Herschell it is stated that all the judges of all the courts were agreed on the question of infringement.

A recent and instructive case is that of *Proctor* v. *Bennis*, (36 Ch. Div., 740,) in regard to a patent for self-acting mechanism for supplying fuel at intervals to, and distributing it over the surface of, a fire. The court of first instance held the patent to be valid and to have been infringed. In the court of appeal, Lords Justices Cotton, Bowen, and Fry unanimously affirmed the decision, and held that a patent for a combination of known mechanical contrivances, producing a new result, was infringed by a machine producing the same result by a combination of mechanical equivalents of such contrivances, with some alterations and omissions, which did not prevent the new machine from being one which took the substance and essence of the patented invention; but that, where the result was old, and the novelty consisted only of improvements in a known machine for producing a known result, the patentee must be tied down strictly to the mode which he had described of effecting the improvements.

Lord Justice Cotton, after referring to the case of *Curtis* v. *Platt*, (3 Ch. Div., 135, note,) said, (p. 757:)

Where there is no novelty in the result, and where the machine is not a new one, but the claim is only for improvements in a known machine for producing a known result, the patentee must be tied down strictly to the invention which he claims, and the mode which he points out of effecting the improvement. But here the throwing coal on to the furnace by the intermittent radial action of a flap or door was new. Nothing of the kind had been done before. It is true, there had previously been imperfect machines for feeding furnaces automatically, but that had not, previously to this machine, been done by an intermittent radial action of a flap or door, as is done by the plaintiff. In my opinion, therefore, the opinions expressed by the judges with reference to mere improvements in an old machine for an old purpose cannot apply to a case like this, where there was not only novelty in the machine, but novelty in the result to be produced by that machine.

Lord Justice Bowen said, (p. 764:)

Now, I think it goes to the root of this case to remember that this is, as was described by one of the counsel, really a pioneer invention: and it is by the light of that, as it seems to me, that we ought to consider the question whether there have been variations, or omissions, and additions, which prevent the machine which is complained of from being an infringement of the plaintiff's. With regard to the variations, I take precisely the same view that the Lord Justice Cotton has taken; and I will not travel over the ground again. With regard to the additions and omissions, it is obvious that additions may be an improvement, and that omissions may be an improvement; but the mere fact that there is an addition, or the mere fact that there is an omission, does not enable you to take the substance of the plaintiff's patent. The question is not whether the addition is material, or whether the omission is material, but whether what has been taken is the substance and essence of the invention. That seems to me to be the true test, as propounded by the House of Lords in *Clark* v. *Adie*, (2 App. Cas., 315, 320.)

Lord Justice Fry said, (p. 766:)

The pith and substance of the plaintiff's invention is, in my judgment, putting coals upon a fire by an intermittent radial action, an invention which, it may be remarked, reproduces with great exactitude the action of the human arm in placing coals upon a fire.

Also, (p. 768:)

In the present case, we have these broad features of likeness, that in both machines the motion is a radial motion, in both machines it is an intermittent motion, in both machines it is of course produced by means of a radius, in both machines that radius is moved in one direction by tappets, and the same radius is moved in the opposite direction by a spring. All those broad features of the machines are in common; but there is this difference, that in the plaintiff's machine a shaft is impelled by the tappets and by the spring, whereas in the defendant's machine the radius itself is impelled by the tappets and the spring. It follows that the radius in the plaintiff's is attached to the shaft, whereas the radius in the defendant's works on a pin. That is the broad distinction between them. The result, however, appears to me to be substantially the same; by substituting the pin for the shaft as the center on which the radius acts, and by impelling the radius itself instead of impelling the shaft fixed to the radius, you have produced in substance precisely the same radial action by the same means. You drive your radius in one direction by tappets, and you drive it in the other direction by the spring, and you produce the same result, namely, the feeding of coal by a radial motion made intermittent in one direction by the operation of the tappets, and in the other direction by the spring. I think, therefore, that we have a new combination for a new object, and that the gist of that combination has been taken by the defendant, and that, consequently, there is an infringement.

Applying these views to the case in hand, Morley having been the first inventor of an automatic button-sewing machine, by uniting in one organization mechanism for feeding buttons from a mass, and delivering them one by one to sewing mechanism and to the fabric to which they are to be secured, and sewing mechanism for passing a thread through the eye of the button, and securing it to the fabric, and feeding mechanism for moving the fabric the required distances to space the buttons, another machine is an infringement, in which such three sets of mechanism are combined, provided each mechanism, individually considered, is a proper equivalent for the corresponding mechanism in the Morley patent; and it makes no difference that, in the infringing machine, the button-feeding mechanism is more simple, and the sewing mechanism and the mechanism for feeding the fabric are different in mechanical construction, so long as they perform each the same function as the corresponding mechanism in the Morley machine, in substantially the same way, and are combined to produce the same result.

The view taken on the part of the defendant, in regard to the question of infringement, is that, inasmuch as the Lancaster machine uses different devices in its mechanisms which correspond to those referred to in the first, second, eighth, and thirteenth claims of the patent, those claims are to be limited to the special devices described in the patent, which make up such combinations, although both machines contain the same main group of instrumentalities which, when combined, make up the machine. But, in a pioneer patent, such as that of Morley, with the 4 claims in question such as they are, the special devices set forth by Morley are not necessary constituents of the claims. The main operative features of both machines are the same. In each there is a receptacle for shank-buttons in a mass; in each the mass of buttons passes in order into a conveyer-way; and in each the buttons conveyed to the sewing mechanism are presented successively with their shanks in a horizontal position, so as to allow of the passage of the needle through the eye. In the Morley machine, the buttons are carried along the raceway with their shanks downward, and are turned over by proper devices, so that the needle can enter the eye. In the Lancaster machine, the buttons travel along the raceway with their shanks upward, and the twisted shape of the raceway causes the buttons to be presented properly in succession to the needle. The only difference is, that in the Morley machine there is an active operating device for turning the buttons, in the shape of a button-wheel which receives them, and shuts off the column, and takes one at a time out of the raceway; while in the Lancaster machine there is a passive device for accomplishing the same result of turning the buttons, and there is no button-wheel, but there is a spring-gate at the end of the raceway, which shuts off the column and, with the addition of other devices, allows one button at a time to be withdrawn from the raceway. But in the Morley patent a modification is described, whereby the button-wheel is dispensed with, and a spring-gate, as in the Lancaster machine, is employed, and an active device is used to open the spring-gate and discharge the button, while in the Lancaster machine an active instrumentality is used to effect the same result, in combination with the sidewise movement of the raceway and in connection with the fact that the needle enters the eye of the button and passes a thread through it.

As to the mechanism for feeding the fabric, it is substantially the same in the two machines, for in each the needle operates to feed the fabric, while inserted in it, and it makes no difference that in the Morley machine the two needles swing like an inverted pendulum, while in the Lancaster machine the single needle swings in a straight line.

The principal difference relied on by the defendant is in regard to the sewing or stitching mechanism, based upon the difference in the kind of stitch used in the two machines for fastening the button to the fabric. The two stitches are, indeed, different, specifically considered. Morley uses the chain-stitch. In the Lancaster machine, the stitch is made by looping the thread upon itself, and putting the bight of the loop around the shank of the button, so as to prevent the loop from pulling out, as it would otherwise do. The Morley patent, however, is not for any particular kind of stitch, or for any particular kind of mechanism for making such stich. When the form of the stitch is changed, the instrumentalities for making it must change. Morley says, in his specification, that different means for making a stitch may be employed, as well as other feed mechanisms.

The contention of the defendant, in regard to the sewing mechanism, rests upon the proposition, that the convolution or concatenation of thread which makes up the stitch in the Lancaster machine is different from that which is found in the Morley machine. In each machine, however, the buttons are spaced at the proper distances apart by the feeding mechanism which moves the fabric along, and the feeding device is moved alternately different distances, to alternate short stitches with long stitches between the buttons. In each machine, the button is taken possession of by the sewing mechanism, and the needle in each enters the eye of the button. In the Lancaster machine, however, the thread is so looped as to embrace also the shank of the button, and thus, if the button were not present in the Lancaster machine, the lock-stitch would not be formed, but merely a succession of loops, which could be pulled out of the fabric. But this convolution or concatenation of the thread to form the fastening of the stitch, and the particular device which forms such convolution or concatenation, are not made, by the Morley patent, elements which enter into the claims in question. Those claims are not for a result or effect, irrespective of the means by which the effect is accomplished. It is open to a subsequent inventor to accomplish the same result, if he can, by substantially different means. The effect of the rule before laid down is merely to require that, in determining whether the means employed in the Lancaster machine are substantially the same means as those employed in the Morley machine, the Morley patent is to receive a liberal construction, in view of the fact that he was a pioneer in the construction of an automatic button-sewing machine, and that his patent, especially in view of the character and terms of the four claims in question, is not to be limited to the particular devices or instrumentalities described by him, used in the three main elements of his machine, which, combined together, make it up. This is the principle applied by this Court in *Consolidated Valve Co.* v. *Crosby Valve Co.*, (113 U. S., 157.)

In all three of the main mechanisms used in the Lancaster machine, the means employed in it are substantially equivalents of those employed in the Morley machine. There is in each a hopper containing the mass of buttons, and an inclined conveyer-way leading from the hopper to the sewing mechanism. The only question in regard to the button-feeding mechanism is, whether the means employed in the Lancaster machine for turning the buttons so that the eyes will come into the path of the needle, are within the means employed for the same purpose in the Morley machine. In the Morley machine there is a flexible, corrugated strip of metal, which is oscillated to and fro, and operates to roll the buttons over, so that their shanks will occupy a groove at the bottom of the trough. In the Lancaster machine, the reciprocating brush which sweeps over the bottom of the hopper in which the buttons lie in a mass, operates in an equivalent way with the corrugated strip of the Morley machine, and causes the shanks, which stand upward, of the buttons which have been rolled over by its action, to enter slits in a metal plate, which converge in the single conveyer-way. The only difference is that, in the Morley machine, the shanks are caused to lie in one direction at one time in their path, and in the Lancaster machine the same result is accomplished by equivalent devices at another time.

As to the instrumentalities employed in the two machines for bringing the buttons one by one so that their eyes will stand in a horizontal position, ready to receive the needle, the buttons in the Morley machine pass down the conveyer-way with their eyes pointing

downward, and occupying the groove, and from the conveyer-way they enter one by one into a button-wheel, which, by revolving, turns them 180 degrees, and they are then received into a carrier which further turns them 90 degrees, so as to get the eye into a horizontal plane. In the Lancaster machine, it is not necessary to turn the buttons more than 90 degrees, because they have been so rolled over by the brush in the hopper that their eyes point upward and enter the slits, and the conveyer-way is twisted and so turns the button that its eye will occupy a horizontal plane, ready to receive the needle. Then the needle, entering the eye of the button, pulls the button out of the conveyer, and the latter moves out of the way, leaving the button in the possession of the sewing mechanism. These instrumentalities are the equivalents of each other, the differences being merely formal, active instrumentalities being employed in one case to turn the buttons, and in the other that end being accomplished by the twisting of the conveyer-way. To employ a curved path to change the plane occupied by a body passing along that path was well known in mechanics, and is a device shown in the Morley patent for turning the buttons from a nearly vertical position to a horizontal position, by a corresponding variation in the inclination of the conveyer-way. The only difference in the particular devices in the two machines in this respect results from the fact that in the Morley machine the buttons pass from the hopper with their shanks downward, while in the Lancaster machine they pass with their shanks upward. From this it results that, while the means employed in the two machines are substantially the same, to effect the same result, active agents can be used in the one case, while passive agents are used in the other, to effect the same turning of the button. Indeed, in the modified form of construction suggested in the Morley specification, there is a spring-gate for holding the buttons up, while in the Lancaster machine there is a similar spring, the only difference being that in the Morley machine the spring-gate is opened by a special device, while in the Lancaster machine the button itself opens the spring when the button-holding contrivance moves out of the way. In that modification of the Morley arrangement, as the specification states, the button-wheel and the plunger are dispensed with, and it is not necessary to turn the button 180 degrees on a vertical axis. So, in this respect, the only difference between the two machines is, that in the Morley machine the spring-gate is opened by an active device, while in the Lancaster machine the conveyer-way is moved sidewise by an active device, leaving the button behind, which opens the spring-gate because the needle has entered the eye of the button.

In regard to the sewing mechanism in the two machines, a sewing-needle with thread is employed in each to fasten the buttons to the fabric. In each, the thread is continuous, and follows the fabric as that is moved along by the mechanism which feeds it. The Morley machine employs the common stitch. In the Lancaster machine there is a peculiar stitch, in which a loop is drawn around the shank of the button and thus the stitch is locked against being drawn out; but, notwithstanding the new convolution or concatenation of thread used in the Lancaster machine to secure the shank of the button to the fabric, the sewing mechanism of that machine is a substantial equivalent for the corresponding mechanism of the Morley patent. The invention of Morley in that respect did not consist in the peculiarity of the stitch, but in the combination of the needle, and the mechanism for operating it, with a button having a shank and an eye, the eye being held in a horizontal plane in the path of the needle, so that the thread carried by the needle could secure the button to the fabric. It is immaterial, in so securing the button, whether or not a loop is passed over the head of the button. The defendant's device and arrangement may be an improvement, and the subject of a patent, but nevertheless the use of it involves the plaintiff's invention.

It may be true that the defendant's peculiar form of stitch was unknown before; and it may also be true that his arrangement for carrying the buttons with their eyes upward, and turning the eyes into a horizontal plane by the twisting of the conveyer-way, was not before known. Of course, they were not before known in a machine for automatically sewing buttons to a fabric, because Morley's machine was the first to do that. But still, the defendant employs for the above purposes known devices, which, in mechanics, were recognized as proper substitutes for the devices used by Morley to effect the same results. Thus, in the Lancaster machine, the brush for rolling over the buttons is the obvious equivalent of the corrugated plate in the Morley machine. The mode of operation used in the Lancaster machine for rolling over the buttons so that their shanks shall point in a particular direction before entering the main conveyer-way is the same mode of operation found in the Morley machine, where the corrugated plate rolls the buttons over during their passage to the grooved conveyer-way, so that their shanks shall all point in the same direction. In the Lancaster machine the action resulting from the twisted way is a mechanical equivalent for the button-wheel, the punch, and the carrier used in the Morley machine to turn the eye into the proper plane for the needle to enter it; and the specific difference in the devices in this respect becomes less when the modification described in the Morley patent is used, so that in each of the two machines the button is turned only 90 degrees on a horizontal axis, and in each of them a spring-gate is employed, opened in the one case by an active device, while in the other case an active device moves the conveyer away from the particular button which is being held by the needle. In this sense the mechanical devices used by the defend .nt are known substitutes or equivalents for those employed in the Morley machine to effect the same result; and this is the proper meaning of the term "known equivalent," in reference to a pioneer machine such as that of Morley. Otherwise, a difference in the particular devices used to accomplish a particular result in such a machine would always enable a defendant to escape the charge of infringement, provided such devices were new with the defendant in such a machine, because, as no machine for accomplishing the result existed before that of the plaintiff, the particular device alleged to avoid infringement could not have existed or been known in such a machine prior to the plaintiffs' invention.

It results from these views that the decree of the circuit court must be reversed, and the case be remanded to that court with a direction to enter a decree in favor of the plaintiffs, sustaining the validity of claims 1, 2, 8, and 13 of the plaintiffs' patent, and adjudging that those claims have been infringed by the defendant, and ordering a reference to a master to take an account of profits and damages in respect to such infringement, and awarding to the plaintiffs a perpetual injunction in respect to the four claims above mentioned; and to take such further proceedings as shall be according to law and not inconsistent with this opinion.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Appendix No. 2 to the index to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1883, has been issued, and is now for sale. These indexes, arranged alphabetically, numerically, and by classes, are completed to June 30, 1883, and comprise the following volumes:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Notice.

UNITED STATES PATENT OFFICE,
Washington, D. C., April 13, 1888.

To expedite the distribution of the mail in this Office, and to insure the prompt and certain delivery of communications to the divisions and officials having charge of the matters to which they relate, attorneys and correspondents are respectfully requested to enter upon the upper left-hand corner of amendments and other communications, if known to them, the number of the room and the name of the examiner or designation of the division to which the communication should be sent.

BENTON J. HALL,
Commissioner of Patents.

DESIGNS.

19,047.—ASH-RECEIVER, &c.—*Joseph E. Dallon*, Brooklyn, N. Y. Application filed January 28, 1889. Serial No. 297,832. Term of patent 3½ years.

19,048.—RACKET.—*Charles A. Davis*, Washington, D. C. Application filed March 18, 1889. Serial No. 303,783. Term of patent 14 years.

19,049.—MIRROR OR BRUSH BACK.—*Charles Kunze*, Newark, N. J., assignor to *P. Wiederer & Brother*, New York, N. Y. Application filed February 26, 1889. Serial No. 301,261. Term of patent 3½ years.

19,050.—CANTEEN.—*Charles W. Ledig*, Philadelphia, Pa. Application filed January 5, 1889. Serial No. 295,568. Term of patent 3½ years.

19,051.—RUG.—*Thomas E. Meagher*, Philadelphia, Pa. Application filed March 21, 1889. Serial No. 304,173. Term of patent 3½ years.

19,052.—BOTTLE.—*Erskine J. S. Van Houten*, Nyack, N. Y. Application filed October 17, 1888. Serial No. 288,397. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,488.—EMMENAGOGUE.—*Chichester Chemical Co.*, Philadelphia, Pa. Application filed January 24, 1889. Used since October 20, 1887.

"The words 'DIAMOND BRAND.'"

16,489.—CIGARETTES OR CHEROOTS.—*Consolidated Cigarette Company*, New York, N. Y. Application filed March 5, 1889. Used since November 1, 1888.

"The word 'CONSOLS.'"

16,490.—SOAP.—*Curtis Davis & Co.*, Boston, Mass. Application filed February 28, 1889. Used since February 13, 1889.

"The words 'CUI BONO.'"

16,491.—HUNGARIAN WINES.—*The Willman Cossenas Company*, New York, N. Y. Application filed December 20, 1888. Used since November 13, 1888.

"A green-colored strip with the wreath-encircled Hungarian coat of arms and the words 'ROYAL HUNGARIAN MODEL WINE-CELLAR AT BUDAPEST,' in the Hungarian, German, French, and English languages, along the said strip."

16,492.—MEN'S OVERALLS.—*Dittenhoefer, Haas & Co.*, Portland, Oreg. Application filed March 5, 1889. Used since 1881.

"The word 'IRON-CLAD.'"

16,493.—TOILET PERFUMES, WATERS, POWDERS, AND SOAPS.—*The Doussan French Perfumery Company*, New Orleans, La. Application filed February 4, 1889. Used since September 1, 1888.

"The representation of a circular stone window inclosing a cliff surrounded by water, &c., and a light-house on top of it and a cobweb across the face of the window, and the words 'DELICATE AS A COBWEB, LASTING AS THE HILLS,' on the stones which form the window."

16,494.—WATCHES.—*Julien Gallet & Co.*, New York, N. Y. Application filed February 28, 1889. Used since May 22, 1888.

"The word 'PATRIOT.'"

16,495.—ARTICLES OF JEWELRY AND ORNAMENTATION FOR PERSONAL WEAR.—*Hammond Turner & Sons*, Snow Hill, Birmingham, county of Warwick, England. Application filed June 7, 1888. Used since February 8, 1866.

"The representation of a lion."

16,496.—LEATHER GLOVES.—*Sinclair T. Hunting*, New York, N. Y. Application filed March 2, 1889. Used since February, 1886.

"The word 'RICHELIEU.'"

16,497.—WHISKY.—*Max Klein*, Allegheny, Pa. Application filed December 24, 1888. Used since 1877.

"The words 'SILVER AGE.'"

16,498.—SHEATHING-PAPER.—*Margaret E. Manahan*, New York, N. Y. Application filed February 27, 1889. Used since September 7, 1885.

"The words 'PARCHMENT SHEATHING.'"

16,499.—WEEKLY PERIODICALS.—*Perry Mason & Co.*, Boston, Mass. Application filed March 8, 1889. Used since April 16, 1827.

"The words 'YOUTH'S COMPANION.'"

16,500.—MEDICAL REMEDIES FOR EXTERNAL USE.—*F. O. Robertson*, Janesville, Wis. Application filed August 30, 1888. Used since 1871.

"The representation of a cactus-plant and a photograph of the registrant."

16,501.—GRANULAR EFFERVESCENT MEDICINE.—*Henry K. Wampole & Co.*, Philadelphia, Pa. Application filed February 27, 1889. Used since October 19, 1888.

"The word 'BROMO-PYRINE.'"

16,502.—BOOTS AND SHOES.—*Waukenphast & Co.*, London, England. Application filed September 7, 1888. Used since February 23, 1869.

"The name 'WAUKEN-PHAST.'"

LABELS.

5,868.—Title: "BIRD'S INFALLIBLE ORIENTAL LOTION."—*Samuel M. Bird*, Philadelphia, Pa. Application filed March 20, 1889.

5,869.—Title: "DR COLE'S NERVE PILLS."—*Drs. P. C. Cole & Son*, South Solon, Ohio. Application filed March 18, 1889.

5,870.—Title: "DR COLE'S KIDNEY PILLS."—*Drs. P. C. Cole & Son*, South Solon, Ohio. Application filed March 18, 1889.

5,871.—Title: "MELILOTUS LOTION."—*Thomas H. Field*, Chicago, Ill. Application filed March 20, 1889.

5,872.—Title: "SUPERIORE BAKING POWDER."—*F. L. Hooper & Co.*, Baltimore, Md. Application filed March 21, 1889.

5,873.—Title: "INDIAN BLOOD CURE." (FOR A MEDICAL COMPOUND.)—*F. P. Mayes* and *Green Abbey*, Weatherford, Tex. Application filed March 18, 1889.

5,874.—Title: "SHEPARD'S COMPOUND" (FOR A MEDICINE.)—*A. P. Shepard*, Lapeer, Mich. Application filed March 20, 1889.

5,875.—Title: "THE GREAT KENTUCKY TONIC BOURBON BITTERS."—*Jesse B. Shumaker*, Bridgewater, Pa. Application filed March 20, 1889.

DISCLAIMERS.

252,002.—*Camille A. Faure*, Paris, France. IMPROVEMENT IN POLARIZATION OR SECONDARY ELECTRIC BATTERIES. Patent dated January 3, 1882. Disclaimer filed April 9, 1889, by the assignee, *The Electrical Accumulator Company*, New York, N. Y.

Enters its disclaimer to—

"From the first claim of said Letters Patent No. 252,002, any electrode of a secondary battery coated with an active layer of absorptive substance, to which the active layer is wholly applied otherwise than in the form of a paint, paste, or cement practically insoluble in the electrolytic liquid."

Also, to the following words on the first page of said Letters Patent, to wit:

"in the form of a deposit by galvanic action or chemical precipitation, or otherwise."

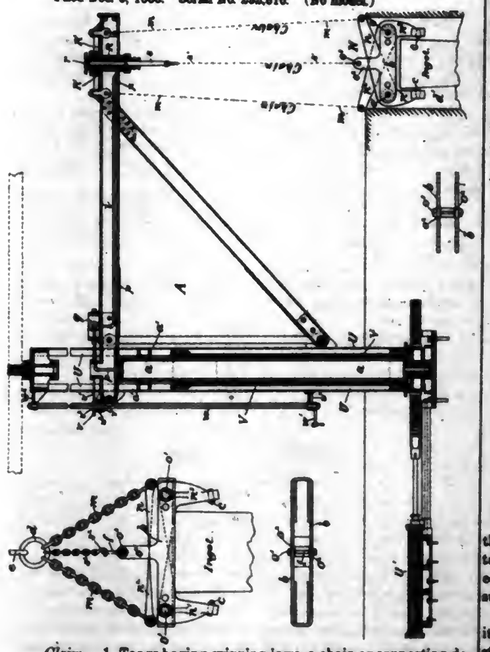
Also, to the following words on the second page of said Letters Patent after the words "lead plates," to wit:

"in any suitable way."

Also, to the following words, also on the second page of said Letters Patent, to wit:

"The plates *a* can be coated with an active porous layer in any suitable way."

263,067.—*Marshall J. Allen*, New York, N. Y., and *William E. Bradley*, Frankfort, Ky. IMPROVEMENT IN PROCESS OF MAKING WHISKY. Patent dated August 22, 1882. Disclaimer filed April 5, 1889, by the *Frankfort Whisky Process Company*, assignee.



Enters its disclaimer—

"To the first claim of said Letters Patent and to any process as covered by the second claim, in which the coarse waste particles are not removed before distillation, and in which the fine particles are not returned with the spent beer and mixed with fresh material."

PATENTS

GRANTED APRIL 16, 1889.

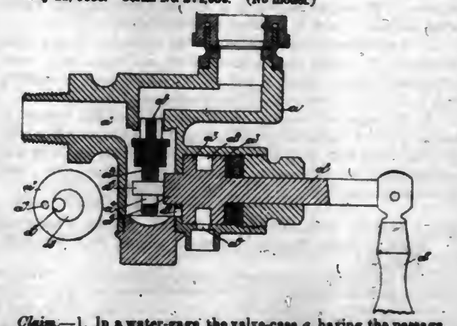
401,325. MILL APPLIANCE. HENRY AIKEN, Homestead, Pa. Filed Dec. 6, 1888. Serial No. 293,816. (No model.)

Claim.—1. Tongs having gripping-jaws, a chain or supporting device by which the tongs may be suspended without exerting a closing action on the jaws, and a second supporting device—such as chains—connected with the jaws and acting thereon to close the same when the tongs are suspended therefrom, substantially as and for the purposes described.

2. Tongs having gripping-jaws, a chain or supporting device by which the tongs may be suspended without exerting a closing action on the jaws, a second supporting device—such as chains—connected with the jaws and acting thereon to close the same when the tongs are suspended therefrom, a crane from which the tongs are suspended, and power devices on the crane connected with the tongs, whereby the weight of the tongs may be shifted from one of said supporting devices to the other to cause the tongs to open or close, substantially as and for the purposes described.

3. Tongs having arms forming jaws and levers, a cross bar or frame connecting the jaws, and a lifting device connected with the cross bar or frame, substantially as and for the purposes described.

4. As an improvement in ingot-tongs, the combination of a crane having a cylinder at the outer end of the jib, a pipe conveying motive fluid from the motive-fluid supply of the crane to the cylinder, and tongs which are connected with and operated by the moving parts of said cylinder, substantially as and for the purposes described.



5. As an improvement in devices for transporting ingots and like articles, the combination of a crane having a lifting-cylinder and plunger, fluid-power connection between the crane-plunger and the lifting-cylinder, and a valve operated by a vertical shaft, to which the valve is connected by a traveling connection, substantially as and for the purposes described.

6. Tongs having pivotally-movable jaws and a cross-frame in which the jaws are pivoted, said cross-frame being constructed to afford for the jaws a number of pivots more or less remote from the center to permit the relative positions of the jaws to be varied, substantially as and for the purposes described.

7. Tongs having jaws pivoted on separated pivots, substantially as and for the purposes described.

8. Tongs having pivotally-movable jaws and a cross bar or frame constituted of separated side pieces or bars, between which the jaws are pivoted, substantially as described.

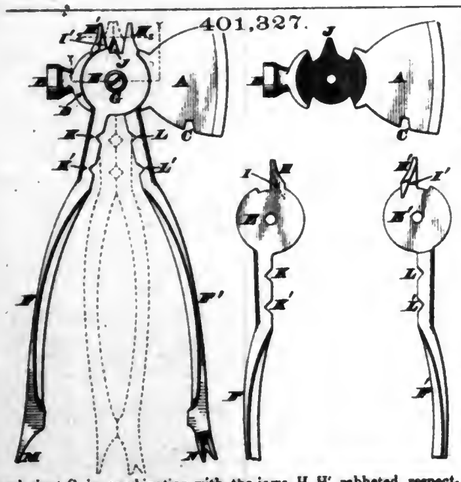
401,326. WATER-GAGE. JOHN G. BLOUNT, Boston, Mass. Filed May 22, 1888. Serial No. 274,639. (No model.)

Claim.—1. In a water-gage, the valve-case *a*, having the passage through it formed with but one communicating port, the valve to control said port, combined with the link a^3, loosely connected thereto, eccentric-stud a^2, engaging therewith, and the rotatable valve-stem a^5, substantially as described.

2. In a water-gage, the valve-case *a*, having the passage through it, and the movable valve, as a^3, within said case, and the rotatable stem a^5, combined with a hub partially rotated by the stem, having a port or passage through it and controlling a port into the chamber formed within the valve-case to serve as a blow-off, substantially as described.

3. In a water-gage, the valve-case *a*, having the entire passage through it formed with but one connecting port or orifice, and the valve, as a^3, combined with a rotatable stem, the eccentric-stud thereon, and the slotted link loosely connecting said valve and stem, by which the valve a^3 may be moved positively toward or from its seat, and may also be held at an intermediate position to serve as a check-valve, and the hand-piece a^{10}, by which the said stem is semi-oscillated, substantially as described.

4. In a water-gage, the valve-case *a*, having a passage through it, a valve controlling said passage, combined with a slotted link, a^3, loosely connected with the said valve, and the stem for moving the link, substantially as described.



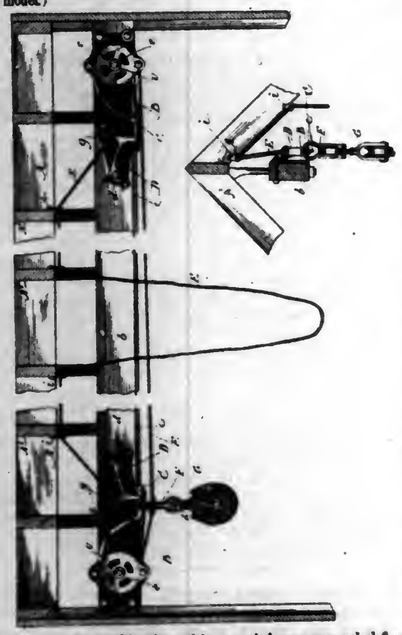
5. In a water-gage, the valve-case *a*, having the passage through it, and a single connecting-port therein, the valve a^3 for said port, and the blow-off passage or port, combined with the oscillating valve-stem for simultaneously moving the valve a^3 and for controlling the blow-off port or passage, substantially as described.

401,327. COMBINATION-TOOL. ANDREW J. BRYANT, Winton Place, assignor of one-half to Thomas E. Spivey, Cincinnati, Ohio. Filed Sept. 13, 1888. Serial No. 285,267. (No model.)

Claim.—1. A combination-tool consisting of the hatchet A, having a pair of levers, F F', pivoted thereto at G, which handles terminate with jaws H H', as herein described.

2. The hatchet A, having a cutter-bit, J, a pair of levers, F F',

401,327.

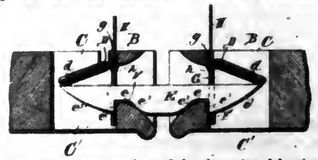


and pivot G, in combination with the jaws H H', rabbeted, respectively, at I I', as herein described.

3. A combination-tool consisting of the hatchet A, having a pair of levers, F F', pivoted thereto at G, the inner faces of said handles being notched, as at K L, for the purpose described.

4. A combination-tool consisting of the hatchet A, having a pair of levers, F F', pivoted thereto at G, one of said levers, as F, terminating with a screw-driver, M, and the other lever, as F', terminating with a claw, N, for the purpose described.

5. An improved combination-tool consisting of the hatchet A, having a poll, B, cutter-bit J, and sockets D D', which sockets receive the joint-plates E E', of levers F F', said handles being provided with rabbeted jaws H I H' I', and being pivoted to said hatchet by a bolt, G', as herein described.

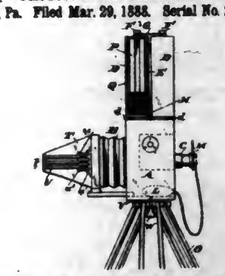


401,328. PULLEY-CHANGING DEVICE. ABNER J. BURBANK and EUGENE L. CHURCH, Harvard, Ill. Filed Dec. 10, 1888. Serial No. 293,210. (No model.)

Claim.—1. In combination with a track-beam suspended from the frame of the roof, the plates B, one of which is attached to each end of such beam, each plate being provided with a sheave, *s*, and an arm, C, and a wire track, *c*, connecting said plates, spring-stops D, and the endless rope E, extending around the sheaves and held up by supports above the plates and provided with a long loop, whereby the clevis F and its pulley are adapted to be moved from one end of the building to the other, substantially as described.

2. In combination with the endless rope E, mounted upon bearings above the sheaves *s*, as described, the said sheaves, the plates B, and their arms C, the wire track *c*, connecting said arms, and the spring-stops D, pivoted to plates B, adapted to be confined or released by operating said rope as required, substantially as described.

401,329. CAR-COUPLING. FRANK J. CASE and JAMES F. PRESTON, Arrington, Kans. Filed June 30, 1888. Serial No. 278,616. (No model.)



Claim.—1. The combination of the draw-head having the shoulder F and the recess *g*, the link engaging the shoulder F, and the frame G, seated in the recess *g* and having its upper cross-bar bearing on the upper edge of the link, the said frame G being arranged entirely within the draw-head, as set forth.

2. The combination of the draw-head having a shoulder, F, the link engaging said shoulder, the frame G, arranged within the draw-head and engaging the link, and the shaft D, mounted in the draw-head in rear of said frame G and having its crank-arm *d* resting on the upper edge of the link, as specified.

3. In a car-coupler, the combination of the recessed draw-head provided with the slots C C', the link-bar E, and the transverse shaft D, provided with the central lever-arm, *d*, and crank-handles *d'* outside of its bearings.

401,330. PHOTOGRAPHING-INSTRUMENT. GEORGE A. COOKE, Philadelphia, Pa. Filed Mar. 29, 1888. Serial No. 268,837. (No model.)

Claim.—1. A carrying-case for a camera, consisting of an inclosing-frame in which the camera is secured, in combination with removable door or cover upon opposite sides thereof corresponding to the front and rear of the camera, so as to expose both ends of the camera without removing it from the inclosing-frame, a plate-holding compartment carried by one of said doors or covers, and a handle for carrying the case.

2. A portable photographic apparatus consisting of a main case in which the camera is formed or secured, having means of attachment for use to a tripod or other support, in combination with an auxiliary box or case to contain the photographic sensitized plates or holders hinged at its upper edge to said main case and capable of being folded upon the top of the main case, exposing the focusing-plate of the camera according as to whether the camera is to be carried or used.

3. In a portable photographic apparatus, a main case provided with means of attachment for use to a tripod or other support and having compartments within it to receive the photographing-shutter and stop-sights, in combination with a camera secured in said main case, and a movable compartment for the plates or holders attached to said main case.

4. In a portable photographic apparatus, the combination of a case or box-frame independent of the camera and having means of support upon a tripod, two covers or doors for opposite sides of said frame to expose the front and rear of the camera, a collapsible camera secured within said box-frame, and a collapsible focusing shade or screen secured to the rear of the camera.

5. In a portable photographic apparatus, a main case provided with means of attachment to a tripod or other stand, in combination with a camera secured therein, having a collapsible focusing shade or screen, consisting of the double-jointed side pieces, U u, and cross-pieces U', and the textile or flexible covering T.

6. In a portable photographic apparatus, the main case A, having doors or covers and means of attachment to a tripod or other support for use, in combination with a camera, B, formed or secured

within said main case A, having a lens, C, secured to the removable and reversible board R, whereby said lens C may be turned into the camera when it is not in use.

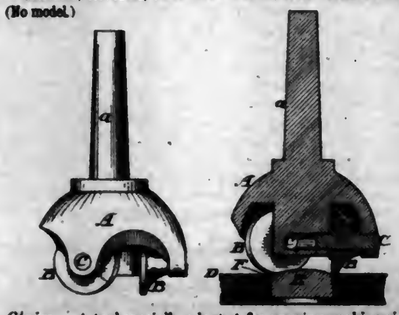
7. In a portable photographic apparatus, the main case A, having doors or covers and means of attachment to a tripod or other support for use, in combination with a camera, B, formed or secured within said main case A, having a lens, C, secured to the removable and reversible board R, whereby said lens C may be turned into the camera when it is not in use, and compartments K and J within said main frame A.

8. In a portable photographic apparatus, the main case A, having doors or covers and means of attachment to a tripod or other support for use, in combination with a camera, B, formed or secured within said main case A, having a lens, C, secured to the removable and reversible board R, whereby said lens C may be turned into the camera when it is not in use, compartments K and J within said main frame A, and movable compartments for the photographing plate-holder formed on the door or covers of the case A.

9. The combination of a box-frame having its opposite ends open, a collapsible camera secured within said frame and having its lens at one of the open ends and its focusing-plate at the other open end and extensible from said frame, and a plate-holding compartment secured to said frame and arranged above it when photographing and having no communication with the camera proper.

10. The combination of a box-frame having its opposite ends open, a collapsible camera secured within said frame and having its lens at one of the open ends and its focusing-plate at the other open end, a removable plate holding said lens, so that it may be turned into the camera when not in use, a plate-holding compartment secured to said frame and arranged above it when photographing, and a handle for carrying said apparatus arranged at its top.

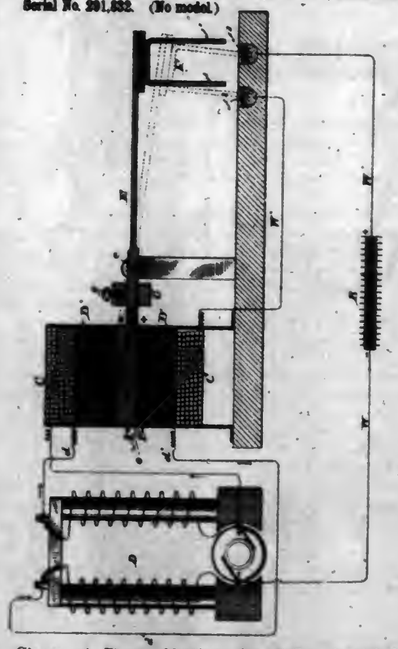
11. A camera-case consisting of a frame independent of the camera proper, provided with means for attachment to a tripod and having two of its diametrically-opposite sides open, in combination with two doors or lids adapted to close said open ends or sides and a carrying-handle secured to the upper part of the case between the doors or lids and on the opposite side with reference to the means for attachment to the tripod.



12. A combined camera and plate-holder case consisting of the camera-compartment A, having a handle, in combination with the two plate-holder compartments D D, having doors E and hinged to the compartment A.

13. A combined camera and plate-holder case consisting of the camera-compartment A, having a handle and plate V, in combination with the two plate-holder compartments D D, having doors E and hinged to the compartment A and provided with feet F F, and a rubber band, G, to snap over said feet to hold the case open or closed.

14. The combination of a box-frame open at opposite ends and provided on two of its sides at right angles to each other with plates V V', for securing it to a tripod, doors or covers for said open ends of the box-frame, and a collapsible camera having a rectangular focusing-plate longer in one direction than the other and secured within said box-frame, so that its sides or edges are parallel with the box frame sides.



15. A camera made collapsible having an independent plate holding compartment secured to it when in use, but above and forward of the plate-holding part of the camera, but having no communication with the camera proper, whereby plates may be taken from the compartment by hand and inserted in place in the camera and in which the focusing plate or glass is exposed when the apparatus is in its normal position and condition for photographing, and inclosing-covers on front and back to inclose and protect the camera when being transported.

401,331. TOOL FOR CONSTRUCTING VAULT-LIGHTS. HARRY A. CROSSLEY, Cleveland, Ohio. Filed Aug. 17, 1888. Serial No. 270,967. (No model.)

Claim.—A tool specially adapted for pressing packing-rings in vault-lights, consisting of a chambered hemispherical head, A, having a spindle, *a*, and side openings, and provided with compressing-rollers B, substantially as shown and described.

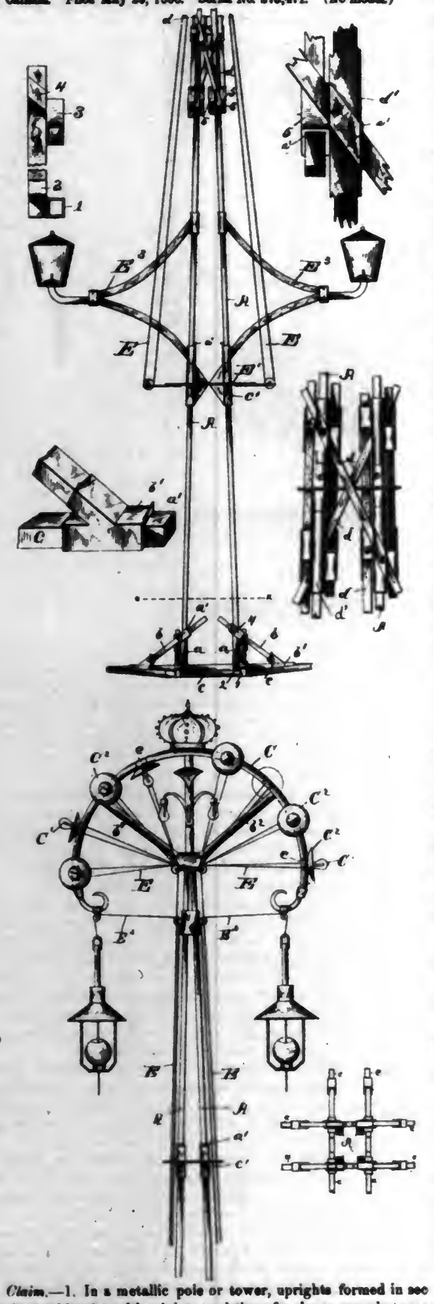
401,332. AUTOMATIC CUT-OUT FOR SECONDARY BATTERIES. STANLEY G. G. CURRIE, Philadelphia, Pa., assignor to the United Electric Improvement Company, Gloucester City, N. J. Filed Nov. 26, 1888. Serial No. 291,832. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a dynamo-electric machine, an accumulator, and an energizing-coil, all in the main circuit, a second energizing-coil (in a separate or branch circuit) adjacent to and parallel with the main-circuit coil, a permanent magnet within said coils, a soft-iron armature, also within said coils, and a circuit-controller or switch in the main circuit controlled by said armature.

2. The combination, substantially as hereinbefore set forth, of a shunt-wound dynamo, an accumulator, and an energizing-coil, all in the main circuit, a second energizing-coil (in a constantly-closed field-circuit) coincident with the main-circuit coil, an armature vibrating within both coils, a permanent magnet actuating the armature, and the main-circuit switch controlled by said armature.

3. The combination, substantially as hereinbefore set forth, of a dynamo, an accumulator, and an energizing-coil of coarse wire, all in the main circuit, a second energizing-coil of fine wire, (in a separate or branch circuit,) a permanent magnet and an armature both inclosed by the coils, and the main-circuit switch controlled by the armature.

4. The combination, substantially as hereinbefore set forth, of the main-circuit coil, the branch-circuit coil coincident therewith, the permanent magnet and the soft-iron armature both inclosed by the coils, and the main-circuit switch controlled by the armature.



5. The combination, substantially as hereinbefore set forth, of the main-circuit coil, the concentric coacting branch-circuit coil, the permanent magnet inclosed therein, the armature vibratable laterally relatively to the permanent magnet, and the interposed diamagnetic plate which prevents the adhesion of the magnet and armature.

6. The combination, substantially as hereinbefore set forth, of the coacting concentric coils, the permanent magnet therein, the armature vibratable within the coils, the arm, pivot, and counterpoise of the armature, and the circuit-controller carried by said arm.

7. The automatic circuit-controller hereinbefore described, consisting of the combination of a dynamo, an accumulator, and an energizing-coil, all in the main circuit, a second energizing-coil, (in a separate or branch circuit,) concentric and coacting with the main coil, a permanent magnet within said coils, an armature vibratable therein, an arm on which said armature is mounted, a pivot on which said armature rocks, a counterpoise normally holding said magnet and armature together, and a switch controlling the main circuit, also mounted on said arm and controlled by the vibrations of the armature, substantially as hereinbefore set forth.

8. The combination, substantially as hereinbefore set forth, of the energizing-coil, its fixed permanent magnet-core, and its movable soft iron armature, normally similarly polarized and vibratable laterally within the coil.

401,333. POLE OR TOWER. JOHN W. DAVY, Kingston, Ontario Canada. Filed May 29, 1888. Serial No. 275,471. (No model.)

Claim.—1. In a metallic pole or tower, uprights formed in sections, in combination with a joint consisting of a sleeve or socket open at each end, into which the adjoining ends of two sections are inserted, and wedges driven into the socket or sleeve between its inner surface and the outer faces of the sections, thereby removably and rigidly clamping the sections together to form a continuous piece, substantially as set forth.

2. The combination, with a pole or tower, of a base or anchor consisting of horizontal transverse bars secured to the lower end of the tower or pole and projecting laterally beyond the same, inclined braces secured to said bars and to the tower or pole, and sleeves provided with sockets, whereby said bars, braces, and tower or pole are secured together, substantially as described.

3. The combination, with a pole or tower, of a suitable anchor secured to the lower end of the same and adapted to be buried a suitable distance below the surface of the ground, and vertically-adjustable lamps or burners carried by said pole or tower a suitable distance above the surface of ground by adjustable sleeves and brackets, substantially as described.

4. The herein-described upwardly-tapering light-tower, consisting of three or more uprights formed in sections detachably jointed together by means of suitable sleeves or sockets, cross-braces, and wedges for removably clamping the upright sections in said sleeves, links, or sockets, substantially as described.

5. A light-tower composed of uprights formed in sections and suitably connected and jointed together, in combination with an anchor or base for the same, a crown supported by the top of the tower, lamps or burners adjustably supported by said crown, and ropes or chains connected with the lamps and by which the same are adjusted, said ropes extending downwardly to or near the ground, substantially as described.

6. A light-tower tapering upwardly and consisting of uprights formed in interchangeable sections removably clamped together and supporting a crown upon which the lights are carried, and an anchor or base for the tower composed of interchangeable parts removably clamped together, as set forth.

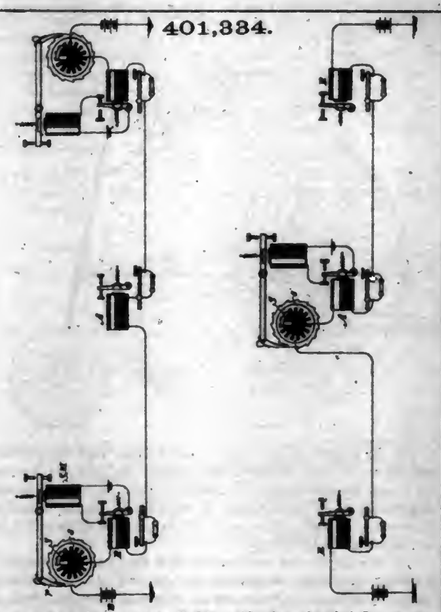
7. A light-tower tapering upwardly and consisting of uprights formed in sections removably clamped together by means of sockets connected in sets, and wedges by which said sections are clamped in the sockets, whereby the height of the tower can be increased or diminished, substantially as described.

8. A stationary upwardly-tapering light-tower comprising uprights suitably secured together, in combination with an anchor for the same buried a suitable distance beneath the surface of the ground, and comprising a number of horizontal beams equal to the number of uprights, each beam connecting, secured directly to, and extending beyond the lower ends of two or more uprights, and inclined braces secured to each upright and to the horizontal beams directly secured to the lower end of the same, substantially as described.

9. The herein-described light-tower, composed of uprights formed in sections and provided with a suitable anchor or base and a light-supporting crown, and the herein-described joint and brace between a set of upright sections consisting of sleeves provided with inclined sockets, inclined brace-rods removably clamped in said sockets and extending diagonally from each upright to the next adjoining uprights and from a section above the joint to a section below a joint, and wedges for clamping the rods and uprights in the sleeves and sockets, substantially as described.

10. The combination, with a light-tower, of a crown supported by the top of the tower and provided with a segmental supporting-rod, and lamps or burners provided with reflectors and carried by sleeves loosely mounted on the supporting-rod, and means whereby the lamps can be turned in the desired direction, substantially as described.

11. In a light-tower provided with a crown, lamps or burners provided with reflectors and adjustably mounted on said crown, and ropes or chains extending to or near the ground, whereby each lamp can be independently adjusted from the ground to throw a light in any direction, substantially as described.



12. A light-tower the various parts and sections of which are clamped and removably secured together by means of sleeves and wedges, thereby dispensing with the use of nails, bolts, &c., substantially as described.

401,334. TELEGRAPHY. PATRICK B. DELANY, New York, N. Y. Filed Nov. 10, 1888. Serial No. 290,444. (No model.)

Claim.—1. The combination, substantially as set forth, of a line, a battery at each end thereof, with which the line is normally connected, transmitting and receiving devices at each end of the line, and line-opening devices at each end of the line, said devices consisting of separable contacts included in the line, one of which is disconnected or insulated from the other and from earth when the contacts are separated, and contact-separating devices controlled by the relay, which momentarily separate said contacts and leave the line open or disconnected from earth and battery for a brief period after each interruption of the main circuit.

2. The combination, substantially as set forth, of a line, a battery, transmitting devices at one end thereof, a receiving-relay in the line at a point removed from the transmitting-station, line-opening devices at said relay, said devices consisting of separable contacts in the line-circuit, which while separated leave the line broken or open, and con-

401,334.

tact-separating devices controlled by said relay, that briefly separate the contacts, and thereby open the line upon the movement of the relay when the circuit is opened at the transmitter.

3. The combination, substantially as set forth, of a line, terminal and way stations connected in the line, a battery, transmitting devices at one end thereof, a receiving-relay in the line at a point removed from the transmitting-station, line-opening devices at said relay, said devices consisting of separable contacts in the line-circuit, which while separated leave the line broken or open, and contact-separating devices controlled by said relay, that briefly separate the contacts, and thereby open the line upon the movement of the relay when the circuit is opened at the transmitter.

4. The combination, substantially as set forth, with a line, a battery at each end thereof, with which the line is normally connected, and electro-magnetic receiving devices and transmitting-keys connected directly in the line, of a series of contacts connected with the battery at each terminal station, said contacts being separated by intervening insulated spaces, a trailer or contact-maker actuated by the electro-magnetic receiving devices to pass from one battery-contact across the intervening space, thereby opening the line to the next battery-contact each time the circuit is opened at a transmitter, and electro-magnetic receiving devices connected in the line at intermediate or way stations.

5. The combination, substantially as set forth, of a line having terminal and way or intermediate stations, a battery with which the line is normally connected, transmitting and receiving devices at each end of the line, and line-opening devices at each end of the line, said devices consisting of separable contacts included in the line, one of which is disconnected or insulated from the other and from earth when the contacts are separated, and contact-separating devices controlled by the relay, which momentarily separate said contacts and leave the line open or disconnected from earth and battery for a brief period after each interruption of the circuit.

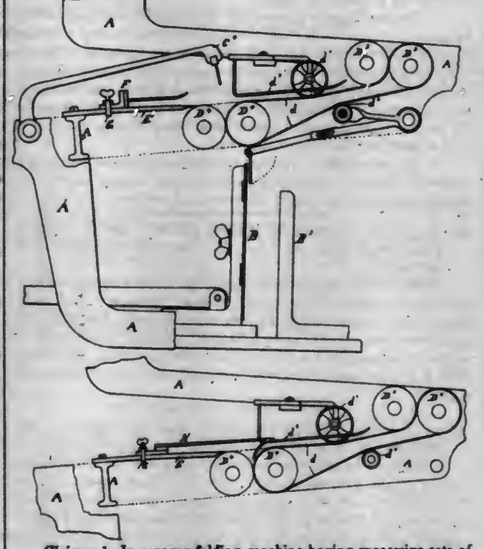
6. The combination, substantially as set forth, with a relay, of a rotating trailer or contact-maker, a series of segments or contacts over which the trailer rotates, the said segments being separated by intervening insulation, trailer-rotating devices controlled by the relay, an electric circuit including the relay-coil, the rotating contact, and the circle of segments traversed thereby, and a source of electric energy, whereby, upon the movement of the relay-armature, the rotating contact is moved from one segment across the intervening insulation to the next segment and the circuit thereby momentarily opened.

401,335. HAND-STAMP. ISAAC R. DODSON, Danville, Va. Filed Apr. 17, 1888. Serial No. 270,900. (No model.)

Claim.—1. In a hand-stamp, the combination of the type-roller, the spring for returning the same to its initial position, and an adjustable stop for limiting the rotation of the roller, whereby the initial position of the latter may be adjusted, substantially as specified.

2. In a hand-stamp, the side plates provided with a series of apertures, N, combined with a roller, F, mounted between the plates, having a stud or pin, L, and provided with a spring to return it to its initial position, and the adjustable stop fitting in one of the apertures N in the path of the stud or pin, substantially as and for the purpose specified.

401,335.

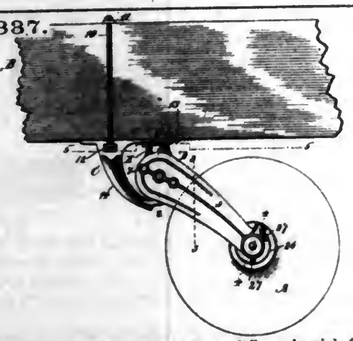


3. In a hand-stamp, the side plates provided with a series of apertures, N, combined with the roller provided with a spring to return it to its initial position and having a series of apertures, K, in one end, the adjustable stud or pin arranged in one of the apertures K, and the adjustable stop M, fitting in one of the apertures N in the path of the stud or pin, substantially as specified.

4. In a hand-stamp, the combination, with the side plates having the radial slots O O P therein, of the roller F, mounted between the said plates, the rods *r r s*, arranged in the slots O O P, respectively, and having eyes or rings on their ends, the springs T T, attached at their upper ends to the rods *r r*, the springs *t t*, connecting the ends of the rod *s* to the ends of the rods *r r*, and the rollers R R and S, mounted on the rods *r r* and *s*, respectively, substantially as specified.

5. In a hand-stamp, the combination, with the side plates having the roller F mounted therebetween and provided with slots arranged radially to the said roller, of the inking-rollers R R, mounted in the said slots and connected by springs T T to the roller F, and the roller S, arranged between and in contact with the rollers R and connected to the latter by springs *t t*, substantially as specified.

401,336. PAPER-FOLDING MACHINE. WELLINGTON DOWNER, Erie, Pa. Filed Jan. 11, 1888. Renewed Feb. 23, 1889. Serial No. 301,502. (No model.)



Claim.—1. In a paper-folding machine having successive sets of folding-rollers set parallel to each other, the combination, with the second set of said successive sets of parallel rollers, of the detachable deflectors H, interchangeable with the detachable upper guards, F, substantially as and for the purposes set forth.

2. In a paper-folding machine, the combination, with the folding-rollers D^3 D^3 and D^4 D^4, arranged parallel to each other and successively, and the packing-box B B', in position to receive papers from the rollers D^4 D^4, of the detachable deflectors H, made interchangeable with the detachable upper guards, F.

401,337. COLTER ATTACHMENT FOR PLOWS. WILLIAM J EDWARDS, Chicago, Ill. Filed Mar. 20, 1888. Serial No. 267,899. (No model.)

401,337.

Claim.—1. The combination, substantially as hereinbefore set forth, of the rotary hub E, provided with oppositely-arranged toothed faces, the vertical pivot 1, arranged as a stationary portion of a bracket and providing an axis about which the hub is arranged to turn, and the colter-yoke carrying a colter-blade and having toothed portions which engage with the toothed faces of the hub, for the purpose described.

2. The combination, substantially as hereinbefore set forth, of the rotary hub E, fitted to turn upon a vertical pivot and provided with oppositely-arranged toothed faces, the colter-yoke carrying a colter-blade and having toothed portions which engage with the toothed faces of the hub, and one or more bolts, 7, engaging the colter-yoke and extending through one or more curved slots, 9, that are formed through opposite sides of the hub, for the purpose described.

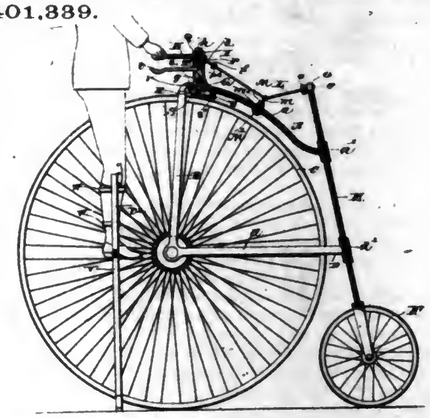
3. The combination, substantially as hereinbefore set forth, of the colter-yoke carrying a colter-blade and having toothed portions, as described, and the rotary head E, fitted to turn about a vertical pivot and having at opposite sides the circular toothed face portions 4, and projecting journals 2, arranged centrally with relation to said circular toothed portions, the colter-yoke being hung upon said journals and held with its teeth in engagement with the teeth of the hub, for the purpose described.

4. The combination, substantially as hereinbefore set forth, of the bracket C, adapted to fit against a plow-beam and having a vertical pivot, 1, rigid therewith and extending from the lower end of its arm 14 to its top portion, 13, the hub E, fitted to turn about said pivot and provided with oppositely-arranged toothed faces, and the colter-yoke carrying a colter-blade and having toothed portions engaging the toothed faces of the hub, said bracket being directly attached to a plow-beam, for the purpose described.

5. The colter-yoke having the inner opposing faces of its two sides or division formed to diverge from their upper toward their lower edges, substantially as and for the purpose described.

401,338. PROCESS OF MAKING BATTERY-ZINCS. HIRAM G. FARR, Boston, Mass. Filed Apr. 27, 1888. Serial No. 272,063. (No specimens.)

Claim.—That improvement in the art of constructing battery-zincs which consists in melting zinc, adding tin and mercury to the molten mass, casting or shaping the same in molds, submitting the blanks thus cast or formed to heat until a portion of the mercury exudes or appears on the surface, and then submitting said blanks while hot to the action of a weak acid solution, substantially as described.



401,339. BICYCLE. RICHARD H. FLETCHER, Socorro, N. Mex. Filed Nov. 26, 1888. Serial No. 292,106. (No model.)

Claim.—1. In a bicycle, the combination, with the frame having the main wheel mounted therein, of the steering-rod mounted on the frame, and provided at its lower end with a steering-wheel and at its upper end with a cross-bar, the steering-handles attached to a revolving head, and the steering-lines connecting the handle with the corresponding arms of the said cross-bar, substantially as specified.

2. In a bicycle, the combination, with the frame having the backbone a, bifurcated at its rear end to form the forks B B and terminating at its front end in a sleeve, and the brace-rod terminating at its front end in a sleeve, and having the extremities of its bifurcated rear end fixed to the lower ends of the forks, and the main wheel mounted between the said forks, of the steering-rod mounted in the said sleeves and having a steering-wheel mounted on its lower end, and the handles connected to a revoluble head and connected to the said steering-rod, substantially as specified.

3. In a bicycle, the combination, with the frame A, having the main wheel mounted thereon, and the steering-rod provided at its lower end with a steering-wheel and having a cross-bar, *c*, at its upper

401,339.

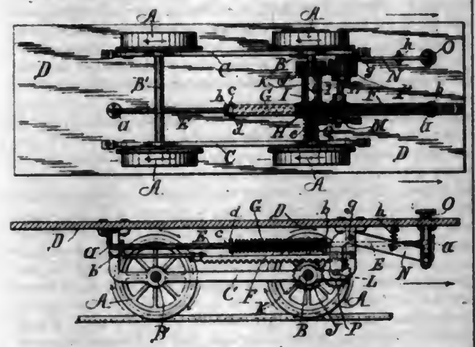
end, of the handles K K, secured to a revoluble head, the guide-bar secured to the frame of the bicycle between the head and the cross-bar *c*, and the steering-lines connected at their front and rear ends, respectively, to the cross-bar and the handles, and passing at intermediate points through guide-eyes on the extremities of the said guide-bar, substantially as specified.

4. In a bicycle, the combination, with the frame provided with a backbone, *a*, the main wheel mounted on the said frame, and the steering-rod mounted on the frame and provided with a steering-wheel and a cross-bar, *c*, of the clip G, adjustably mounted on the backbone and provided with a vertical spindle, the head mounted on the said spindle, and the handles K K, attached to the head and connected to the arms of the cross-bar *c* by the steering-lines L N, substantially as and for the purpose specified.

5. In a bicycle, the combination, with the frame having a backbone, *a*, the main wheel mounted in the frame, and the steering-rod mounted on the frame and provided with a steering-wheel and a cross-bar, *c*, of the guide-bar M, provided at its center with a clip, M', adjustably mounted on the backbone and provided at its ends with the guide-eyes *m m*, the handles attached at their adjacent ends to a revoluble head in rear of the said guide-bar, and the steering-lines connecting the handles to the arms of the cross-bar *c*, and passing at intermediate points through the guide-eyes *m m*, substantially as specified.

6. In a bicycle, the combination, with the frame having the main wheel mounted thereon, and the steering-rod provided with a cross-bar, *c*, and having the steering-wheel mounted on its lower end, of the handles K K, connected to a revoluble head which is mounted on the frame, the steering-lines connected at their front ends to the arms of the cross-bar *c*, the loops P P, connected at their rear closed ends to the handles, the transverse bars *p'*, secured to the rear ends of the steering-lines and provided with eyes p^3 p^3, fitting over the free ends of the said loops, and the adjusting-nuts engaging the threaded extremities of the loops, whereby the steering-lines may be tightened, substantially as and for the purpose specified.

7. In a bicycle, the combination, with the frame having the main wheel mounted thereon, and the steering-rod provided with a cross-bar, *c*, and having a steering-wheel on its lower end, of the clips O O on the arms of the cross-bar, the steering-lines engaged at their front ends in the said clips, the handles K K, connected to a revoluble head, the clips Q on the said handles, the loops P, engaged at their rear ends in the clips Q, the transverse bars *p'*, extending through eyes on the rear ends of the steering-lines and provided with eyes p^3 p^3, which fit on the free ends of the loops, and the adjusting-nuts engaging the threaded extremities of the loops and bearing against the eyes p^3, substantially as and for the purpose specified.



8. In a bicycle, the combination, with the frame having the main wheel mounted thereon, and the steering-rod provided with a steering-wheel, of the handles K K, attached to a revoluble head and connected to the steering-rod, the brake-shoe pivoted at its rear end to the frame of the bicycle and adapted to bear at its free end on the main wheel, and the brake-lever mounted on the revoluble head and provided with a curved loop which engages hooks on the said free end of the shoe, substantially as specified.

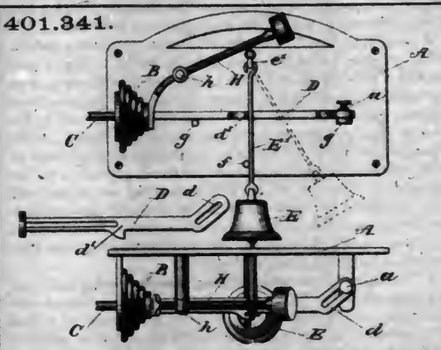
9. In a bicycle, the combination, with a frame having forwardly-inclined forks, the main wheel mounted between the lower ends of the forks, and the steering-rod mounted on the front of the frame and provided with a steering-wheel, of the head mounted on the frame in front of the forks, and the handles connected to the steering-rod, substantially as specified.

10. In a bicycle, the combination, with the frame, the main wheel,

and the steering-rod provided with a steering-wheel, of the revoluble head mounted on the frame and provided with handles K K, which are connected to the steering-rod, the bifurcated brake-shoe S, having the rear ends of its arms pivoted to the frame and provided at its free end with the hooks *s' s'*, and the brake-lever having the arms *t t*, pivoted to opposite sides of the revoluble head and terminating at their front ends in the curved loop U, which engages the hooks *s' s'* on the brake-shoe, substantially as and for the purpose specified.

401,340. COMBINED CAR STARTER AND BRAKE. SILAS B. FYLER, East Syracuse, N. Y. Filed Jan. 12, 1889. Serial No. 296,132. (No model.)

Claim.—1. In a combined car starter and brake, a horizontally-disposed rack-bar movably mounted on a carrying-rod attached to the car-bottom and adapted to longitudinal movement thereon, a recoil-spring upon said rod, a pinion loosely mounted on the car-axle and meshing in the rack-face of the rack-bar, a keyed pinion upon the opposite end of the car-axle, said respective pinions having an integral serrated sleeve portion adapted to engage one with the other and forming a ratchet-clutch, a shaft journaled at one end in a bearing upon the car and its opposite end in a movable operating-bar pivoted at its rear portion to the car and at its front end to a vertical manipulating-rod, a pinion keyed to one end of the aforenamed shaft adapted to be thrown into and out of engagement with the keyed pinion on the car-axle, and a pinion keyed to the opposite end of the shaft and adapted to be thrown into and out of engagement with the rack-face of the horizontal rack-bar, all combined and operating together substantially as described, and for the purposes specified.



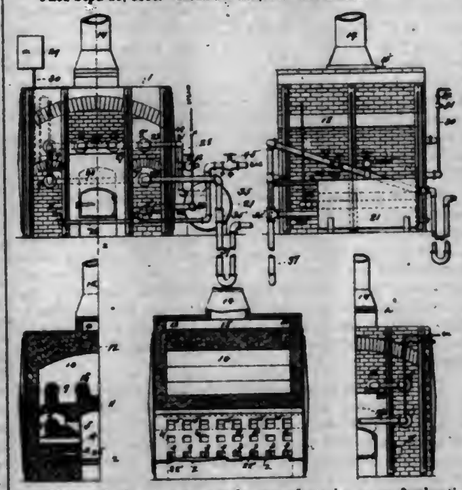
2. In a combined car starter and brake, a horizontal carrying-rod with vertical hangers connected to the car-bottom, a recoil-spring coiled upon said rod part way of its length, a horizontal rack-bar having cogs on its lower face suspended at either end from the carrying-rod by vertical hangers adapted to move longitudinally thereon, carrying the rack-bar forward or rearward longitudinally, a fixed collar on the carrying-rod abutting against the recoil-spring, a loose pinion upon the car-axle adapted to engage with the lower or rack face of the rack-bar, and a keyed pinion at the opposite end of the aforesaid axle, each of said pinions having a sleeve portion serrated at its end, the two combined forming a ratchet-clutch and adapted to be held in engagement one with the other by a coiled spring upon the car-axle bearing against the loose pinion, a supplemental shaft journaled at one end in a stationary hanger and at the other in an angular operating-bar pivotally connected to the car, a keyed pinion upon the supplemental shaft adjacent to the operating-bar, adapted by the movement of said bar to be thrown in and out of engagement with the keyed pinion on the car-axle, and a keyed pinion at the opposite end of said shaft adapted to be thrown in and out of engagement with the under rack-face of the horizontal rack-bar, all combined and operating together substantially as described and shown.

401,341. PNEUMATIC BELL. ROBERT P. GARBER, Norristown, Pa. Filed Dec. 18, 1888. Serial No. 294,020. (No model.)

Claim.—1. The combination, in a pneumatic bell, of the frame A, with a suspended bell, E, having a rod, E', supported by hook *e'*, attached to said frame, bellows B, attached to frame A, and having a pushing-rod, D, with a slant and shoulder on its side adapted to move back and forth with the motions of said bellows, and air-pipe, *c*, leading to said bellows, and the rod E' of said bell adapted to engage and disengage itself from the rod D, whereby a jingling of the bell E takes place, substantially as and for the purposes set forth.

2. The combination, in a pneumatic bell, of the air-conveying pipe *c*, the frame A, with supported bellows B, and a suspended bell with its rod E', and an actuating-arm, D, adapted to move back and forth, attached to said bellows, said arm D having a projection, *d'*, on

401,341.



its side, with a slant and shoulder adapted by the movement of said arm to engage and disengage the bell-rod E', and the collapsing-lever H, pivoted to the frame A by the pivot *h*, and having a weight on one end and at the other adapted to engage the bellows B to collapse the same, substantially as and for the purposes set forth.

3. The combination, in a pneumatic bell, of the air-conveying pipe *c*, the frame A, with the suspended bell E, and a supported bellows, B, carrying an actuating-arm, D, with a projecting part adapted by the movement of said arm to engage and disengage the rod E' of said bell, said arm also having a diagonal slot, *d*, to give lateral motion to it when engaging pin *a*, the pin *a*, supported by the stud *g*, and passing through said slot, and the stud *g*, supported on said frame A, substantially as and for the purposes set forth.

4. The combination, in a pneumatic bell, of the air-conveying pipe *c*, a frame carrying a suspended bell, E, and bellows B therefor, which is provided with an actuating-arm, D, said arm formed with a projection, *d'*, on its side with a slant and shoulder, and an inclined end, *d*, to give lateral motion to it when engaging the pin *a*, said pin *a* and the studs *f* and *g* each secured to the frame, and the collapsing-lever H, pivoted intermediate of its length on the stud *h*, the outer long arm being weighted and the inner and shorter arm engaging the actuating-rod D to collapse the bellows and restore the parts to their normal position, substantially as set forth.

401,342. APPARATUS FOR THE MANUFACTURE OF GAS. CHARLES M. GEARING, Pittsburg, Pa., assignor to Thomas Liggett, Charles M. Clarke, Robert S. Fraser, and Alex. M. Neeper, all of same place. Filed Sept. 25, 1888. Serial No. 286,337. (No model.)

Claim.—1. In an apparatus for manufacturing gases for heating and illuminating purposes from a liquid hydrocarbon and air, a furnace combined with a series of retorts having suitable connections, one or more of the series being used as superheaters, the others as gas-generators, an injector operated by steam, an elevated receptacle for said hydrocarbon having a pipe connecting between the last superheating and first gas-generating retort, and a condenser connected between said injector and first superheating-retort for the purpose of injecting air through said retorts, extracting the steam therefrom by means of said condenser before the same reaches said first superheat-

ing-retort to bring the same to a proper condition to combine with said hydrocarbon and form a gas, substantially as described.

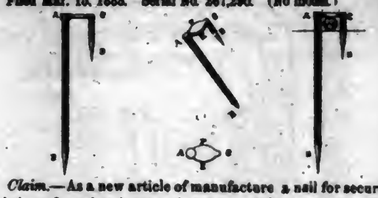
2. In an apparatus for manufacturing gases for heating and illuminating purposes from a liquid hydrocarbon and air, a furnace combined with a series of retorts having suitable connections, one or more of the series being used as superheaters, the others as gas-generators, an injector operated by steam, an elevated receptacle for said hydrocarbon having a pipe connecting between the last superheater and the first gas-generating retort, a condenser connected between said injector and the first superheating-retort, and a washer connected to the last gas-generating retort for the purpose of injecting air through said retorts, extracting the steam therefrom by means of said condenser before the same reaches the first superheating-retort to bring the same to a proper condition to combine with said hydrocarbon and form and purify a gas, substantially as described.

3. In an apparatus for manufacturing gases for heating and illuminating purposes from a liquid hydrocarbon and air, a furnace combined with a series of retorts having suitable connections, all packed with fragments of a heat-conducting non-fusible refractory material, one or more of said series being used as superheaters, the others as gas-generating retorts, an injector operated by steam, an elevated receptacle for said hydrocarbon having a pipe connecting between the last superheating and the first gas-generating retort, and a condenser connected between said injector and the said first superheating-retort for the purpose of injecting air through said retorts, extracting the steam therefrom by means of said condenser before the same reaches said first superheating-retort to bring the same to a proper condition to combine with said hydrocarbon and form a gas, substantially as described.

4. In an apparatus for manufacturing gases for heating and illuminating purposes from a liquid hydrocarbon and air, a furnace combined with a series of retorts having suitable connections, all packed with fragments of a heat-conducting non-fusible refractory material, one or more of said series being used as superheating, the others as gas-generating retorts, an injector operated by steam, an elevated receptacle for said hydrocarbon having a pipe connecting between the last superheating and the first gas-generating retort, a condenser connected between said injector and the first superheating-retort, and a washer connected to the last gas-generating retort for the purpose of injecting air through said retorts, extracting the steam therefrom before the same reaches said first superheating-retort to bring the same to a proper condition to combine with said hydrocarbon to form and purify a gas, substantially as described.

5. A furnace in an apparatus for manufacturing gases for heating and illuminating purposes from a liquid hydrocarbon and air, having an arched fire-box, an arched chamber containing a retort on both sides thereof, each of said chambers connecting thereto by two series of ports at different levels, the ports of the upper series being inclined upward on the bottom and having in their arches two series of ports diverging from each other and from a vertical line, and a third chamber the floor of which is formed of the arches of the fire-box and said chambers on both sides thereof, the roof thereof being formed of an arch sprung across the top of the furnace and having ports at its front and rear ends connecting with a flue extending longitudinally on top of the same, having a damper for the purpose of preventing the flames and heat from playing directly upon the retorts contained therein and evenly distributing the same, substantially as described.

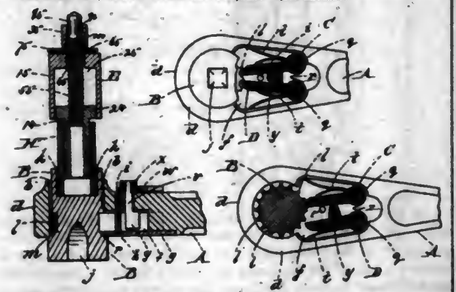
6. In an apparatus for manufacturing gases for heating and illuminating purposes from a liquid hydrocarbon and air, a combined condenser and washer having a water-vessel provided with an inlet, an outlet provided with a water seal, a gas-inlet with opening below the water-level and a gas-outlet above the same, a condensing-coil fixed therein below the water-level and having an inlet for air and steam and an outlet provided with a water seal, through which is drained condensation from the condensing-coil, and a connection to conduct the moist air therefrom, substantially as and for the purposes described.



7. A furnace in an apparatus for manufacturing gases for heating and illuminating purposes from a liquid hydrocarbon and air, having an arched fire-box, an arched chamber containing a retort on both sides thereof, each of said chambers connecting thereto by two series of ports at different levels, the ports of the upper series being inclined upward on the bottom and having in their arches two series of ports diverging from each other and from a vertical line, a third chamber the floor of which is formed of the arches of the fire-box and said chambers on both sides thereof, the roof thereof being formed of an arch sprung across the top of the furnace and having ports at its front and rear ends connecting with a flue extending longitudinally on top of the same, having a damper for the purpose of preventing the flames and heat from playing directly upon the retorts contained therein and evenly distributing the same, combined with a series of retorts having suitable connections, one or more of the series being used as superheaters, the others as gas-generators, an injector operated by steam, an elevated receptacle for said hydrocarbon having a pipe connecting between the last superheater and the first gas-generating retort, a condenser connected between said injector and the first superheating-retort, and a washer connected to the last gas-generating retort for the purpose of injecting air through said retorts, extracting the steam therefrom by means of said condenser before the same reaches said first superheating-retort to bring the same to a proper condition to combine with said hydrocarbon and form a gas, substantially as described.

8. A furnace in an apparatus for manufacturing gases for heating and illuminating purposes from a liquid hydrocarbon and air, having an arched fire-box, an arched chamber containing a retort on both sides thereof, each of said chambers connecting thereto by two series of ports at different levels, the ports of the upper series being inclined upward on the bottom and having in their arches two series of ports diverging from each other and from a vertical line, a third chamber the floor of which is formed of the arches of the fire-box and said chambers on both sides thereof, the roof thereof being formed of an arch sprung across the top of the furnace and having ports at its front and rear ends connecting with a flue extending longitudinally on top of the same, having a damper for the purpose of preventing the flames and heat from playing directly upon the retorts contained therein and evenly distributing the same, combined with a series of retorts having suitable connections, one or more of the series being used as superheaters, the others as gas-generators, an injector operated by steam, an elevated receptacle for said hydrocarbon having a pipe connecting between the last superheating and first gas-generating retort, and a condenser connected between said injector and first superheating-retort for the purpose of injecting air through said retorts, extracting the steam therefrom by means of said condenser before the same reaches said first superheating-retort to bring the same to a proper condition to combine with said hydrocarbon and form a gas, substantially as described.

9. A furnace in an apparatus for manufacturing gases for heating and illuminating purposes from a liquid hydrocarbon and air, having an arched fire-box, an arched chamber containing a retort on both sides thereof, each of said chambers connecting thereto by two series of ports at different levels, the ports of the upper series being inclined upward on the bottom and having in their arches two series of ports diverging from each other and from a vertical line, a third chamber the floor of which is formed of the arches of the fire-box and said chambers on both sides thereof, the roof thereof being formed of an arch sprung across the top of the furnace and having ports at its front and rear ends connecting with a flue extending longitudinally on top of the same, having a damper for the purpose of preventing the flames and heat from playing directly upon the retorts contained therein and evenly distributing the same, combined with a series of retorts having suitable connections, all packed with fragments of a heat-conducting non-fusible refractory material, one or more of said series being used as superheaters, the others as gas-generators, an injector operated by steam, an elevated receptacle for said hydrocarbon having a pipe connecting between the last superheating and first gas-generating retort, and a condenser connected between said injector and the said first superheating-retort for the purpose of injecting air through said retorts, extracting the steam therefrom by means of said condenser before the same reaches said first superheating-retort to bring the same to a proper condition to combine with said hydrocarbon and form a gas, substantially as described.



10. A furnace in an apparatus for manufacturing gases for heating and illuminating purposes from a liquid hydrocarbon and air, having an arched fire-box, an arched chamber containing a retort on both sides thereof, each of said chambers connecting thereto by two series of ports at different levels, the ports of the upper series being inclined upward on the bottom and having in their arches two series of ports diverging from each other and from a vertical line, a third chamber the floor of which is formed of the arches of the fire-box and said chambers on both sides thereof, the roof thereof being formed of an arch sprung across the top of the furnace and having ports at its front and rear ends connecting with a flue extending longitudinally on top of the same, having a damper for the purpose of preventing the flames and heat from playing directly upon the retorts contained therein and evenly distributing the same, combined with a series of retorts having suitable connections, all packed with fragments of a heat-conducting non-fusible refractory material, one or more of said series being used as superheating, the other as gas-generating, retorts, an injector operated by steam, an elevated receptacle for said hydrocarbon having a pipe connecting between the last superheating and the first gas-generating retort, a condenser connected between said injector and the first superheating-retort, and a washer connected to the last gas-generating retort for the purpose of injecting air through said retorts, extracting the steam therefrom before the same reaches said first superheating-retort to bring the same to a proper condition to combine with said hydrocarbon to form and purify a gas, substantially as described.

401,843. ELECTRIC-WIRE NAIL. CHARLES A. GILDEMEYER, Haddonfield, N. J., assignor of one-half to Madison Rush, Philadelphia, Pa. Filed Mar. 15, 1888. Serial No. 267,290. (No model.)

Claim.—As a new article of manufacture a nail for securing wire, consisting of a pointed rod, a shorter parallel pointed rod, a thin flattened connecting-bar broader than the pointed rods arranged with the plane of its surface substantially at right angles to said rods, and a nail-head substantially in line with the longer rod.

401,844. RATCHET-DRILL. HUMPHREY M. GLENN, Boston, Mass. Filed Nov. 30, 1888. Serial No. 292,225. (No model.)

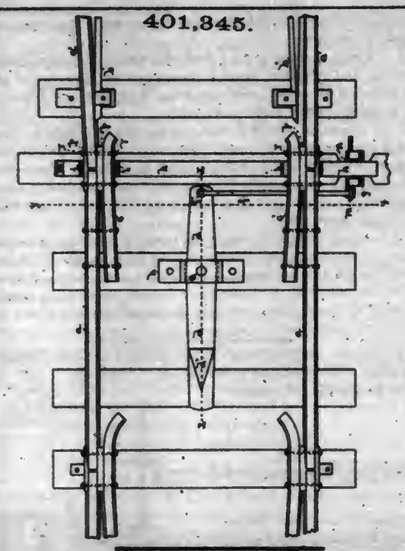
Claim.—1. In a drill-ratchet, the combination of a body, a corrugated ratchet-block fitted to rotate therein and provided with a socket, two spring-actuated pawls loosely disposed in said body in engagement with said ratchet, a cam-rod for alternately disengaging said pawls, a feed mechanism, and a pipe adapted to enter said socket and receive said feed mechanism, substantially as described.

2. In a drill-ratchet, the combination of a handle provided with a ratchet-block socket, a chamber opening therein, a corrugated ratchet-block fitted to revolve in said socket, two pawls disposed in said chamber, springs for holding said pawls in engagement with the corrugations of said block, a socket in said block, a pipe adapted to enter said socket and receive a feed mechanism, and a plate for closing said chamber, the forward end of said plate projecting into a groove in the ratchet-block, substantially as and for the purpose set forth.

3. In a drill-ratchet, the feed mechanism E, comprising the cylinder 15, screw-bolt 55, bearing 85, and nut 14, in combination with the pipe H, ratchet-block B, provided with the socket *k*, and adjunctive mechanism for actuating said block, substantially as set forth.

4. In a drill-ratchet, the feed mechanism E, comprising the cylinder 15, provided with the cap 35, the screw-bolt 55, secured in said cap, the bearing 85, provided with cone-shaped ends and fitted to rotate in said cap and the head of said bolt, the pipe H, and the nut 14, all being combined and arranged to operate substantially as described.

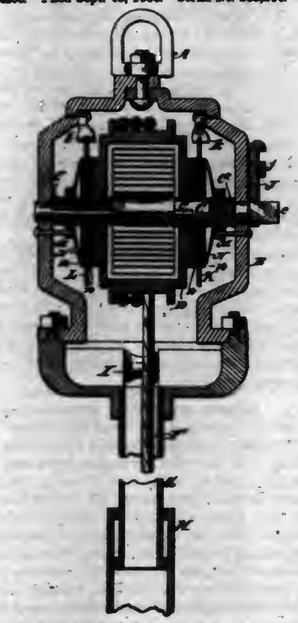
5. In a drill-ratchet, the feed mechanism E, in combination with pipe H, the ratchet-block B, having the socket *k* for receiving the nut 14 of said feed, and adjunctive mechanism for actuating said ratchet, substantially as described.



6. In a drill-ratchet, the feed mechanism E, provided with the nut 14, having the head 24, in combination with the pipe H, adapted to receive the body of said nut and engage the head thereof, the ratchet-block B, provided with the socket *k* for receiving said pipe, and adjunctive mechanism for actuating said ratchet, substantially as set forth.

401,845. RAILROAD-SWITCH. EDWIN GORDON, Hyde Park, Mass. Filed July 2, 1888. Serial No. 278,330. (No model.)

Claim.—The lever *d*, pivot *e*, rod *f*, pin *f'*, pivot *m*, link *g*, pin *o*, bar *h*, and bar *m'*, in combination with the continuous rails *a a'*, fixed point-rails *b b'*, guard-rails *c c*, blocks *p p*, and bolts *r r*, substantially as and for the purpose above described.



401,845.

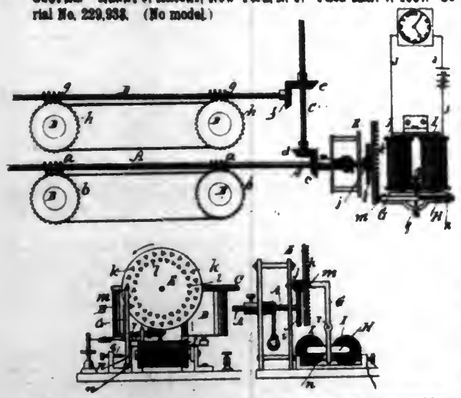
401,846. METHOD OF FINISHING RAILROAD-SPIKES. HOWARD GREER, Lake View, Ill. Filed Jan. 17, 1889. Serial No. 296,690. (No model.)

Claim.—The method of finishing spikes, which consists in grinding the point on one or both sides, heating it by the grinding operation, and tempering or hardening the point so heated, and at the same heat, by subjecting it to the action of a suitable tempering or hardening fluid or liquid, substantially as described.

401,847. EXTENSION-FIXTURE FOR LAMPS, &c. LEWIS F. GRISWOLD, Meriden, Conn., assignor to The Charles Parker Company, same place. Filed Sept. 13, 1888. Serial No. 285,296. (No model.)

Claim.—1. In a suspension device, the combination of a spring which counterbalances the suspended article midway between its highest and lowest elevation, a drum turned by said spring, and two friction brakes or stops, one resisting upward motion and the other resisting downward motion, substantially as set forth.

2. The combination of a shaft, a drum movable endwise thereon, friction-brakes on each side of it, with which it is brought in contact alternatively by such endwise motion in either direction, a suspend-



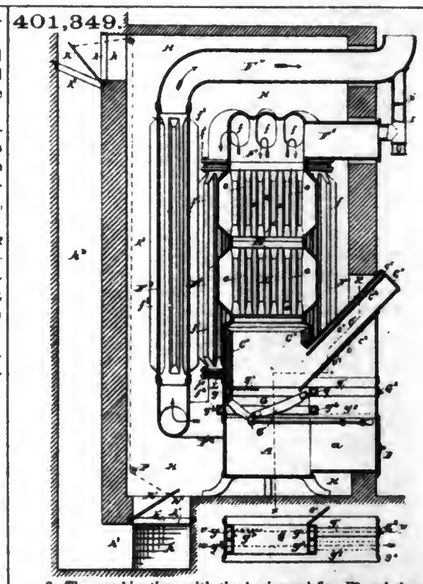
ing-cord wound on said drum, and a spring actuating the latter, substantially as set forth.

3. A spring-actuated drum, a shaft with which it has screw-thread connection, and frictional devices alternatively on each side of said drum arranged for contact with said drum, in whichever direction the latter is moved, substantially as set forth.

4. In combination with a shaft having screw-threads, a spring-actuated drum movably mounted thereon and having screw-threads to engage therewith, brake-disks arranged on each side of said drum and having peripheral teeth facing in opposite directions, pawls engaging said teeth, and springs forcing said brake-disks toward said drum, substantially as set forth.

5. In combination with a shaft and spring-drum movable endwise thereon, a suspension-cord winding on said drum, a pair of friction brakes arranged to resist, respectively, upward motion only and downward motion only, and the locking-key J, arranged to make contact with one of the faces of the prismatic end of said shaft, or to free the same at will, substantially as set forth.

401,348. ATTACHMENT FOR ELECTRO-MAGNETIC THERMOSCOPES. HENRY J. HAIGHT, New York, N. Y. Filed Mar. 7, 1887. Serial No. 229,938. (No model.)



Claim.—1. In an electro-magnetic thermoscope, the combination of a mechanically-turned driving-shaft, tablet-rollers actuated directly by the said driving-shaft, an escapement-wheel geared to the driving-shaft, an escapement or pallet lever controlled by an electro-magnet, a clock, and a clock-time-transmitting circuit, including the coil of the said electro-magnet, for the purpose herein specified.

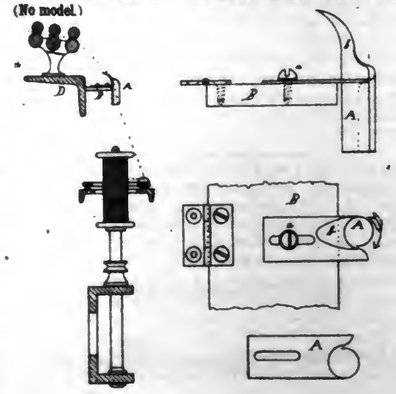
2. The combination of a mechanically-turned driving-shaft, an escapement-wheel geared to the driving-shaft, an escapement or pallet lever controlled by an electro-magnet, a clock, a clock-time-transmitting circuit, including the coil of the said electro-magnet, an additional shaft or shafts turned by the driving-shaft, and one or more sets of tablet-rollers driven by the said additional shaft or shafts, for the purpose herein specified.

3. The combination of a mechanically-turned driving-shaft, tablet-rollers actuated by the said shaft, an escapement-wheel geared to the driving-shaft and provided with two concentric rows of alternately-arranged triangular escapement-teeth, and a vibrating escapement or pallet lever having a triangular pallet projection engaging with the said escapement-teeth and actuated by an electro-magnet in the circuit of an electro-magnetic clock-time transmitter, substantially as and for the purpose herein set forth.

401,349. HEATING APPARATUS. HERMANN HEIM, Ober-Döbling, near Vienna, Austria-Hungary. Filed Aug. 14, 1886. Serial No. 210,899. (No model.) Patented in Germany June 26, 1886, No. 41,674; in France July 1, 1886, No. 177,131; in Belgium July 1, 1886, No. 73,684; in England July 1, 1886, No. 8,643; in Italy Sept. 30, 1886, XX, 20,168, XL, 33, and in Austria-Hungary Jan. 24, 1887, No. 25,668 and No. 66,239.

Claim.—1. In a heater, a grate-section having air-flues formed in its walls at points above and below the grate, respectively, the flue above the grate having a multiplicity of air-ports to divide the body of air admitted above the grate, and a single air-delivery port for the flue below the grate, whereby the air passing through said flue is delivered in a body below said grate, substantially as and for the purpose specified.

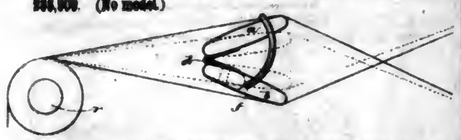
2. In a heater, a grate-section having air-flues formed in its walls at points above and below the grate and completely encompassing said grate, the upper flue being unobstructed and provided with perforations extending along the back and partly along the sides of the flue, the lower flue being obstructed by a partition at a point where said flue returns upon itself and provided at that point with an outlet leading under the grate, substantially as and for the purposes specified.



3. The combination, with the horizontal flue F^2 and the vertical flues F' F^3, connected therewith, said flue F^2 having a horizontal extension, F^4, of the furnace-section F, provided with branch flues *f*, to which the flues F' are connected, and with a flue, F^5, connected with the flue F^4, said branches and connection between flues F^4 F^5 constituting the supports for the system of pipes F' F^2 F^3 F^4, substantially as and for the purposes specified.

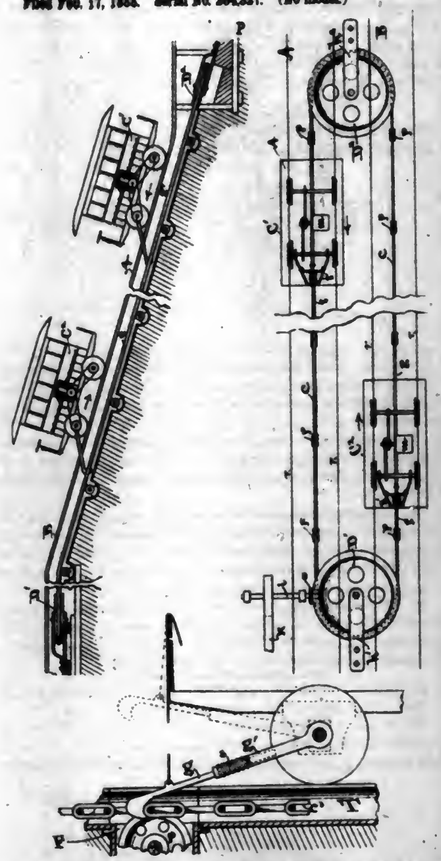
4. The combination, with the section F, of the furnace provided with branches *f* and draft-flue F^6, of the diving-flues F', the horizontal flue F^2, the draft-flue F^6 F^4, connected together and suspended from said branches *f* of section F, as described, and the valved flue I, connecting the flues F^5 F^6 and serving to support the free end of said flue F, substantially as and for the purposes specified.

5. The combination, with the branches *f* of the furnace-section F, the branches f^2 of the flue F^5, and the flue F^4, provided with bolt-flanges and stepped seats f^4 f^5, respectively, projecting from said flanges, of the flues F' and F^6, similarly provided with bolt-flanges and stepped seats, the upper flue-seats fitting onto the corresponding seats of the branches *f* and flue F^4, and the lower seats of said flues F' F^6 fitting into the corresponding seats of the branches f^3 of flue F^6, substantially as and for the purposes specified.



6. The combination of the following elements: the furnace, the hot-air chamber H, the cold-air flue *h'*, in communication with said chamber through a valved passage, $h^\times$, in the floor thereof, the vertical flue h^3, in communication with said cold-air flue and with the hot-air chamber through the valved passage $h^\times$ and through a passage, *h*, near the roof of said chamber, and the valve K, arranged to close either the vertical flue or said passage *h*, substantially as and for the purposes specified.

401,350. GUIDE-TUBE FOR SPINNING-FRAMES, &c. SAMUEL HENDERSON, Millville, N. J. Filed Dec. 17, 1888. Serial No. 293,906. (No model.)



Claim.—In a yarn-guide for spinning or twisting machines, the combination, with the guide-board B, of a yarn-guide consisting of a tube, A, having a lip, *b*, and a lap-opening, as shown and described.

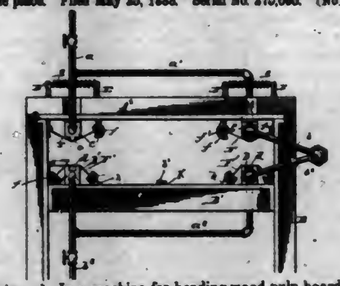
401,351. LEASE-ROD FOR LOOMS. CHARLES H. HOBBS and TIMOTHY P. WHELAN, Slatersville, R. I. Filed Oct. 23, 1888. Serial No. 288,909. (No model.)

Claim.—The two bars hinged together at their edges to form a lease-rod and a spring to normally separate the said bars to act upon the warp-threads, substantially as described.

401,352. STREET-RAILWAY. LEWIS M. HOBBS, Cincinnati, Ohio. Filed Feb. 17, 1888. Serial No. 264,337. (No model.)

Claim.—1. In a tram or rail way system, in combination with cars or motors provided with independent means of propulsion, an endless normally-idle cable carried in a surface-slotted conduit or conduits in or parallel with the trackway, fixed carrying-pulleys arranged in the terminal bights of the cable, and means for temporarily connecting the cars or motors to said cable through the surface slot of the conduit, substantially as set forth.

2. In a tram or rail way system, in combination with cars or motors provided with independent means of propulsion, an endless normally-idle cable carried over a gradient or other section of said railway in a surface-slotted conduit or conduits in or parallel with the trackways, fixed pulleys arranged at the terminus of such railway-section in the bights of the cable, and means for connecting cars or motors to such cable through the surface slot of the conduit while passing over said section of the railway, substantially as set forth.



3. In a tram or rail way, in combination with cars or motors provided with independent means of propulsion, an endless normally-idle cable arranged upon a section of the railway and carried around fixed carrying-pulleys at the termini of such section, a surface-slotted conduit inclosing the cable between said pulleys, power-connections for the temporary application of power to one or both of said terminal carrying-pulleys to drive the cable, and means carried by the cars or motors to connect with said cable temporarily while passing over said section, substantially as set forth.

4. In a double-track tram or rail way system operating cars provided with independent means of propulsion in opposite directions over said tracks, the combination, with such cars so provided, of an idler-cable carried in opposite directions in surface-slotted conduits in or parallel with the trackways, respectively, and means for connecting said cars with said cable through the slot, whereby the cars moving in one direction may impart motion through the medium of said cable to cars moving in the opposite direction, substantially as set forth.

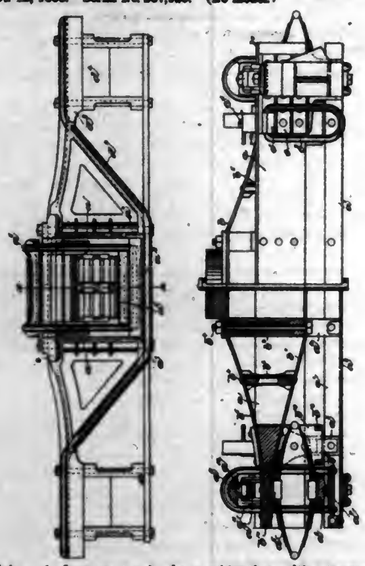
5. In a tram or rail way system, the combination, with the trackway, of a cable-conduit having a surface slot, a cable having engaging-stops thereon carried in said conduit, cars or motors provided with independent means of propulsion traveling said railway, and adjustable engaging devices carried by said cars for connecting to or disconnecting from said cable at will to give power thereto or receive power therefrom, substantially as set forth.

6. In a street-railway, in combination with a section of double trackway upon which cars move in opposite directions, a surface-slotted cable-conduit arranged at or parallel with the trackway, a horizontal carrying-pulley at each terminus of such trackway-section, and an endless normally-idle cable passed around said pulleys and through said conduits in opposite directions, and means carried upon the cars for temporarily attaching to said cable at either track upon reaching said section of trackway and while passing the same, and for disconnecting from the same upon reaching the terminus of said section, substantially as set forth.

401,353. WOOD-PULP-BOARD-BENDING MACHINE. CHARLES B. JAMMON, Mansfield, Ohio, assignor to the Bodine Roofing Company, same place. Filed May 25, 1888. Serial No. 275,095. (No model.)

Claim.—1. In a machine for bending wood-pulp board, the combination, with the dies, of the interposed flexible sheets and yielding holders therefor on opposite sides of dies for keeping the sheets under tension, substantially as described.

2. The combination of fixed and movable hollow dies, interposed flexible sheets between which the material operated upon is pressed into the dies, and yielding holders for said sheets for keeping them under tension, substantially as described.



3. The combination of the fixed and movable hollow dies, the flexible sheets held under tension between said dies, yielding holders for said sheets, and means, substantially as described, for maintaining the tension on said flexible sheets during the operation of bending the material operated upon.

4. The combination of the fixed and movable dies C C' and D D', the steam-pipes *a* and *a'*, supplying and connecting the fixed dies, the flexible pipe connecting the fixed and movable dies for supplying steam to the latter, the pipe a^3, connecting the movable dies, and the exhaust b^3, all substantially as and for the purpose described.

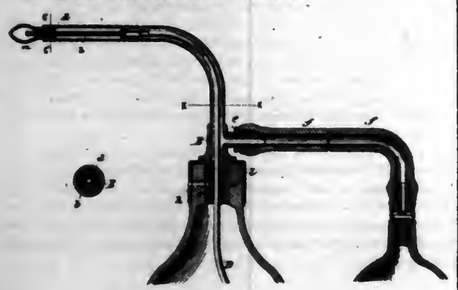
5. The combination, with the fixed hollow dies, of the movable hollow dies, the steam-pipes connecting said fixed and movable dies and permitting their relative movement toward and away from each other, the frame or support for the movable dies, and the toggle-links connected in pairs to opposite sides of said support for upholding and moving it, those upon the same side being connected to move together, substantially as described.

6. In a machine for molding pulp board, the combination, with the movable frame or table supporting the movable dies, of the parallel hollow dies on said frame, and the toggle-links for upholding and moving said frame, connected in pairs to opposite sides thereof, those upon the same side being connected to move together and all connected to a common shaft or motor for simultaneous movement, substantially as described.

401,354. CAR-TRUCK. LUTHER K. JEWETT, Boston, Mass. Filed Oct. 12, 1888. Serial No. 287,925. (No model.)

Claim.—1. In a car-truck, the combination, with a transom, of a metallic bolster composed of top and bottom separated by posts or studs, the said top being concaved or curved downward on opposite sides of the bolster center to prevent upward buckling of the bolster under excessive loads, substantially as described.

2. In a car-truck, the combination, with a metallic transom having independent sides *a*, of arch-bar-sustaining blocks having each an arm, *c*, secured to the said sides to leave free space between the said arms and the bottom of the transom, substantially as and for the purpose specified.

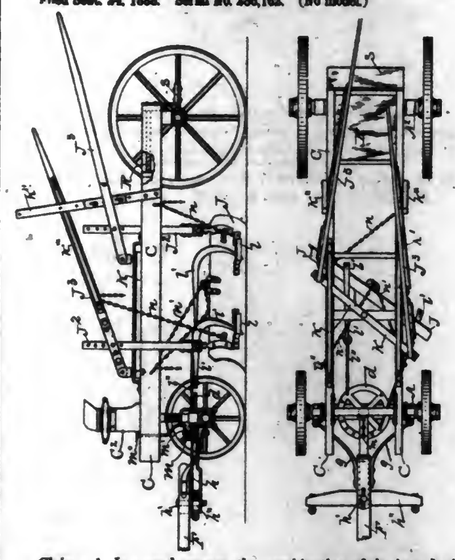


3. In a car-truck, the combination, with a metallic transom having independent sides *a*, of arch-bar-sustaining blocks having each an arm, *c*, and provided with a lug, *c'*, to support a link, as c^3, and a lock to secure said link on said lug, substantially as described.

4. In a car-truck, a metallic transom and a metallic bolster adapted to swing in said transom, and composed of a top plate, *b*, and bottom plate, *b'*, combined with castings b^{10}, inserted between the said plates at their opposite ends and secured thereto and provided with chafe-irons, forming an integral part of the said castings, substantially as and for the purpose specified.

5. In a car-truck, a metallic transom and a bolster vertically movable in said transom, arch-bar-sustaining blocks secured to said transom and provided with projections or ribs, combined with clips having ribs or projections to co-operate with the ribs or projections on the arch-bar-sustaining blocks, substantially as and for the purpose specified.

6. In a car-truck, a metallic transom and a metallic bolster adapted to swing in said transom, and composed of a top plate, *b*, and bottom plate, *b'*, combined with castings b^{10}, inserted between the said plates at their opposite ends, and secured thereto and provided with chafe-irons, forming an integral part of the said castings, and tie-bars to join the chafe-irons of the said castings, substantially as described.



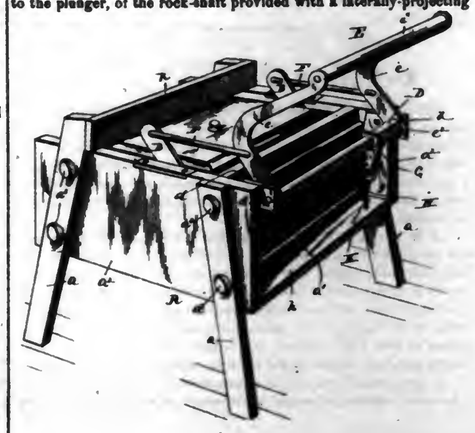
401,355. ATOMIZER. GEORGE KNEUPER, New York, N. Y. Filed Feb. 2, 1889. Serial No. 298,502. (No model.)

Claim.—1. The liquid-vessel A and its air-tube B, provided with the opening *g*, said opening being adapted to be closed and unclosed, in combination with the pipe *f* and bulb E, substantially as described.

2. The liquid-vessel A, having a flexible neck, *j*, combined with a rigid cap, *l*, around and overlapping said neck, and with the tube B, that enters said neck, substantially as described.

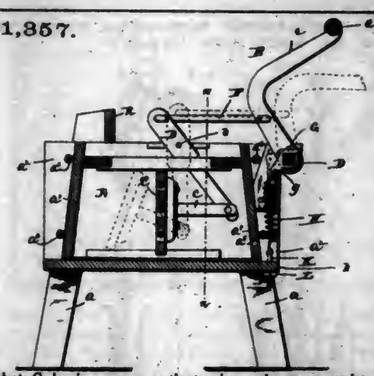
401,356. ROAD-SCRAPER. HENRY C. LAFKHARTHEA, Star, Iowa. Filed Sept. 24, 1888. Serial No. 286,162. (No model.)

Claim.—1. In a road-scraper, the combination of the bars A, pin *K'*, doubletree *K''*, a pole having a slot, a circular plate, *d*, and a bolt, *d'*, with the front axle and bolster of a four-wheeled carriage, for the purpose stated.



2. A road-scraper having drag-bars at its opposite ends adjustably connected with a circular perforated plate pivoted to the center of the axle of a carriage, to operate in the manner set forth, for the purposes stated.

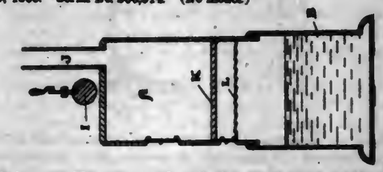
3. A scraper having loops *l* on its back, drag-bars having rear ends adapted to enter said loops and to fit against the back of the scraper, and a circular plate pivoted to the axle of a carriage and adjustably connected with the drag-bars by means of links, to operate in the manner set forth, for the purposes stated.



4. The combination of the perforated plate *d*, pivoted to the carriage-axle, the perforated bars *k*, fixed to the same axle, and the locking device composed of the pin *m*, lever *m'*, and treadle *m''*, substantially as shown and described, for the purposes stated.

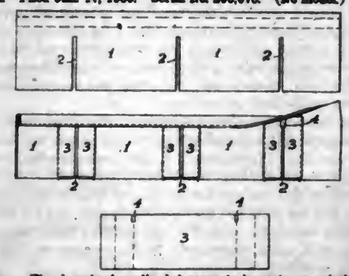
401,357. WASHING-MACHINE. JOHN O. LEFFINGWELL, Nevada, Iowa. Filed Aug. 4, 1888. Serial No. 281,995. (No model.)

Claim.—In a washing-machine, the combination, with the tub, the plunger arranged therein, and the operating-levers B B, connected to the plunger, of the rock-shaft provided with a laterally-projecting



401,357.

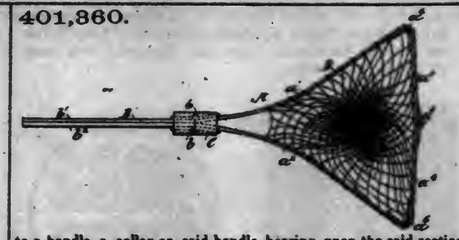
bracket, G, having an eye, *g*, the tension-spring connected to the said bracket, for the purpose specified, and the hand-lever comprising the curved or angle arms *e e*, connected, respectively, to the levers B B, and provided with squared eyes e^4, fitting on the squared portion of the rock-shaft, and the hand-bar connected to the free ends of the hand-levers, substantially as specified.



401,358. SAFETY SELF-EXTINGUISHING CAR-HEATING STOVE. WILLIAM J. LOCKE and ISAAC THAYER, San Francisco, Cal. Filed Sept. 25, 1888. Serial No. 286,314. (No model.)

Claim.—1. The car-stove described, consisting, essentially, of the water-chamber, the fire-chamber arranged above the same and adapted to move therein and having the pivoted lattice-work beneath the fire-grate, the guide-frame C, secured to the water-tank and looped over the fire-chamber, the springs encircling the guide-frame and secured at one end to the fire-chamber and at the other end to the water-chamber, the bracket-arm, and the weighted connection having a ball-and-socket joint for connecting the fire-chamber with the bracket, substantially as specified.

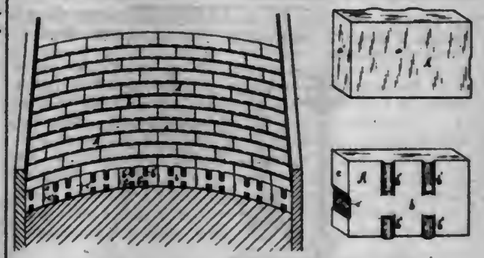
2. In a car-stove, the combination of the water-chamber, the fire-chamber arranged above the same and adapted to move therein, the guide-frame C, secured to the water-chamber, the springs encircling the guide-frame and secured at one end to the fire-chamber and at the other end to the water-chamber, the bracket-arm, and the weighted connection having a ball-and-socket joint for connecting the fire-chamber with the bracket, substantially as specified.



401,359. BUTTON-HOLE STRIP. HENRY W. LYON, Bridgeport, Conn. Filed Jan. 17, 1889. Serial No. 296,670. (No model.)

Claim.—The herein-described button-hole strip, consisting of a body-strip having cut therein button-holes, one end of the latter intersecting the inner edge of said strip, in combination with the edge-binders having notches in one side abutting against the closed ends of the button-holes, the ends of said binders being doubled and secured to said strip, and the outer edge of the latter being folded down across the closed ends of the button-holes and then secured to the strip, substantially as set forth.

401,360. FISHERMAN'S NET. JAMES P. MARSTERS, Brooklyn N. Y. Filed Sept. 15, 1888. Serial No. 285,483. (No model.)



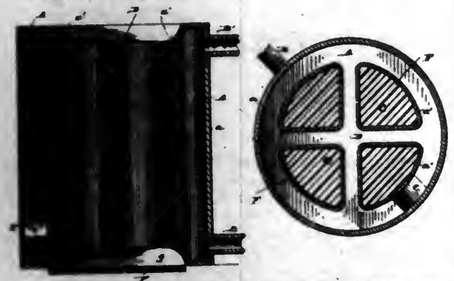
Claim.—1. A net-frame having resilient diverging sections hinged

to a handle, a collar on said handle bearing upon the said sections, and two flexible sections hinged to the outer ends of the diverging sections and hinged together at their inner ends, substantially as specified.

2. The combination, with the handle and the resilient diverging arms hinged thereto, of the slide adapted to vary the resilience of the diverging sections, and the two flexible sections hinged to the outer ends of the diverging sections and hinged together at their inner ends, the said sections being deflected outwardly, substantially as specified.

401,361. PAVING-BLOCK. WILLIAM MCREYNOLDS and JOHN W. MCREYNOLDS, Cleveland, Ohio. Filed Feb. 9, 1889. Serial No. 299,322. (No specimens.)

Claim.—1. In a pavement, the combination of two paving-blocks laid on their longitudinal edges, each of said blocks having one plane longitudinal face and provided on its opposite longitudinal face with two projections located in different vertical planes, said projections of less vertical length than the vertical height of the face on which they are located, the longitudinal plane face of one block and the longitudinal face that is provided with projections of the adjacent block located in proximity to each other, whereby an interstice is formed between adjacent faces of the two blocks, a portion of said interstice being located in the same vertical plane with each of said projections, substantially as set forth.

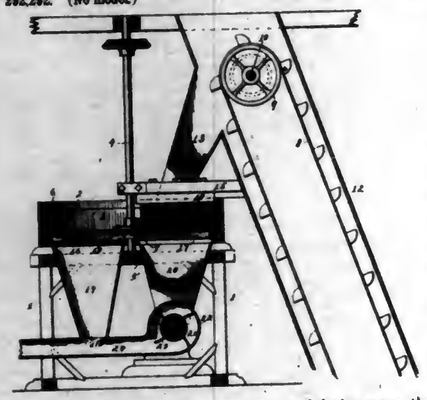


2. In a pavement, the combination of two paving-blocks laid on their longitudinal edges, each of said blocks having one plane face and provided on its opposite longitudinal face with two lugs located transversely to the length of the face from which they project, said lugs located in different vertical planes, said projections of less vertical length than the vertical height of the face on which they are located, the longitudinal plane face of one block and the longitudinal face that is provided with projections of the adjacent block located in proximity to each other, whereby an interstice is formed between adjacent faces of the two blocks, a portion of said interstice being located in the same vertical plane with each of said projections, substantially as set forth.

3. In a pavement, the combination of two paving-blocks laid on their longitudinal edges, each of said blocks having one plane face and provided on its opposite longitudinal face with two lugs located in different vertical planes, said projections of less vertical height than the vertical height of the face on which they are located, said block further provided on one of its end faces with a transverse recess extending across said end, the longitudinal plane face of one block and the longitudinal face that is provided with projections of the adjacent block located in proximity to each other, whereby an interstice is formed between adjacent faces of the two blocks, a portion of said interstice being located in the same vertical plane with each of said projections, substantially as set forth.

4. A paving-block provided on its longitudinal face with transverse lugs located near the opposite edges of said face and having a smooth face portion formed intermediate of them, said lugs of segmental form in cross-section, said block further provided on one of its end faces with a transverse recess extending across said end, the greater part of the body of said recess located below the transverse center of said block, substantially as set forth.

401,862. HOT-WATER HEATER.



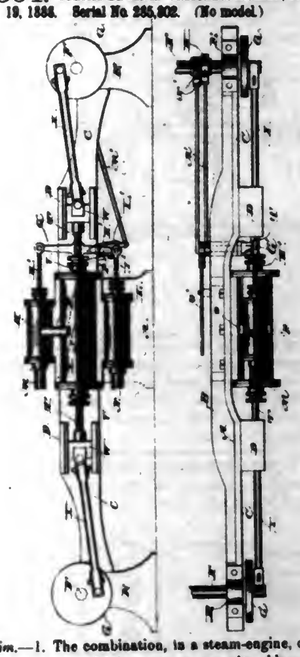
EDWIN MEDDEN and JOHN URQUHART, Sr., Seneca Falls, N. Y., assignors of one-half to Frank Walter and Charles R. Wessell, both of same place. Filed Apr. 5, 1888. Serial No. 269,743. (No model.)

Claim.—In a hot-water heater, the combination, with an exterior continuous water-compartment provided with inlet and outlet pipes, of interior diametrical water-compartments connected therewith and provided with concave or contracted lower ends, for the purpose described, said exterior and interior compartments forming complete fire-chambers, as and for the purpose set forth, and a grate disposed under the heater, substantially as described.

401,863. MACHINE FOR GRANULATING AND DRYING SUGAR.

LOUIS A. MOREL, Jr., Jeanerette, La. Filed Nov. 30, 1888. Serial No. 292,292. (No model.)

Claim.—1. In a machine for granulating and drying sugar, the combination of a horizontal fixed receptacle having an opening in its bottom, a rotary sieve operating in said receptacle, a fixed brush arranged above and in contact with the sieve, a sweep intermediate the sieve and bottom of the receptacle and fixed to the sieve-carrying shaft, and an air-blower arranged immediately below said receptacle to receive and dry the sugar after it leaves the sieve, substantially as and for the purpose described.



2. In a machine for granulating and drying sugar, the combination of a receptacle having an opening in its bottom, a rotary sieve, an air-blower below said receptacle, a conduit communicating with the blower, and a chute intermediate the receptacle and conduit for discharging the sugar in the conduit in the path of the blast or current generated by the blower, substantially as described.

3. In a machine for granulating and drying sugar, the combination of a receptacle having an opening in its bottom, a rotary sieve operating in said receptacle, a stationary brush arranged in contact with the sieve, a sweep fixed to and rotating with the sieve to force the sugar between the sieve and bottom of the receptacle into the opening in the latter, an air-blower beneath the receptacle, a conduit communicating with said blower, and a chute intermediate the receptacle and conduit, substantially as described.

4. In a machine for granulating and drying sugar, the combination of the following elements, to wit: a stationary receptacle having the openings in its bottom and a valve-plate for closing one of said openings, a rotary sieve carried by a shaft, the stiff brush fixed above the sieve, an elevator having an inclined discharge-chute terminating immediately above the sieve, a rotary blower, a conduit communicating with said blower, and the chutes depending from the receptacle, one of said chutes communicating with the blower-shell and the other with the conduit, all arranged and adapted for service substantially as described.

401,864. STEAM-ENGINE.

MATTHIAS MULLER, Trenton, Ill. Filed Sept. 19, 1888. Serial No. 285,802. (No model.)

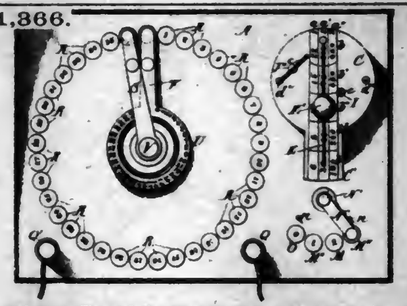
Claim.—1. The combination, in a steam-engine, of the cylinder having the exhaust and inlet ports on opposite sides communicating with its center and with its end, the steam-chest on one side of the cylinder, the exhaust-steam chamber on the opposite side thereof, the cut-off valve in the steam-chest, adapted to alternately register with the end and center steam-ports, the exhaust-valve in the exhaust-chamber, adapted to alternately register with the end and center exhaust-ports, and the lever Y, having its ends connected to the said valves, and means, substantially as specified, to operate the said lever, whereby the valves will be moved simultaneously in opposite directions, substantially as described.

2. The combination, in an engine, of the cylinder having the end and center steam and exhaust ports on opposite sides, the steam-chest on one side of the cylinder, the exhaust-steam chamber on the opposite side thereof, the cut-off and exhaust valves, the lever Y, having its ends connected to the said valves in the steam and exhaust chambers, respectively, and provided with the pin or stud K', the slotted link fulcrumed on said pin or stud, and the eccentric-rods connected to opposite ends of the said link, substantially as described.

3. In a steam-engine, the cylinder having the steam and exhaust ports or channels, each communicating with its center and ends, the steam and exhaust chambers, the cut-off and exhaust valves therein, respectively, the pistons in the cylinder having the piston-rods extending through opposite ends thereof, the independent crank-shafts, the pitman connecting the latter to the pistons, and connections, substantially as described, between the crank-shafts and the cut-off and exhaust valves, substantially as set forth.

4. In a steam-engine, the combination of the cylinder having the inlet steam-ports O P, communicating with its center and ends, respectively, and the exhaust-ports R S, also communicating, respectively, with its center and ends, the pistons in the cylinder, the steam-chest, the cut-off valve therein, having the port B', adapted to register alternately with the ports O P, the exhaust-chamber, and the exhaust-valve therein, having the ports E' F', adapted to register alternately with the ports R and S, respectively, for the purpose set forth, substantially as described.

401,865. ARTIFICIAL FUEL.



ALEXANDER K. MURRAY and CLARA M. MURRAY, Bradford, Pa. Filed Mar. 6, 1888. Serial No. 266,872. (No specimens.)

Claim.—In a fuel compound, the combination of crude petroleum, hay, straw, (or the specified equivalents,) and a hardening-mixture—such as water-lime or plaster-of-paris and water—with an illuminating coloring-matter, in the proportions substantially as set forth.

401,866. THERAPEUTIC ATTACHMENT FOR GALVANIC BATTERIES.

CHAUNCEY V. CHOCKE, Chicago, Ill., assignor to the McIntosh Battery and Optical Company, same place. Filed May 17, 1886. Serial No. 202,463. (No model.)

401,866.

Claim.—1. The rod E, adjustable weight E', verge-shaft *e*, and verge *f*, in combination with the verge-wheel F and a motive power for driving such wheel, strips *k k' k''*, pins *l*, strip *l'*, and pin *l''*, for making and breaking the contact at regular intervals, substantially as specified.

2. The rod E, adjustable weight E', verge-shaft *e*, and verge *f*, in combination with the verge-wheel F, pins *l*, strips *k*, and wire L, for making and breaking the circuit of the wire L, substantially as and for the purpose specified.

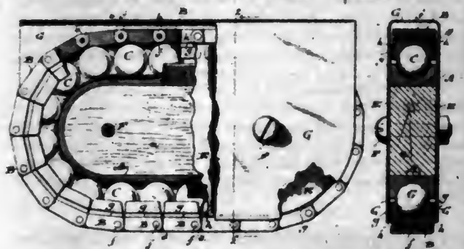
3. The rod E, adjustable weight E', verge-shaft *e*, and verge *f*, in combination with the verge-wheel F, strip *l'*, strip *k'*, and wire L', for making and breaking the circuit of the wire L', substantially as and for the purpose specified.

4. The rod E, adjustable weight E', verge-shaft *e*, and verge *f*, in combination with the verge-wheel F, pin *l''*, strip *k''*, and wire L'', for making and breaking the circuit of the wire L'', substantially as and for the purpose specified.

5. The rod E, adjustable weight E', verge-shaft *e*, verge *f*, and verge-wheel F, in combination with the support K, wires L L' L'', strips *k k' k''*, pins *l*, strip *l'*, and pin *l''*, for making and breaking the circuits of the wires, substantially as and for the purpose specified.

6. The rod E, adjustable weight E', shaft *e*, verge *f*, and verge-wheel F, in combination with the support K, wires L L' L'', strips *k k' k''*, pins *l*, strip *l'*, pin *l''*, buttons *m m' m''*, and switch-lever N, for selecting the wire and making and breaking the circuit thereof, substantially as and for the purpose specified.

7. The combination, with a weighted rod and a rock-shaft, of a graduated scale, circuit-wires, and a switch-lever for throwing into circuit any one of several contact-springs having different rates of rupture, substantially as specified.



8. The combination, with a rheotome, of a weighted vibratory rod, E, having an adjustable weight, E', and a scale over which said rod and weight vibrate, said scale indicating the several variations in the make and break of the circuit selected in accordance with the adjustment of the weight, substantially as described.

9. The rod E, adjustable weight E', shaft *e*, verge *f*, verge-wheel F, and a motive power therefor, support K, wires L L' L'', strips *k k' k''*, pins *l*, strip *l'*, and pin *l''*, in combination with the buttons M M' M'', switch-lever N, and a graduated scale coacting with the weight of the vibrating rod for selecting and indicating the circuit and denoting upon said scale the breaks thereof with relation to the adjustable weight E', substantially as specified.

10. A series of buttons arranged in a circle, in combination with the levers S T and indicator U, mounted upon the central pivot carrying said levers S and T, for selecting and determining the cells in use, substantially as specified.

401,867. VEHICLE-RUNNER.

CHARLES L. PIERCE, Milwaukee, Wis. Filed Aug. 3, 1888. Serial No. 281,853. (No model.)

Claim.—The combination of a central stationary bearing, a moving track or runner consisting of a series of sliding blocks surrounding said bearing, and a series of loose independent balls or rolls confined between the central bearing and the moving track.

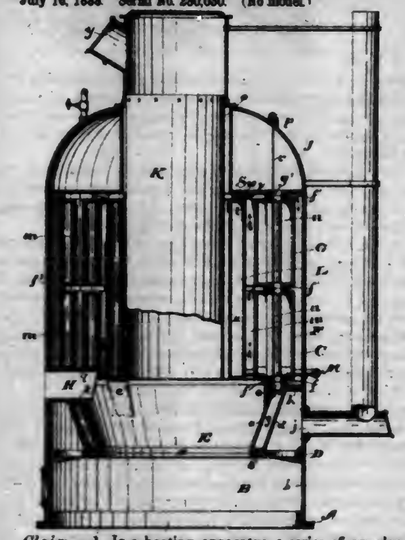
401,868. LIFTING-JACK.

WILLIAM M. PIPER, Allegheny, Pa. Filed July 24, 1888. Serial No. 280,574. (No model.)

Claim.—1. The combination, with a bottom piece and vertically-movable top piece, the distance between said pieces being greatest at their central point and decreasing toward their ends, of interposed wedges and a screw-shaft having right and left threads which engage the said wedges, substantially as and for the purposes described.

2. The combination, with a bottom piece and a vertically-movable top piece, the distance between said pieces decreasing from the central point toward the ends, of interposed wedges and a screw-shaft having right and left threads which engage the said wedges, said bottom piece having inclined sunken ways in which said wedges travel, substantially as and for the purposes described.

3. The combination, with a bottom piece and a vertically-movable top piece, of interposed wedges, a screw-shaft having right and left threads which engage the said wedges, and said top piece having vertical guide-flanges which fit against the bottom piece, substantially as and for the purposes described.



4. The combination, with a bottom piece and a vertically-movable top piece, of interposed wedges, a screw-shaft having right and left threads which engage the said wedges, and said top piece having vertical guide-flanges which fit against the bottom piece, and which are provided with vertical elongated slots through which the screw shaft passes, substantially as and for the purposes described.

5. The combination, with a bottom piece and a vertically-movable top piece, of interposed wedges, a screw-shaft having right and left threads which engage the said wedges, and projections on the said wedges which fit in inclined guides on the top piece, whereby the motion of the wedges is caused to impart a simultaneous vertical and lateral motion to the top piece, substantially as and for the purposes described.

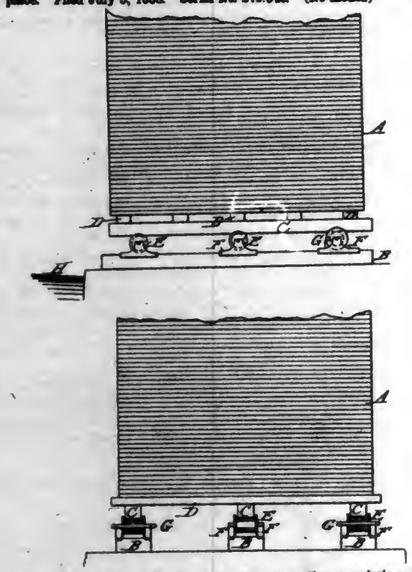
6. The combination, with a bottom piece and a vertically-movable top piece, of interposed wedges and a screw-shaft having right and left threads which engage the said wedges, said top piece having vertical guide-flanges fitting in corresponding guide-recesses in the bottom piece, substantially as and for the purposes described.

401,869. BOILER.

EMANUEL W. POORMAN, Canton, Ohio. Filed July 16, 1888. Serial No. 280,080. (No model.)

Claim.—1. In a heating apparatus, a series of annular hollow water-sections placed one upon another, spaced apart and having a series of communicating apertures, a cylinder, L, and a passage for the water between the said annular water-sections and the cylinder L, substantially as set forth.

2. In a heating apparatus, a series of annular tubular water-sec-



tions placed one upon another and spaced apart by spacing-necks formed about a series of communicating apertures, and a bottom section, as E, having outwardly and upwardly inclined walls *c d*, a flange, *h*, and a series of perforations forming a communication between the tube *g* and the inner portion of the adjacent section, substantially as described, and for the purpose set forth.

3. The combination, in a heating apparatus, of the tubular conical fire-box E, a series of annular tubular sections placed in vertical order and spaced apart to form flues between said sections, a series of vertical corresponding flues centrally located in said sections, a dome supported by and having apertures communicating with said sections, and a depending hollow cylinder communicating with said dome, substantially as described, and for the purpose set forth.

4. The combination, in a heating apparatus, of the tubular section E, having the outwardly and upwardly inclined walls *c d*, sections F and G, dome J, depending cylinder L, and fuel-magazine K, substantially as described, and for the purpose set forth.

401,370. DEVICE FOR LAUNCHING LUMBER-PILES.

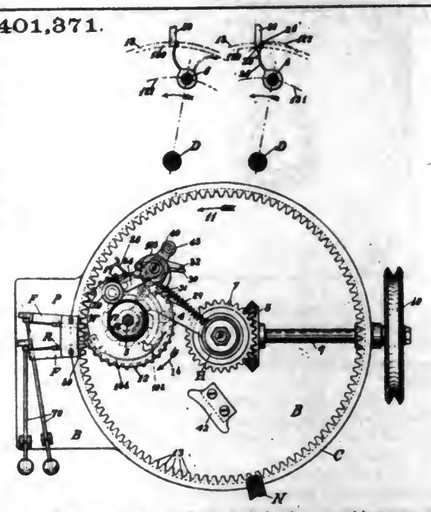
HARRISON ROSE, Muskegon, Mich., assignor of one-half to Edwin Rich, same place. Filed July 5, 1883. Serial No. 279,040. (No model.)

Claim.—1. A device for launching lumber-piles, consisting of a series of inclined rollers adapted to support the lumber-pile, and means, consisting of a bar, for locking and unlocking certain of these rollers, so that the lumber-pile may be caused to move when desired, substantially as described.

2. In a device for launching lumber-piles, the inclined bed, the series of rollers located thereon, certain of which are grooved and held by a locking-bar so as not to rotate, and a lumber-supporting frame arranged upon the rollers, substantially as described.

3. In a device for launching lumber-piles, the combination of the beams B B B, each carrying a series of rollers, E E E, journaled in brackets F F F, the beams C C, carried by the rollers, and the transverse beams D D, located on the beams C, substantially as described.

4. In a device for launching lumber-piles, the combination of the beams B, carrying rollers E, journaled in brackets F, the rearmost roller adapted to be locked against rotation by the bar G, the timbers C C, and the transverse timbers D D, substantially as described.



401,371. MECHANICAL MOVEMENT.

FRANCIS H. RICHARDS, Springfield, Mass., assignor to Darien W. Dodson, Wilkes-Barré, Pa. Filed Nov. 15, 1886. Renewed May 2, 1888. Serial No. 273,531. (No model.)

Claim.—1. The combination of a frictionally-mounted wheel having an orbital movement, a detent apparatus carried with said wheel and acting to restrain the axial rotation thereof, said apparatus having a starting-arm, substantially as described, and a latch adapted to be interposed in the path of said arm to unset said apparatus and thereby allow the starting of said wheel, all substantially as described.

2. The combination of a revolving shaft having an orbital movement, a wheel frictionally mounted on said shaft and having thereon a stop, a stop-arm carried by said wheel and acting against the stop thereof to restrain the axial rotation thereof, and mechanism operating to unset and reset said arm, all substantially as described.

401,371.

3. The combination, with a shaft having an orbital movement and having a starting-arm, of a latch adapted to be interposed in the path of said arm, said latch being normally held back in a state of tension, and constructed and arranged to have, on being released, a free and instantaneous movement in said path, all substantially as described.

4. The combination of a shaft having an orbital movement and having thereon the starting-arm, and a latch having a movement crosswise to said orbital movement and adapted to be interposed in the path of and to engage with said arm, the arm being constructed to push back the latch, and the latch to turn the arm and shaft, substantially as described.

5. The combination of the reciprocating latch 50, having thereon the spring-catch operating to hold back said latch, and a tripping-rod operating in connection with an incline to unhook said catch, all arranged and operating substantially as shown and described.

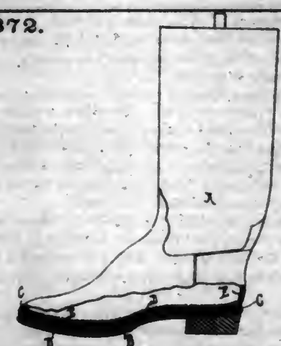
6. The combination of the reciprocating latch, a spring-catch for holding back said latch, and vertically-movable tripping-rod operating in connection with an incline to unhook said catch, the upper end of said rod having a movement in crosswise directions, all substantially as and for the purpose described.

7. The combination of a reciprocating latch having a longitudinal and a lateral movement, and a tripping-rod also having a longitudinal and a lateral movement, the longitudinal movement of the one being crosswise to the longitudinal movement of the other, substantially as and for the purpose described.

8. The combination, with the frame, as F, having a bearing for a reciprocating latch, incline 66, and notch 58, of a reciprocating latch having spring 56 and hook 57, and tripping-rod 60, all operating substantially as described.

9. The combination, in a mechanical movement of the class described, of a shaft having an orbital motion about an axis, and having thereon a starting-arm and a resetting-arm, a latch mechanism acting on said arm to turn said shaft in one direction, and a resetting-cam acting on said resetting-arm to afterward turn said shaft in the reverse direction during said orbital motion, substantially as described.

10. The combination, with a shaft having an orbital movement and adapted to have a turning movement about its own axis during its orbital movement, of a starting-arm fixed on said shaft and having the two points 26′ and 26″, and a latch interposable in the path of the first point and taking its bearing in a concavity between the two points, substantially as and for the purpose described

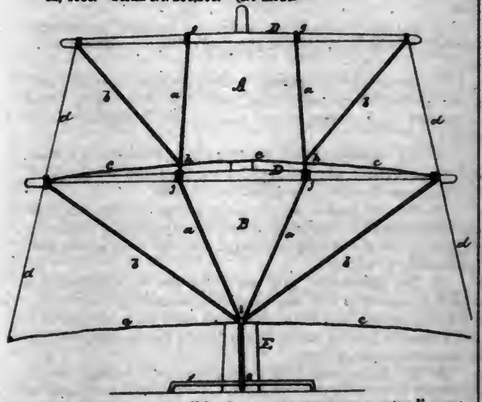


11. The combination, with a revolving shaft having the notched flange 15, of wheel W, frictionally mounted thereon and carrying a hooked lever, and a detent apparatus operating to restrain the rotary movement of said wheel and having cam 105, said apparatus and cam being operated to release the wheel and to permit the engagement of the hook with said flange, all substantially as and for the purpose described.

401,372. PROTECTIVE SOLE FOR RUBBER FOOT-WEAR.

TIMOTHY REGAN, New York, assignor of one-half to William V. Ross, Brooklyn, N. Y. Filed May 11, 1888. Serial No. 273,545. (No model.)

Claim.—As an improved article of manufacture, a rubber boot having a sole comprising a superposed layer of felt, an interposed sheet of metal, and an under layer composed of two sheets of rubber,

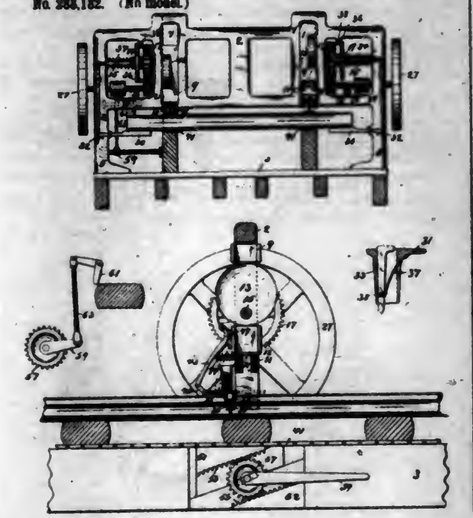


401,372.

the upper layer being soft and the lower hard, substantially as described.

401,373. SHIP'S SAIL.

JOHN ROBERTS, Boston, Mass. Filed Jan. 12, 1888. Serial No. 296,209. (No model.)



Claim.—1. A ship's sail having one or more ropes extending vertically midway across the same, secured to the sail and to the yards or gaff and boom, substantially as described.

2. A ship's sail having one or more ropes extending vertically midway across the same, secured to said sail and to the yards or gaff and boom, and a rope also secured to the sail extending from the top outer corner of the sail to the foot of the vertical rope, substantially as described.

401,374. RAIL-SPIKING MACHINE.

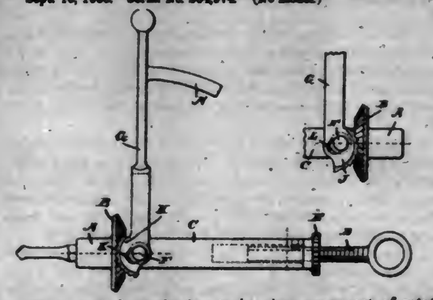
SOLOMON W. ROBERTS and EDWARD P. CALDWELL, Minneapolis, Minn. Filed Oct. 15, 1883. Serial No. 288,182. (No model.)

Claim.—1. The combination, in a machine of the class described, with the sliding plate 31, provided with the spike-holders 33, of the reciprocating plunger 9, provided with the drivers 11, adapted to enter said spike-holders and push the spikes through said holders, substantially as described.

2. The combination, in a machine of the class described, with the sliding plate 31, of the depending spike-holders 33, secured upon said plate and adapted to receive spikes from a suitable receptacle, the springs 35 and 37, arranged upon the inner side of the said spike-holders, the reciprocating plunger 9, provided with the drivers 11, adapted to enter said spike-holders, and the driving-shaft 15, provided with the eccentric 13, engaging said plunger, whereby said shaft is rotated and said plunger is raised and lowered, all substantially as described.

3. The combination, in a machine of the class described, with the reciprocating plunger 9, provided with the spike-drivers 11, of the driving-shaft 15, provided with the eccentric 13, engaging said plunger, the clutch mechanism upon said shaft, and the releasing-treadle 30, adapted to be engaged by a moving tie releasing said clutch mechanism when the tie passes beneath the plunger, for the purpose specified.

4. The combination, in a machine of the class described, with the reciprocating plunger 9, of the laterally-adjustable spike-drivers 11, secured upon the bottom of said plunger and adapted to be moved from or toward each other, substantially as described.



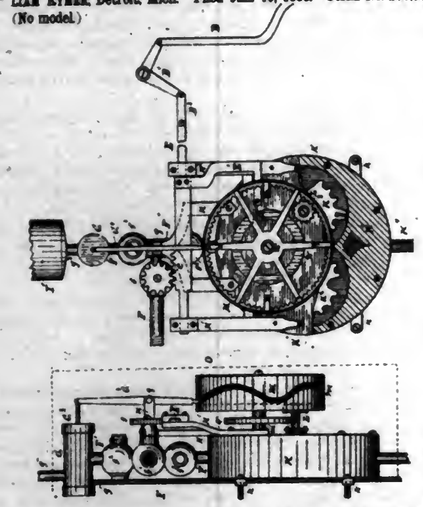
5. The combination, in a machine of the class described, with the sliding plate 31, provided with the spike-holders, of the vertically-reciprocating plunger provided with the spike-drivers 11, and the inclined support 51, arranged beneath said plunger, substantially as described.

6. The combination, in a machine of the class described, with the sliding plate 31, provided with the spike-holders 33, of the vertically-reciprocating plunger 9, provided with the spike-drivers 11, the block 52, provided with the inclined upper surface, the block 51, provided with the inclined lower surface resting upon said block 52, and means for moving said block 51 upon said block 52, for the purpose specified.

7. The combination, in a machine of the class described, with the sliding plate 31, provided with the spike-holders 33, of the vertically-reciprocating plunger 9, provided with the spike-drivers 11, the block 52, provided with the inclined upper surface, the block 51, provided with the inclined lower surface resting upon said block 52, the rack-bars 53 and 55, upon said blocks, a pinion, 57, engaging said rack-bar, the bell-cranked lever 61, adapted to be engaged by a moving tie, the lever 59, connected with said pinion, and the rod 63, connecting said bell-crank lever with said lever 59, all substantially as described.

401,375. RATCHET-DRILL.

WINFIELD S. ROGERS and WILLIS C. JOURS, Cincinnati, Ohio, assignors to P. G. March, same place. Filed Sept. 10, 1888. Serial No. 284,974. (No model.)



Claim.—1. In mechanism to be given movement of rotation through the medium of an oscillating lever, the combination, substantially as set forth, of a rotatory disk having a bevel-face provided with ratchet-form teeth, a pair of trunnions or pivots arranged with their axes in the plane of and at right angles to the axis of rotation of said disk, a bifurcated lever fitted to oscillate on said pivots and engage the same by diagonally-slotted pivot-bearings, and segments at the pivot portions of said lever provided with ratchet-form teeth adapted to engage the teeth of said disk upon opposite sides of its axis.

2. In a ratchet-drill, the combination, substantially as set forth, of stock C, provided with trunnions F, drill-socket A, journaled axially in the front end thereof, bevel-disk B upon the drill-socket and provided upon its bevel-face with ratchet-form teeth, bifurcated hand-lever G, engaging said trunnions by slot-bearings K and L, and segments H and J upon said hand-lever and provided with ratchet-form teeth adapted to engage the teeth of disk B.

3. In a ratchet-drill, the combination, substantially as set forth, of a stock, a drill-socket journaled axially therein, a hand-lever connected with said stock by a pivot of oscillation having its axis at right

angles to the axis of said stock, means for transmitting motion from said hand-lever to said drill-socket, a pawl projecting from said hand-lever in the direction of its motion of oscillation, and feed mechanism connected with said stock and provided with a feed-ratchet arranged with its axis coincident with the axis of the stock and in position to have its teeth engaged by said pawl.

401,376. AUTOMATIC RAILWAY-ALARM APPARATUS. WILLIAM RYNER, Detroit, Mich. Filed Jan. 10, 1888. Serial No. 260,335. (No model.)

Claim.—1. The combination, with a whistle and a piston-cylinder in connection with the whistle, of a piston within the cylinder to control the blast in pipes leading from a common power-supply to the piston-cylinder and to the whistle, whereby the piston is actuated by the same power that blows the whistle, the valve in the supply-pipe, and a reciprocating bar connected with the valve for operating it and having an irregular intermittent movement, substantially as set forth.

2. The combination, with a whistle and a piston-cylinder in connection with the whistle, of a piston within the cylinder to control the blast of the whistle, a rotary mechanism in connection with the piston to determine the length of the blast, and an actuating medium common to both rotary mechanism and whistle, substantially as set forth.

3. The combination, with a whistle and a piston-cylinder in connection therewith provided with an inlet-opening, of a piston within the cylinder to control the blast, a rotary mechanism for operating the piston, and a valve to admit the whistle-actuating medium to the cylinder and to the piston-actuating mechanism, substantially as set forth.

4. The combination, with a whistle and a piston-cylinder in connection therewith provided with an inlet-opening, of a piston within the cylinder to control the blast, a rotary mechanism to operate the piston, a valve to control the admission of the whistle-actuating medium to both the cylinder and the rotary mechanism, and means for operating the valve intermittently, substantially as set forth.

5. The combination, with a whistle, of a piston-cylinder, an inlet-pipe, and connecting-pipe F, said inlet-pipe provided with a controlling-valve and said connecting-pipe with a regulating-valve, the piston-cylinder and the whistle being each connected with a common power-supply, substantially as described.

6. In combination, a piston-cylinder, a piston, a rotary mechanism to operate the piston, a pipe connecting the piston-cylinder and rotary mechanism, a supply-pipe in connection with the connecting-pipe, and a valve in the supply-pipe to control the admission of the whistle-actuating medium to both cylinder and rotary mechanism, substantially as set forth.

7. The combination of the piston-cylinder and rotary mechanism united by a connecting-pipe, an inlet-pipe communicating with said connecting-pipe, a controlling-valve located in the inlet-pipe, and valves f^2 f^3, located in the connecting-pipe, substantially as described.

8. The combination of a whistle, a cylinder, a power-conducting supply-pipe connecting said cylinder with the whistle, a piston within the cylinder to control the whistle, and a rotatable cam to control the movements of the piston, substantially as set forth.

9. The combination, with the piston and its cylinder, of a rotatable cam-cylinder to control said piston and a locking device to dog said cam-cylinder, substantially as described.

10. The combination of the whistle, a cylinder in connection therewith, a piston within the cylinder to control the blast, a lever to control the operation of the piston, and rotary mechanism to actuate said lever, substantially as set forth.

11. In combination, a whistle, a cylinder in connection therewith, a piston within the cylinder to control the whistle, a supply-pipe in communication with the whistle, a supply-pipe in communication with the cylinder, the pipes from the whistle and cylinder each leading to a common power-supply, a valve in the supply-pipe, a reciprocating bar to operate the valve, and a fixed tripping device for the purpose of operating the said bar, substantially as set forth.

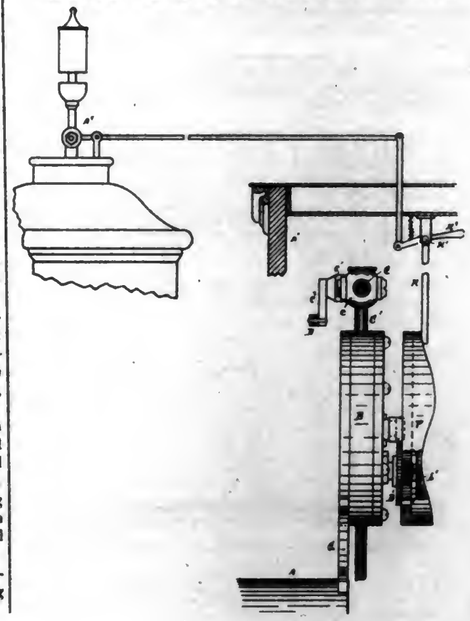
12. In combination, the whistle, the cylinder in connection therewith, the piston to control the whistle, the inlet-pipe in connection with the cylinder, the valve provided with a pinion, and a reciprocating rack-bar meshing with the pinion to operate the valve, substantially as set forth.

13. In combination, the cylinder, the piston, the inlet-pipe, the controlling-valve, the bar C, to operate the valve, and a fixed tripping device for the purpose of operating said bar, substantially as set forth.

14. In combination, a rotary mechanism, a pipe to admit the actuating medium to the rotary mechanism, a cylinder provided with a cam and driven by the rotary mechanism, a cylinder, and a piston in the cylinder, the said piston driven by the cam, substantially as set forth.

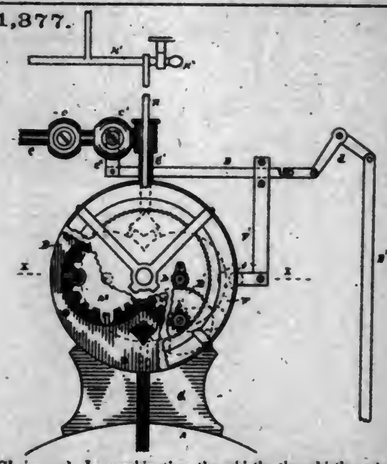
15. In a whistle-actuating mechanism, a rotatable cam-cylinder having in combination therewith a locking device, substantially as set forth.

16. The combination, with the rotary mechanism, of an inlet-pipe, a cam-cylinder driven by said rotary mechanism, and a locking device to regulate the movement of said cam-cylinder, substantially as set forth.



17. The combination, with the piston and its cylinder, of a rotatable cam-cylinder to operate the piston, a locking-disk, and a locking-arm to engage the disk, substantially as set forth.

18. The combination, with the piston and its cylinder, of a rotatable cam-cylinder to operate the piston, a locking-disk, a reciprocating bar, E, and a locking-arm engaged with the reciprocating bar, substantially as set forth.



19. The combination, with the piston and its cylinder and a whistle in connection with said cylinder, of the inlet-pipe, controlling-valve, reciprocatory bar E, to operate the valve, reciprocating rod D and a retracting-spring, and stationary means for operating said rod D, substantially as set forth.

20. The combination, with a locomotive, of a movable bar, C, connected with a reciprocatory bar, E, and valve f', located in an inlet-pipe to control the admission of steam to a locomotive-whistle, substantially as described.

401,377. WHISTLE-ACTUATING MECHANISM. WILLIAM RYNER, Detroit, Mich. Filed Oct. 29, 1888. Serial No. 289,375. (No model.)

401,377.

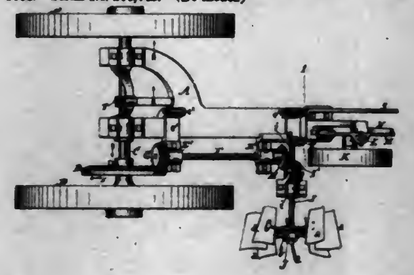
Claim.—1. In combination, the whistle, the whistle-actuating lever, a movable cam to operate the lever, a power-supply pipe to communicate power to drive the cam, said pipe provided with a controlling-valve, and automatic tripping mechanism to throw the said valve, substantially as set forth.

2. In combination, the whistle, the whistle-actuating lever, a movable cam to operate the lever, a power-supply pipe to communicate power to drive the cam, said pipe provided with a controlling-valve, and a reciprocatory tripping-bar to throw said valve, substantially as set forth.

3. In combination, the whistle, the whistle-actuating lever, a movable cam to operate the lever, a power-supply pipe provided with a controlling-valve to communicate power to drive the cam, and tripping mechanism to throw said valve, substantially as set forth.

4. In combination, the whistle, the whistle-actuating lever, a rotary cam, rotary mechanism to actuate the cam, and a power-supply pipe communicating with the rotary mechanism provided with a controlling-valve, substantially as set forth.

5. In combination, the whistle, the whistle-actuating lever, a rotary cam, rotary mechanism to operate said cam, a power-supply pipe communicating with said rotary mechanism, said pipe provided with a controlling-valve, and a reciprocatory bar engaged with said valve, substantially as set forth.



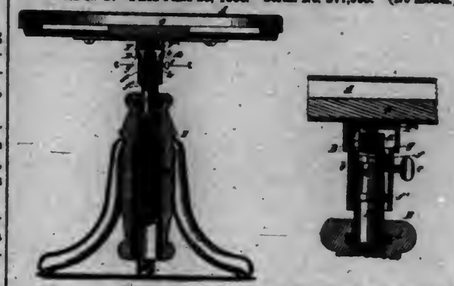
6. In combination, a whistle, an actuating-lever, a rotary mechanism, a cylinder provided with a cam driven by said rotary mechanism to actuate said lever, and an inlet-pipe to admit the power-supply to the rotary mechanism, said pipe provided with a controlling-valve, substantially as set forth.

7. In combination, the whistle, the rotary cam, a lever connecting the whistle with said cam, rotary mechanism to drive said cam, and an inlet-pipe communicating with the rotary mechanism, said pipe provided with a regulating-valve and a controlling-valve, substantially as set forth.

8. In combination, the whistle, the rotary cam, a whistle-actuating lever connecting the whistle with said rotary cam, and a locking device, substantially as set forth.

9. In combination, a rotary mechanism provided with a supply-pipe and controlling-valve, a rotatable cam geared with rotary mechanism, a locking device to hold the cam, a whistle, and a whistle-actuating lever connecting the rotary cam and whistle, substantially as set forth.

401,878. WEEDING-MACHINE. AMBROSE L. SADDLEMYER, Knox, N. Y., assignor of one-half to Alvinus Gray, same place. Filed Mar. 29, 1888. Serial No. 268,743. (No model.)

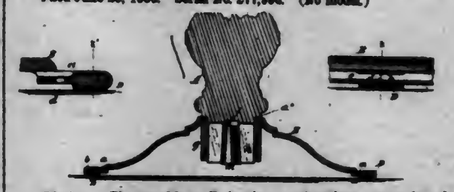


Claim.—1. The combination, with the longitudinal shaft F, inclined forwardly and downwardly and actuated by gears, pinion H, secured to said shaft, shaft I, provided with gear I', set at an angle with shaft F and inclining outwardly and upwardly, of the adjustably-secured hub *b* on shaft I, and the series of blades or cutters *a a*, arranged relatively oblique to the direction of the axis of hub *b*, with their cutting-edges inclined relatively inwardly and toward shaft I, substantially as and for the purposes set forth.

2. The combination, with the gear D, revolved by the drive-wheel, shaft F, provided with pinions G and H, of the shaft I, provided with pinion I', and set at an angle to the inclined shaft F and inclined upwardly and outwardly from the axis of pinion I', and the series of cutters or blades connected with the central hub, *b*, adjustably secured to shaft I and having their cutting-edges made from one side edge to the other inclined in relation to the axis of said shaft, substantially as and for the purposes set forth.

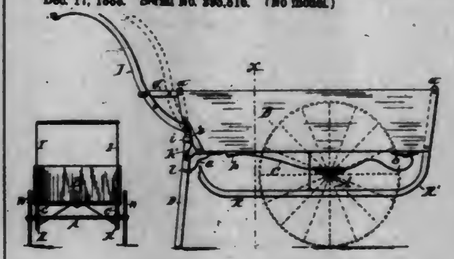
3. The combination, with the frame A, mounted on drive-wheels, and the gear mechanism described, of the hinged brackets having within them the bearings E E', the supplemental bearings *e*, and the shaft of the revolving hoe, substantially as and for the purposes set forth.

401,879. STORE STOOL OR CHAIR. JACOB S. SAMMONS, New York, N. Y. Filed June 23, 1888. Serial No. 277,996. (No model.)



Claim.—1. The screw-rod E, having bearing *d* at its upper end and the notch *h* on its side, combined with the socket *b*, having pin *c*, and with the movable bearing F, spring G, and swivel-seat A, secured to socket *b*, substantially as described.

2. The screw-rod E, having oil-cup D, bearing *d* in said oil-cup, and notch *h*, combined with the socket *b*, pin *c*, movable bearing F, and spring G, within the socket *b*, all arranged substantially as described.



3. The pedestal B, having nut *a* and packing *i*, screw-rod E, bearing *d*, and notch *h* on said rod E, in combination with the seat A, socket *b*, pin *c*, movable bearing F, and spring G, all arranged for operation, substantially as herein shown and described.

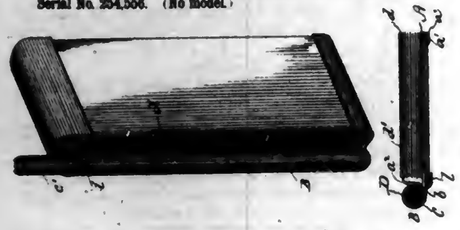
401,880. STORE-STOOL. JACOB S. SAMMONS, New York, N. Y. Filed June 23, 1888. Serial No. 277,996. (No model.)

Claim.—The stool-base B, having perforations *a* near its edge, combined with the binding-strips D, that are lapped over the edge of the base near said perforations, the ends of said binding-strips being secured by fastenings that pass through said perforations, substantially as described.

401,881. HAND-CART. AUGUST SCHUBERT, Oneida, N. Y. Filed Dec. 17, 1888. Serial No. 293,816. (No model.)

Claim.—1. The combination of the runners curved upward at both ends and integral with the posts *a a*, the sides and ends of the body attached to said posts, springs detachably connected to the body, an axle attached to said springs, and wheels mounted on said axle, substantially as described and shown.

2. In combination with the body B and axle A, shoes attached to the body, and the longitudinal springs C C, secured intermediate of their ends to the axle and having their ends removably inserted into the aforesaid shoes, substantially as set forth.



3. In combination with the body B and axle A, the shoe *b*, secured to the body near one end thereof and provided with the recess *b'*, the shoe *c*, secured to the body near the opposite end thereof and consisting of the base-plate *c'*, formed with the loop *d*, and the side springs, C, having one end inserted into the recess *b'* of the shoe *b* and the opposite end curved upward and backward and passing through the loop *d* and detachably confined therein, as set forth.

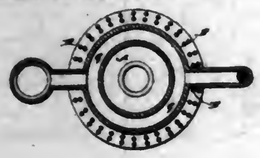
4. In combination with the body B and axle A, the shoe *b*, secured to the body near one end thereof and provided with the recess *b'*, the shoe *c*, secured to the body near the opposite end thereof and consisting of the base-plate *c'*, formed with the loop *d*, transverse slot *c''*, and side slots, *d'*, the side springs, C, having one end inserted into the recess *b'* and the opposite end curved upward and backward and terminated with the hook *f* and passing through the loop *d* and hooked into the slot *c''*, and the key *e*, inserted into the slots *d'*, substantially as described and shown.

5. In combination with the body, the handles I, hinged thereon and perforated at different points in their length, and the stays *g*, hinged on the body and perforated at intervals of their lengths, and bolts or pins passing through the perforations of the stays and handles, substantially as described and shown.

6. In combination with the cart-body, the bracket *h*, formed with ears *h' h'*, the leg D, hinged on said ears, the sleeve *i*, sliding on the bracket and over the upper end of the leg, and the catch *n*, secured to the body and adapted to engage said leg below its hinge, substantially as described and shown.

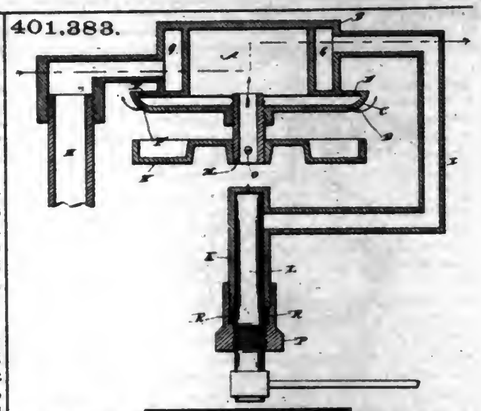
401,382. CARBON-PAPER ATTACHMENT FOR RECEIPT OR NOTE BOOKS. HORACE C. SEELY, Philadelphia, Pa. Filed Nov. 7, 1887. Serial No. 254,566. (No model.)

Claim.—1. In combination with a book or pad, the attachable and detachable plate A, having fastening-clips, a cylinder, B, a roller, C, having handle *c'*, mounted on said cylinder, and a roll of carbonized paper on said roller, substantially as set forth.



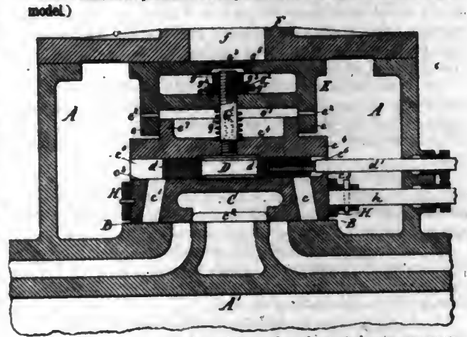
2. A plate, A, having fastening-clips *a' l*, slotted cylinder B, a roller, C, having handle *c'*, mounted on said cylinder, and a roll of carbonized paper on said roller, substantially as set forth.

3. A plate, A, having integral fastening-clips *a' l* and slotted cylinder B', and roller C, having handle *c'*, mounted on said cylinder, substantially as set forth.



4. A plate, A, having fastening-clips *a' l*, slotted cylinder B, one end of which projects beyond the adjacent end of said plate, and roller C, having handle *c'*, mounted on said cylinder, substantially as set forth.

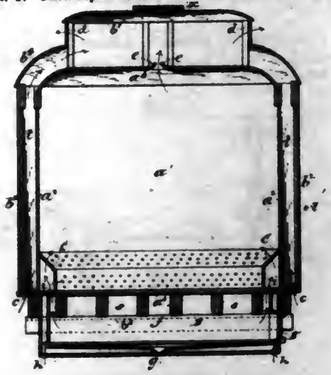
401,383. VAPOR-BURNER. CHARLES H. SHULTS, St. Joseph, Mo. Filed May 16, 1887. Serial No. 238,342. (No model.)



Claim.—The burner A, having the annular vaporizing-chamber G on its outer side and closed at the top, the lower side of the burner being extended laterally at the bottom beyond the outer side of the vaporizing-chamber to form a hollow projecting portion or offset, C, said offset or hollow portion being provided with the openings E in its upper side, which openings are inclined inwardly, and the mixing-tube entering the bottom of the burner, as set forth.

401,383.

401,384. BALANCED SLIDE AND CUT-OFF VALVE. WILLIAM SIMPKIN, Richmond, Va., assignor to the Richmond Locomotive and Machine Works, same place. Filed Sept. 14, 1888. Serial No. 285,376. (No model.)



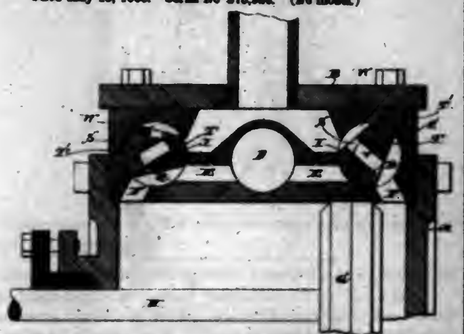
Claim.—1. In combination with a valve-chest, A, having an opening, *f*, in its cover, the slide-valve C, having supply and exhaust ports, rimmed pressure-plate c^4 c^5, balance-plate E, having aperture e^3, closing-plug e^2, diaphragm e', and rim *e*, bolt G, nut *g*, spring *g'*, and cut-off valve D, substantially as and for the purpose set forth.

2. The combination, with a valve-chest, A, of the described main slide-valve C, pressure-plate c^4, the balance-plate E, and the bolt G, having spring *g'*, the nut *g*, having shoulder g^3, the washer g^5, having dowel-pin g^4, and set-screw g^2, substantially as and for the purpose set forth.

3. The combination, with a valve-chest, A, of the described slide-valve C, the described balance-plate E, having aperture e^3, closing-plug e^2, and the described bolt G, having nut g^3, substantially as and for the purpose set forth.

4. In combination with a valve-chest, A, of the slide-valve C, having supply and exhaust ports, rimmed pressure-plates c^4 c^5, balance-plate E, having diaphragm e' and perforated rim e e^3, bolt G, nut *g*, spring *g'*, and cut-off valve D, substantially as described.

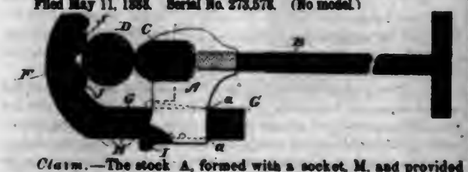
401,385. REFRIGERATOR-CAR. WILLIAM H. H. SIBUM, Brooklyn, N. Y. Filed Sept. 19, 1888. Serial No. 285,790. (No model.)



401,385.

Claim.—In a refrigerator-car, the combination, with the car-body, comprising double side and end walls secured to stanchions and a double roof, of vertical air-passages formed by the stanchions and double side and end walls and the double walls of the roof, said passages opening to the outside atmosphere at the bottom of the car and having an outlet through the roof, a floor for the car, consisting of two courses, an ice-box arranged beneath the floor and having air communication between said courses and through openings in the upper course with the interior of the car, deflectors over said openings, and hinged valves in the inner wall of the roof, substantially as specified.

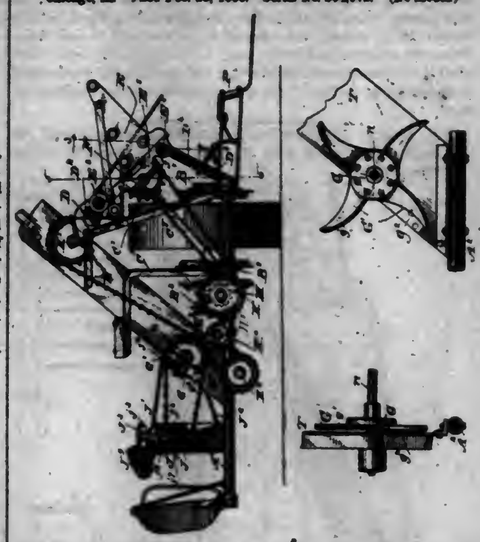
401,386. STEAM-ENGINE. CHARLES A. SMITH, Dresden, N. Y. Filed May 15, 1888. Serial No. 273,926. (No model.)



Claim.—1. The combination, in a steam-engine, of the cylinder having the exhaust-opening D, the channels E, and ports F, with the steam-chest having the recesses C, communicating with the said ports and channels and with the interior of the chest, and the oscillating valves arranged in the recesses C and having the channels S R, for the purpose set forth, substantially as described.

2. The combination, in a steam-engine, of the cylinder having the steam-chest, the recesses C and the inlet and exhaust ports communicating therewith, and the oscillating valves I, arranged in the recesses C and having the converging channels W R on opposite sides, and the transverse channels S, connecting the same, substantially as described.

3. The combination, in a steam-engine, of the cylinder having the steam-chest, the recesses C and the inlet and exhaust ports communicating therewith, the oscillating valves I, arranged in the recesses C and having the converging channels W R on opposite sides, and the transverse channels S, connecting the same, and the arms X, attached to the valves, and the link connecting said arms, whereby the valves are caused to operate in unison, substantially as described.



4. In a steam-engine, the combination of the valves I, having the central longitudinal bores, the transverse channels S, and the conveying-channels W R on opposite sides, communicating with channels S, the valves T, arranged in the bores of valves I and having the transverse channels V, means, substantially as set forth, to oscillate the valves I, the governor and connections between the same, and the valves T, substantially as described.

401,387. PIPE-CUTTER. VERNON R. STEVENS, Bridgeport, Conn. Filed May 11, 1888. Serial No. 273,578. (No model.)

Claim.—The stock A, formed with a socket, M, and provided with the block C and adjustable handle B, and formed with the passage E, the outer wall thereof being parallel with the handle B, and provided with a pin, I, the opposite wall being inclined, in combination with the curved jaw F G, provided with rotating cutters J and formed with a series of sockets, H, the block C being provided with a rotating cutter, D, substantially as described.

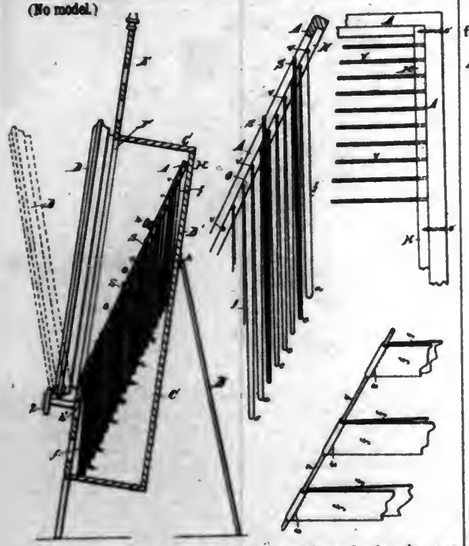
401,388. CORN-HARVESTING MACHINE. JOHN F. STEWARD, Chicago, Ill. Filed Feb. 23, 1888. Serial No. 264,972. (No model.)

Claim.—1. In a corn-harvester, in combination with conveying mechanism which includes an endless belt operating transversely with respect to the stalks, a case in which such endless belt travels and into which it is adapted to convey the stalks, the rear or head end of such case being armed with a metal edge at the entrance of the case, and a cutter fixed on the shaft of such endless belt and operating past such metal edge at the entrance of the case to sever the portion of the heads of the stalks which protrude beyond such cutter to permit them to enter the case, substantially as set forth.

2. In a corn-harvester, in combination with conveying mechanism which includes an endless belt operating transversely with respect to the stalks, and a case in which such belt travels and into which it is adapted to carry the stalks, such case having its rear or head end formed of thin metal plate or sheet, a cutter fixed on the shaft of the driving-roll of such conveyer rearward of the rear or head end of the case and operating past the edge thereof and co-operating with said edge to sever the protruding portion of the heads of the stalks to permit the stalks to enter the case, substantially as set forth.

3. In combination with the main frame and the binder-frame sustained and movable back and forward thereon, the main frame having slide-bearings for the binder-frame, which comprises the gear standard or bracket and has slide-bars, which are held in such gearing standard or bracket and extend rearward therefrom and adapted to fit to the slide-bearings both in front and in rear of said standard, substantially as set forth.

4. In combination with the binder-frame and the main frame which sustains it, the binder main driving-shaft having a bearing in the binder rear gearing-standard and projecting rearward therefrom, and two similar driving-wheels on said shaft, one located forward of the gear-standard and the other rearward of the same, substantially as and for the purpose set forth.



5. In combination with the main frame and the binder-frame sustained thereon, the binder main driving-shaft having a bearing in the binder rear gearing standard or bracket, the main frame having a bearing for a driving-wheel in line with said shaft-bearing, and two similar driving-wheels, each adapted to be journaled in said main-frame wheel-bearing and both located on said shaft, one in front of the binder rear gearing-standard and one in rear of same, substantially as set forth.

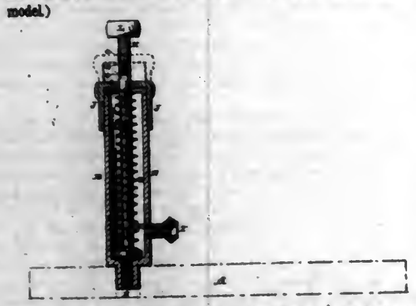
6. In combination with the main frame and the binder-frame sustained and movable back and forward thereon, the binder main driving-shaft having a bearing in the binder rear gearing standard or bracket and extended both forward and rearward of said bearing and adapted to receive and slide through a driving-wheel, the main frame having a bearing for a driving-wheel located in line with said binder-frame shaft-bearing, and a driving-wheel journaled therein and apertured through its hub to fit said shaft both forward and rearward of its bearing in the rear binder gearing-standard, substantially as set forth.

7. In combination with the main frame and the binder-frame sustained and movable back and forward thereon, the binder main driving-shaft having a bearing in the binder rear gearing standard or bracket and extended rearward of said bearing, the main frame hav-

ing a bearing for a drive-wheel in line with said bearing on the binder rear gearing-standard, said shaft, both forward and rearward of its said bearing, being adapted to slide through a driving-wheel, and two similar driving-wheels, each adapted to be journaled in said main-frame wheel-bearing and having their hubs apertured to receive said shaft and located thereon, one forward and the other rearward of said shaft-bearing in the binder rear gearing-standard, substantially as set forth.

401,389. COMBINED EASEL AND SHEET-MUSIC CABINET. OSCAR STODDARD, Detroit, Mich. Filed Apr. 11, 1888. Serial No. 270,355 (No model.)

Claim.—1. In combination with the easel-frame having the open front, the case mounted on the back of said easel-frame, and the frame located in said case and having a series of supporting-rods, said rods having attached thereto the strip of textile fabric or flexible material forming the pockets for the sheet-music, as and for the purpose specified.



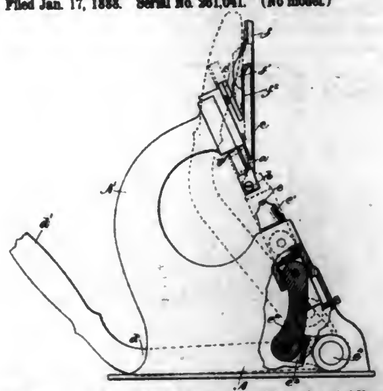
2. In combination with the easel-frame having the open front, the case mounted on the back thereof, the leg hinged to said case, the frame located in said case having its lower end hinged to the easel-frame, the series of rods attached to the frame A, and the flexible material mounted on said rods and doubled, so as to form the series of pockets *a*, substantially as and for the purposes specified.

3. In combination with the easel-frame having the opening F, the case C, attached to the back face of the easel-frame and communicating with the opening thereof, and having pockets for sheet-music located therein, as and for the purposes specified.

401,390. SHOE-BLACKING. CHARLES D. ST. PIERRE, Brooklyn, N. Y. Filed Oct. 6, 1888. Serial No. 287,400. (Specimens.)

Claim.—A boot and shoe blacking or polish composed of ivory-black, sugar, linseed-tea, sweet-oil, Diamond black dye, oil of vitriol, whisky, wormwood-tea, extract of nux vomica, vinegar, and alum, in substantially the proportions hereinbefore described.

401,391. REGULATING-VALVE FOR DENTAL VULCANIZERS. LEVI STOCK, Hart, Mich. Filed May 17, 1888. Serial No. 274,228. (No model.)



Claim.—The combination, with a vulcanizer, of a cylinder provided with a valve-seat and a blow-off pipe, the valve, the graduated valve-stem, a spring applied to the valve-stem, and an adjustable cap, by means of which the pressure of the spring is regulated to correspond to the graduations on the stem, substantially as shown and described.

401,392. RULER. NICOLAI VERMEHREN, Copenhagen, Denmark. Filed Dec. 11, 1888. Serial No. 293,276. (No model.) Patented in Norway Nov. 16, 1887, No. 582, and in Sweden Dec. 9, 1887, No. 1,165.

Claim.—A ruler consisting of a right-angled plate or disk, M, furnished on both sides with narrower plates, H and H'.

401,393. BUTTON-SETTING MACHINE. JOHN H. VINTON, Boston, Mass., assignor to the Peninsular Novelty Company, Grand Rapids, Mich. Filed Jan. 17, 1888. Serial No. 261,041. (No model.)

Claim.—1. In a button-setting machine, the rigidly-attached driver *a* and yielding carrier *b*, arranged to automatically present a single fastening having a button attached thereto beneath the driver, combined with the anvil movable in a straight line toward the driver, as set forth.

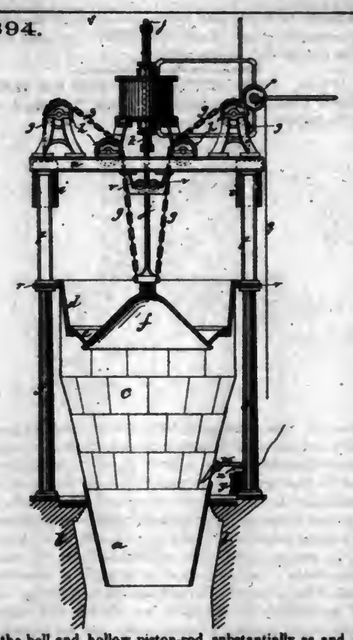
2. In a button-setting machine, the button-setting devices mounted in the face of a stationary frame-work which is inclined rearwardly from the operator, and a substantially-vertical attached chute, substantially as described.

3. In a button-setting machine, the button-setting devices, combined with a rearwardly-extended hand-lever movable upward in the arc of a circle to effect the upward movement of the movable member of the button-setting devices, substantially as described.

4. In a button-setting machine, the driver and carrier, combined with the anvil movable toward the driver in a straight line, the rearwardly-extended toggle-jointed levers, and bent hand-lever, the said lever having an upward and forward movement, substantially as described.

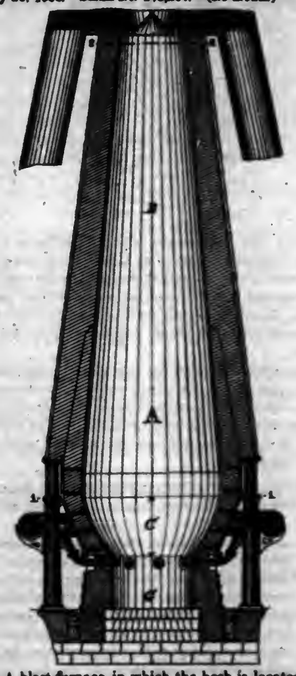
5. In a button-setting machine, the raceway and detachable tube and its yielding connection between the said detachable tube and the raceway, substantially as described.

401,394. CHARGING APPARATUS FOR BLAST-FURNACES. EDWARD WALSH, Jr., St. Louis, Mo. Filed May 26, 1888. Serial No. 275,206. (No model.)



Claim.—1. The combination, with a blast-furnace, of a feed-bell provided with a suspension-rod having key-slots, and a cylinder arranged over the feed-bell and having a tubular piston-rod through which the suspension-rod of the bell passes, substantially as and for the purposes described.

2. The combination, with a blast-furnace, of a feed-bell provided with a suspension-rod having key-slots, a cylinder arranged over the feed-bell, having a tubular piston-rod through which the suspension-rod of the bell passes, and counter-weights connected directly to the bell, substantially as and for the purposes described.

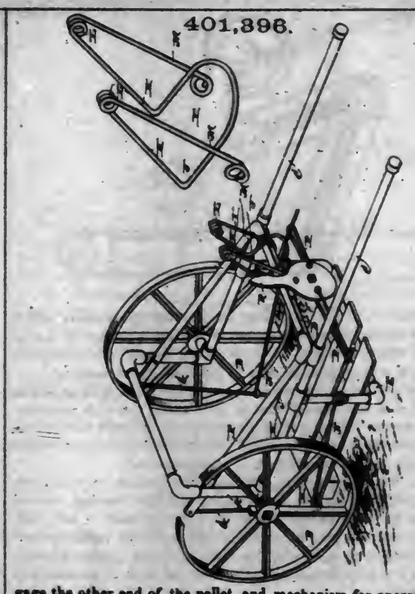


3. The combination, with a blast-furnace, of a feed-bell provided with a suspension-rod having key-slots, a cylinder arranged over the feed-bell and having a tubular piston-rod through which the suspension-rod of the bell passes, and guide-rollers for preserving the relation of the bell and hollow piston-rod, substantially as and for the purposes described.

4. The combination, with a blast-furnace, of a feed-bell provided with a suspension-rod having key-slots, a cylinder arranged over the bell and having a tubular piston-rod through which the suspension-rod of the bell passes, counter-weights connected directly to the bell on opposite sides of the stem, and guide-rollers for preserving the relation of the bell and hollow piston-rod, substantially as and for the purposes described.

401,394.

401,395. BLAST-FURNACE. EDWARD WALSH, Jr., St. Louis, Mo. Filed May 26, 1888. Serial No. 275,207. (No model.)



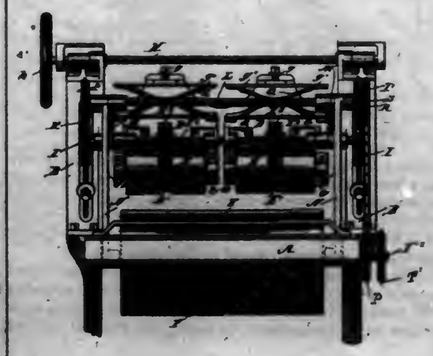
Claim.—A blast-furnace in which the bosh is located well down within the zone of fusion, and in which the sectional area of the upper limit of its bosh is substantially three times it hearth-area and substantially five to seven times the area of its tunnel-head, substantially as shown, and for the purposes specified.

401,396. BRICK-TRUCK. JOHN W. WEBBER, Fort Worth, Tex. Filed Dec. 31, 1888. Serial No. 296,095. (No model.)

Claim.—1. A truck for carrying bricks, provided with a depending frame to support one end of the pallet and supporting-arms to engage the other end of the pallet, and mechanism for operating said arms, as set forth.

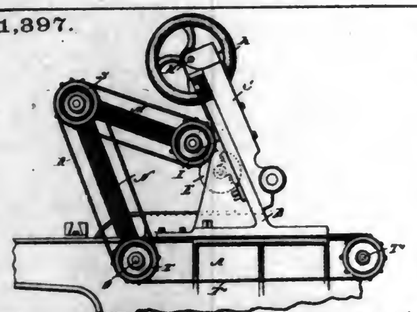
401,396.

2. A truck comprising the crank-axle and the handles extended therefrom, the supporting-frame depending from the handles, the levers fulcrumed on the axle, and the supporting-arms carried by said levers, as set forth.



3. The combination, with the axle, the handles extending therefrom, and the cross-bar connecting the handles, of the supporting-frame depending from the handles, the levers fulcrumed on the axle, the supporting-arms carried by said levers, and the spring-latch mounted on the cross-bar between the handles and engaging said lever, as set forth.

4. In a truck, the combination, with the main frame, of the U-shaped frame depending therefrom, the supporting-arms supported by the main frame, the horizontal vibrating levers mounted on the arms of the U-shaped frame and having their rear ends connected to the supporting-arms, and mechanism for operating said levers, as set forth.



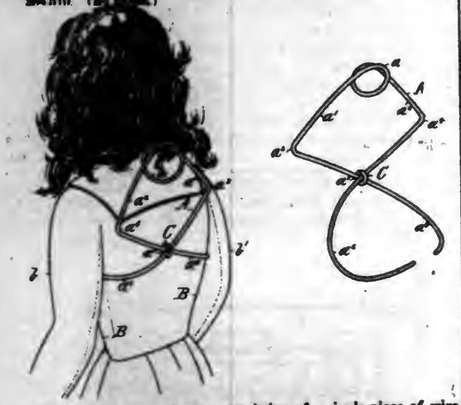
5. The combination, with the main frame, the arms G G, and the levers having their rear ends connected to said arms, of the crank-disk and the pitmen extending between the front ends of the levers and diametrically opposite points of the crank-disk, as set forth.

6. The combination, with the lever F and the cross-bar G, of the spring-latch mounted on the cross-bar and engaging the lever, the said spring-latch consisting of a single spring-wire bent to form the U-shaped locking portion J, the arms K K, extending upward from said locking portion, the coils L L at the upper ends of said arms, and the branches M M, depending from the coils and secured to the cross-bar, as set forth.

401,397. WOOD-PLANING MACHINE. GEORGE F. WETHERELL and RICHARD B. JOHNS, Chicago, Ill., assignors of one-third to Ransom Richards, same place. Filed Sept. 27, 1887. Serial No. 250,906. (No model.)

401,897.

Claim.—1. In a wood-planing machine, the combination, with a positively-driven endless carrier-belt or feed-table formed of slats or lags and with a vertically-movable presser roll or rolls, of suitable gearing for driving said roll or rolls, substantially as described.

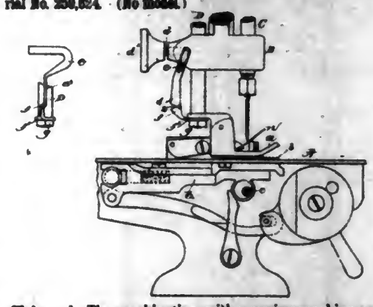


2. In a wood-planing machine, the combination, with an endless carrier-belt or feed-table formed of slats or lags and with vertically-movable presser-rolls, of suitable gearing for driving said rolls, extending between the shafts of said rolls and the drive-shaft of the endless carrier-belt or feed-table, substantially as described.

3. In a wood-planing machine, the combination, with the vertically-movable presser-rolls and vertically-movable housings, wherein said rolls are sustained, of cog-wheels upon the shaft of said rolls, vertically-movable gear-wheels for driving said rolls, vertically-movable shafts carrying said gear-wheels and journaled upon the movable housings, and suitable gearing for driving said shaft, all substantially as described.

4. In a wood-planing machine, the combination, with vertically-movable presser-rolls, of cog-wheels for said rolls, gear-wheels engaging with said cog-wheels, shafts for said gear-wheels extending across said presser-rolls, vertically-movable housings wherein said shafts and said presser-rolls are mounted, a transverse shaft in gear with the shafts of said gear-wheels, and a driving-shaft in gear with said transverse shaft, substantially as described.

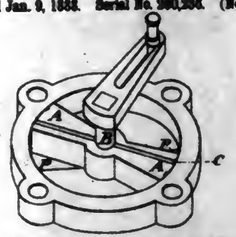
5. In a wood-planing machine, the combination, with vertically-movable presser-rolls and housings wherein said rolls are mounted, of the gear-wheels for driving said rolls, provided with shafts journaled in said housings, sprocket-wheels upon said shafts, a transverse shaft mounted upon movable arms and provided with sprocket-wheels, belts leading from said transverse shaft to the shafts on the housings, a slatted carrier-belt, and suitable gearing extending between said transverse shaft and the shaft that drives the carrier-belt, substantially as described.



401,898. SPRING-HANGER. ALBERT WHITE, Lowell, Mass., assignor to Joseph L. Pinder, same place. Filed Feb. 18, 1888. Serial No. 264,510. (No model.)

Claim.—1. A spring-hanger consisting of a single piece of wire having a bend adapted to engage a hook, nail, or other support, and having arms extending laterally outward from said bend, then laterally inward across each other, and having their free ends bent forward in curves to form jaws having concave inner faces to grasp the object to be suspended by said hanger, as and for the purpose specified.

2. The combination of the spring-hanger having a bend adapted to engage a hook, nail, or other support, and having arms extending laterally outward from said bend, then laterally inward across each other below said first-named bend, and having their free ends provided with forwardly-extending jaws having concave inner faces, and a ring or clasp surrounding both of said arms where they cross each other loosely, as and for the purpose specified.



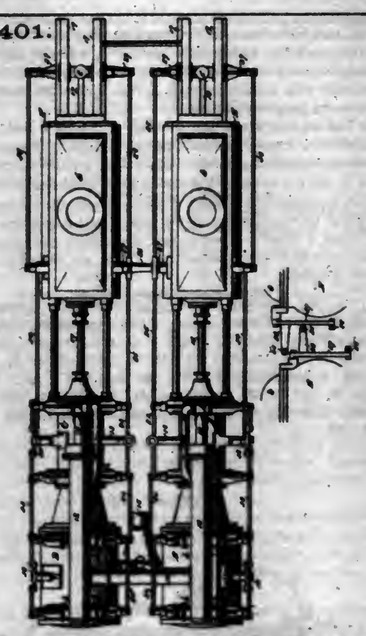
401,899. THREAD-CUTTING MECHANISM FOR SEWING-MACHINES. CHARLES F. WILCOX, Ipswich, Mass. Filed Jan. 3, 1888. Serial No. 259,624. (No model.)

Claim.—1. The combination, with a sewing-machine presser-bar, of a cutter or blade rigidly attached thereto, and thus vertically movable therewith as the said bar is lifted slightly at each stitch by the action of the feed against the presser-foot, and a stationary cutter or blade contiguous to the said movable cutter or blade, said cutters or blades serving to operate with a shearing effect to sever threads which may be inserted between their ends, substantially as set forth.

2. In a sewing-machine, the combination, with the head B and the cutting-blade d', having a shank, c, by which it is secured to the said head, of the presser-bar D, and the blade f, having a shank or plate, f', by which it is attached to the said bar, said blades being contiguous to and parallel with each other, and one or both of them having inclined ends to form a V-shaped notch into which the thread to be severed may be inserted, substantially as set forth.

401,400. VALVE FOR ENGINES. JOHN H. WILLIAMS, Urbana, Ohio. Filed Jan. 9, 1888. Serial No. 260,236. (No model.)

Claim.—1. The combination, with an oscillating valve and its steam-chest, composed in part of an annular body and a cap-plate, of a steam-cylinder having a boss fashioned to form the remainder of said chest and provided with port-mouths, at diametrical points, of substantially the shape and slightly smaller than the arms of said valve, and constructed with ports proper whose area is not less than that of said mouths.



2. The combination, with the steam-chest composed of an annular body, a cap-plate, and the cylinder-boss, of two steam-pipes which connect with the boss at diametrical points of the chest and communicate with the chest through openings in the boss, an oscillating valve whose shaft is mounted in said boss, and said plate and cylinder-ports within said chest.

401,401. DIRECT-ACTING DUPLEX ENGINE. CHARLES C. WORTHINGTON, Irvington, N. Y. Filed Sept. 24, 1888. Serial No. 286,163. (No model.)

Claim.—1. The combination, with a steam-cylinder and piston, of separate induction and exhaust ports for each end of the cylinder and two oscillating valves, one for controlling the induction and exhaust of the steam to and from each end of the cylinder, said valves moving synchronously and being so timed and connected that the opening of the exhaust-port at one end of the cylinder commences immediately upon the closing of the exhaust-port at the other end of the cylinder, substantially as described.

2. The combination, with a steam-cylinder and piston, of separate induction and exhaust ports for each end of the cylinder and two oscillating valves, one for controlling the induction and exhaust of the steam to and from each end of the cylinder, said valves moving synchronously and being so timed and connected that the opening of the induction-port at one end of the cylinder commences immediately upon the closing of the induction-port at the other end of the cylinder, substantially as described.

401,401.

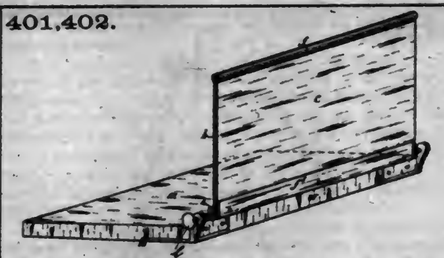
3. The combination, with a steam-cylinder and piston, of separate induction and exhaust ports for each end of the cylinder and two oscillating valves, one for controlling the induction and exhaust of steam to and from each end of the cylinder, said valves moving synchronously and being so timed and connected that the exhaust-port for one end of the cylinder and the induction-port for the other end of the cylinder are opened simultaneously, substantially as described.

4. The combination, with the steam-cylinders and pistons of a duplex engine, of an oscillating valve for controlling the induction and exhaust of the steam to and from each end of the cylinders of the two sides of the engine, rods 23, connecting with two valves of each cylinder, so as to cause them to move synchronously and in the same direction and without lost motion, and connections between one of the valves of each side of the engine and the piston-rod of the other side of the engine, substantially as described.

5. The combination, with a steam-cylinder and piston, of separate induction and exhaust ports for each end of the cylinder, two oscillating valves, one for controlling the induction and exhaust port for each end of the cylinder, ports 2 3, located in the valve-chests and connecting the induction and exhaust ports, and adjustable valves 39, controlling said ports, substantially as described.

6. The combination, with the main steam-cylinders, pistons, and piston-rods of a duplex engine, of induction and exhaust valves and cut-off valves, a cross-head carried by the piston-rod of each engine, a rod, 36, connected to one end of the cross-head of each engine to operate the cut-off of that engine, and a rod, 26, connected to the other end of the cross-head to operate the induction and exhaust of the other engine, substantially as described.

7. The combination, with a steam-cylinder and piston, of an induction and exhaust valve and a cut-off valve for each end of the cylinder, and connections for operating the cut-off valves from one side of the cylinder and for operating the induction and exhaust valves from the other side of the cylinder, substantially as described.



8. The combination, with a steam-cylinder and piston, the cylinder being provided with separate induction and exhaust ports at each end, of two independent valve-chests, A, located at the ends of the cylinder and detachably connected thereto, each chest containing an oscillating valve for controlling the induction and exhaust of the steam to and from that end of the cylinder, substantially as described.

401,402. APPARATUS FOR COPYING WRITINGS. FRANZ A. C. SAHR, Ingolstadt, assignor to Huber & Lorenz, Halle-on-the-Saale, Prussia, Germany. Filed May 1, 1885. Serial No. 164,200. (No model.) Patented in Germany Jan. 8, 1881, No. 14,775.

Claim.—1. A manifold-copying apparatus comprising a stone or plate to receive the matter to be copied and a transfer-plate having an elastic front face and a backing of inelastic flexible material, substantially as described.

2. In a manifold-copying apparatus, the combination, with an impression stone or plate, of a transfer sheet or plate having an elastic front face and inelastic flexible backing, and side rails constituting a frame, substantially as described.

401,402.

3. In a manifold-copying apparatus, the combination of the stone a with the sheet-metal piece w, the bearings k k', and the impression-plate c, pivoted in said bearings, said plate having an elastic front face and an inelastic flexible backing, substantially as described.

401,403. MACHINE FOR MAKING BASKETS. ISAAC J. W. ADAMS, Laurel, Del. Filed Nov. 2, 1888. Serial No. 289,790. (No model.)

Claim.—1. A sectional form for making baskets or carriers, comprising semicircular metallic plates registering to form rings of varying diameter, provided on their inner faces with hoop-receiving spaces, semicircular spaced hinged ribs, to the inner faces of which said plates are secured, and connecting bars or bolts securing the semicircular ribs of each section together, substantially as set forth.

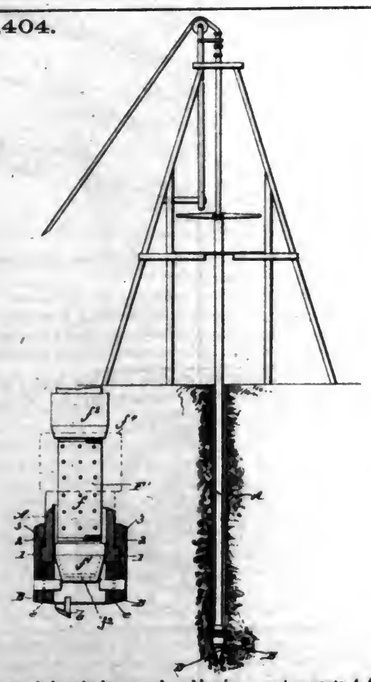
2. A form for making baskets or carriers, comprising the two hinged sections each composed of semicircular metallic plates having inward-projecting hoop-retaining projections or lugs and registering at their ends to form rings of varying internal diameter, the semicircular spaced ribs, on the inner faces of which are the said metallic plates, the bolts or bars securing the ribs of each section together, and a fastening to secure the two hinged sections together, said fastenings and the hinges lying within the peripheries of the ribs to present an unbroken surface and allow of the rotation of the form, substantially as set forth.

3. A basket-machine comprising a stationary frame having a series of ribs provided with semicircular recesses in their upper edges, anti-friction rollers journaled therein, and the curved guiding-plates, and a rotary two-part hinged form having semicircular spaced connected ribs resting on said rollers, the internal diameters of the ribs varying according to the shape of the basket or carrier, and provided with semicircular hoop-retaining metallic plates, substantially as set forth.

401,404. WELL-BORER. BENJAMIN ANDREWS, New Orleans, La. Filed Aug. 26, 1888. Serial No. 283,815. (No model.)

Claim.—1. In a well-boring apparatus, the combination of the well-tube, the boring-head journaled thereto, and the water-tube connected with said boring-head and constructed to fit snugly therein, whereby water forced down said water-tube will be prevented from passing up between the same and the boring-head, all substantially as and for the purposes specified.

2. The combination, in a well-boring apparatus, of the well-tube, the boring-head journaled thereto, the turning-stem detachably connected with said head, and the center cutter or bit supported on said turning-stem, substantially as set forth.



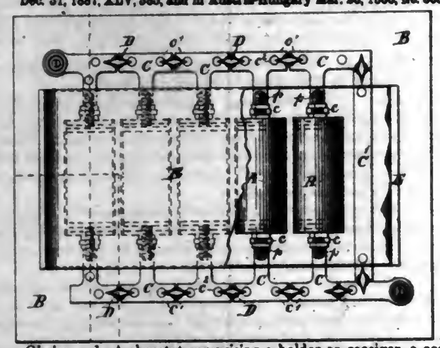
3. The combination, in a well-boring apparatus, of the well-tube, the boring-head journaled thereon, and the turning-stem made tubular or having a passage formed through it for the water and provided with a check-valve, substantially as set forth.

4. In a well-boring apparatus, the combination of the well-tube, the boring-head journaled thereon and provided with inwardly-extended studs or projections, and the turning-stem having at its lower end slots arranged to receive said studs or projections, substantially as set forth.

5. In a well-boring apparatus, the combination, with the well-tube and the boring-head journaled on the well-tube, of the studs projected into the bore of said head for engagement by the turning-stem, and fragile fastenings for said studs, substantially as set forth.

6. In a well-boring apparatus, the well-tube having the boring-

401,404.

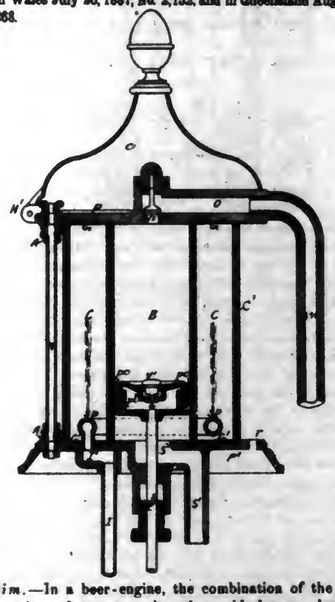


head journaled on its lower end, and having a vent or vents, 4, formed through it, substantially as described, and for the purposes specified.

7. The well-tube and the boring-head journaled on the lower end thereof and provided with inwardly-projected studs, combined with the turning-stem, having slots made L shape and engaged with said studs, substantially as set forth.

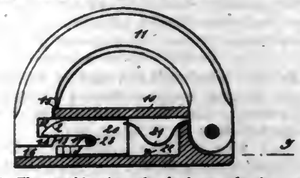
8. The improvement in well-boring apparatus, substantially as herein described, consisting of the well-tube, the boring-head journaled thereon, the studs projected into the bore of said well-tube, fragile fastenings for said studs, the turning-stem fitted at its lower end tightly in the well-tube and provided at such end with slots constructed to engage the studs, and the center cutter or bit supported on said turning-stem, substantially as set forth.

401,405. RHEOSTAT. NICHOLAS BENARDOS, St. Petersburg, Russia. Filed Jan. 7, 1888. Renewed Mar. 9, 1889. Serial No. 302,745. (No model.) Patented in England Dec. 21, 1887, No. 17,585; in Belgium Dec. 19, 1887, No. 79,974; in France Dec. 19, 1887, No. 187,683; in Italy Dec. 31, 1887, XLV, 385, and in Austria-Hungary Mar. 26, 1888, No. 805



Claim.—1. A rheostat comprising a holder or receiver, a conductive material capable of being compressed or compacted, and an adjustable metallic follower or piston arranged to operate upon said material, in combination with a support for the rheostat, consisting of a metallic band, bar, or strap of T shape, provided with a bearing for the piston-rod in its vertical branch, and with recesses in the outer edges of the horizontal branch or branches, substantially as described, for the purposes set forth.

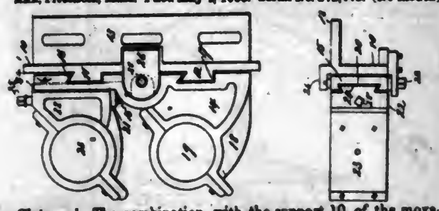
2. A rheostat comprising a holder or receiver of non-conductive material, a compressible conductive material contained in said cylinder, and a metallic piston or pistons arranged to operate upon said material, in combination with a support for the rheostat in electrical connection with the compressible conductive material, said support consisting of a band or bar of T shape, the horizontal arms whereof are provided with a notch or recess in their outer ends, substantially as and for the purposes specified.



3. The combination, with a plurality of rheostats, each comprising a holder or receiver of non-conductive material, a compressible conductive material contained in said holder, a piston or pistons arranged to operate upon said material, and a T-shaped metallic support, the foot or horizontal arms of which are provided in their outer ends with a notch or recess, of the pins D, the connecting band or strap C', and a suitable supporting-bar, upon which said rheostats are arranged side by side, substantially as shown and described, for the purposes specified.

401,406. CONSTRUCTION OF BEER-ENGINES. JAMES A. BIGELOW, Melbourne, Victoria, assignor to John Hyam Nathan, Sydney, New South Wales. Filed July 16, 1887. Serial No. 244,543. (No model.) Patented in Victoria June 20, 1884, No. 3,743, and Apr. 29, 1887, No. 5,043; in New Zealand Nov. 21, 1884, No. 1,303; in South Australia Apr. 29, 1887, No. 800; in England May 31, 1887, No. 7,904; in New South Wales July 20, 1887, No. 2,132, and in Queensland Aug. 26, 1887, No. 263.

Claim.—In a beer-engine, the combination of the following elements: a base-plate, a pump-barrel on said plate, a valved plunger and its rod working upwardly in the pump-barrel and base-plate, a cylinder surrounding the pump-barrel and forming a chamber therebetween, a circular spray-pipe in said chamber, an inlet-pipe communicating with the spray-pipe, an outlet-pipe leading from the base of the chamber, a cap-plate centrally apertured over the pump-barrel and fitted thereat with a valve, and having openings over said chamber provided with detachable covers, adjustable connections between the base and cap plates, an outlet-pipe leading from the valved aperture in the cap-plate and provided with a delivery-tap, valved pipes connecting the pump-barrel with liquor-receptacles, and a foot-lever for operating the plunger-rod, all constructed, arranged, and adapted to operate as herein shown and described.



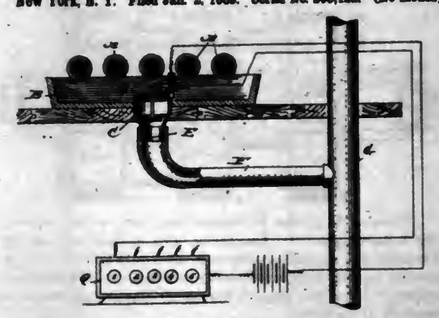
401,407. PADLOCK. GRANT BRAMBEL, Lake Park, Minn. Filed Mar. 26, 1888. Serial No. 268,478. (No model.)

Claim.—1. The combination of a lock-case having an open end and its upper wall cut away at said open end, a pivoted shackle having its recessed free end entering the lock-case through the cut-away portion, with its outer surface flush with end of the case and extending into the said case a distance less than the depth thereof, to leave a space between the lower wall of the case and the shackle for the insertion of a key, and a series of sliding and spring-actuated tumblers in said case and engaging the recess of the shackle, substantially as described.

2. The combination of the lock-case 10, having an open end and its upper wall cut away at said end, the shackle 11, pivoted to the case and provided with the recess 12 and shoulder 15, the tumblers 20, provided with the slots 17, the transverse pins 23, and the springs 21, substantially as herein shown and described.

401,408. ADJUSTABLE BOX FOR SHAFTS. EDWARD H. BRIDGMAN, Pittsfield, Mass. Filed May 4, 1888. Serial No. 272,773. (No model.)

Claim.—1. The combination, with the support 10, of the movable frame, upper and lower shaft-boxes carried by said frame, and screws for vertically adjusting the upper box and for adjusting both boxes laterally, as shown and described.



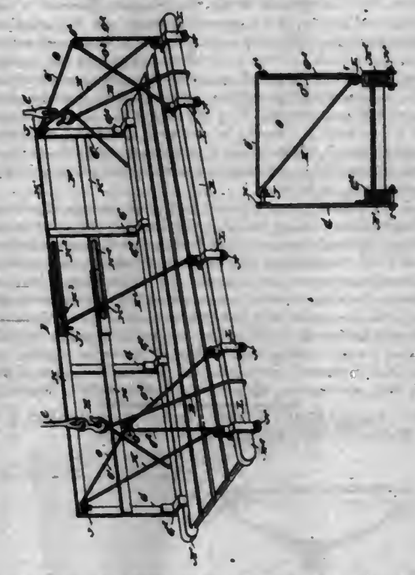
2. The combination, with the support 10, of the frame which is laterally adjustable thereon, a screw for adjusting the said frame, and boxes attached to the latter for carrying slitter-shafts, as shown and described, whereby the latter may be adjusted with the boxes, as specified.

3. The combination, with the support 10, having dovetail projections upon its face, of a frame carrying an upper and lower box, said frame being provided with dovetailed recesses adapted to receive the projections of the bracket, and a screw, substantially as shown and described, for adjusting such box-frame, as and for the purpose specified.

4. The combination, with a body-bracket provided with essentially dovetail projections upon one face and horizontally-projecting ears between said projections, of a frame carrying a lower and upper box, provided with a central horizontal lug, and a set-screw passing through said ears and the frame-lug, substantially as shown and described.

5. The combination, with a body-bracket provided with essentially dovetail projections upon one face and horizontal aligning ears extending outward between said projections, a frame carrying a box at its lower end, provided upon the inner face with horizontal dovetail recesses, a vertical dovetail recess in the upper end, and a leg between said recesses, and a set-screw passing through the ears of the bracket and the leg of the frame, of a second box-carrying frame provided upon the inner face with a dovetail projection adapted to enter the upper dovetail recess of the lower box-frame, and means, substantially as shown and described, for vertically adjusting the upper box in the said lower box-frame, as and for the purpose specified.

401,409. LEAK-DETECTOR FOR PIPES. ANDREW H. BROWN, New York, N. Y. Filed Jan. 2, 1889. Serial No. 295,122. (No model.)



Claim.—1. A leak-detector for pipes, comprising a head into which passes the leak-water, a valve held in the said head and opened by the accumulated leak-water, and an annunciator connected with the said valve and actuated when the latter opens, substantially as shown and described.

2. A leak-detector for pipes, comprising a drip-pan over which pass the various pipes, a head held in the said drip-pan and connected with a pipe, a valve held close in the said head until a sufficient amount of water accumulates in the said head, and a lever supporting the said valve and weighted to hold it on its seat in the head, substantially as shown and described.

3. A leak-detector for pipes, comprising a drip-pan over which the various pipes pass, a head held in the said drip-pan and connected with a waste-pipe, a valve held closed in the said head until a sufficient amount of leak-water accumulates in the said head, a lever supporting the said valve and weighted to hold it on its seat in the head, a contact-point held on the said lever, a screw held above the said contact-point, and an annunciator connected with the said contact-point and the said screw to establish an electric current when the said valve is opened, substantially as shown and described.

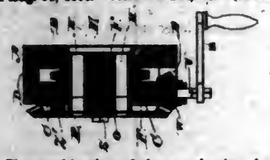
4. The combination, with a drip-pan, a head held in the said drip-pan, and a waste-pipe connected with the said head, of a valve held on its seat in the said head, a lever pivotally connected with the said valve and weighted to hold the valve closed, a saddle in which the free end of the said lever plays, a screw screwing in the said saddle, wires leading from the said screw in the said lever, and an annunciator connected with the said wires and actuated when the said valve opens and throws the free end of the said lever in contact with the said screw to establish an electric current, substantially as shown and described.

401,410. SAFETY-SCAFFOLD. JOHN CARMICHAEL, Brooklyn, N. Y. Filed Oct. 6, 1888. Serial No. 287,419. (No model.)

Claim.—1. In a safety-scaffold, the combination, with a scaffold-ladder, of a railing made in two parts adapted to slide over each other, and also to be clamped to one of the longitudinal beams of the scaffold-ladder, substantially as shown and described.

2. In a safety-scaffold, the combination, with a scaffold-ladder, of a railing made in two parts, each comprising vertical posts clamped to one of the longitudinal beams of the scaffold-ladder, and longitudinal rails secured on the said posts and mounted to slide over each other, being provided for this purpose with slots and bolts, substantially as shown and described.

3. In a safety-scaffold, the combination, with a scaffold-ladder, of a railing made in two parts adapted to slide over each other, and also adapted to be clamped to one of the longitudinal beams of the scaffold-ladder, and end railings connected with the ends of the said railing and clamped to the other longitudinal beam of the said scaffold-ladder, substantially as shown and described.



4. In a safety-scaffold, the combination, with a scaffold-ladder, of a railing made in two parts adapted to slide over each other, and also adapted to be clamped to one of the longitudinal beams of the scaffold-ladder, and braces connected with the said railing and clamped to the other longitudinal beam of the said scaffold-ladder, substantially as shown and described.

5. In a safety-scaffold, the combination, with a scaffold-ladder, of a railing made in two parts adapted to slide over each other, and also adapted to be clamped to one of the longitudinal beams of the scaffold-ladder, and braces connected with the said railing and clamped to the other longitudinal beam of the said scaffold-ladder, and end railings connected with the ends of the said railing and adapted to be

clamped to the longitudinal beam of the said scaffold-ladder, substantially as shown and described.

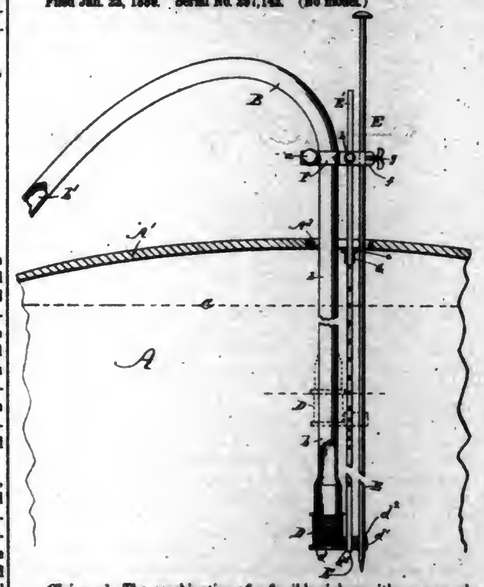
6. In a safety-scaffold, the combination, with a scaffold-ladder, of a railing made in two parts adapted to slide over each other, and also adapted to be clamped to one of the longitudinal beams of the scaffold-ladder, braces connected with the said railing and clamped to the other longitudinal beam of the said scaffold-ladder, and railings connected with the ends of the said railing and adapted to be clamped to the longitudinal beam of the said scaffold-ladder, and braces connected with the said end railings and clamped to the other longitudinal beam of the said scaffold-ladder, substantially as shown and described.

401,411. WIRE-TWISTING MACHINE. DANIEL T. CLARK, Leslie, Mich. Filed Aug. 31, 1888. Serial No. 284,261. (No model.)

Claim.—1. The combination of the case having the openings in its sides, the twisting-heads having the trunnions journaled in said openings and having the transverse openings and the peripheral sprocket-teeth, the endless chain connecting the twisting-heads and engaging the teeth thereof, the block bearing against the rear trunnion of one of the twisting-heads, the gear-wheel R on the outer side of said blocks, said block and gear-wheel having openings coincident with those of the head, the strap U on one edge of the case, the crank-shaft V, journaled in a bearing in said strap and having the pinion engaging wheel R, and the flange Z' on the rear side of the case, concentric with the block, and bearing against the inner side of the wheel R, substantially as described.

2. The combination of the case having the openings in its sides, the twisting-heads having the projecting trunnions journaled in said openings, said heads being provided, further, with the transverse openings and with the peripheral sprocket-teeth, the endless chain connecting the said twisting-heads and adapted to rotate the same in the same direction, the block bearing against one of the twisting-heads and having the openings coinciding with those of said head, the gear-wheel R, bearing against said block and having similar openings, the bolts clamping the said twisting-head, block, and gear-wheel together, the crank-shaft journaled in one side of the case, and the pinion on said crank-shaft and engaging the gear-wheel, substantially as described.

401,412. SHAFT-SUPPORT. EDWARD CLARK, New York, N. Y. Filed Dec. 31, 1888. Serial No. 296,050. (No model.)



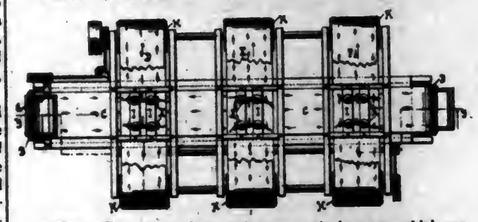
Claim.—1. A shaft-support comprising a beam secured to the front end of the vehicle and projecting under the shafts, a stiff plate pivoted at one end to the top of the said beam and engaging with its free end the under side of the transverse beam of the shafts, and a screw-rod screwing vertically in the outer end of the said beam and supporting at its upper end the free end of the said pivoted stiff plate, substantially as shown and described.

2. A shaft-support comprising a beam secured to the front end of the vehicle and projecting under the shafts, a pivot formed on the top of the said beam near its front end, a stiff plate hung with one end on the said pivot and engaging with its free end the under side of the transverse beam of the shafts, a nut held in the outer end of the said beam, and a screw-rod screwing vertically in the said nut and supporting at its upper end the free end of the said pivoted stiff plate, substantially as shown and described.

3. The combination, with the shafts pivoted to the vehicle and provided with a transverse beam, of a longitudinal beam secured to the front end of the vehicle and projecting under the said transverse beam, a stiff plate pivoted at one end to the top of the said longitudinal beam and engaging with its free end the under side of the said transverse beam of the shafts, and a screw-rod screwing vertically in the outer end of the said longitudinal beam and supporting at its upper end the free end of the said pivoted stiff plate, substantially as shown and described.

4. The combination, with the shafts pivoted to the vehicle and provided with a transverse beam, of a longitudinal beam secured to the front end of the vehicle and projecting under the said transverse beam, a stiff plate pivoted at one end to the top of said longitudinal beam and engaging with its free end the under side of the said transverse beams of the shaft, a screw-rod screwing vertically in the outer end of the said longitudinal beam and supporting at its upper end the free end of the said pivoted stiff plate, and an upwardly-extending projection formed on the free end of the said stiff plate and engaging the front edge of the said transverse beam of the shafts, substantially as shown and described.

401,413. MEASURING-SIPHON. JAMES M. CLARK, Louisville, Ky. Filed Jan. 22, 1889. Serial No. 297,142. (No model.)

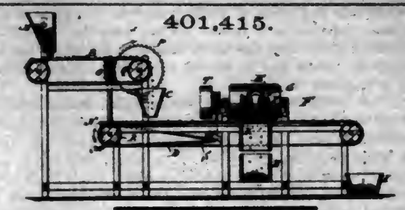


Claim.—1. The combination of a flexible siphon with a gage-rod and a supporting-rod adjustably secured to said siphon, as herein shown, and for the purposes set forth.

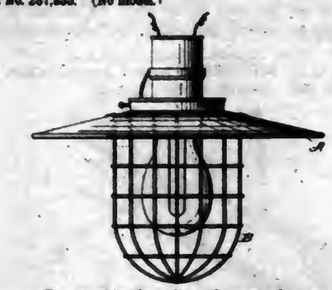
2. In combination with a siphon, a supporting-rod, E, an adjustable clamp, F, and a bottom guide-lug, d', as and for the purpose herein set forth.

3. In combination with a siphon, a supporting-rod, E, an adjustable clamp, F, a gage-rod, E', and guide-lug d', as herein shown and set forth.

4. In combination with a siphon, a supporting-rod, E, a gage-rod, E', an adjustable clamp, F, and a wire cage, D, provided with an extension-lug, d', as and for the purposes herein set forth.



401,414. PROCESS OF TREATING MAGNETIC IRON ORE. GORDON CONKLING, Glens Falls, N. Y. Filed July 31, 1888. Serial No. 281,495. (No model.)

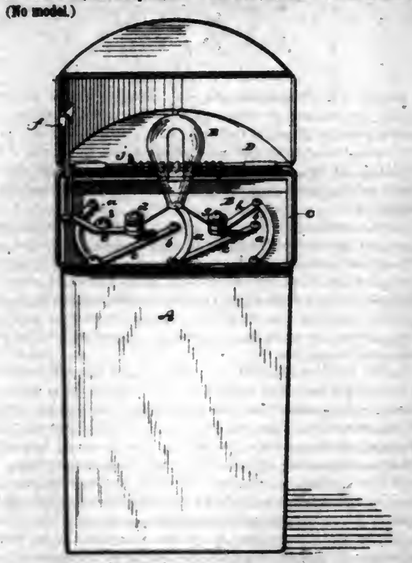


Claim.—The process for treating magnetic iron ore, which consists in exposing the ore after having been crushed to the action of a succession of magnets of graduated intensity in relation to the mass exposed to their action, and finally collecting the iron particles attracted by the several magnets in separate heaps or receptacles, substantially as described.

401,415. MAGNETIC SEPARATOR. GORDON CONKLING, Glens Falls, N. Y. Filed Aug. 9, 1888. Serial No. 282,305. (No model.)

Claim.—The combination, with the carrying-conveyer D, the movable diaphragm E, and the magnet F, of the feed-conveyer B, which moves at a different velocity from that of the carrying-conveyer, and mechanism, substantially as described, for moving the feed and carrying conveyer each at the required velocity.

401,416. COMBINED LAMP SHADE OR REFLECTOR AND GUARD. CHARLES A. COOLEY, Montreal, Quebec, Canada. Filed Oct. 11, 1888. Serial No. 287,835. (No model.)

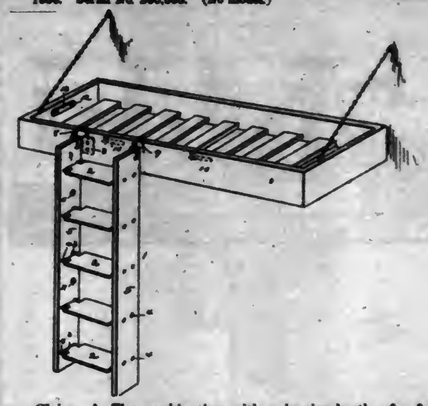


Claim.—1. The combination of a reflector and a guard for the light or lamp, the guard being rigidly secured to the reflector, as described.

2. As a new article of manufacture, a reflector or shade rigidly secured to a cage or guard, the whole being provided with attaching devices for securing it to a lamp.

3. A lamp reflector or shade having an opening large enough to admit a lamp, in combination with a guard for said lamp rigidly secured to the reflector, as set forth.

4. A lamp reflector or shade having an opening large enough to admit a lamp, in combination with a guard for said lamp rigidly secured to the reflector directly in front of the opening in said reflector.



401,417. ELECTRIC LANTERN. CHARLES W. COX and THOMAS R. VAN DYKE, Philadelphia, Pa. Filed Oct. 27, 1888. Serial No. 289,305. (No model.)

Claim.—1. In an electric lantern, the combination of the opaque casing A, the battery B, the lamp E, and the switch-arm e, adapted to be pressed down by the cover of the casing, thereby breaking the circuit, substantially as specified.

2. The combination, with the casing A, provided with the spring cover D, of the battery B, having posts $d\,g$, the lamp E, connected with the posts $d\,g$, the spring switch-arm e, and the arm f, carried by the cover D, substantially as specified.

401,418. LADDER AND GUARD FOR SLEEPING-CAR BERTHS. SIMON COLLIER and CARVER C. BROWN, Alexandria, La. Filed July 24, 1888. Serial No. 280,805. (No model.)

Claim.—1. The combination, with a sleeping-berth, of a folding ladder and detachable guard for the edge of the berth, substantially as shown and described.

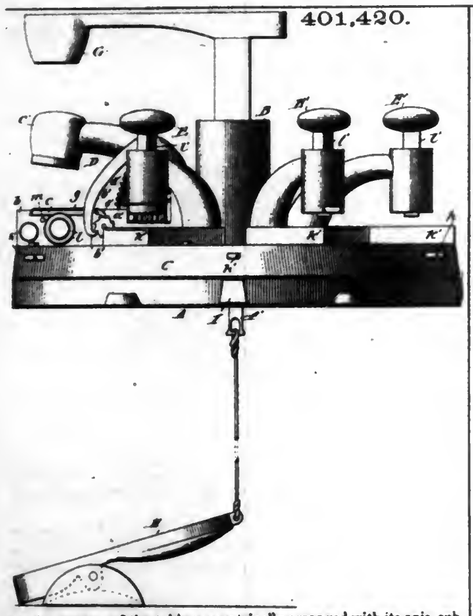
2. The combination, with a sleeping-berth, of a folding ladder and jointed connection by means of which the ladder may be swung in and out of and suspended from the berth, substantially as shown and described.

3. The combination, with the berth 6, having pivoted arm 13, with perforated end 12 at the end of the berth and pivoted pins 10 at the side of the berth, of the folding ladder 1, having steps 2, with their ends hinged to the uprights 5 by means of folded ends 3 engaging staples 4, and one of the uprights 5 having holes 11 and connected by a chain, 7, with the inside of berth 6, and the other upright having a hook, 9, substantially as shown and described.

4. The combination, with a sleeping-berth, of a ladder having folding steps and uprights and a chain connecting one of the uprights with the inside of the berth, and a hook on the other upright adapted to engage the edge of the berth, substantially as shown and described.

401,419. HANDLE. LEVI M. DEVORE, Prospect, Ill. Filed Jan. 8, 1889. Serial No. 295,792. (No model.)

Claim.—1. In a handle of the class described, the combination, with a spiral coil and an integrally-formed rod lying within the same, of a suitable boss adapted to receive the free end of the spiral, and an elongated bearing attached to the boss and receiving and supporting the free end of said rod, substantially as and for the purpose set forth.

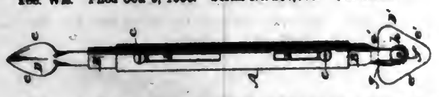


2. The combination of the boss A' and the clasps $a\,a'\,a''\,a'''$, formed integrally therewith and making up a socket, the coil B', abutting against the boss A', and the rod B, seated in the socket and having its end E' bent to prevent withdrawal of the rod from the socket, substantially as and for the purpose set forth.

401,420. COMBINATION COUPON-TICKET STAMP AND PUNCH. WILSON M. DUNAWAY, Dolphus, Kans. Filed May 22, 1888. Serial No. 274,782. (No model.)

Claim.—1. A combined ticket stamp and punch consisting, essentially, in the stationary base A, revolable table mounted thereon, a vertically-reciprocating-hammer or striker above said table, a ticket-stamp, and a series of punches, each having a separate and independent bed-piece detachably secured to the upper side of the revolable table, said punches and stamp being arranged to allow of their being brought under the hammer or striker, substantially as set forth.

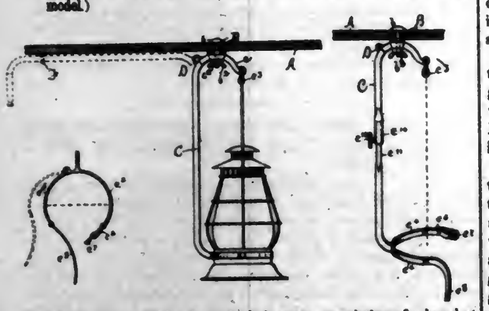
2. The combination, with the stationary base having a tubular bearing, a circular revolable base on said bearing, the vertically-reciprocating hammer having an operating-rod extending down through the tubular bearing, a spring throwing said rod upward, and a treadle connected with the lower end of the rod, of the stamping device and



401,420.

punches on top of the table concentrically arranged with its axis, substantially as set forth.

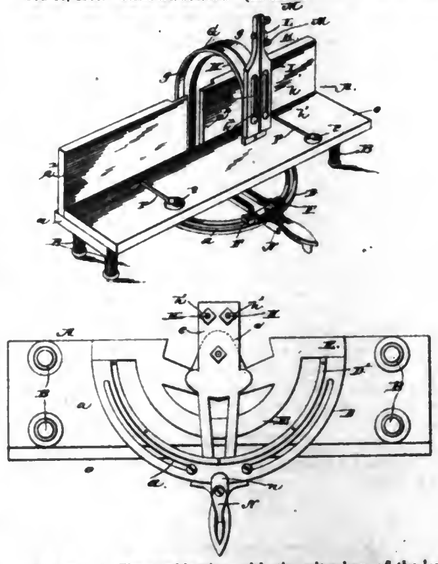
3. The combination, with the stationary base having a catch, I, projecting at its inner end above the face thereof, and the vertically-reciprocating hammer, of the circular revoluble table having a stamping device and radial punches concentrically arranged with its axis, and provided with a series of concentric notches, *i*, substantially as set forth.



401,421. KNIFE FOR PRINTERS' USE. LOUIS J. DUS, Milwaukee, Wis. Filed Oct. 9, 1888. Serial No. 287,678. (No model.)

Claim.—1. The combination, with the knife-handle, of extensible blade-holders at opposite ends thereof, a stationary double-edged cutting-blade attached to one of said holders, and a rotatably-adjustable blade having a greater number of cutting-edges attached to the other of said holders, substantially as specified.

2. The combination of the longitudinally-slotted tubular handle A, the extensible blade-holders B B at opposite ends thereof, the cutting-blade D, having two opposite cutting-edges, *e e*, attached to the one of said holders, the rotatably-adjustable cutting-blade D′, pivoted to the other of said holders, the ratchet *h*, and the spring-pawl *g*, essentially as shown and described.



401,422. LAMP-HOLDER FOR VEHICLES. CHARLES L. ELLICOTT, Baltimore County, Md. Filed Nov. 27, 1888. Serial No. 292,011. (No model.)

Claim.—1. A holder for vehicle-lanterns, consisting of a bracket suspended from the under side of the floor of a vehicle and having a laterally-extending arm at its top, the end of which is provided with a snap-hook in position to engage the bail of the lantern when in a perpendicular position, and provided on its lower end with a laterally-extending fork in position to partially encircle the base of the lantern when suspended in a vertical position from the snap-hook, in combination with a strap and buckle secured to the ends of the fork, whereby the lantern may be securely held within the fork, substantially as described.

2. A holder for vehicle-lanterns, consisting of a bracket suspended from the under side of the floor of a vehicle and having a laterally-extending arm at its top, the end of which is provided with a snap-hook in position to engage the bail of the lantern when it is in a perpendicular position, said bracket being provided with a hinge to permit its being raised to a horizontal position when not in use, and having on its lower end a laterally-extending fork semicircular in shape in position to engage and partially encircle the base of the lantern, in combination with a strap and buckle, one secured to one end of the fork and the other to the other end thereof, whereby the lantern may be securely held within the fork, substantially as described.

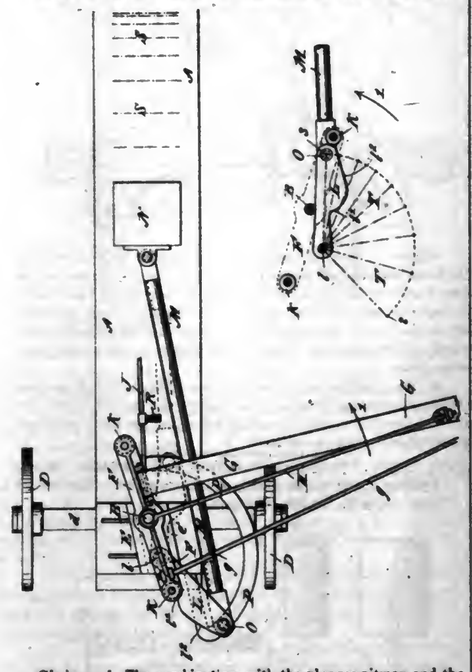
401,423. MITER-BOX. WILLIAM H. ENGLEHARD, Espy, Pa. Filed Oct. 10, 1888. Serial No. 287,754. (No model.)

Claim.—1. The combination, with the miter-box, of the lever mounted thereon and provided with suitable locking devices, the arched saw-guides affixed at their rear ends to the heel of the lever, and the clamp comprising the arms affixed to the front ends of the said guides and connected by an adjusting-bolt, L, whereby the extremities of the guides may be relatively adjusted, substantially as specified.

2. The combination, with the miter-box, of the lever mounted thereon and provided with suitable locking devices, the arched saw-guides affixed to the heel of the lever and provided at their extremities with the set-screws *k′ k′*, the vertical slotted arms K K, mounted on the said set-screws, the adjusting-bolt L, connecting the upper ends of the arms, and the set-screws M M, engaging transverse apertures in the upper end of one of the arms and bearing against the other arm, substantially as specified.

3. The combination, with the miter-box, of the lever mounted thereon and provided with suitable locking devices, the arched saw-guides provided at their rear ends with apertures *h h*, which register with transverse slots in the heel of the said lever, the adjusting-bolts H H, engaging the apertures and the slot, and the clamp I, connecting the free extremities of the guides, substantially as specified.

4. The combination, with the miter-box, of the lever mounted thereon and provided at its heel with the transverse groove g^3 and the transverse slot *h′*, the saw-guides provided at their rear ends with the ribs *g′ g′*, fitting in the groove g^3, and the apertures *h h*, registering with the slot *h′*, the adjusting-bolts H H, engaging the registering slot and apertures, and the clamp connecting the free ends of the said guides and comprising the arms K K, affixed, respectively, to the guides and connected by an adjusting-bolt, L, whereby they are relatively adjustable, substantially as specified.



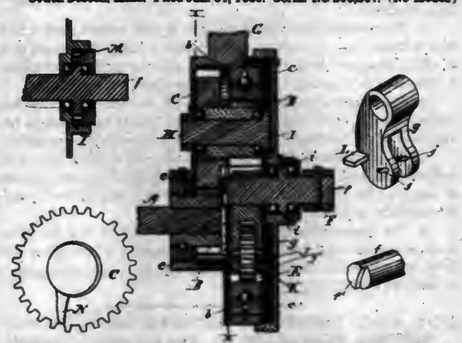
5. The combination, with the miter-box, of the semicircular guide arranged under the base-plate thereof, the lever C, mounted on the box and bearing at its free end on the said guide, the cam-lever mounted on the said lever and provided with a lip, *n*, engaging under the semi-

circular guide, and the arched saw-guides affixed to the heel of the lever C, substantially as specified.

6. The combination, with the miter-box, of the semicircular slotted guide D, the lever C, mounted on the box and provided with the arched saw-guides G G, the cam-lever N, mounted on the lever C and adapted to engage the guide D, and the adjusting-bolts F F, arranged in the slot of the guide D and adapted to be adjusted on opposite sides of the lever C, substantially as and for the purpose specified.

7. The combination, with the miter-box, having its bottom provided with transverse slots P P, and the lever C, mounted on the box and provided with the saw-guides G, of the bevel-plates Q Q, provided at their lower edges with apertures *q q*, adapted to register with the slots P P, and the adjusting-bolts R R, engaging the registering apertures and slots to clamp the said plates in the desired position, substantially as and for the purpose specified.

401,424. POWER MECHANISM FOR BALING-PRESSES. GEORGE EKTEL, Quincy, Ill. Filed Oct. 15, 1888. Serial No. 288,065. (No model.)



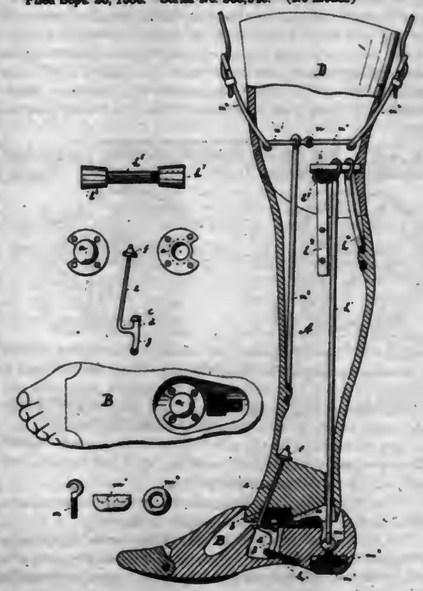
Claim.—1. The combination, with the plunger-pitman and the sweep having two rollers or bearing-points on its head, of a knuckle or link pivoted at one end to the press-frame at a point between the sweep-head pivot and the range of travel of the rollers or bearing-points of the sweep-head and pivoted at its other end to the plunger-pitman, so as to give two effective rearwardly-pushing strokes of the plunger for each complete turn of the sweep, said knuckle having an outer face formed with a curve or incline where the sweep-head first strikes it to give a quick initial movement to the plunger and assure its gradually-decreasing speed as the plunger is completing its rearward effective pushing stroke, substantially as herein set forth.

2. The combination, with the plunger-pitman and the sweep having a bearing point or roller on its head and a knuckle or link pivoted at one end to the press-frame at a point between the sweep-head pivot and the range of travel of the sweep-head bearing point or roller and pivoted at its other end to the pitman, of a spring arranged to be struck and put in tension by the pitman to assure rebound of the plunger after the sweep-head bearing point or roller slips past the end of the knuckle, substantially as herein set forth.

3. The combination, with the bed or frame A and the front truck, *d* D D, of the press, of a yoke, C, connected to the axle, a plate, *e*, on the frame and resting on the yoke, a vertical shaft, B, on the frame and passing through the parts *e* C as a king-bolt, a sweep-head, F, on said shaft, a sleeve, I, and pin *b* on the shaft, and a knuckle, L, pivoted at *l* to the press-frame and adapted for engagement by the sweep-head, substantially as shown and described.

4. The combination, with the press-frame, of a bracket, E, having base *e* and ledge *e′*, a shaft, B, and pin *b*, a knuckle, L, pivoted on a pin, *l*, between the parts *e e′* and connected at its outer end to the plunger-pitman, a sweep having a head, F, fulcrumed on the shaft B and having rollers K K, a sleeve, I, on said shaft, a track, P, on the press-frame, and a roller, *o*, next the joint of the knuckle and pitman, substantially as herein set forth.

401,425. GEARING FOR BICYCLES. WILLIAM J. FITZPATRICK, South Boston, Mass. Filed Jan. 31, 1889. Serial No. 298,207. (No model.)



Claim.—1. In combination, the internal driving-gear, D, the pedal-arm and its shaft, an arm, *g*, also attached to and operated by said shaft, a pawl-gear, J, having its bearings in slots in the said arm *g* and meshing with the driving-gear, and a locking-pin, L, attached to the said arm and adapted to enter the tooth of the pawl-gear to lock the same.

2. In combination, the internal driving-gear, D, the pedal-arm and its shaft, an arm, *g*, also attached to and operated by said shaft, a pawl-gear, J, having its bearings in slots in the said arm *g* and meshing with the driving-gear, a locking-pin, L, attached to the said arm and adapted to enter the tooth of the pawl-gear to lock the same, and stops K K, located upon an adjacent portion of the fork or non-revolving part of the device and adapted to engage with a portion of the arm *g* to stop its motion and that of its connected parts, as described.

3. In combination, the pedal-arm-returning mechanism herein described, consisting of the pedal-arm F, with its shaft *f*, having an arc-shaped projection, *f′*, formed thereon, and the gear C, having the projection N, adapted to strike against the said projection *f′* to return the pedal-arm to its upper position.

4. In combination with the fork G, the cover-plate I, adapted to be attached thereto, the said plate being provided with stops K K, for the purpose set forth, and also with a box, *i*, to form a bearing for the pedal-arm shaft.

401,426. ARTIFICIAL LEG. CHANCY A. FERRIS, New York, N. Y. Filed Sept. 20, 1888. Serial No. 285,846. (No model.)

Claim.—1. The combination of leg A and foot B, with the bulged plate *a* forming a ball on one side and a socket on the other, and with a ball engaging the socket of said plate, and with a socket for receiving the ball of said plate, substantially as specified.

2. The combination of leg A and foot B, with bulged plate *a*, and with a forked bar provided with ball *c*, and with spring *k*, substantially as specified.

3. The combination of leg A and foot B, with bulged plate *a*, and with a forked bar, one arm of which carries a ball, *c*, the second arm of which is connected to a fixed support, and the third arm of which is connected to a spring, *k*, substantially as specified.

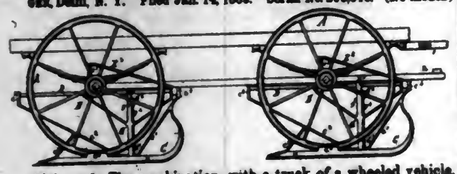
4. The combination of leg A and thigh D, with bolt A^3, having conical head A^3 at one end, and with conical nut A^7, that receives the other end of the bolt, and with the braces A^5, substantially as specified.

5. The combination of leg A and foot B, with the heel-tendon *k'*, and with the hook *m* connected therewith, and with the grooved plate *m'* engaging the hook, and with gasket m^2 within said grooved plate, substantially as specified.

6. The combination of leg A, foot B, and thigh D, with the pivot *n* traversing the thigh, and with the equalizing-bar *n'* turning on said pivot and adapted to be connected to the shoulder-strap, substantially as specified.

401,427. COMPOSITION OF MATTER FOR THE PRODUCTION OF ARTIFICIAL SCHOOL-SLATES, &c. HUGO GALLINOWSKY, Rochester, N. Y., assignor of one-half to Henry L. Becker, same place. Filed Jan. 30, 1889. Serial No. 298,069. (No specimens.)

Claim.—The composition of matter herein described, consisting of muriatic acid, water, burnt magnesia, white bone-ash, mineral flour, and pumice-stone flour, in proportions substantially as named, and for the purposes specified.



401,428. PROCESS OF DETERMINING THE CENTER OF ATTRACTION IN POLARIZED BODIES. ADOLPHUS GIFFERICH, Richmond, Va. Filed Jan. 19, 1889. Serial No. 296,821. (No model.)

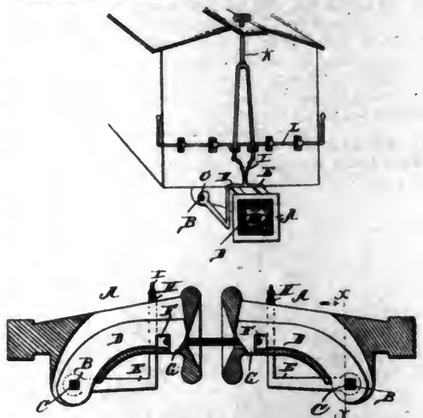
Claim.—1. The mode or process of determining the center of attraction or point of leverage in a polarized body, which consists in neutralizing such body against the influence of terrestrial magnetism, loading the poles of the body with a substance capable of being attracted and held thereby, removing the load from one of the poles, weighing such load, and suspending an equal weight from said pole at a point where it will equilibrate the load at the opposite pole, as described, for the purposes specified.

2. In the art of determining the center of attraction or point of leverage in a polarized bar or beam, the herein-described process of neutralizing such body as against the influence of terrestrial magnetism, which consists in magnetizing or polarizing an equilibrated bar or beam and maintaining such bar or beam in a state of equilibrium as against the force of terrestrial magnetism by a weight suspended from one of the links thereof, substantially as and for the purposes specified.

401,429. RUNNER FOR WHEELED VEHICLES. JAMES B. GRAHAM, Delhi, N. Y. Filed Jan. 14, 1889. Serial No. 296,316. (No model.)

Claim.—1. The combination, with a truck of a wheeled vehicle, of the horizontally-hinged and longitudinally-sliding runners hung to the axle-tree, whereby said vehicle can be mounted upon said runners, as a sleigh, and also dismounted from said runners and remounted upon wheels, as a carriage, substantially as described.

2. In combination with the axle B of a vehicle, a spring-support E E^2 E^3 e^4 e^5, clamp F, sliding and revolving rod D, and runner C, substantially as and for the purpose described.

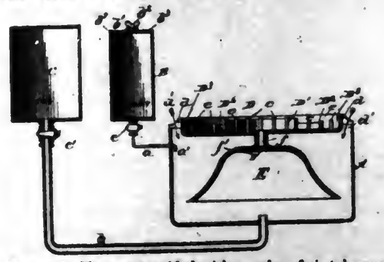


3. The combination of a folding and sliding runner C, wheel-axle B, frame I, and spring-bolt G^3, substantially as described.

4. The combination of a sliding and folding runner, C, having a spring-support upon the axle B of a vehicle, the swinging brace G, having a spring-bolt, G', and notches e^4 e^5 in the runner, substantially as and for the purpose described.

5. The combination of the swinging brace G, spring-bolt G', rods g^4 g^5, bell-crank lever G^2, levers i^7, links i^8, and sliding block i^9, substantially as and for the purpose described.

6. In combination with the bearing E and brace G, the spring e^5, substantially as and for the purpose described.



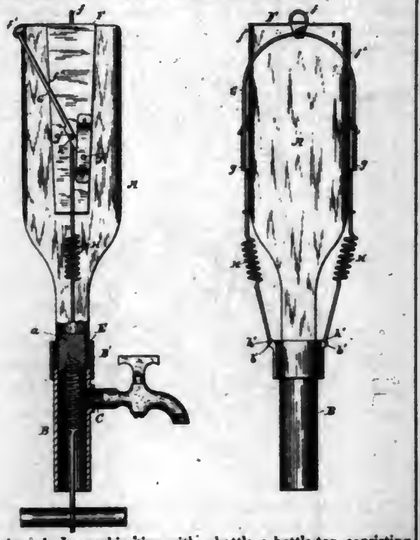
401,430. CAR-COUPLING. DAVID U. GRAVELINE, Chicago, Ill. Filed Jan. 9, 1889. Serial No. 296,820. (No model.)

Claim.—1. In a car-coupling, the combination of the draw-head, the pivot-bolt inserted transversely through the rear portion of the draw-head and having angular portions the uncoupling-yoke having its rear ends secured to the outer angular portions of the pivot-bolt, the coupling-hook having its rear end secured to the central angular portion of the pivot-bolt, and the link adapted to engage said hook, as set forth.

2. The combination of the draw-head, the pivot-bolt mounted therein, the coupling-hook and uncoupling-yoke secured thereto, the rod K, connected to the uncoupling-yoke, and the crank-shaft connected to said rod K, as set forth.

401,431. HYDROCARBON-BURNER FOR FURNACES. GRAVES GRIFFITH and THEODORE L. MILLER, Blanchard, Iowa. Filed Oct. 10, 1888. Serial No. 287,753. (No model.)

Claim.—1. The pan provided with a series of air-tubes and having a series of concentric rings of varying height, forming annular chambers, in which said air-conducting tubes are distributed, and means for supplying oil to the inner chamber, as shown and described.



2. The pan having a series of concentric rings forming annular chambers, which are of varying height, and a series of air-conducting tubes distributed in said chambers, their upper ends projecting above the top edges of the chambers in which they are respectively located, and means for supplying oil to the inner chamber of the series, as shown and described.

3. The combination, with the pan for receiving and holding oil and the oil and water tank A, above which said pan is located, of the bell-shaped chamber E, arranged in said tank and connected with the pan, as shown and described.

4. The combination of the pan having a series of concentric rings of varying height, forming annular chambers, the series of air-tubes interspersed throughout said sub-chambers and opening through the bottom of the pan, and the conical or bell-shaped chamber depending from the bottom of the pan and communicating therewith through a tube or neck, substantially as specified.

5. The combination, with the receptacle A and connecting oil-tank and water-tank, of the pan having a series of concentric rings of varying height, forming annular oil-chambers, and the conical or bell-shaped chamber depending from the bottom of the pan and communicating therewith, the pipes connecting said water and oil tanks together being provided with cocks, while the discharging end of the water-supply pipe is turned down to submerge it below the water-level in said receptacle, substantially as specified.

401,432. BOTTLE-TAP. ELIAS H. GRISWOLD, Baker City, Oreg. Filed Oct. 15, 1887. Serial No. 252,451. (No model.)

Claim.—1. In combination with a bottle, a bottle-tap consisting of an open-ended tube secured upon the neck of the bottle, and a faucet communicating therewith at one side and midway the length of the tube, the bore of such tube being substantially equal in diameter to that of the neck of the bottle, as set forth.

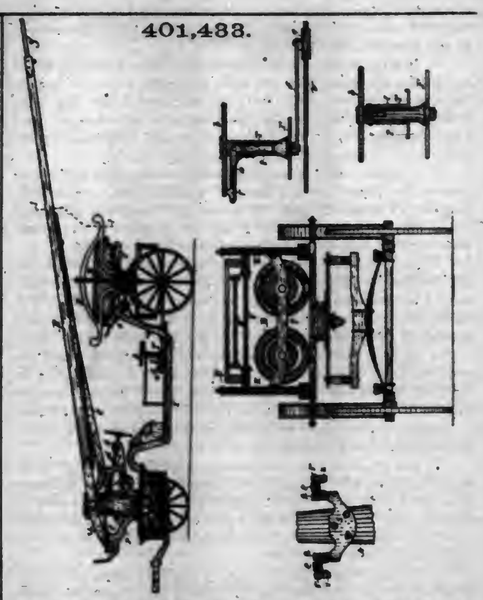
2. In combination with a bottle, a bottle-tap provided with an open-ended tube of substantially the same bore as the neck of the bottle, having one end enlarged by a supplemental tube to fit over the said neck, and a faucet communicating with said chamber at one side and midway the length of the tube, in combination with a spring-fastening which serves to secure the tap in position on the bottle, as set forth.

3. In combination with the tap, the bent plate embracing the bottom and sides of the bottle, the bail pivoted thereto, and the springs connecting the tap with the bail, and means for holding the bail in a locked position, as set forth.

4. The combination, with a bottle, of a tap consisting of the faucet and the tube having an enlarged end fitting over the bottle, the packing-ring, the springs with hooked ends, the bail having perforations to receive the hooks, the plate to which the bail is pivoted formed with a loop by which to suspend the bottle, and a hook to secure the bail, as set forth.

5. A bottle-tap-attaching device consisting of a bent plate to embrace the bottom of the bottle, a bail pivoted thereto, and a pair of coiled springs having hooked ends, one of which engages with said bail and the tap, and means for securing the bail in a locked position, as set forth.

401,433. FIRE-LADDER. LEVI HARRIS, Kalamazoo, Mich. Filed Dec. 6, 1887. Serial No. 257,125. (No model.)



Claim.—1. In combination, a ladder-support, a ladder fulcrumed at its base to said support and having the end extensions beyond said fulcrum, and springs exerting a downward leverage on said end extensions to assist in raising the ladder, substantially as set forth.

2. In combination, a ladder-support, a ladder fulcrumed at its base to said support and having the end extensions, a two-part lever having the angled end, one part sliding within the other, said lever at the angled end having a pivotal support, the other end being pivoted to the end extension of the ladder, and a spring attached to the angled end of said lever and exerting a downward leverage on the lever to assist in raising the ladder, substantially as set forth.

3. In combination, a ladder-support, a ladder fulcrumed to said support and having the end extensions beyond the fulcrum, a pivoted lifting-lever, a screw for operating said lever, and a spring or springs exerting a downward leverage on the end extensions of the ladder to assist the lifting-lever and screw in raising the ladder, substantially as set forth.

4. In combination, a ladder-support, a ladder fulcrumed to said

401,433.

support at its base and having the end extensions beyond the fulcrum, a lifting-lever pivoted to a support, a screw for operating said lever, levers made in two parts, one part sliding within the other and having the angled ends, said ends pivoted to a support, the other ends being pivoted to the end extensions of the ladder, and the springs exerting a downward leverage on said extensions to assist the lifting-lever and screws in raising the ladder, substantially as set forth.

5. In combination, a truck having the revoluble pillar mounted thereon, a ladder having the end extensions and being pivoted to said pillar back of said extensions, a transverse bar attached to said pillar and provided with an elbow end each side of the pillar, levers capable of lengthening and shortening and being pivoted at one end to the elbow ends of said bar and having the angled ends, the other end of these levers being pivoted to the end extensions of the ladder, and the springs attached to the angled ends of the two-part levers and to the elbow ends of the transverse bar, said springs and their levers exerting a downward leverage on the end extensions of the ladder to assist in raising said ladder, substantially as set forth.

6. In a tiller for a truck, the combination of the tiller-wheel, a pivoted foot-lever, and a spring-actuated dog pivoted to said lever in position to engage the tiller-wheel and lock the tiller in its normal position, substantially as set forth.

7. The combination of the truck-body, the transverse support, the hollow standard mounted upon said support, the tiller-wheel and its vertical shaft, the latter being revoluble in said support, the vibratory arm attached to the wheel-shaft, the forked lever, a sliding collar thereon, to which collar the end of the vibratory lever is pivoted, and the wheeled axle to which the forked lever is attached, substantially as set forth.

401,434. PROCESS OF TANNING. JAMES W. HITT, Lisle, assignor to Theodore L. Corwin, Marathon, N. Y. Filed Jan. 14, 1889. Serial No. 296,329. (No specimens.)

Claim.—The improved mode of tanning heretofore described, which consists in submitting the depilated hides to a mixture of saltpeter, alum, and Glauber's salt in admixture with a bark-liquor, in the proportion and manner and during the time substantially as set forth.

401,435. PEN-HOLDER. LOUIS M. HOPKINS, Chicago, Ill. Filed Aug. 13, 1888. Serial No. 282,540. (No model.)

Claim.—1. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen and a spiral plug secured within the open end of said stem, said plug being sufficiently less in diameter than the interior of said stem to afford space for the admission of the pen between them, substantially as set forth.

2. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen and a spiral plug of sufficiently less diameter than the interior of said stem to afford space for the admis-

sion of the pen between them, removably secured within the open end of said stem, substantially as set forth.

3. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen and a spiral plug formed of springy material and secured within the open end thereof, said plug being sufficiently less in diameter than the interior of said stem to afford space between them for the admission of the pen, substantially as set forth.

4. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen, and a longitudinally-compressible plug secured within the open end thereof, said plug being sufficiently less in diameter than the interior of said stem to afford space between them for the admission of the pen, substantially as set forth.

5. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen, and a longitudinally-compressible spiral plug secured within the open end thereof, said plug being sufficiently less in diameter than the interior of the stem to afford space between them for the admission of the pen, substantially as set forth.

6. In a pen holder, the combination of a hollow stem open at one end for the admission of the pen, and a spiral plug situated within the open end thereof, said plug being sufficiently less in diameter than the interior of the stem to afford space between them for the admission of the pen, and having its inner end secured so as to prevent its accidental displacement, substantially as set forth.

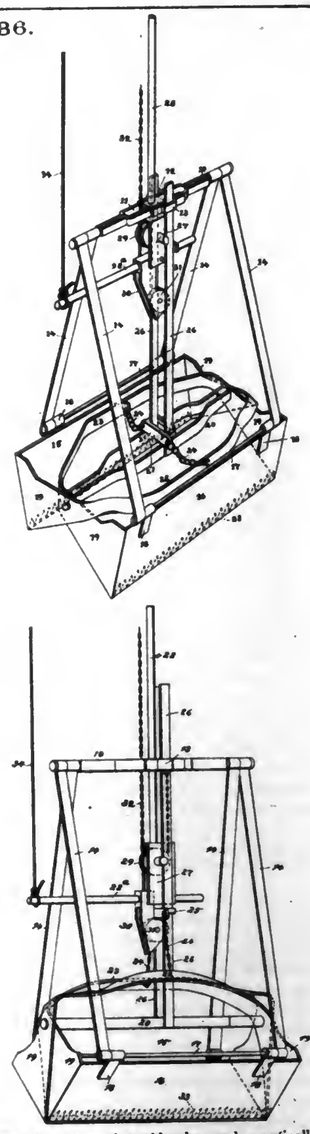
7. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen, and a spiral plug situated within the open end thereof, said plug being sufficiently less in diameter than the interior of the stem to afford space between them for the admission of the pen, and having one of its convolutions enlarged or bent outward, substantially as set forth.

8. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen, and a spiral plug situated within the open end thereof, said plug being sufficiently less in diameter than the interior of the stem to afford space between them for the admission of the pen, and having its innermost convolution enlarged or bent outward, substantially as set forth.

9. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen, and a spiral plug situated within the open end thereof, said plug being sufficiently less in diameter than the interior of the stem to afford space between them for the admission of the pen, and said stem having upon its interior a shoulder for engaging said plug and preventing its accidental displacement, substantially as set forth.

10. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen, and a spiral plug situated within the open end thereof, said plug being sufficiently less in diameter than the interior of said stem to afford space between them for the admission of the pen, and said stem having upon its interior shoulders for engaging said plug and preventing its accidental displacement in either direction, substantially as set forth.

11. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen, and a spiral plug sufficiently less in diameter than the interior of the stem within which it is situated to afford between them necessary space for the admission of the pen, and having one of its convolutions enlarged or bent outward, said stem having upon its interior a shoulder for engaging said enlarged or bent convolution and preventing displacement of the plug, substantially as set forth.



12. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen, and a spiral plug of less diameter than the interior of the stem secured within the open end thereof, the internal surface of said stem and external surface of said plug converging inward, substantially as and for the purpose set forth.

13. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen, and a spiral plug secured within the open end thereof, said plug being tapered inward or from the open end of the stem, substantially as set forth.

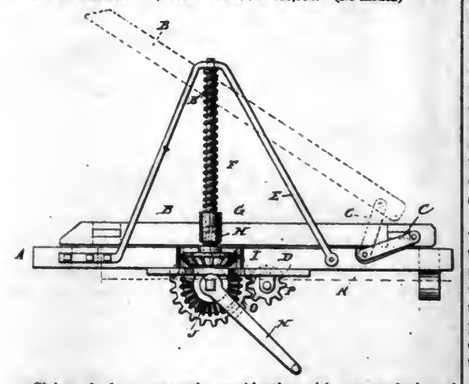
14. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen, and a spiral plug slightly less in diameter than the interior of said stem secured within the open end thereof and protruding slightly therefrom, the outer convolution of said plug being enlarged or bent outward, substantially as and for the purpose set forth.

15. In a pen-holder, the combination of a hollow stem open at one end for the admission of the pen, and an inward tapering spiral plug secured within the open end thereof and protruding slightly therefrom, the outer convolution of said plug being enlarged or bent outward, substantially as set forth.

401,486.

401,486. DREDGING-BUCKET. REBIE HOSFORD, Lebanon, Ind. Filed Sept. 26, 1888. Serial No. 286,432. (No model.)

Claim.—1. The combination, with a frame and shovels pivoted to said frame and to each other, of yokes oppositely curved, secured to the shovels, a link connecting said yokes, and a vertically-reciprocating latch engaging said link, substantially as shown and described.



2. The combination, with a frame and shovels pivoted to said frame and to each other, of yokes oppositely curved, secured to the shovels, a link connecting said yokes, a vertically-reciprocating carriage, a latch pivoted in the carriage, engaging the link, and means, substantially as described, for manipulating said carriage, as and for the purpose specified.

3. The combination, with a frame, shovels pivoted to said frame and to each other, and yokes oppositely secured to the shovels, of a link connecting the yokes, a vertically-reciprocating carriage provided with a grooved pulley, a counterbalanced latch pivoted in the carriage, and a chain attached to the frame, passing over the carriage-pulley and upward beyond the frame, substantially as shown and described.

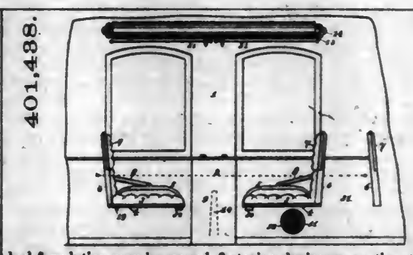
4. The combination, with a frame, shovels pivoted to said frame and to each other, yokes oppositely secured to the shovels, and a link connecting said yokes, of a vertically-reciprocating carriage provided with a pulley, a latch pivoted in said carriage, engaging said link, a trip-bar extending an unequal distance each side of the latch, and a chain attached to the frame, passing over the carriage-pulley and upward beyond the said frame, substantially as shown and described.

5. The combination, with a frame consisting of an apertured head and downwardly-extending oppositely-disposed arms, shovels pivoted to said arms and to each other, oppositely-curved yokes secured to said shovels, a link connecting said yokes, and vertical guide-rods secured to base-bar 20, of a carriage sliding upon said guide-rods, containing a grooved pulley, a manipulating-rod integral with the top of the carriage, a latch pivoted in the lower end of the same, a trip-bar extending an unequal distance from the sides of the latch, a chain attached to the frame, passing over the carriage-pulley and upward beyond the frame, and means, substantially as described, for manipulating the trip-bar, as and for the purpose specified.

401,487. DUMPING-WAGON. WILLIAM JACHMANN, New York, N. Y. Filed Nov. 12, 1888. Serial No. 290,557. (No model.)

Claim.—1. In a wagon, the combination, with a wagon-body and a wagon-bed pivotally connected at its rear end to the said wagon-body, of two nuts connected with each other by a rod, on which rests the front end of the said wagon-bed, upright screws held to turn in suitable bearings on the said wagon-body, and on which screw said nuts, and a turning mechanism located under the wagon-body for imparting a simultaneous rotary motion to the said screws, substantially as shown and described.

2. In a wagon, a wagon-bed, a wagon-body, and links for connecting the rear ends of the said wagon-bed with the wagon-body, in combination with a transversely-extending rod, on which rests the front end of the wagon-bed, nuts secured on the outer ends of the said transversely-extending rod, upright screws held to turn in suitable bearings on the wagon-body and screwing in the said nuts, a transversely-extending shaft mounted to rotate in suitable bearings on the wagon-body and connected by gear-wheels with the said upright screws, and a crank-arm for turning the said shaft, substantially as shown and described.



3. In a wagon, a wagon-bed, a wagon-body, and links for connecting the rear ends of the said wagon-bed with the said wagon-body, in combination with a transversely-extending rod, on which rests the front end of the wagon-bed, nuts secured on the outer ends of the said transversely-extending rod, upright screws held to turn in suitable bearings on the wagon-body and screwing in the said nuts, a transversely-extending shaft mounted to rotate in suitable bearings on the wagon-body and connected by gear-wheels with said upright screws, and a second shaft mounted to turn in suitable bearings on the under side of the said wagon-body and geared with the said first-named shaft, substantially as shown and described.

4. In a wagon, a wagon-bed, a wagon-body, and links for connecting the rear ends of the said wagon-bed with the said wagon-body, in combination with a transversely-extending rod, on which rests the front end of the wagon-bed, nuts secured on the outer ends of the said transversely-extending rod, upright screws held to turn in suitable bearings on the wagon-body and screwing in the said nuts, a transversely-extending shaft mounted to rotate in suitable bearings on the wagon-body and connected by gear-wheels with said upright screws, a second shaft mounted to turn in suitable bearings on the under side of the said wagon-body and geared with the said first-named shaft, and a crank-arm for turning the said second shaft, substantially as shown and described.

401,488. COMBINED SLEEPING AND DAY CAR. HENRY M. JONES, Denver, Colo. Filed Mar. 31, 1888. Serial No. 269,195. (No model.)

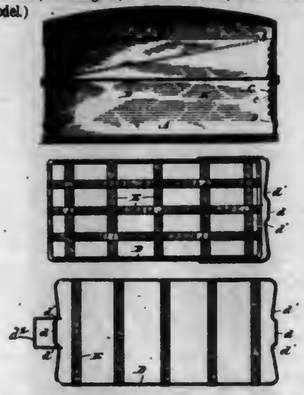
Claim.—1. The combination of the seats of a section, the seats being pivoted at or near their rear edges in the seat-frame and adapted to fold up against the seat-backs, a mattress or bed-foundation secured to a roller journaled under one seat, and upon which the mattress or

401,488.

bed-foundation may be wound, fastening devices upon the other end thereof, and coacting fastening devices secured beneath the other seat, substantially as set forth.

2. The combination, in a car-seat, of a seat portion, 3, pivoted at or near one edge in the seat-frame, and a back having its base or foundation vertically divided through a portion of its width, such division dividing the cushioned front or front proper thereof into two parts, one permanently or rigidly secured to such base or foundation and the other part, 7, being secured thereto by single hinges at the top of the back, whereby the part 7 may be turned outwardly and over upon the top of the back to extend it upwardly, substantially as set forth.

3. The combination of a roller pivotally secured or journaled upon the side of the car, a mattress or bed-foundation secured at one side thereto and provided with hooks upon or near its ends, arms or rods pivotally secured to the side of the car—one at either end of the mattress or bed-foundation—and adapted to be turned outwardly from the side of the car to support the mattress or bed-foundation, rods 22, pivoted to and in use depending from the ceiling to support such rods or arms, and diagonal braces 23, also pivoted to and depending from the ceiling to steady the same, substantially as described.



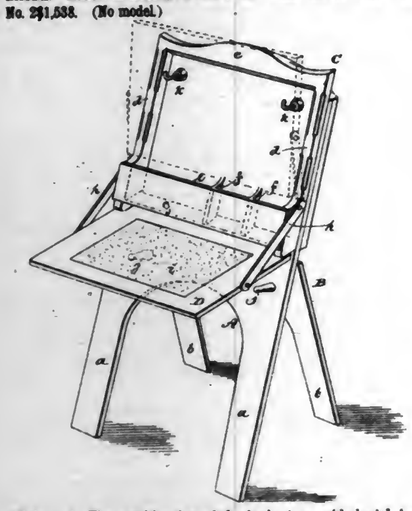
4. The combination, with the rolling mattress or bed-foundation, of side and end wings secured thereto along one edge and adapted to be folded and rolled therewith, and provided with fastening devices along or near the opposite edges, whereby they may be secured in position to surround and form the walls of a berth, substantially as set forth.

5. The combination, with the seats of a section, of half-gates hinged to the side framings of the seat, a half-gate on either side, and adapted to be closed to form a solid front frame for the lower berth, substantially as set forth.

6. The combination of the upper rolling mattress, 13, provided with hooks 17, supporting-rods 21 therefor pivoted each at one end to the side of the car, the brace-rods 22 and 23, pivoted at one end to the ceiling and depending therefrom to support and brace the rods 21, and the catches 24, for holding the brace-rods, when not in use, against the ceiling or roof, substantially as set forth.

7. The combination, with the upper rolling mattress, 13, of end wings, 15, and side wing, 16, each secured thereto along one edge and provided along their opposite edges with fastening devices 18, substantially as set forth.

401,489. FOLLOWER FOR TRUNKS OR PACKING-BOXES. KING I. KARO, Washington, D. C. Filed Oct. 2, 1888. Serial No. 286,993. (No model.)



Claim.—1. The combination, with a trunk or packing-box provided with series of ratchet-notches on its inner walls, of a follower, the end of the follower adjacent to one of the series of ratchet-notches having a horizontally-yielding movement for engaging and disengaging said notches, substantially as set forth.

2. The combination, with a trunk or packing-box provided with series of ratchet-notches on its opposite inner walls, the upper walls of the notches being concave, of a follower having a horizontally yielding end adapted to engage the concave walls of the notches, substantially as set forth.

3. The herein-described follower, consisting of a frame formed of wire having strips of webbing stretched across it, and a dog pivoted on one end of the frame, in combination with a series of ratchet-notches secured to the inner wall of a trunk or box, substantially as set forth.

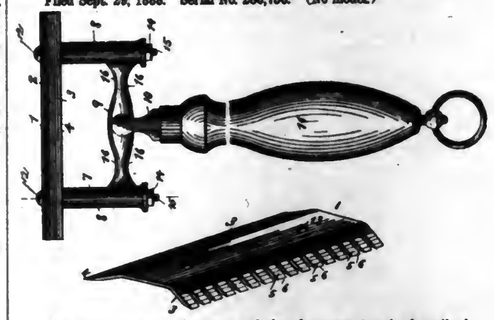
4. The herein-described follower, consisting of a frame formed of wire having portions of its end bent inwardly, a dog loosely mounted on one end of the frame, and transverse strips of webbing stretched across the frame, in combination with a series of ratchet-notches secured to the inner wall of a trunk or box, substantially as set forth.

401,440. COMBINED WRITING-DESK, DRAWING-BOARD, AND EASEL. HENRY L. KEITH, Stockton, Cal. Filed July 31, 1888. Serial No. 281,538. (No model.)

Claim.—1. The combination of the body A, provided with board C, secured to its front face, the board B, hinged to the back of the body, and the board D, pivotally connected to the body by straps *h*, and having its rear edge, when lowered into a horizontal position, resting under the lower end of the board C, substantially as described.

2. The combination, with the body A, provided with the legs *a*, of the hinged board B, having legs *b*, the cross-piece *c*, side pieces, *d*, the boards *e f g*, the straps *h*, and the board D, substantially as specified.

3. The combination, with the body A, provided with the legs *a*, of the hinged board B, having legs *b*, the cross-piece *c*, side pieces, *d*, the boards *e f g*, the straps *h*, the board D, and the pins *j*, inserted in the body A, substantially as specified.

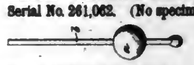


401,441. METHOD OF MOUNTING PORTRAITS. PHILIP G. KRAMER, Jr., Detroit, Mich., assignor of one-half to Caspar H. Schulte, same place. Filed Apr. 19, 1888. Serial No. 271,206. (No model.)

Claim.—1. The herein-described method of mounting pictures, which consists in first tinting the portrait, then applying liquid cement over the card surrounding the portrait, and then sprinkling on said cemented surface a covering of flaked hematite and flaked metallic bronze, as and for the purposes specified.

2. The method of finishing portraits, which method consists in first tinting or coloring the portrait, then coating the untinted portion or front surface of the picture with cement, and then sprinkling on the cemented surface a coating of flaked hematite, as and for the purposes specified.

401,442. SCRAPER. ETIENNE L. LEVEQUE, New York, N. Y. Filed Sept. 29, 1888. Serial No. 286,756. (No model.)



Claim.—1. A wood-scraper of the character herein described, constructed with a blade having a central horizontal portion and edge portions abruptly inclined at an angle to the central horizontal portion, one of which edge portions has a beveled scraping-edge and the other a scraping-edge formed with short teeth, substantially as shown and described.

2. In a scraper, the combination, with frame 7, having tubular arms 8, of the blade 1 and the bolts 12, substantially as shown and described.

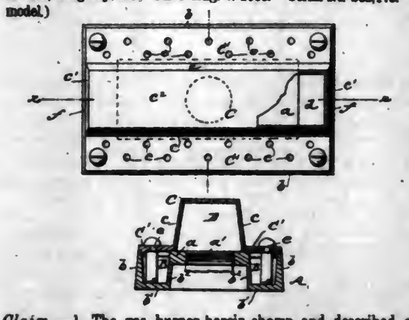
3. A scraper consisting of the blade 1, formed with the central horizontal portion, 2, and the inclined portions 3, one of which has the beveled scraping-edge 4 and the other the scraping-teeth 5, with beveled edges 6, the metallic frame 7, consisting of tubular arms 8, connected by cross-bar 9, having depressions 16, bolts 12, passing through holes 13 in blade 1 and tubular arms 8, and secured by nuts 14, engaging the ends of bolts 12, and the handle 11, secured to frame 7, substantially as shown and described.

4. In a scraper, as herein described, the blade 1, formed with a central horizontal portion, 2, and edge portions 3, abruptly inclined at an angle to the central horizontal portion, 2, one of said portions, 3, having the beveled scraping-edge 4 and the other the short scraping-teeth 5, with beveled edge 6, substantially as shown and described.

401,443. MATCH. FREDERICK LEIBE, New York, N. Y. Filed Jan. 17, 1888. Serial No. 261,062. (No specimens.)

Claim.—As a new article of manufacture, a match provided with a globule or ball of sealing-wax attached directly to the stem or body thereof, substantially as set forth.

401,444. INCANDESCENT LAMP. HERMANN LEMP and MERLE J. WIGHTMAN, Hartford, Conn., assignors to The Schuyler Electric Company, of Connecticut. Filed Sept. 14, 1886. Serial No. 213,484. (No model.)

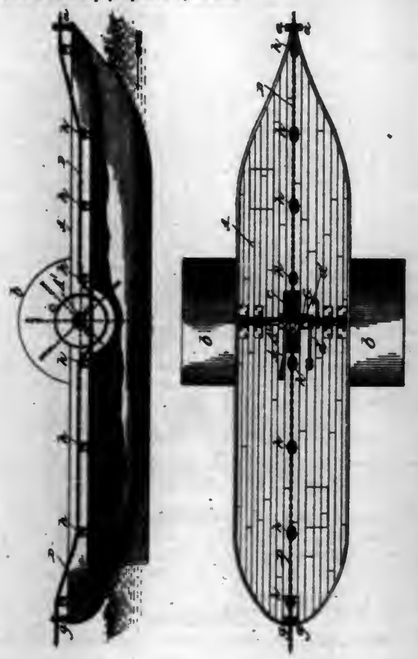


Claim.—1. A leading-in wire for an incandescent electric lamp and a conductor flattened through the portion within the glass of the globe, the flattened portion having rounded edges, substantially as and for the purpose described.

2. In an incandescent electric lamp, a sheet-metal entering-conductor consisting of a thin metal plate within the lamp and formed with longitudinal corrugations, as and for the purpose set forth.

3. The herein-described method of constructing electric incandescent lamps, which consists in forming a sheet-metal blank with two legs or bifurcations separated from one another, sealing the said bifurcated portions of the blank and dividing the blank longitudinally on a line passing between the two legs or bifurcations to make a separate insulated support for attachment to the ends of the incandescent conductor.

401,445. GAS-BURNER FOR HEATING PURPOSES. PHILLIP LEISER, Ridgway, Pa. Filed Aug. 7, 1888. Serial No. 282,173. (No model.)

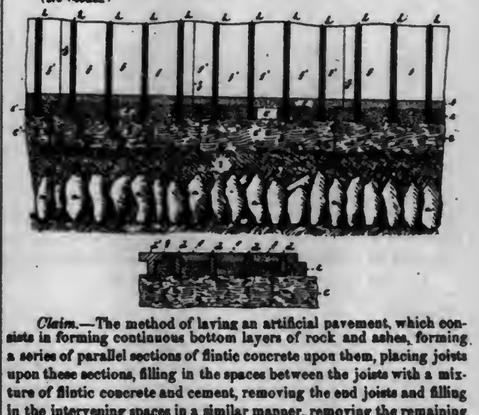


Claim.—1. The gas-burner herein shown and described, constructed to form a top chamber to which the gas is first applied, an end passage leading from said top chamber downward, and side chambers or channels on a lower level than the top chamber and communicating therewith through said end passage, said side chambers being covered by perforated plates, substantially as described.

2. A gas-burner consisting in the raised bottom *a*, having a surrounding channel, B, around its sides and ends, the top of the channel being open, and the raised bottomless cap-plate C, resting at its lower longitudinal edges on the side edges of the bottom *a* and with its end walls, *c'*, on the outer end walls, *f f*, of the chamber B to form the end passages, *d d*, and formed with the perforated side plates, C' C', forming covers for the side of the channel B, the chamber D, formed by said cap-plate, being provided with a gas-inlet, substantially as set forth.

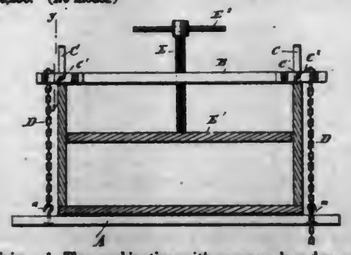
401,446. CURRENT-PROPELLER FOR VESSELS. ERNST LOTES, Spokane Falls, Wash. Filed July 24, 1888. Serial No. 280,935. (No model.)

Brief.—The current strikes against paddle-wheels, which set in motion a shaft bearing a sprocket-wheel. The sprocket-wheel is brought into contact with a chain anchored along the river-bed, and the vessel is thereby propelled up stream.



Claim.—1. The boat, substantially as described, provided with a main wheel and with guide-rolls by which to direct the chain into contact with said wheel, the upper surface of the rolls adjacent to the said main wheel being arranged above the lower surface of the main wheel, whereby the chain passed over such guide-rolls and under the main wheel will be held firmly in contact with such main wheel and the chain passed over said guide-rolls and under the main wheel, substantially as set forth.

2. An improved boat, substantially as described, provided with a shaft suitably journaled and having a wheel or wheels arranged to be turned by the current, a main wheel carried by and loose with reference to said shaft, a clutch by which to key the said wheel to such shaft, and guides located on said boat by which to direct an anchored chain into contact with said main wheel, substantially as set forth.

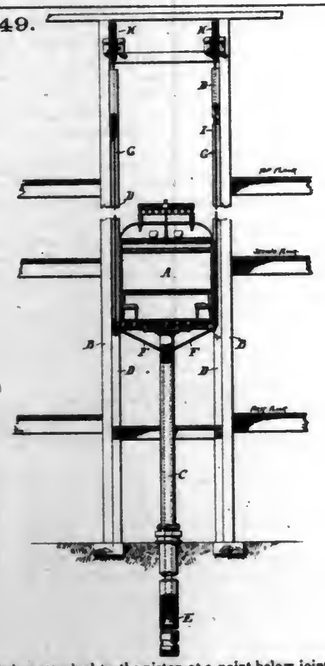


3. The combination, in a boat, substantially as described, of the boat hull or body, the shaft journaled thereto and bearing the undershot side wheels at its ends, the main wheel C, loose on such shaft, the clutch by which such wheel may be keyed on the shaft, the brake consisting of disk D' on the shaft, the pawl *f*, and the vertical and horizontal guide-rollers, and the chain guided by said rollers and engaging the main wheel, substantially as set forth.

401,447. METHOD OF LAYING ARTIFICIAL PAVEMENT. JOHN W. MACKNIGHT, New York, N. Y. Filed Jan. 2, 1889. Serial No. 295,197. (No model.)

Claim.—The method of laying an artificial pavement, which consists in forming continuous bottom layers of rock and ashes, forming a series of parallel sections of flintic concrete upon them, placing joists upon these sections, filling in the spaces between the joists with a mixture of flintic concrete and cement, removing the end joists and filling in the intervening spaces in a similar manner, removing the remaining joists, and filling in the grooves with a yielding mixture, substantially as specified.

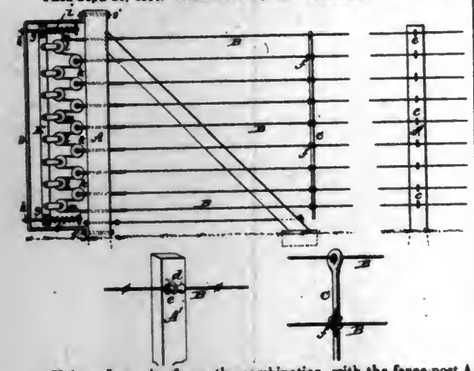
401,448. PORTABLE TOBACCO-PRESS. IRVING A. MCKIBLEY, Cicero, N. Y. Filed Apr. 12, 1888. Renewed Jan. 31, 1889. Serial No. 298,253. (No model.)



Claim.—1. The combination, with an upper board provided with rests, a screw passing through said upper board, and a follower engaging the lower end of said screw, of a bottom board and a detachable link-connection between the ends of the said upper and lower boards, substantially as and for the purpose herein set forth.

2. The combination, with an upper board provided with adjustable essentially U-shaped rests, a screw passing centrally through said board, having a hand-hold at the upper end, and a plate or follower engaging the lower end of the screw, of a bottom board having eyes attached at the ends and a chain secured to the ends of the upper board and detachably engaged with said eyes, substantially as and for the purpose herein set forth.

401,449. ELEVATOR. WILLIAM H. MILLIKEN, Philadelphia, Pa. Filed Nov. 22, 1888. Serial No. 291,557. (No model.)



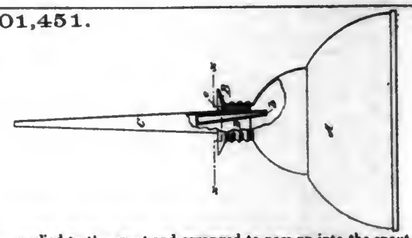
Claim.—In an elevator system having a car and an actuating-piston attached to the bottom thereof, the combination, with said piston, of a counterbalance-weight and a rope supporting the same,

401,449.

said rope being attached to the piston at a point below joint with the car, substantially as set forth.

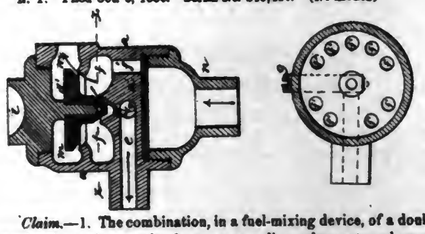
401,450. WIRE FENCE. WILLIAM H. MITCHELL, Horse Cave, Ky. Filed Sept. 29, 1888. Serial No. 286,767. (No model.)

Claim.—In a wire fence, the combination, with the fence-post A and wires B B, of the outer fixed bar or casing, D, the loose bar E, arranged between said post and said outer bar, adjustable spring-tension devices applied to said bars D and E, the sheaves or pulleys *k l*, connected, respectively, with the bar E and ends of the wires B B, and the flexible connection or rope *m*, arranged to pass around said pulleys and connected at its ends with the upper and lower wires of the fence, substantially as and for the purposes specified.



401,451. OIL-CAN. HENRY MULLER, New York, N. Y. Filed Feb. 15, 1889. Serial No. 299,957. (No model.)

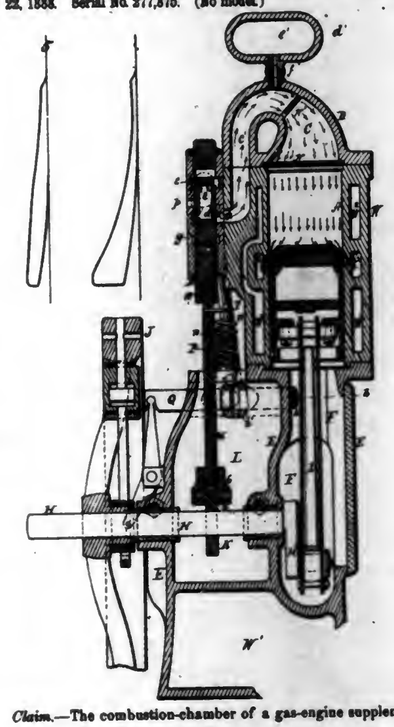
Claim.—1. In an oil-can, the combination, with the spout and drip pan or cup of a can, of a tube applied to the spout arranged to pass up into the spout and down into the can, and provided with a combined drip-aperture and air-vent intermediately of its length and above the drip pan or cup, substantially as specified.



2. In an oil-can, the combination, with the body of the can and its drip pan or cup and spout, of a tube closed at its top, but open below, applied to the spout of the can and arranged to pass up into the spout and down into the can, and provided with a combined drip-aperture and air-vent intermediately of its length and above the drip pan or cup, essentially as specified.

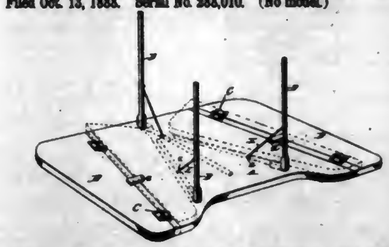
3. The combination, with the body of the can and its drip pan or cup B and spout C, of the tapering tube D, closed at its top, but open below, applied to the spout and arranged to pass up into the spout and down into the can, and provided with a combined drip-aperture and air-vent, *c*, intermediately of its length and passing through it and the spout above the drip pan or cup, substantially as shown and described.

401,451.



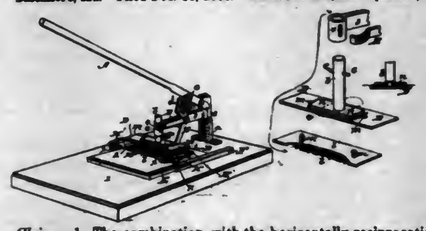
401,452. FUEL-MIXING DEVICE FOR GAS-ENGINES. LEWIS H. HASH, Brooklyn, assignor to the National Meter Company, New York, N. Y. Filed Oct. 6, 1886. Serial No. 215,417. (No model.)

Claim.—1. The combination, in a fuel-mixing device, of a double-seated valve and a case having corresponding valve-seats and supply-passages, with the adjustable plug *g* and the adjustable cup *n*, substantially as herein set forth.



2. The fuel-mixing device herein described, consisting of the case *a*, having a bottom plate, *a'*, provided with the passages *e*, *e'*, and *f'*, and a central valve-seat, a chamber formed by said bottom plate and an upper valve-seat, the passage *m*, and a double-seated lift-valve operating in the passage *m* and in said chamber, and constructed substantially as herein set forth.

401,453. GAS-ENGINE. LEWIS H. NASH, South Norwalk, Conn., assignor to the National Meter Company, New York, N. Y. Filed June 22, 1888. Serial No. 277,875. (No model.)



Claim.—The combustion-chamber of a gas-engine supplemented with an external-valved communicating chamber placed between the charge-supplying port and the combustion-chamber for relieving the pressure in said chamber in starting the engine, in combination with a piston compressing the charge upon its back-stroke, as described.

401,454. TRIMMING-BOARD. FRANCIS NATHAN, New York, N. Y. Filed Oct. 13, 1888. Serial No. 288,010. (No model.)

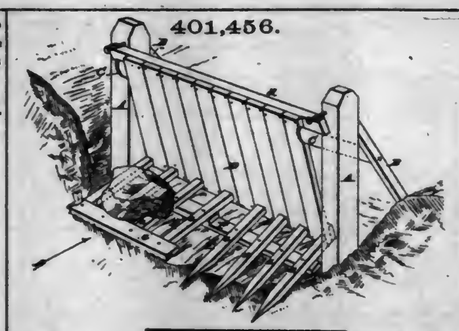
Claim.—The combination, in a trimming board or table, of a central portion having its front narrower than its rear, leaves hinged thereto having their front edges wider than their rear edges, a hinged leg attached to the center of the front, and two rear legs hinged to fold at an angle to the sides, substantially as and for the purpose specified.

401,455. HAND PRINTING-MACHINE. WILLIAM O. NELSON, Baltimore, Md. Filed Feb. 18, 1888. Serial No. 264,455. (Model.)

Claim.—1. The combination, with the horizontally-reciprocating platen, and an inking-pad attached to it, of the bed-plate or type-carrier reciprocating in a vertical guide over the platen, pivoted levers connected with said platen and bed-plate, and the main or hand lever, which is connected with and vibrates the first-mentioned levers, substantially as shown and described, so that when the hand-lever is elevated to its limit the bed-plate descends and is forcibly pressed on the inking-pad and when the lever is depressed to its limit the bed-plate is forcibly pressed on the surface to be printed, as set forth.

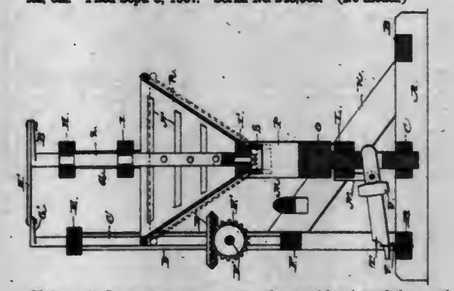
2. The combination, with the vertically-reciprocating type-carrier and horizontally-reciprocating platen, and slotted pivoted levers for operating them, of a vibrating hand-lever having lateral pins which work in the slots of the other levers, as shown and described.

3. The combination of the following parts: the vertically-reciprocating bed-plate, the horizontally-reciprocating platen, and operating-levers, pivoted as described, and having angular slots in their upper arms, which extend in opposite directions from their pivot, and a hand-lever having lateral pins that work in the slots of the other levers, as shown and described.



4. The combination of the pivoted hand-lever, the standard, a tubular guide, H, fixed in position, the bed-plate and its stem working in the guide and made of such length as to project above it when the bed-plate is down, and a pivoted elbow-lever connecting the hand-lever with the bed-plate and serving to elevate and depress the latter, all as shown and described.

5. The combination, with the vertically-reciprocating type-carrier and the horizontally-reciprocating platen, of stops or guards which project forward and backward on the platen from a point intermediate of the inking and printing positions of the type-carrier, so as to arrest the downward movement of the type-carrier in both positions, as specified.



401,456. WATER-GATE. THOMAS A. NEWCOMER, Cleveland, Tenn. Filed Feb. 25, 1888. Renewed Mar. 12, 1889. Serial No. 303,062. (No model.)

Claim.—The inclined spilling composed of stakes *a*, having their lower ends secured at the bottom of the stream and their upper ends connected by a stringer, F, and terminating at the vertical line of the gate to form a stop or abutment for the latter, in combination with the water-gate D, having a horizontal axis, the posts A A, braces B B, and stripe C C, carrying the axis of the gate, substantially as shown and described.

401,456.

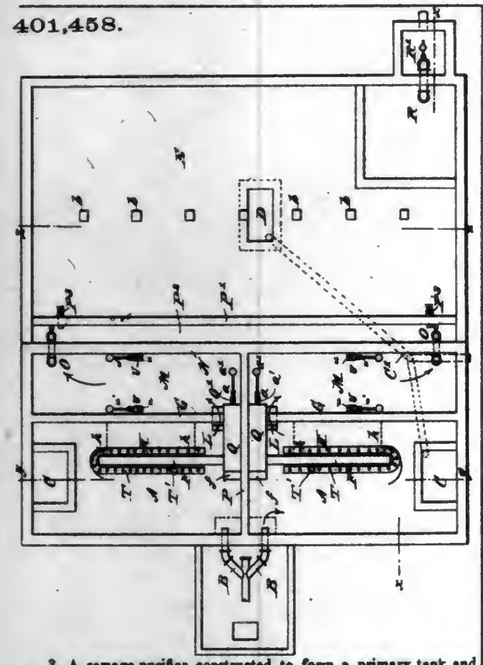
401,457. ORE-CONCENTRATOR. JOHN H. PENDERTON, Los Angeles, Cal. Filed Sept. 5, 1887. Serial No. 248,865. (No model.)

Claim.—1. In an ore-concentrator, the combination of the vertically-movable hopper having the discharge-opening in its lower end, the agitator secured against vertical movement, and the stationary valve attached to the agitator and normally closing the discharge-opening of the hopper, substantially as described.

2. In an ore-concentrator, the combination of the vertically-movable conical hopper having the discharge-opening, the agitator arranged in the hopper and adapted to rotate therein, said agitator being secured against vertical movement, and the conical valve swiveled to the lower end of the agitator and adapted to close the discharge-opening in the hopper in the normal position of the latter, and means for moving the hopper and agitator, substantially as described.

3. In an ore-concentrator, the combination of the vertical frame-work provided with the guide-bars, a standard playing in said guide-bars, a hopper secured to said standard, the valve stationary against vertical movement for closing the lower end of the hopper, an agitator connected to said valve, and counterbalancing devices for effecting the vertical movement of the hopper and its standard to open its lower end, substantially as described.

4. In an ore-concentrator, the combination of the vertical frame-work provided with the guide-bars, a standard playing in said guide-bars, a hopper secured to said standard, a stationary valve at the lower end of said hopper, a balance beam or lever, T, pivoted, as described, to elevate said hopper, cords connected to said yoke-frame and passing over sheaves in the main frame, and weights connected to said cords, substantially as described.



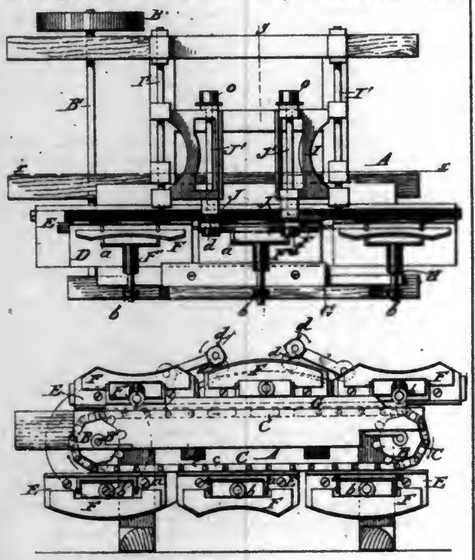
5. In an ore-concentrator, the combination of the vertically-movable conical hopper having the discharge-opening, and the conical valve adapted to close the said discharge-opening in the normal position of the hopper, and the agitator within the hopper, both the valve and the agitator being held against vertical movement, as set forth.

401,458. SEWAGE-PURIFIER. JAMES J. POWERS, New York, N. Y. Filed Oct. 26, 1888. Serial No. 289,170. (No model.)

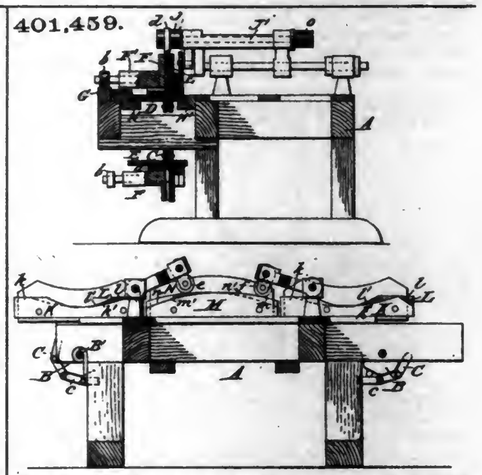
Claim.—1. The tanks A and M and connecting-passage L, in combination with the lime-receiver Q, pipe Q', connecting said receiver with a water supply or head, a float-valve fitted in said supply-pipe within the tank M, and a siphon for intermittently emptying the tank M, the float-valve being adapted to be opened and closed at intervals by the rise and fall of sewage in tank M, whereby a given quantity of lime may be automatically supplied at intervals to a given quantity of sewage, substantially as described.

2. The tank M, chemical-receptacles U, located within said tank, and pipes *u*, connecting the receptacles U with a water supply or head, in combination with a siphon, O, for intermittently emptying the tank M, and float-valves *u'*, fitted in the pipes *u* within the tank M, substantially as and for the purposes set forth.

401,458.



3. A sewage-purifier constructed to form a primary tank and settling or disinfecting tank M, in combination with perforated tubes H and pipes T', lime-injector Q, water-supply pipe Q', closed by a float-valve, and chemical-injectors located in the tank M and provided with float-valves, substantially as described.



401,459. SELF-FEEDING MACHINE FOR SHAPING IRREGULAR FORMS. WILLIAM REID, West Hebron, N. Y., and GEORGE M. REID, Rutland, Vt., assignors to William Reid, West Hebron, N. Y. Filed June 28, 1888. Serial No. 278,474. (No model.)

Claim.—1. In a machine for dressing irregular forms or articles, the combination, with the main frame provided with gibbed ways, of an endless chain running in said ways and carrying automatically-operating clamps, the reversely-rotating cutters beneath which the clamps pass, and the pairs of forms or patterns carried by the clamps, substantially as described.

2. In a machine for dressing irregular forms or articles, two oppositely-rotating cutters, an endless chain carrying the automatically-operating clamps, constructed substantially as described, for holding

401,459.

the articles to be dressed, and the patterns arranged in pairs on the clamps, so that the cutters may act by turns upon the article to avoid splitting it, substantially as described.

3. In a machine for dressing irregular forms or articles, the combination of the reversely-rotating cutters, the rocking frames therefor having rollers, the feeding mechanism, the automatically-operating clamps carried thereby for holding the articles to be dressed, and patterns or forms likewise carried by the feeding mechanism and moving beneath the rollers on the cutter-frames, all substantially as described.

4. In a machine for dressing irregular forms or articles, the combination of the rotating cutters, the rocker-frames supporting the same, the endless feeding-bed carrying clamps for the articles to be dressed, and consisting of a plate secured to said bed, a rigid jaw thereon, and also a hinged jaw, and suitable patterns on the clamps which co-operate with rollers on the cutter-frames to cause the cutters to act properly on the articles to be dressed, substantially as described.

5. In a machine for dressing irregular forms or articles, the combination, with the main frame having a horizontal bar upon the same and a conveying chain or belt, of a clamp for holding the article to be dressed, consisting of a flat plate secured to the chain, a rigid jaw on said plate, and a movable jaw pivoted to the plate and carrying a projecting arm that rides upon the horizontal bar, substantially as described.

6. In a machine for dressing irregular forms or articles, the combination, with the dressing mechanism and an endless conveying-chain, of clamps for the articles to be dressed, consisting of a flat plate secured to one of the chain-links, a plate rigid thereon forming one jaw, and a movable plate pivoted thereon forming the other jaw, said movable jaw having an arm, and a bar or surface on the main machine-frame on which said arm is adapted to move for the purpose of automatically closing the clamp, substantially as described.

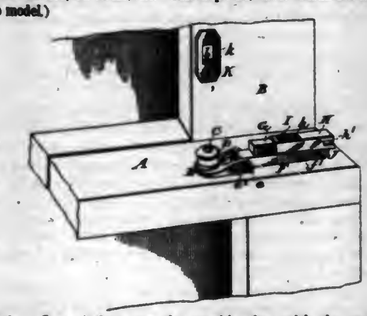
7. In a machine for dressing irregular forms or articles, the combination, with a conveying-chain, C, consisting of links *c* and the sprocket-wheels B B, of a series of clamps carried by said chain, consisting each of a plate, D, a rigid plate, E, secured thereto and forming one of the jaws, a pivoted plate, F, forming the other jaw, and having an outwardly-extending arm, F', furnished with a roller, *b*, and a horizontal bar, as G, on the main frame of the machine, upon which said roller *b* travels, substantially as and for the purpose described.

8. In a machine for dressing irregular forms or articles, the combination of the main frame of the machine, the frames I I, carried on shafts I' I', journaled in the upper portion of said main frame, said frames carrying shafts J' J', having the reversely-rotating cutters J J thereon, and the feeding mechanism for conveying the articles to be dressed to the action of said cutters, the self-operating clamps on said mechanism, and the patterns likewise carried thereby, all substantially as described.

9. In a machine for dressing irregular forms or articles, the combination, with the cutting or dressing devices, of an endless chain and a series of clamps consisting each of a plate secured to one of the chain-links, a rigid plate carried thereby, and a movable plate likewise carried thereby, said plates forming the jaws of the clamp, and said jaws of each alternate clamp being convexed on its upper edge, while the jaws of the remaining clamps are concaved on the upper edge, substantially as and for the purpose described.

10. In a machine for dressing irregular forms or articles, the combination of the cutters, their frames having rollers, a clamping device, and forms or patterns upon the upper edges of which said rollers travel, said patterns consisting of vertical plates whose upper edges are straight for a portion of their length and curved throughout the remainder, and said patterns being relatively arranged so that their dissimilar portions may be opposite, substantially as described.

11. In a machine for dressing irregular forms or articles, a pair of patterns, M N, said pattern M having its upper edge straight at *m* and curved at *m'*, and said pattern N having its upper edge straight at *n* and curved at *n'*, the dissimilar portions of the two patterns being located opposite each other, in combination with cutter-frames having rollers that travel on the upper edges of the patterns, substantially as described.



12. In a machine for dressing irregular forms or articles, the combination of the cutters, their frames having small rollers, an endless feed-chain carrying suitable clamping devices which are alternately convex and concave, and patterns arranged in connection with said clamping devices, said patterns for the convex clamps consisting of a pair of plates whose upper edges are partially straight and partially convexly curved, and said patterns for the concave clamps consisting of a pair of plates whose upper edges are partially straight and partially concavely curved, all substantially as described.

13. In a machine for dressing irregular forms or articles, the combination of an endless series of clamps which are alternately convex and concave, as described, with a double series of patterns arranged in connection with said clamps, the patterns with the convex clamps having their upper edges straight for a certain distance and convexly curved throughout the remainder, and relatively located so that the curved portion of the one shall be opposite the straight portion of the other, and the patterns with the concave clamps having their upper edges straight for a portion of their length and concavely curved throughout the remainder, and relatively located so that the curved portion of the one shall be opposite the straight portion of the other, substantially as described.

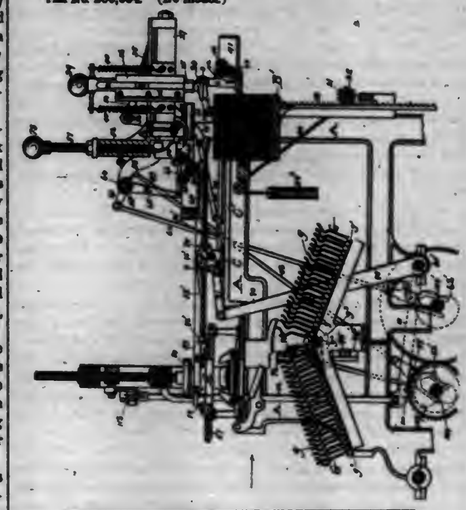
14. In a machine for dressing irregular forms or articles, the combination of an endless chain, C, having link *c*, the sprocket-wheels B, the endless series of clamps carried by said endless chain, and the parallel series of patterns constructed as described and arranged in connection with the clamps, as specified, and the reversely-rotating cutters carried in frames having small rollers that travel on the upper edges of the patterns, substantially as described.

15. In a machine for dressing irregular forms or articles, a series of clamping devices that are alternately convex and concave, in combination with a series of patterns, the patterns for the concave clamps consisting of a pair of plates whose upper edges are partially straight and partially concavely curved, and the patterns for the convex clamps consisting of a pair of plates whose upper edges are partially straight and partially convexly curved, said patterns of both kinds of clamps being so arranged with relation to each other that their dissimilar portions shall be opposite each other, substantially as described.

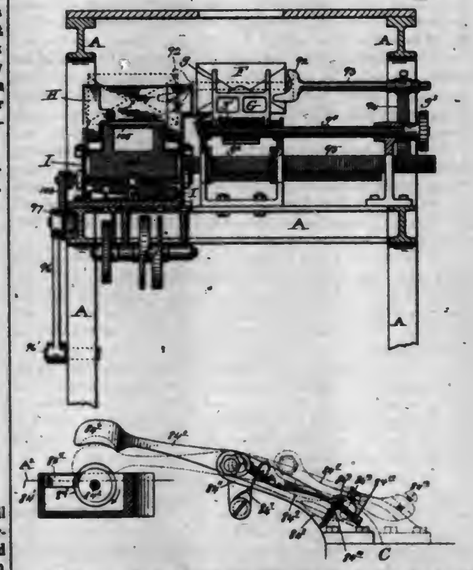
401,460. FASTENER FOR MEETING-RAILS OF SASHES. RICHARD A. REESE, St. Louis, Mo. Filed Sept. 24, 1888. Serial No. 286,177. (No model.)

Claim.—In sash-fasteners, the combination, with the upper rail of lower sash carrying a pivot, C, and the side rail of upper sash carrying the undercut socket L, of the three jointed pieces E F G, and the flanged plate H, slotted at A A' A', the piece E being swiveled on pivot C and the piece F being provided with side projections, *f'*, as and for the purpose described.

401,461. TONGUE-SUPPORT. BARNUM REEVE, Waco, Nebr. Filed Feb. 12, 1889. Serial No. 299,574. (No model.)



Claim.—1. The combination of the springs A, having the arms B C, arranged at right angles to each other, said arms C being secured on the tongue, with the bolts E, secured to the mud-board and attached to the upper ends of arms B, substantially as described.



401,461.

2. The tongue-support, comprising the coiled springs A, having the arms B C, arranged at right angles to each other, and the eye-bolts E, connected to the upper ends of arms B and adapted to be secured to the mud-board, substantially as described.

401,462. ENVELOPE-MACHINE. ADRIAN A. REBOTAN, Worcester, Mass., assignor to Wade H. Hill, same place. Filed June 30, 1886. Serial No. 206,634. (No model.)

Claim.—1. In an envelope-machine, the gum-box 41 and its rolls located in front of and below the top of the pile of blanks, the gummer 20, having vertical movements imparted to it through the flange 35, and horizontal movements through suitable connections with carriage C, said carriage and flange 35, means, essentially as shown, for feeding up the pile of blanks, and feet, substantially as described, independent of the gummer and picker mechanism, operatively connected with carriage C, for holding the top blank in position while its front and back flaps are being gummed, in combination with the picker 50, hav-

ing vertical reciprocating movements, and arranged to descend upon the back flap of the top blank to gum the same, then lift it a short distance and hold it until it is removed therefrom preparatory to being drawn forward, the gum-roll 59, having horizontal reciprocating movements under the picker to gum the bottom thereof when elevated, and the gum-box 69 and its rolls, located back of and above the pile of blanks, substantially as set forth.

2. The picker 50 and means, substantially as described, for operating the same up and down, in combination with the gum-roll 59, having hubs 70 70 of irregular shape in cross-section, said hubs being reversed in shape, and the roll mounted in suitable bearings on sliding carriages, having means, substantially as described, for imparting forward and back reciprocating movements thereto, the gum-box 69, having one or more rolls, stationary curved fingers 71 71, so arranged that when the roll 59 moves forward and back, as aforesaid, its hubs 70 70 will come in contact with and travel over the surface thereof, and thus cause irregular rotary motions to be imparted to said roll 59, substantially as and for the purpose set forth.

3. In an envelope-machine, a blank-conveyer comprising, in combination, a sliding carriage having continuous forward and back reciprocating movements imparted to it between the back-flap gumming and the folding mechanism, a hinged gripping-finger upon the front end of said carriage, arranged to grip the back edge of the blanks between its front end and the top front end of the carriage, when said finger is forced down upon said carriage, and the means described for operating the finger and carriage to produce the results herein specified.

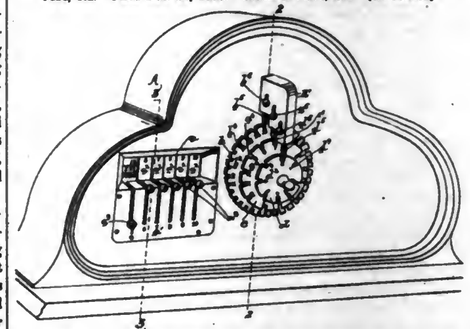
4. In an envelope-machine, the carriage C, provided with the hooks 82 82', and with means, substantially as described, for imparting forward and back reciprocating movements thereto, in combination with the gripping-finger 74 and mechanism for operating the same, substantially as and for the purpose set forth.

5. In an envelope-machine, the blank-gripping and back-feeding mechanism, constructed and arranged to operate as described, in combination with the hooks on the carriage or conveyer of said mechanism for feeding the blanks back from the picker and depositing the same under the plunger, and the movable and rigid guide-stops arranged, respectively, back of and in front of said plunger, and adapted to adjust and hold each blank in position preparatory to its being forced down into the folder-box, substantially as set forth.

6. In an envelope-machine, the combination of the creasing-die A^3 and plunger 84 with adjustable stationary stops arranged in front of the creasing-die opening, movable stops arranged at the back side thereof, and means, substantially as described, for imparting forward and back reciprocating movements to said movable stops, substantially as and for the purpose set forth.

7. In an envelope-machine, a gum-roll arranged at one side of the creasing-die under one of the side flaps of the blank when the latter is in position under the plunger, and means, substantially as described, for imparting a slow rotary movement to said gum-roll in a box containing gum or other suitable adhesive substance, in combination with a compressing-head arranged over said roll, and means, substantially as described, connected with the mechanism for conveying the blanks to the folding mechanism, whereby said head is moved down upon the end of the blank to bring the latter in contact with the gum-roll at each forward movement of said conveying mechanism, substantially as and for the purpose set forth.

8. The picker or distributing roll having horisontal reciprocating movements imparted to it in the manner described, and the picker having vertical reciprocating movements, in combination with the blank conveyer or carriage provided with the gripping-finger, and mechanism for operating said carriage and finger, substantially as shown and specified.



9. The combination of the creasing-die A^3, provided with the adjustable stationary stops 90 90, arranged in front of its opening, with the sliding carriage or conveyer C, provided with the hooks 82', whereby the envelope-blanks are pushed over said stops 90 90 and deposited back of the same under the plunger, and their backward movements thereby controlled, substantially as and for the purpose set forth.

10. The combination of the head 92 and means, substantially as described, for imparting horisontal reciprocating movements thereto crosswise of the drying-chain between the fingers thereof, with said chain and means, substantially as described, for operating the same, whereby the envelopes are pushed laterally from between said fingers, substantially as shown and specified.

11. The combination of the head 92 and means, substantially as described, for imparting forward and back reciprocating movements thereto crosswise of the drying-chain between the fingers thereof to push the envelopes therefrom, with an envelope-receiver interposed between the point of discharging the envelopes from the drying-chain and the counting-box, said receiver having a supporting-plate which is moved forward and back by suitable means to catch the envelopes when delivered from the chain and to discharge the same therefrom into the counting-box, substantially as shown and specified.

12. The reciprocating head 92, having the finger 92' arranged to travel forward and back horizontally crosswise of the drying-chain between the fingers thereof, in combination with said drying-chain, substantially as shown, and for the purpose set forth.

401,468. CALCULATING-MACHINE. EUGENE M. ROSENTHAL, San José, Cal. Filed Dec. 22, 1888. Serial No. 294,388. (No model.)

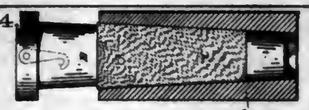
Claim.—1. In a calculating-machine, independent and separately-rotatable dial-plates provided with suitable numbers previously calculated, said plates being located one behind the other and having suitable openings, d^2, so that the numbers may be seen through said openings, in combination with independent slides on the faces of the case for exposing and concealing the numbers on the dials, substantially as described.

2. In a calculating-machine, and in combination with a case having a sight-aperture in its face, independent and separately-rotatable dial-plates within said case and having a series of numbers thereon adapted by the movement of said plates to be brought into position behind the sight-aperture of the case, said plates having openings through which the numbers on the plates may be seen through the sight-aperture, and vertical slides for exposing and concealing the numbers, substantially as herein described.

3. In a calculating-machine, and in combination with a case having a sight-aperture in its face, the independent and separately-rotatable dial-plates within the case, having the concentric series of previously-calculated numbers upon them, adapted to be brought into position behind the sight-aperture of the case, said plates having openings through which the numbers can be seen, and the independent slides a^3 on the face of the case and controlling its sight-aperture for exposing and concealing the different numbers of the concentric series on the dial-plates, substantially as herein described.

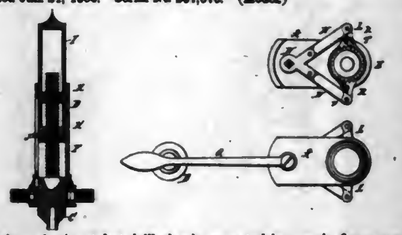
4. In a calculating-machine, the case A, having a sight-aperture in its face, in combination with the independent dial-plates within the case and having the previously-calculated numbers thereon and openings through which they may be seen, the concentric sleeves passing through the face of the case and each carrying a dial-plate, the separate thumb-wheels on the outer ends of the sleeves, whereby the dial-plates may be separately moved, and the independent slides a^3, controlling different portions of the sight-aperture and exposing and concealing the different numbers on the dial-plates, substantially as herein described.

5. In a calculating-machine, the case A, having a sight-aperture in its face, in combination with the independent dial-plates within the case and having the previously-calculated numbers upon them and openings by which the figures on the dial-plates may be seen through the sight-aperture, the concentric sleeves passing through the face of the case and each carrying a dial-plate, the independent thumb-wheels on the outer end of the sleeves, each thumb-wheel having notches, and the vertically-moving spring-actuated pawls over the thumb-wheels engaging the notches therein and controlling said wheels, substantially as herein described.



6. A calculating-machine consisting of the combination of the case A, having a sight-aperture, *a*, in its face, the independent dial-plates within the case and having the numbers thereon and openings through which the numbers may be seen through the sight-aperture, the concentric sleeves carrying the dial-plates, the notched and independent thumb-wheels on the outer ends of the sleeves for rotating the dial-plates, the pawls controlling the thumb-wheels, and the independent separate slides a^3, controlling the sight-aperture and exposing and concealing the numbers on the dial-plates, all arranged and adapted to operate substantially as herein described.

401,464. ART OF MANUFACTURING CORN-COB PIPES. AUGUST RUTH, St. Louis, Mo. Filed Aug. 15, 1888. Serial No. 282,770. (No model.)



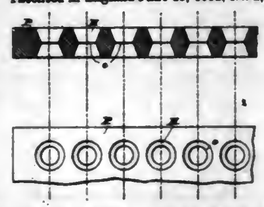
Claim.—1. The improvement in the art of manufacturing corn-cob pipes, consisting in treating the corn-cob to render it pliable, then compressing it, and subsequently boring it to form a pipe-bowl.

2. The improvement in the art of manufacturing corn-cob pipes, consisting in, first, boiling a corn-cob to render it pliable; second, compressing it in a mold, and subsequently boring the compressed cob to form the pipe-bowl.

401,464.

401,465. RATCHET-DRILL. THEODORE N. SCOTT, Brooklyn, N. Y. Filed Jan. 21, 1889. Serial No. 297,070. (Model.)

Claim.—1. A ratchet-drill chuck mounted in a main frame provided with a holding-handle, in combination with independent movable arms bearing pawls and projecting at each side of the drill-chuck, said arms being connected to an operating-hub having a handle secured thereto, substantially as shown and described.



2. The combination, with the drill-chuck bearing a ratchet-wheel, as set forth, of rings encircling said chuck and having projecting arms whereon are pivoted pawls, the extremities of said arms being connected to an operating hub, cam, or shaft, substantially as shown and described.

3. The combination with the main frame and the drill-chuck provided with a screw-threaded stem, of a detachable shell mounted upon the main frame and containing the feeding-tube, substantially as shown and described.

4. The combination, with the feeding-tube having an internal screw-thread wherein the stem of the drill-chuck engages, and an outwardly-projecting pin or screw, of the surrounding shell having a slot through which said pin or screw projects, and a catch for detachably securing said shell to the main frame, substantially as shown and described.

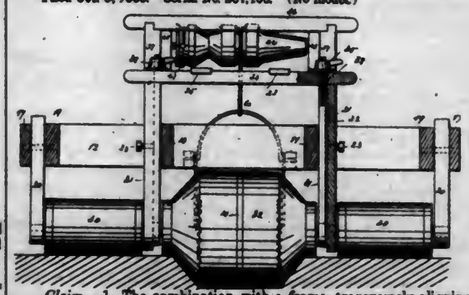
5. A ratchet-drill consisting of a main frame provided with a holding-handle, a drill-chuck whereon is located a ratchet, rings encircling the drill-chuck and bearing arms whereon spring-pawls are pivoted, a hub to which the arms are connected by links, said hub having an operating-handle, a removable shell held to the main frame by a bayonet-catch or its equivalent, and a feeding-tube sliding in said shell, the interior of the feeding-tube being threaded and engaging with the screw-threaded stem of the drill-chuck, the whole combined and arranged to operate substantially as shown and described.

401,466. SECONDARY BATTERY. JOHN S. SELLON, Hatton Gardens, County of Middlesex, England, assignor to The Electrical Accumulator Company, of New York. Filed Apr. 19, 1887. Serial No. 235,425. (No model.) Patented in England June 15, 1882, No. 2,818.

Claim.—In a secondary battery, a plate or support of conducting material containing a series of uniform holes or perforations separated and surrounded by walls or partitions having a double-bevel cross-section so arranged that the areas at the surfaces are substantially equal, but greater than the area at an intermediate plane, in combination with an active material located within such holes or perforations in the form of a series of equal truncated cones or pyramids united at their apices, substantially as described.

401,467. HAY RAKE AND LOADER. JOHN E. SHINN, Bridgman, Mich. Filed Apr. 16, 1888. Serial No. 270,812. (No model.)

Claim.—1. The combination, in a hay rake and loader, of the elevator-frame having the standards E F at its rear end, the rear axle, I, having the driving-wheels, one of which is provided with a gear-wheel, M, the endless elevator arranged in the elevator-frame and having one of its rollers provided with the gear-wheel X outside of the standard E, the wheel D', journaled to the standard E on the outside and meshing with the wheel X, and the lever to raise the said standard, thereby to throw said wheel D' into engagement with the wheel M to revolve the endless elevator, substantially as described.



2. The combination, in a hay rake and loader, of the elevator-frame having the standards E F at its rear end, the axle I, from which said frame is suspended by the said standards, the standard E having the vertical slot in its upper end and being thereby adapted to move vertically about the axle, the supporting-wheels journaled to the axle, one of said wheels being provided with the wheel M, the endless elevator having one of its rollers provided with the gear-wheel X, the gear-wheel D', journaled on standard E and engaging wheel X, the lever to raise the standard E and cause wheel D' to engage wheel M, and the plate or key adapted to enter between the upper end of the slot in standard E and the axle I, substantially as described.

3. The combination, in a hay rake and loader, of the rear axle having the supporting-wheels, one of which is provided with gear-wheel M, the elevating-frame having its rear end suspended from the said axle and adapted on one side to be raised and lowered, the endless elevator in the said frame, and the gears to operate the said elevator journaled in the elevator-frame and adapted to engage the wheel M when the elevator-frame is raised and to be disengaged when lowered, substantially as described.

4. The combination of the elevator-frame, the rear axle, I, having the supporting-wheels, one of which has the wheel N, the conveyer arranged at the front end of the elevator and having the operating-pulley G^3, the plate U^3, pivoted to one side of the frame, the geared wheels V^3 and X^3, mounted on the said plate, one of said wheels being adapted to engage the wheel N, the pulley W^3, secured to the wheel V^3, and the endless belt Y^3, connecting said pulley to the pulley G^3, substantially as described.

5. The combination, in a hay rake and loader, of the endless elevator, the rake at the rear end thereof, the revolving shaft X', having the radial arms or teeth arranged between the rake teeth or tines, and the fender-bar A^3, having the pivoted arms B^3 and bearing on the teeth of the revolving shaft in succession, substantially as described.

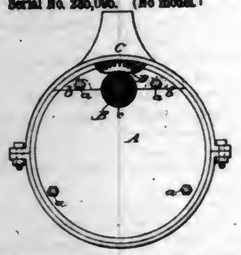
401,468. CULTIVATOR. HARRISON STAGG, near Valencia, Kans. Filed Oct. 3, 1888. Serial No. 287,108. (No model.)

Claim.—1. The combination, with a frame, transversely-aligning standards secured thereto, and ridge-rollers journaled between the outer and intermediate standards, of bearings held to vertically slide in the contiguous faces of the intermediate standards, and an extensible furrow-roller journaled in said sliding standards, as and for the purpose specified.

2. The combination, with a frame and transversely-aligning standards secured thereto between the outer and intermediate standards,

of bearings held to vertically slide in the contiguous faces of the intermediate standards and an extensible and removable furrow-roller journaled in said sliding bearings, drag-plows detachably pivoted to the frame, a rotary drum connected with the said plow, and a lever connected with said drum, substantially as shown and described.

3. The combination, with a frame and transversely-aligning standards secured thereto between the outer and intermediate standards, of bearings held to vertically slide in the contiguous faces of the intermediate standards and an extensible and removable furrow-roller journaled in said sliding bearings, drag-plows detachably pivoted to the frame and consisting of parallel beams, vertical blades adjustably attached to said beams, triangular shares horizontally extending from the bottom of the blades, and vertical scrapers attached to the face of the blades contiguous to the shares, and means, substantially as shown and described, for elevating the said drag-plows, as and for the purpose specified.



4. In a cultivator, a frame consisting of longitudinal central beams, 10 and 11, the rear transverse beam, 12, the spaced side beams, 17 and 19, the front beam, 13, diagonal brace-beams 18, connecting the side and center beams, vertically and downwardly projecting standards attached to the side beams, 17 and 19, and similar horizontally-aligning standards, 21, secured to the outer faces of the central longitudinal beams, 10 and 11, all combined for operation substantially as shown and described.

5. The combination, with the frame and the horizontally-aligned ridge-rollers journaled thereto, of the separate and independent vertically-adjustable furrow-roller between the ridge-rollers, substantially as set forth.

6. The combination, with the frame and the horizontally-aligned ridge-rollers journaled thereon, of an extensible vertically-adjustable separate and independent furrow-roller between the inner ends of said ridge-rollers, substantially as set forth.

7. In a cultivator, a furrow-roller consisting of two sections, 37 38, the inner end of one section having its inner end reduced or rabbeted to form a tongue, 40, and a recess, 39, in the inner end of the outer section, receiving said tongue, and the intermediate ring fitting on said tongue, the outer faces or peripheries of said sections and ring being flush to present an unbroken surface, substantially as set forth.

401,469. HAND-CAR. VIRGIL A. STASKER, Haines City, Fla. Filed Sept. 10, 1888. Serial No. 285,095. (No model.)

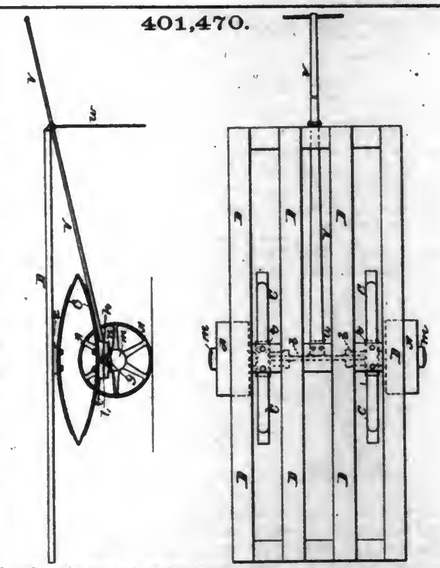
Claim.—1. The combination, in a motor for vehicles, of the lever *g*, connecting-rod *f*, internally-toothed ring or band C, pinion D, and disks A A, all substantially as set forth.

2. The combination, in a motor for vehicles, of the internally-toothed ring or band C, pinion D, and eccentrically-mounted disks A A, all substantially as set forth.

401,470. TRUCK. EDWIN F. STRANGE, Taunton, Mass., assignor of one-half to Elias W. Strange, same place. Filed July 11, 1888. Serial No. 279,633. (No model.)

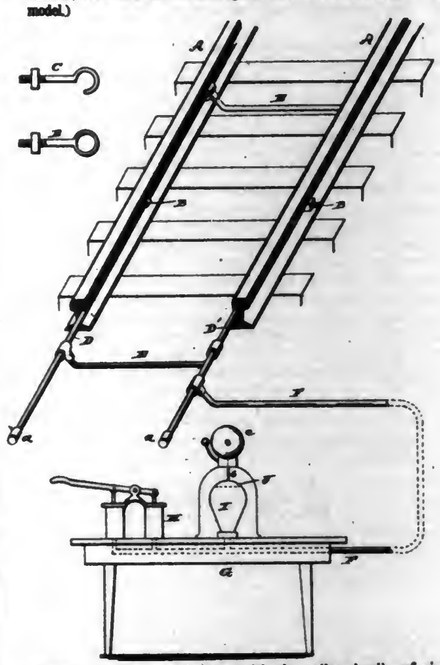
Claim.—1. A truck-axle formed with an integral cast-metal center having tubes *a a*, united by a bar or bars, *b*, with the insertible journals *c c*, removably secured in said tubes, substantially as specified.

2. A truck-axle formed with the integral cast-metal center having tubes *a a* for the reception of journals *c c*, and the lugs *s*, formed at each end to support the springs, substantially as specified.



3. A truck-axle formed with the integral cast-metal center having tubes *a a*, to receive journals *c c*, and a lug, *u*, for connection of the draft-bar, substantially as specified.

4. A truck-axle consisting of a unitary cast-metal center having lug *u* for the draft-bar, lugs *s* for the springs, and tubes *a* for the journals *c*, and said journals therein arranged, all substantially as specified.

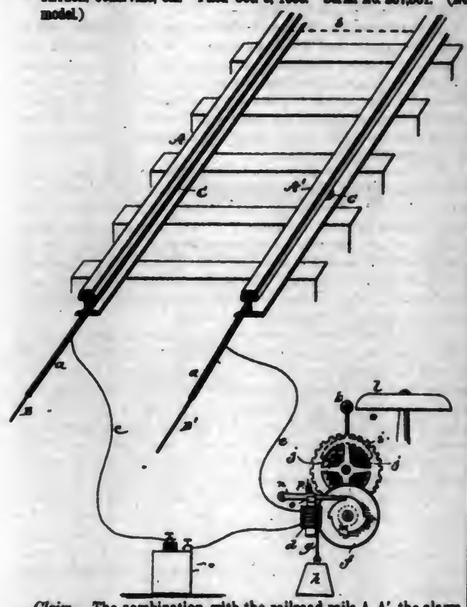


5. The combination, with the cast-metal center of a truck-axle having tubes *a*, of the cylindrical journals *c*, secured in said tubes by set-screws *d*, and formed to be reversed for double duty, as specified.

6. The combination, with wheels A, having metal hubs provided with oil-passages *k*, and the supporting-journals, of boxes *g*, insertible in and removable from said hubs and formed with a chamber or recess, *i*, and perforations *j*, leading from said recess *i* to the journals, substantially as specified.

401,470.

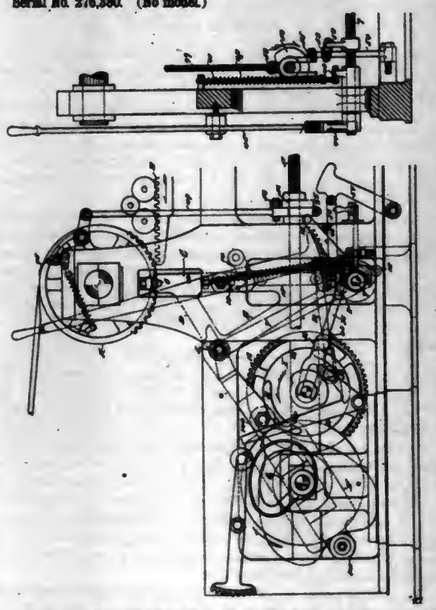
401,471. PNEUMATIC ALARM FOR RAILWAYS. THEODORE TAYLOR, Cedarville, Cal. Filed Aug. 27, 1888. Serial No. 283,919. (No model.)



Claim.—1. The combination, with the railroad-rails, of pipes secured to the several rails parallel therewith, a pump for filling the pipes with compressed air or for exhausting the air therefrom, as the case may be, and a signal or indicator operated by the breaking of a rail and the pipe connected therewith.

2. The combination, with the railroad-rails, of pipes secured to the rails parallel therewith, an air-pump for charging the pipes with compressed air, a flexible bulb held expanded by the compressed air in the pipe, and a signal actuated by the collapse of the bulb caused by the breaking of a rail and the pipe connected therewith, substantially as set forth.

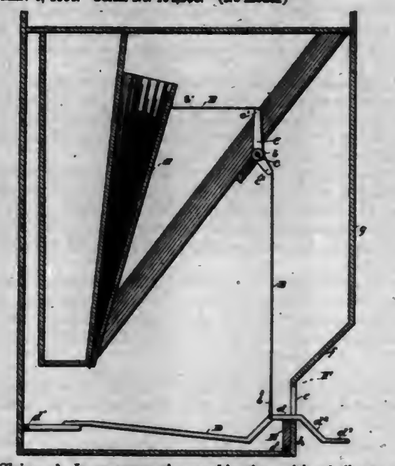
3. The combination, with the alarm, of a compressible bulb, a weight supported thereby and holding the alarm locked until the air escapes from the bulb, substantially as set forth.



4. In a pneumatic railway-track alarm, the combination, with the pipes D D', extending along the track-rails A, of the flexible bulb I, the weight J, and the alarm-bell *c*, substantially as specified.

401,472. ELECTRIC RAILWAY-TRACK ALARM. THEODORE TAYLOR, Cedarville, Cal. Filed Oct. 6, 1888. Serial No. 287,501. (No model.)

Claim.—The combination, with the railroad-rails A A', the alarm apparatus, and an electric generator, of the insulated electric conductor B B', extending alongside and between the rails, and the hooks C, which pass through said rails and secure the conductors to the side thereof, all as shown and described.



401,473. STOP MECHANISM FOR CYLINDER PRINTING-MACHINES. STEPHEN D. TUCKER, New York, N. Y. Filed June 7, 1888. Serial No. 276,360. (No model.)

Claim.—1. The combination, with the cylinder and its stop mechanism, of the rock-shaft 9, for automatically throwing the stop mechanism into and out of operation, and having a rocking motion beyond the points necessary to connect and disconnect the stop mechanism, and a clutch mechanism for connecting and disconnecting the shaft, one member of which is normally held beyond the limit of the movement of the other part when the two are disconnected, substantially as described.

2. The combination, with the cylinder and its gear A, of the catch-lever, the cam-bar for operating the lever, the coupling-bar, rock-shaft 9 and cam 10, for operating the cam-bar, the clutch upon the shaft 9, and connections, substantially such as described, for rocking the shaft 9 at each alternate reciprocation of the bed, the arm 40, secured to the shaft, the spring 42, acting upon the arm 40 to hold the shaft in either position to which it is rocked, and the stops 43, for limiting the movement of the shaft, which are arranged to permit the shaft to be rocked in either direction slightly beyond the position which will permit the two members of the clutch to engage, substantially as described.

401,474. ORGAN. ORMUS G. WHITNEY, Cleveland, Ohio. Filed Mar. 6, 1886. Serial No. 194,288. (No model.)

Claim.—1. In an organ, the combination, with a bellows and a pedal having a free swinging forward extremity, of a rocking lever having its upper arm longer than its lower arm, a connection between said long upper arm and the bellows, and a connection between said short lower arm and said pedal, substantially as set forth.

2. In an organ, the combination, with a bellows and a pedal having its rear extremity pivoted within the case and its forward extremity projecting from the latter, of a rocking lever having its upper arm longer than its lower arm, a connection between said long upper arm and the bellows, and a connection between said short lower arm and the pedal at a point on the latter intermediate of its pivotal rear extremity and its free swinging forward extremity, substantially as set forth.

3. In an organ, the combination, with a bellows and a pedal, of a band connecting said two parts, and a two-arm rocking lever over the arms of which said band passes intermediate of the pedal and bellows, said rocking lever having its upper arm of greater length than its lower arm, substantially as set forth.

4. In an organ, a pedal having the double-crank formation, for the purpose and substantially as set forth.

5. The combination, with the front wall of an organ-case, having slot *e*, of a pedal, D, having a double-crank formation, the horizontal section *d* of which fits in said slot and works therein, substantially as set forth.

6. The combination, with an organ-case having its front wall provided with a pedal-slot and a pedal hinged within said case and working in said slot, of an automatic mouse-guard which covers that portion of the slot not filled by the pedal when the latter is at rest, substantially as set forth.

7. The combination, with a pedal and an organ-case having slot, of a spring-pressed mouse-guard for said slot, substantially as set forth.

8. The combination, with pedal D and organ-case provided with slot *e*, of guard E and spring e^4, substantially as set forth.

9. An organ-case having its front wall below the key-board formed with the recess F in its lower portion, said recess extending to the plane of the lower side of the organ-case floor, substantially as set forth.

10. An organ-case having its front wall located below the key-board formed with the vertical section *f*, the inwardly-inclined sec-

tion *g*, extending below the latter, and the vertical section *h*, extending below said inclined section, substantially as set forth.

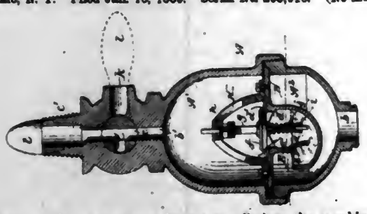
401,475. HEATING ATTACHMENT FOR LAMPS. JOHN W. ZINN, Hawthorne, Fla. Filed July 12, 1888. Serial No. 279,776. (No model.)

Claim.—1. A heating attachment for lamps, consisting, essentially, of a base adapted to encircle the lamp-chimney and be supported thereon, and a series of arms or uprights hinged to the base and extending above the chimney-top, substantially as shown and described.

2. The combination, with the base adapted to encircle the lamp-chimney and be supported thereon, of a series of arms hinged to the base and extended above the lamp-chimney, each provided with a stop projection at the lower end for limiting the downward movement of the said arms, substantially as described.

3. The combination, with the base adapted to encircle the lamp and be supported thereon, of a series of arms hinged to the lower edge of the base and extended above the lamp-chimney, said arms provided with catches adapted to engage the upper edges of the base, whereby said arms are held in a raised position, substantially as shown and described.

4. The combination, with the base adapted to encircle a lamp-chimney, of arms hinged to said base and divided at their upper ends, the said divided portions being bent in opposite directions, forming hooks for suspending the device from the top of the chimney, and supports for a vessel, substantially as described.



401,476. PICKING-THIMBLE FOR MUSICAL INSTRUMENTS. NORMAN E. BARNES, Bay Shore, N. Y. Filed Sept. 27, 1888. Serial No. 286,561. (No model.)

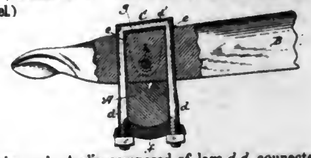
Claim.—1. A picking-thimble for stringed musical instruments, formed with a tubular portion to fit over the end of a finger, a projection inclined downward over one end of the tubular portion and having an interior surface adapted to rest against the end of the finger, with a bent rounded point projecting lengthwise with the tubular portion, substantially as described.

2. A picking-thimble for stringed musical instruments, consisting of the split tubular portion 2, adapted to be slipped over the end of a finger, and having the inclined concave projection 3, with the rounded point 4, beat in the direction of the length of the tubular portion 2, substantially as shown and described.

401,477. CYLINDER RELIEF-VALVE. ALEXANDER M. BARNUM, Buffalo, N. Y. Filed Jan. 10, 1889. Serial No. 296,910. (No model.)

Claim.—1. In a steam-trap for steam-cylinders, the combination, with a casing having an inlet-passage communicating with the steam-cylinder and with a discharge-opening, of an automatic valve arranged in said discharge-opening and closed against its seat by the pressure of the steam in the cylinder, a spring whereby said valve is opened when the steam-pressure is removed therefrom, and an air-trap receiving the water of condensation passing through said discharge, and whereby the exterior atmosphere is excluded from the steam-cylinder, substantially as set forth.

2. In a steam-trap for steam-cylinders, the combination, with a casing communicating with the steam-cylinder and provided with a discharge-opening, of a diaphragm arranged within said casing and having a central opening, an automatic valve applied to said opening and closed against the same by the pressure of the steam in the cylinder, a spring whereby said valve is lifted from its seat to clear said opening when the valve is relieved from the steam-pressure, and an air-trap attached to the under side of said diaphragm and receiving the water of condensation passing through the opening in the diaphragm, substantially as set forth.



3. In a steam-trap for steam-cylinders, the combination, with a casing having inlet and discharge passages, of a diaphragm, D, arranged in said casing and having an opening, *d*, a valve *f*, adapted to close said opening and provided with a stem, *g*, a bridge-tree, H, secured to the upper side of the diaphragm in which said stem is guided, a spring, *j*, bearing against the under side of said valve, and the air-trap E, attached to the under side of said diaphragm below the opening *d*, substantially as set forth.

4. In a steam-trap for steam-cylinders, the combination, with a casing having inlet and discharge passages and composed of two parts, A′ A², united by a screw-thread, of a diaphragm, D, arranged in said casing clamped between the parts A′ A², and having an opening, *d*, a valve, *f*, adapted to close said opening and provided with a stem, *g*, a bridge-tree, H, secured to the upper side of the diaphragm in which said stem is guided, a spring, *j*, bearing against the under side of said valve, and the air-trap E, attached to the under side of said diaphragm below the opening *d*, substantially as set forth.

5. In a steam-trap for steam-cylinders, the combination, with a casing having an inlet-passage communicating with the steam-cylinder and with a discharge-opening, of a stop-cock arranged in said inlet-passage, an automatic valve arranged in said discharge-opening and closed against its seat by the pressure of the steam in the cylinder, a spring whereby said valve is opened when the steam-pressure is removed therefrom, and an air-trap receiving the water of condensation passing through said discharge, and whereby the exterior atmosphere is excluded from the steam-cylinder, substantially as set forth.

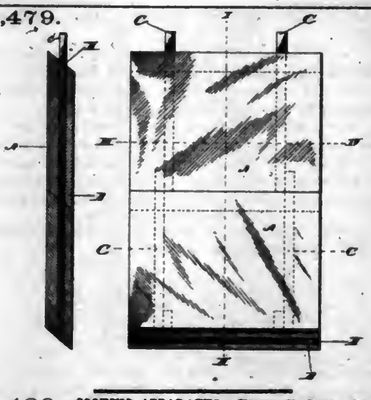
6. In a steam-trap for steam-cylinders, the combination, with the casing A, having an inlet-passage, *b*′, and discharge-passage *b*, of the three-way cock C, arranged in the inlet-passage *b*′, and having a discharge-nozzle, *k*, the diaphragm D, having the opening *d*, the automatic valve *f*, closing said opening, and the spring *j*, substantially as set forth.

401,478. WAGON-CLIP. JAMES R. BAYNES and CHARLES A. HENNICKE, Buffalo, N. Y. Filed Dec. 18, 1888. Serial No. 293,966. (No model.)

Claim.—1. A clip composed of legs *d d*, connected by a cross-bar, *d*′, a tie-bar, *f*, and a curved strengthening-plate, *g*, arranged at right angles to the cross-bar *d*′, substantially as set forth.

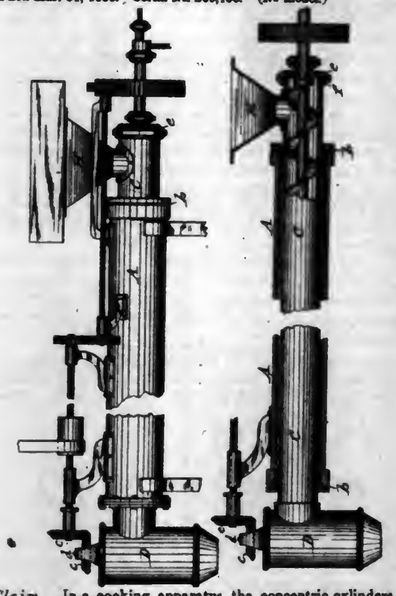
2. The combination, with a side bar and a bolster or axle, of a clip, C, connecting said parts and consisting of legs *d d*, connected by a cross-bar, *d*′, and passing through openings in the side bar and straddling the bolster or axle, a tie-bar, *f*, and a strengthening-plate, *g*, embracing and clamping the side bar, and arranged at right angles to the connecting-bar *d*′, substantially as set forth.

3. The combination, with a side bar and a bolster or axle, of a clip, C, connecting said parts and consisting of legs *d d*, connected by a cross-bar, *d*′, and passing through openings in the side bar and straddling the bolster or axle, a tie-bar, *f*, a strengthening-plate, *g*, embracing the side bar and arranged at right angles to the connecting-bar *d*′, and a horizontal fastening rivet or bolt, A, passing through the end portions of the plate *g* and through the side bar, substantially as set forth.



401,479. FLOORING-BLOCK. WILHELM BÜELLING, Berlin, Germany. Filed Oct. 8, 1887. Serial No. 251,851. (No specimens.) Patented in Germany Feb. 19, 1886, No. 36,471, and in England June 2, 1887, No. 7,966.

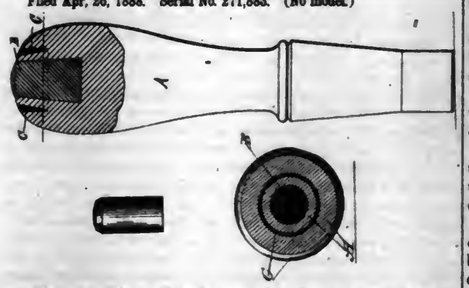
Claim.—1. A flooring-block formed of an upper plate, an under plate, intervening cross-battens, and a filling of pitch or asphalt between the said plates, substantially as and for the purposes described.



2. The flooring-blocks, each of which consists of an upper plate, A, and under plate, B, and cross-battens C, and a filling of pitch or asphalt between the plates, said plates being formed so that plates in one block overlap corresponding plates in an adjoining block, substantially as set forth and described.

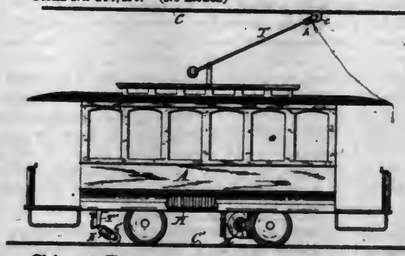
3. A flooring-block consisting of upper and under plates, A and B, battens C, extending beyond the edge of plate A, and a filling of pitch or asphalt between the plates, substantially as described.

401,479.



401,480. COOKING APPARATUS. HENRY H. BOSES, Syracuse, N. Y., assignor to the Hemingway Manufacturing Company, same place. Filed Mar. 31, 1888. Serial No. 269,153. (No model.)

Claim.—In a cooking apparatus, the concentric cylinders, arranged one within the other, the ends of the inner cylinder projecting through the heads of the outer cylinder, the interposed packed joints at each end of the outer cylinder, and the screw-threaded cap on one end of the inner cylinder, in combination with the screw-shafts and beveled gearing by which the same are operated, whereby the free expansion and contraction of the respective cylinders are provided for, substantially as and for the purpose set forth.



401,481. TOOL-HANDLE. GEORGE CARLISLE, Attleborough, Mass. Filed Apr. 26, 1888. Serial No. 271,883. (No model.)

Claim.—1. The tip B, of horn or other durable material, having greater cross-section at its base than at its top, combined with a handle, A, and binding ring or collar C, said tip being nearly concealed within said handle and rigidly secured therein by compression of a portion of the encompassing material of the handle.

2. In a tool-handle, the described tip composed of horn or other durable material and having a plane base of greater cross-section than the top of the tip, combined with a handle, A, of greater diameter than the tip, said tip being, as shown and described, nearly concealed in said handle and rigidly secured therein by compression of a portion of the immediately-surrounding material of the handle.

401,482. ELECTRIC-HEATING APPARATUS FOR RAILWAY SYSTEMS. MARK W. DEWEY, Syracuse, N. Y., assignor of two-thirds to Emil Lean and Charles H. Duell, same place. Filed Jan. 25, 1889. Serial No. 297,490. (No model.)

Claim.—1. The combination, with an electrically-propelled vehicle receiving its current from stationary supply-conductors along the path of the vehicle, and a conductor on the vehicle having its terminals connected with movable contacts on said stationary conductors, of an electric-heating device carried on the vehicle in contact with or in proximity to one of said stationary conductors, for the purpose set forth.

2. The combination, with an electrically-propelled vehicle receiving a continuous current from stationary supply-conductors along the path of the vehicle and a conductor on the vehicle having its terminals connected with movable contacts on said stationary conductors, of a continuity-preserving-current pole-changer operated by the electric motor propelling the vehicle and in circuit with said motor, a portion of the vehicle-conductor having its current therein alternated by the pole-changer, a transformer having its primary coil in circuit with the portion of the conductor wherein the current is alternated and its secondary coil in circuit with a heating device, and a device for cutting out or in the said heating device, as set forth.

3. In combination with an electrically-propelled vehicle receiving a continuous current from stationary supply-conductors along the path of the vehicle and a conductor on the vehicle having its terminals connected with movable contacts on said stationary conductor, two or more suitable electric-heating devices in series and a shunt containing a making and breaking device around each of said heating devices, as set forth.

4. In combination with an electrically-propelled vehicle, the supply-conductor on the vehicle, an electric-heating device connected with said supply-conductor, and a direct low-resistance shunt-path for the current around said heating device containing a circuit maker and breaker.

5. The combination, with an electrically-propelled vehicle and the supply-conductors and motor thereon, of a continuity-preserving-current pole-changer operated by the electric motor propelling the vehicle and in circuit with said motor, a portion of the vehicle-conductor having its current therein alternated by the pole-changer, a transformer having its primary coil in circuit with the portion of the conductor wherein the current is alternated and its secondary coil in circuit with a heating device, and a device for cutting out or in the said heating device, as set forth.

6. The combination of a movable vehicle, a stationary electric conductor along the path of said vehicle, and a suitable heating device supported on the vehicle in contact with or in close proximity to said stationary conductor.

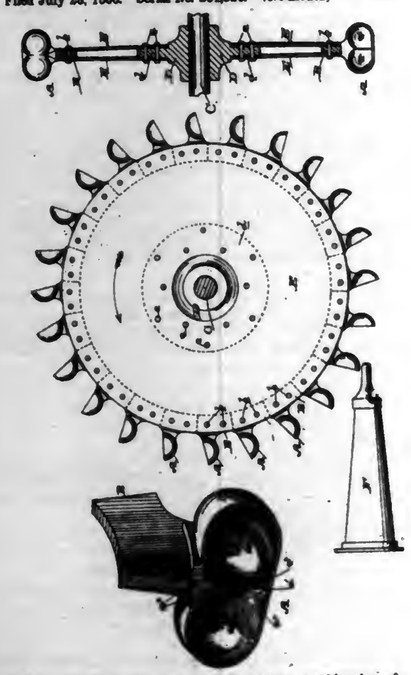
7. The combination, with a movable contact or trolley of an electrically-propelled vehicle, of an electric-heating device on said movable contact or trolley, for the purpose of heating the same.

8. The combination, with a movable contact or trolley of an electrically-propelled vehicle, of a suitable heating device carried by said trolley in contact with or in proximity to a stationary supply-conductor, as set forth.

9. An electric-heating device consisting of a thin strip of metal coiled or formed spirally, a divided core of metal within the said heating device, means for connecting and disconnecting the parts of the core to shunt the heating device, and a suitable shield or case enveloping said device, as set forth.

10. The combination, with a vehicle, stationary electric supply-

conductors along the path of said vehicle, a source of continuous current connected thereto, and a conductor on the vehicle having its terminals connected with movable contacts on said stationary supply-conductors, of a continuity-preserving-current pole-changer and an electric motor for operating the same both upon the vehicle and in circuit with the vehicle-conductor, a portion of the vehicle-conductor having its current therein alternated by the pole-changer, a transformer having its primary coil in circuit with a portion of the conductor wherein the current is alternated and its secondary coil in circuit with a heating device, and means for cutting out the said heating device, as set forth.



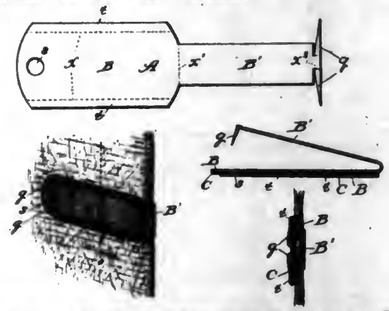
11. The combination, with an electrically-propelled vehicle receiving a continuous current from stationary supply-conductors along the path of the vehicle and a conductor on the vehicle having its terminals connected with movable contacts on said stationary conductors, of a continuity-preserving-current pole-changer operated by the electric motor propelling the vehicle and in circuit with said motor, a portion of the vehicle-conductor having its current therein alternated by the pole-changer, a transformer having its primary coil in circuit with the portion of the conductor wherein the current is alternated and its secondary coil in circuit with a heating device, means for cutting out the said heating device, and suitable means also on the vehicle for throwing the motor out of gear with the driving-axle of the vehicle, so that the motor may operate the pole-changer when the vehicle is at rest, as set forth.

401,483. CRIMSON DYE. THEODOR DIEHL, Mannheim, Germany, assignor to G. C. Zimmer, same place. Filed Oct. 6, 1888. Serial No. 287,396. (No specimens.)

Claim.—1. The process of obtaining a compound that yields coloring-matter when subjected to the action of phenols, amines, or other sulpho or carbon acids, which consists in combining one molecule of beta-phenylnaphthylamine monosulpho-acid with one molecule of a tetrazo salt, substantially as herein set forth.

2. The process of obtaining coloring-matter that dies unmordanted cotton directly, which consists in first combining one molecule of beta-phenylnaphthylamine monosulpho-acid with one molecule of a tetrazo salt and afterward subjecting the obtained product of said combination to the action of phenols, amines, or other sulpho or carbon acids, substantially as herein set forth.

401,484. WATER-WHEEL. WILLIS G. DODD, San Francisco, Cal. Filed July 28, 1888. Serial No. 281,326. (No model.)

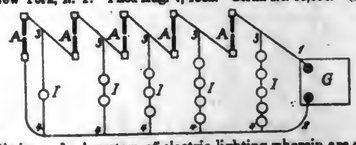


Claim.—1. A water-wheel consisting of the combination of a hub having a central encircling flange, annular separated disks secured to the flange of the hub, and buckets formed with two pockets side by side, having hemispherically-concaved faces separated by a central division-wall for receiving and splitting the stream, said buckets having flanges secured between the outer edges of the disks, substantially as described.

2. A water-wheel consisting of the combination of a hub having a central encircling flange, annular separated disks secured to the flange of the hub, and buckets having flanges secured between the outer edges of the disks, substantially as herein described.

3. A water-wheel consisting of the combination of a hub having a central encircling flange, annular separated disks secured to the flange of the hub, and buckets with flanges seated and secured between the outer edges of the disks, said flanges abutting against each other and forming a continuous ring, substantially as herein described.

401,485. TAG. CHARLES O. DOWST, Waukegan, Ill. Filed Sept. 28, 1888. Serial No. 286,634. (No model.)



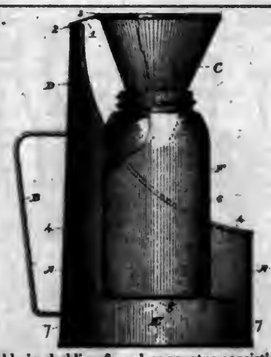
Claim.—1. In a tag, the combination of the body portion B and a strip of cloth, C, on one side of the body portion and secured thereon by the bent edges *t*, substantially as described.

2. A tag comprising, in combination, a body portion, B, having an opening, *s*, a strip of cloth, C, secured on the body portion, and a bent extension, B', having a fastener, *q*, at one end adapted to pass through the opening *s*, substantially as described.

3. A tag comprising, in combination, a body portion, B, having an opening, *s*, a strip of cloth, C, on one side of the body portion and secured thereon by the bent edges *t* thereof, and a bent extension, B', having a fastener, *q*, at one end adapted to pass through the opening *s*, substantially as described.

401,486. SYSTEM OF ELECTRIC LIGHTING. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Aug. 7, 1882. Serial No. 68,658. (No model.)

Claim.—1. A system of electric lighting wherein are combined arc lamps arranged in series and incandescing electric lamps connected with the arc-lamp circuit and shunting one or more of the arc lamps, the shunt circuit or circuits being taken around less than the total number of arc lamps in circuit, substantially as set forth.

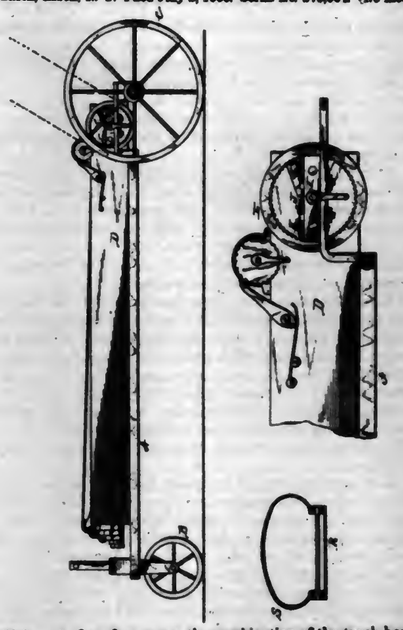


2. In a system of electric lighting, the combination of a circuit containing arc lamps arranged in series with a number of cross or multiple-arc circuits taken from different points between the arc lamps and incandescent electric lamps located in said independent cross-circuits and adjusted by number and capacity for the different electromotive forces existing at said several cross-circuits, substantially as set forth.

401,487. JAR-HOLDING-FUNNEL APPARATUS. MOLLIE ELLIS, Bardstown, Ky. Filed June 11, 1888. Serial No. 276,676. (No model.)

Claim.—1. A portable jar-holding-funnel apparatus consisting of the cup having at the back a handle and a standard fastened to said cup, leaving sufficient open space in front of said handle and standard above the front retaining-wall of the cup to expose the jar below the shoulder, and the movable funnel loosely connected in use with the said cup through said standard, substantially as described.

2. A portable jar-holding-funnel apparatus consisting of the cup having at the back a handle and a standard fastened to said cup, leaving sufficient open space in front of said handle and standard to expose the jar below the shoulder, and the movable funnel loosely connected in use with said cup through said standard, said apparatus being provided with a portion extending beyond the jar below the bottom of the funnel for catching any overflow, and with wings spread out on both sides of said handle partially around the jar, substantially as described.

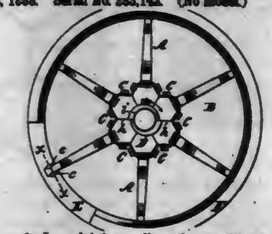


401,487.

3. A portable jar-holding-funnel apparatus consisting of the cup having at the back an upright extension, forming a standard broad at the base and diminishing in width upward, with sloping edges, which merge into and make a continuation of the top edge of the front of the cup, the handle fastened behind the said upright extension, and the movable funnel loosely connected with the top thereof, substantially as described.

4. The combination, with the jar-holding-funnel apparatus composed of the cup having at the back a handle and a standard fastened to said cup, leaving sufficient open space in front of said handle and standard above the front retaining-wall of the cup to expose the jar below the shoulder, and the movable funnel loosely connected with the cup through said standard, of the removable false bottom having underlying supports which rest on the bottom of the cup and a hole in said false bottom, substantially as described.

401,488. FIRE-ESCAPE LADDER AND TRUCK. AUGUSTUS FREDERICK, Essex, N. Y. Filed July 2, 1888. Serial No. 278,804. (No model.)

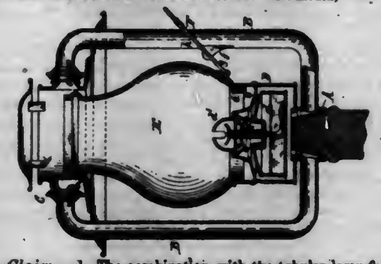


Claim.—1. In a fire-escape, the combination of the truck having two wheels at its front end and a single central wheel at its rear end, the nest of extensible ladders disposed within said truck, the internally-toothed wheel secured to the end of the lower one of said ladders, the crank-shaft having a gear-wheel, and the intermediate gear-wheels located within said internally-toothed wheel, substantially as described.

2. The combination, with the truck, of the nest of ladders herein described, the internally-toothed wheel secured to the end of the lower one of said ladders, the crank-shaft having a gear-wheel, and the intermediate gear-wheels located within said internally-toothed wheel, all constructed and arranged substantially as described.

3. As an improvement in fire-escapes, the ladder having a fire-proof shield or tube secured to the outer side thereof, and the flat shield attached to the inner side of said ladder, substantially as described.

401,489. PULLEY. HENRY J. GILBERT, Saginaw, Mich. Filed Aug. 18, 1888. Serial No. 283,142. (No model.)



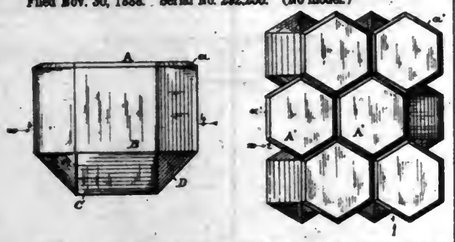
Claim.—1. In a driving-pulley, the combination, with the rim provided with openings for the spoke-tenons, of the spokes having their outer ends beveled relatively to a line through the axis of the pulley to permit their ready adjustment in said rim, substantially as described.

2. In a driving-pulley, the combination, with the rim provided with tapering bores or openings for the spoke-tenons, of the spokes, having their outer ends beveled relatively to a line through the axis of the pulley, and having their tenons provided on their sides with tapering grooves, and wedges adapted to be driven in the openings formed by said grooves and the sides of the bores, substantially as and for the purpose described.

3. In a separable pulley, the combination, with the two-part rim E, provided on its inner surface near each of its two joints with the inclined bores *d*, connected by the grooves *e*, of the metal keys or tie-bars *f*, shaped to conform to said bores and grooves and arranged to be secured therein, substantially as and for the purpose described.

401,490. TUBULAR LANTERN. ELIAS C. GLASIER, Rochester, N. Y., assignor to the Steam Gauge and Lantern Company, same place. Filed June 13, 1887. Serial No. 241,150. (No model.)

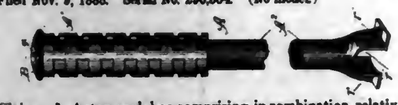
Claim.—1. The combination, with the tubular lamp-frame and the globe made vertically movable therein, of a spring lifting-lever pivoted to one of the side tubes and springing over the convex side of the tube to lock the globe in its raised position, substantially as set forth.



2. The combination, with the tubular lamp-frame, of a removable air-chamber, D, containing the oil-pot and burner, a loose vertically-movable globe, E, resting on said air-chamber, a guide-link pivoted to the tubular frame, and a globe-supporting hook hung to the inner end of the guide-link and extending under the bottom edge of the globe and upwardly on the inner side thereof, said hook entering within the rim of the air-chamber when the globe is seated thereon, substantially as set forth.

401,491. NECKTIE-FASTENER. WILLIAM H. GLENN, Boston, Mass. Filed Jan. 17, 1889. Serial No. 296,627. (No model.)

Claim.—The holder B, comprising the body *b*, provided with the ears *d*, horizontal portions *f*, groove *i*, and hooks *l*, and an attaching-pin on said body for securing it to the necktie, substantially as described.



401,492. PAVING-BLOCK. GEORGE M. GRAHAM, Cleveland, Ohio. Filed Nov. 30, 1888. Serial No. 292,255. (No model.)

Claim.—1. As a new article of building material, blocks of artificial stone with two opposite sides analogously formed and the other two inversely, the horizontal and vertical profiles of said sides having extensions and depressions of hexagonal prismoids, the face side thereof being grooved to resemble said prismoids, substantially as shown, and for the purpose described.

2. An artificial-stone block consisting of a prismoid having six square vertical sides, a flat face with broken edges, and an under side beveled to an edge of opposite corners, substantially as shown, and for the purpose described.

401,493. STOP-COCK BOX. PHILIP H. GUNDERMANN, Chicago, Ill. Filed Nov. 9, 1888. Serial No. 290,354. (No model.)

Claim.—1. A stop-cock box comprising, in combination, relatively-extensible sections A′ and A^2, the upper section, A′, having on its inner surface one or more longitudinal grooves, *t*, annular grooves *s*, communicating with the grooves *t*, and sockets *s′*, extending upward from the annular grooves, and the lower section, A^2, extending into the section A′, and having one or more plugs, *p*, on its outer surface, to enter the grooves *t* and *s* and sockets *s′*, substantially as and for the purpose set forth.

2. A stop-cock box comprising, in combination, relatively-extensible sections A′ and A^2, the upper section, A′, having on its inner surface one or more longitudinal grooves, *t*, annular grooves *s*, communicating with the grooves *t*, and sockets *s′*, extending upward from the annular grooves, and having a head, B, integral with the section A′, and provided with an opening, a removable cover, *q*, for the opening, having a lip, *q′*, and a latch, q^2, to engage with the under side of the head B, respectively, at opposite sides of the opening, and the lower section, A^2, extending into the section A′, and having one or more lugs, *p*, on its outer surface, to enter the grooves *t* and *s* and sockets *s′*, substantially as and for the purpose set forth.

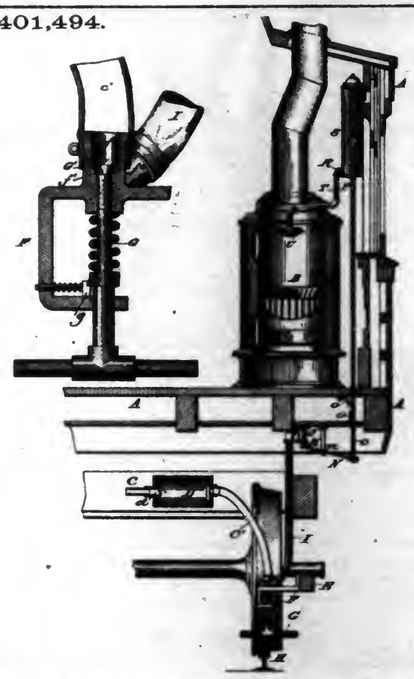
401,494. DEVICE FOR EXTINGUISHING FIRES IN PASSENGER-CARS. SAMUEL H. HARRINGTON, Columbus, Ohio. Filed Feb. 19, 1887. Serial No. 228,274. (No model.)

Claim.—1. The combination of a water-tank having an opening leading into a car-heater closed by a valve, mechanism adapted to open said tank-valve, a compressed-air motor actuating the valve-opening mechanism, a pipe leading from the air-brake system to said motor, a valve closing said pipe or conduit, and a tripping rod or device adapted to open said valve in the event of the derailment of the train, all substantially as and for the purpose specified.

2. The combination of a water-tank having an opening leading into a car-heater closed by a valve, mechanism adapted to open said tank-valve, a compressed-air motor actuating the valve-opening mechanism, a pipe leading from the air-brake system to said motor, a valve closing said pipe or conduit, a reservoir situated between the air-brake system and the said valve, having a valve arranged, as specified, to prevent the exhaustion of the air when the brakes are set, and a tripping rod or device adapted to open said valve in the event of the derailment of the train, all substantially as and for the purpose specified.

3. The combination of a water-tank having an opening leading into a car-heater closed by a valve, mechanism adapted to open said tank-valve, a compressed-air motor actuating the valve-opening mechanism and having an opening situated so as to permit the free egress of the air when its movement is completed, a pipe leading from the air-brake system to said motor, a valve closing said pipe or conduit, and a tripping rod or device adapted to open said valve in the event of the derailment of the train, all substantially as and for the purpose specified.

4. The combination of a water-tank having an opening leading into a car-heater closed by a valve, mechanism adapted to open said tank-valve, a compressed-air motor actuating the valve-opening mechanism, and having an opening situated so as to permit the free egress of the air when its movement is completed, a pipe leading from the air-brake system to said motor, a valve closing said pipe or conduit, a reservoir situated between the air-brake system and the said valve, having a valve arranged as specified, to prevent the exhaustion of the air when the brakes are set, and a tripping rod or device adapted to open said valve in the event of the derailment of the train, all substantially as and for the purpose specified.



5. In a fire-extinguishing apparatus for railway-cars, the combination of the air-brake system with a conduit leading to a compressed-air motor and closed by a valve, a tripping-arm resting on a bracket secured to the equalizing-bar of the car-truck and arranged to open said valve in case of derailment, a water-tank closed by a valve, and mechanism connecting the motor and the valve of the water-tank, substantially as and for the purpose specified.

6. In a fire-extinguishing apparatus for railway-cars, the combination of the air-brake system with a conduit leading to a compressed-air motor and closed by a valve, said conduit being provided with a reservoir having a valve which permits air to pass from it only in a direction away from the brake system, a tripping-arm resting on a bracket secured to the equalizing-bar of the car-truck and arranged in case of derailment to open the valve which closes the conduit, a water-tank closed by a valve, and mechanism connecting the motor and the valve of the water-tank, substantially as and for the purpose specified.

7. In combination with a conduit leading from the air-brake system, a valve closing the same, a tripping-arm arranged to open said valve in case of derailment, a cylinder connected to said conduit and secured to the car-body and having an opening in its lower side, a piston moving in said cylinder, a water-tank connected with a car-heater by a conduit closed by a valve, and mechanism connecting said valve and said piston, substantially as specified, so that the operation of the tripping-rod first opens the valve of the water-tank, and then allows the air to escape from the air-brake system.

8. In combination with a conduit leading from the air-brake system, a reservoir situated in said conduit having a valve which permits the air to pass from it only in the direction away from the air-brake system, a valve closing the same, a tripping-arm arranged to open said valve in case of derailment, a cylinder connected to said conduit and secured to the car-body and having an opening in its lower side, a piston moving in said cylinder, a water-tank connected with a car-heater by a conduit closed by a valve, and mechanism connecting said valve and said piston, substantially as specified, so that the operation of the tripping-rod first opens the valve of the water-tank, and then allows the air to escape from the air-brake system.

401,494.

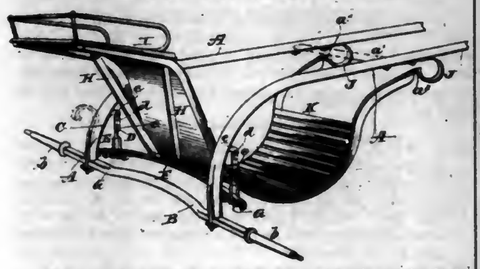
anism, and having an opening situated so as to permit the free egress of the air when its movement is completed, a pipe leading from the air-brake system to said motor, a valve closing said pipe or conduit, a reservoir situated between the air-brake system and the said valve, having a valve arranged as specified, to prevent the exhaustion of the air when the brakes are set, and a tripping rod or device adapted to open said valve in the event of the derailment of the train, all substantially as and for the purpose specified.

5. In a fire-extinguishing apparatus for railway-cars, the combination of the air-brake system with a conduit leading to a compressed-air motor and closed by a valve, a tripping-arm resting on a bracket secured to the equalizing-bar of the car-truck and arranged to open said valve in case of derailment, a water-tank closed by a valve, and mechanism connecting the motor and the valve of the water-tank, substantially as and for the purpose specified.

6. In a fire-extinguishing apparatus for railway-cars, the combination of the air-brake system with a conduit leading to a compressed-air motor and closed by a valve, said conduit being provided with a reservoir having a valve which permits air to pass from it only in a direction away from the brake system, a tripping-arm resting on a bracket secured to the equalizing-bar of the car-truck and arranged in case of derailment to open the valve which closes the conduit, a water-tank closed by a valve, and mechanism connecting the motor and the valve of the water-tank, substantially as and for the purpose specified.

7. In combination with a conduit leading from the air-brake system, a valve closing the same, a tripping-arm arranged to open said valve in case of derailment, a cylinder connected to said conduit and secured to the car-body and having an opening in its lower side, a piston moving in said cylinder, a water-tank connected with a car-heater by a conduit closed by a valve, and mechanism connecting said valve and said piston, substantially as specified, so that the operation of the tripping-rod first opens the valve of the water-tank, and then allows the air to escape from the air-brake system.

8. In combination with a conduit leading from the air-brake system, a reservoir situated in said conduit having a valve which permits the air to pass from it only in the direction away from the air-brake system, a valve closing the same, a tripping-arm arranged to open said valve in case of derailment, a cylinder connected to said conduit and secured to the car-body and having an opening in its lower side, a piston moving in said cylinder, a water-tank connected with a car-heater by a conduit closed by a valve, and mechanism connecting said valve and said piston, substantially as specified, so that the operation of the tripping-rod first opens the valve of the water-tank, and then allows the air to escape from the air-brake system.



9. In combination with a conduit leading from the air-brake system, a valve closing the same, a tripping-arm arranged to open said valve in case of derailment, a cylinder, J, connected with the conduit aforesaid, an opening, K, formed in said cylinder, a piston, L, working in the cylinder, a water-tank, a conduit leading from said tank, a valve, R, closing said conduit, and actuating-rods M N O P, connecting the piston L and valve R.

10. In combination with a conduit leading from the air-brake system, a valve closing the same, a tripping-arm arranged to open said valve in case of derailment, a cylinder, J, connected with the conduit aforesaid, a piston, L, working in the cylinder, a water-tank, a conduit leading from said tank, a valve closing said conduit, a piston-rod, M, a hinged lever, N, secured at one end to rod M, a connecting-rod, O, secured to the other end of lever N, and having detents *o* secured upon it, a valve-actuating rod, P, secured to the free end of rod O, and a pawl, *o′*, placed to engage the detents *o* of rod O and prevent it from falling and closing the valve after being raised.

11. In combination with the air-brake system of a railway-car, a conduit, C, leading from the brake system, a bracket, F, forming the support for a derailment-trip, the tube *f*, formed on said bracket, connecting with conduit C and containing a valve-seat, the branch tube f^3, situated on said bracket below the valve-seat, the conduit I, connected with tube f^3, a valve, G′, and the tripping-rod G, supported in bracket F, and having its head *g* contracted or slotted, so as to trip the valve and leave the passage $f\,f^3$ freely open in case of accident.

12. In combination with the air-brake system of a railway-car, a reservoir, D, having valve *d* connected with the brake system, a conduit, C, leading from the reservoir D, a bracket, F, forming the support for a derailment-trip, the tube *f*, formed on said bracket, connecting with conduit C and containing a valve-seat, the branch tube f^3, situated on said bracket below the valve-seat, the conduit I, connected with tube f^3, a valve, G′, and the tripping-rod G, supported in bracket F, and having its head *g* contracted or slotted, so as to trip the valve and leave the passage $f\,f^3$ freely open in case of accident.

401,495. VEHICLE-SPRING. GEORGE E. HARRIS, Lawrenceville, Pa. Filed Jan. 12, 1889. Serial No. 296,120. (No model.)

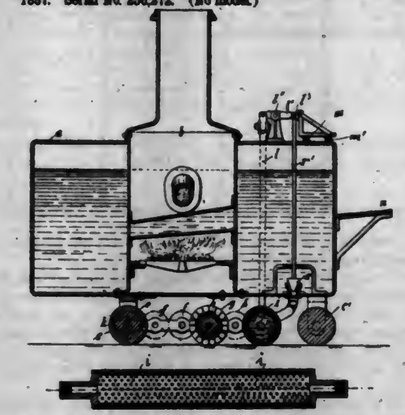
Claim.—1. In a two-wheel vehicle, the combination, with a body and an axle, of a spring attached to the body and supports for the ends of the springs, the said supports being adjustable toward and away from the center of the spring, substantially as set forth.

2. In a two-wheel vehicle, the combination, with a body and a carrying-frame composed of an axle and shafts secured thereto, of loops suspended from said frame and forming supports for the free ends of the spring, the said loops being adjustable toward and away from the center of the spring, substantially as set forth.

3. In a vehicle, the combination, with a body and a carrying-frame composed of an axle, and shafts secured thereto, of a spring secured at its center to the body and provided at each end with a series of notches and swinging loops suspended from the carrying-frame and supporting the ends of the spring, the said loops being adjustable toward and away from the ends of the spring, substantially as set forth.

4. In a vehicle, the combination, with the shafts and shaft-irons secured thereto, of a stirrup adjustably secured to the latter and a spring adjustably connected with the stirrup, substantially as set forth.

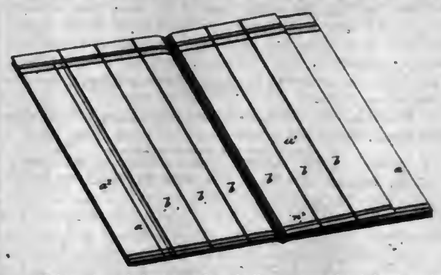
5. The combination, with a body and a carrying frame composed of an axle and shafts secured thereto, of vertically-adjustable loops suspended from said carrying-frame and supporting the spring, the said loops being adjustable toward and away from the center of said spring, substantially as set forth.



6. In a vehicle, the combination, with the shafts, of curved shaft-irons secured thereto, perforated plates attached to the shaft-irons so as to oscillate, stirrups adjustably connected to said plates, and a spring adjustably attached to the stirrups, substantially as set forth.

7. The combination, with a body and a semi-elliptic spring secured thereto and provided at each end with a series of bearings, of suspended loops supporting the ends of the spring and adjustable toward and away from the center thereof, substantially as set forth.

8. In a vehicle, the combination, with a body and a carrying-frame composed of an axle and shafts, of springs connecting the front end of the body to the shafts, a semi-elliptic spring secured to the under side of the body, and loops suspended from the carrying-frame and supporting the ends of the semi-elliptic spring, the said loops adapted to be adjusted toward and away from the center of the spring, substantially as set forth.

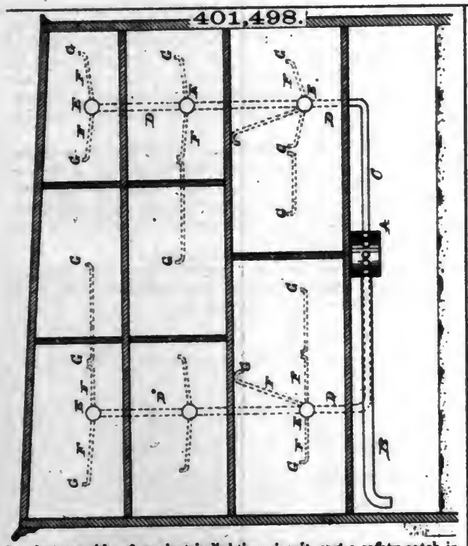


9. In a vehicle, the combination, with the shafts, of stirrups supported thereby, a spring supported by said stirrups, notched plates on said spring to receive the stirrups, spring-jacks or body-supports secured to said spring, and a body supported at one end on said spring-jacks or body-supports and at the other end by the shafts or cross-bars, substantially as set forth.

401,496. MACHINE FOR MELTING SNOW AND CLEANING STREETS. AUGUSTIN HENTSCHEL, Berlin, Germany. Filed Nov. 26, 1887. Serial No. 256,272. (No model.)

Claim.—In a machine for melting snow and cleaning streets, the combination of tank *a*, furnace *b*, located thereto, water-delivery roller *i*, composed of a perforated cylinder wrapped with jute, manila, or other textile material, *q*, connected with said tank, and helical scraper *g*, substantially as described.

401,497. LEDGER OR SIMILAR ACCOUNT-BOOK. JOHN W. HORNE, Boston, Mass. Filed Mar. 1, 1886. Serial No. 193,643. (Model.)



Claim.—1. A ledger or other similar account-book having alternating full or wide and narrow leaves, all of which are complete or integral with the parts thereof which are bound in at the back of the book, the narrow leaves being interposed between the full or wide leaves throughout the book, substantially as set forth.

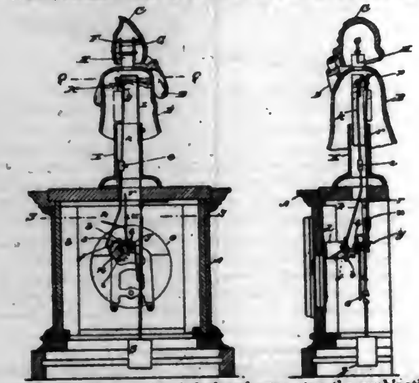
2. A ledger or other similar account-book having alternating full or wide and narrow leaves, all of which are complete or integral with the parts thereof, which are bound into the back of the book, the narrow leaves being interposed between the full or wide leaves throughout the book, one page of each full leaf being provided with a name-entry space or margin which is outside of or beyond the edge of the adjacent narrow leaf or leaves, and the remainder of the page-space of the full leaves and also the pages of the narrow leaves being divided by rulings into monthly sections, substantially as set forth.

401,498. WIRING STRUCTURES FOR ELECTRIC LIGHTING. EDWARD H. JOHNSON and EDWIN T. GREENFIELD, New York, N. Y. Filed Sept. 21, 1888. Serial No. 285,907. (No model.)

Claim.—1. In house-wiring for electric light, the combination of a pipe of insulating material, a pair of wires insulated from each other and placed in close proximity to each other within said pipe, and each

401,498.

forming one side of an electric-lighting circuit, and a safety-catch interpolated in said circuit, substantially as set forth.



2. In house-wiring for electric light, the combination, with the building or structure, of a system of insulating-pipes extending throughout the same, and comprising main and branch pipes, a pair of wires in each pipe, insulated from each other and placed in close proximity to each other, and each forming one side of an electric-lighting circuit, and safety-catches interpolated in the circuit, substantially as set forth.

3. In house-wiring for electric light, the combination of a pipe of insulating material, a pair of insulated wires twisted together within said pipe, each wire forming one side of an electric-lighting circuit, and a safety-catch interpolated in said circuit, substantially as set forth.

4. In house-wiring for electric light, the combination, with the building or structure, of a system of pipes extending throughout the structure, comprising main pipes, branch pipes extending from said main pipes continuously to all points where outlets are required, junction-boxes connecting the branch pipes to the main pipes, a pair of wires placed loosely in each pipe, such wires being placed in close proximity to each other and insulated from each other, and each forming one side of the electric-lighting circuit, and safety-catches in the junction-boxes connecting the wires of main and branch circuits, substantially as set forth.

5. The fishing-wire having, in combination, a core of wire and a flexible wire coiled spirally on said core, substantially as set forth.

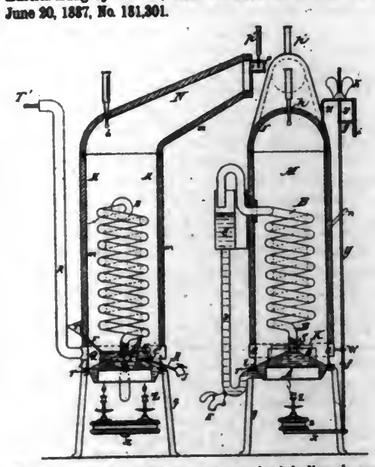
401,499. CLOCK. ARTHUR JUNGHANS, Schramberg, Würtemberg, Prussia, Germany. Filed Feb. 16, 1888. Serial No. 264,846. (No model.)

Claim.—1. In a combined clock and automaton, the combination, with clock mechanism, of a rotative drum provided with a groove in its periphery, a figure or image having one or more movable parts, and a pivoted rod one end of which engages with the drum, the other end of the rod having connection, substantially as described, with a movable part of the image, substantially as and for the purposes set forth.

2. The combination, with clock mechanism, of an image having a movable part provided with a dependent rod, *r*, loosely connected at its upper end with such movable part, the lower end of the rod being bent and adapted to engage with a wire fixed to a shaft which is actuated by the pendulum and said fixed wire, substantially as set forth and described.

3. The combination, with clock mechanism, of a notched cam on a rotary shaft, a fixed pin with a rock-shaft placed loosely thereon, a bent wire fixed to said rock-shaft and in position to engage with said cam, an image having a movable part provided with a pendent rod, *r*, a bent rod, *u*, fixed to said rock-shaft and being in position to engage said pendent rod, and a wire, *y*, fixed to shaft *f*, substantially as and for the purposes described.

4. The combination, with clock mechanism, of a rotary drum provided with a groove, *c*, an image having a movable arm, D, fastened to a shaft, *a*, provided with a bent arm, *g*, and a pivoted rod, *k*, one end of which is adapted to engage with arm *g*, the other end of the rod being in position to engage with the drum in the groove *c*, substantially as and for the purposes described.



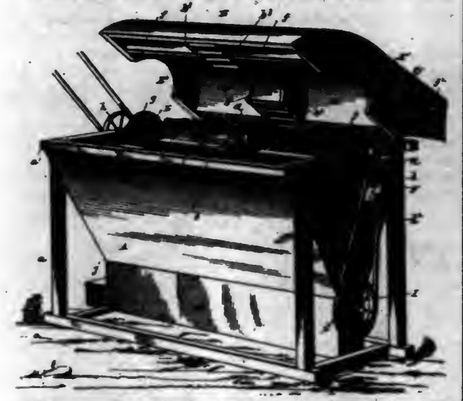
401,500. MEDICAL COMPOUND. FRIEDRICH KRÖGER, Mühlheim, near Frankfort-on-the-Main, Germany, assignor to A. Leonhardt & Co., same place. Filed Nov. 2, 1888. Serial No. 290,378. (No specimens.)

Claim.—The medical compound herein described, having the formula $C_2H_5CH(SO_2C_2H_5)_2$, and having the properties of being almost insoluble in water, hardly soluble in hot water, being without smell, having a slight bitter taste, crystallizing in thin long white needles, melting at 133° Celsius, (uncorrected,) being soluble without decomposing in hot acids and alkalies, and being not acted upon by permanganate of potassium.

401,501. MEDICAL COMPOUND. FRIEDRICH KRÖGER, Mühlheim, near Frankfort-on-the-Main, Germany, assignor to A. Leonhardt & Co., same place. Filed Nov. 10, 1888. Serial No. 290,472. (No specimens.)

Claim.—The medical compound herein described, having the formula $(CH_3)_2C(SO_2CH_3)_2$, and the properties of being easier soluble in water than sulphonal, crystallizing in large white rhombic scales or plates, its melting-point being 119° to 120° centigrade, (uncorrected,) being turned at this temperature directly from the crystal form into the liquid one.

401,502. INHALING APPARATUS. EDUARD KRELL, Güstrow, Mecklenburg-Schwerin, Germany. Filed Mar. 2, 1887. Serial No. 229,406. (No model.) Patented in Germany June 16, 1886, No. 38,641; in England Feb. 8, 1887, No. 1,957; in Belgium Feb. 15, 1887, No. 76,122; in Italy May 7, 1887, No. 21,140; in Denmark May 31, 1887, No. 47; in Austria-Hungary June 11, 1887, No. 10,338 and No. 5,484, and in France June 20, 1887, No. 181,301.

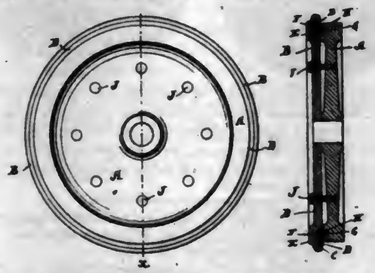


Claim.—1. In a portable apparatus for inhaling damp or warm moist air of a certain and unvarying temperature, the combination, with the water-containing boiler A, for heating the water, and evaporating-vessel G, of the serpentine pipe B, the cold-water reservoir C, and the pipe D, substantially as set forth.

2. In a portable apparatus for inhaling damp or warm air of certain and unvarying temperature, the combination, with the water-evaporating vessel G and boiler A, of the serpentine pipe B, cold-water reservoir C, and pipe D, and the lamp-regulating device consisting of the guided rod Y, provided with a screw-thread, *v*, arm *x*, and fixed stop *f*, substantially as described.

3. In a portable apparatus for inhaling damp or warm air of a certain and unvarying temperature, the combination, with the serpentine pipe B, cold-water reservoir C, and pipe D, of the ring Q, having opening S, and provided with pipe R, for introducing cold air into the inhaling apparatus, substantially as described.

401,503. DUST-COLLECTOR. NELSON LEDOU and ALBERT H. WEEKS, Lockport, N. Y.; said Weeks assignor to said Ledou. Filed Mar. 5, 1887. Renewed Feb. 2, 1888. Serial No. 263,513. (No model.)



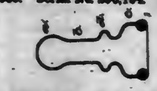
Claim.—1. The herein-described dust-collector, consisting of the V-shaped chamber or receptacle, the still-air chamber having openings in its side walls, the continuous valve and the inclosing box or casing therefor, the deflectors, the shaft having fans, the cover provided with trunks, the screen-covered openings, the circular slatted jackets, and the gearing and driving wheels, the whole arranged to operate substantially as shown and described, and for the purpose specified.

2. The combination, with the chamber or receptacle and the cover having openings at the ends, of the still-air chamber having openings in its side walls, the deflectors, the circular slatted jackets, and the fans, substantially as shown and described.

3. The combination, with the chamber or receptacle provided with openings at the ends and the cover, of the circular jackets secured therein having slatted and closed portions, the operating-fans inclosed in said jackets, and the still-air chamber having openings in its side walls, substantially as shown and described.

4. The combination, with the chamber or receptacle provided with openings at the ends, the cover, the circular jackets, and the fans, of the still-air chamber having openings in its sides and the deflectors arranged one a short distance from the other, substantially as shown, and for the purpose described.

401,504. CAR-WHEEL. HORACE W. LIBBEY, Boston, Mass. Filed Aug. 8, 1888. Serial No. 282,220. (No model.)

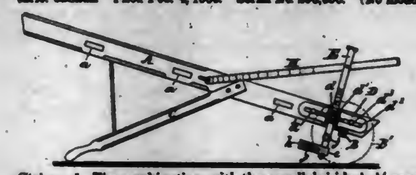


Claim.—1. A car-wheel made in two parts bolted together, with a loose ring in the flange, which projects below the tread of the wheel and is held in position by means of friction-rollers, substantially as and for the purposes set forth.

2. A car-wheel consisting of the tread portion A and flange portion B, bolted together, in combination with the loose ring D and friction-rollers E H, substantially as and for the purposes set forth.

3. In a car-wheel, the tread portion A, provided on its inner face with radial recesses G and friction-rollers H, in combination with the flange portion B, provided on its inner face with a circular recess, C, and radial recesses E, friction-rollers F, and a loose ring, D, substantially as and for the purposes set forth.

4. In a car-wheel, a loose ring mounted in the flange of the wheel so that when it comes into contact with the rail the ring is free to rotate independently of the wheel, substantially as shown and described.

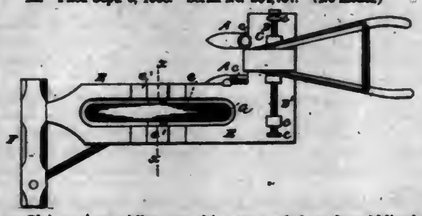


401,505. NURSING-NIPPLE. REUBEN LOCKWOOD, Boston, Mass. Filed Jan. 12, 1889. Serial No. 296,164. (No model.)

Claim.—1. The herein-described india-rubber nipple, it having a body, as *b*, a base, *c*, to embrace the bottle, a contracted waist, *f*, and an independent enlargement or ring intermediate the delivery end of the nipple and the contracted waist *f*, the said waist constituting a free bending-point between the base *c*, which fits the neck of the bottle, and the said guard, substantially as described.

2. An india-rubber nipple having a neck, a base, and an independent enlargement made as a hollow ring and located between the said base and delivery end of the nipple, to operate substantially as described.

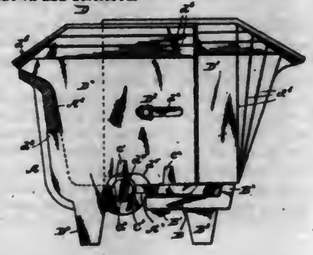
401,506. HAND-TRUCK. DAVID M. MACPHERSON, Lancaster, Ontario, Canada. Filed Feb. 4, 1888. Serial No. 298,660. (No model.)



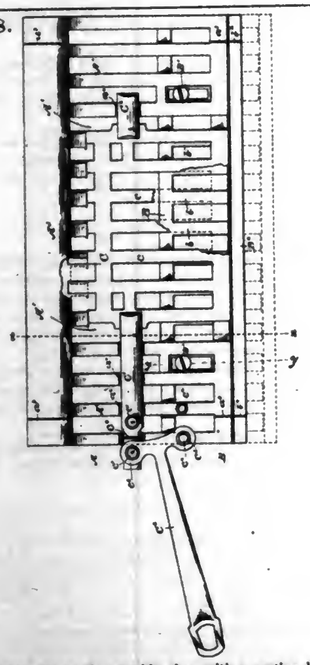
Claim.—1. The combination, with the parallel skids A A', secured to an axle, B, having wheels B', and provided with handles C C', supporting the skids inclinedly, of the jaws E E, toggle-bars *g g'*, and spring side bars, H H', as set forth, for the purposes described.

2. The combination, with the skids A A', of the jaws E E, toggle-bars *g g'*, boxes *e e*, and spirally-coiled spring *j*, as set forth.

3. The combination, with the skids A A', provided with cheek-plates D, of the jaws E E, spring side bars, H H', toggle-bars *g g'*, and spirally-coiled spring *j*, as set forth.



401,507. COTTON-CULTIVATOR. JOHN MARION, Bayou La Chute, La. Filed Sept. 6, 1888. Serial No. 284,737. (No model.)



Claim.—A straddle-row cultivator consisting of a middle slotted main beam, E, provided with a draft-beam at the left of the front end and a plow-standard beam at the right of the rear end, two standards carrying shovel-plows on the right, and one supporting-standard on the left, all substantially as shown and described.

401,508. STOVE-GRATE. WILLIAM C. METTNER, Chicago, Ill. Filed May 16, 1887. Serial No. 238,207. (No model.)

Claim.—1. In a stove-grate, the combination, with a section having an upright part to form the front of the fire-pot and a horizontal part to form the bottom thereof, of a horizontally-adjustable section overlapping the first-named section and end walls composed of adjustable overlapping plates set between the ribs of said sections, substantially as shown and described.

401,508.

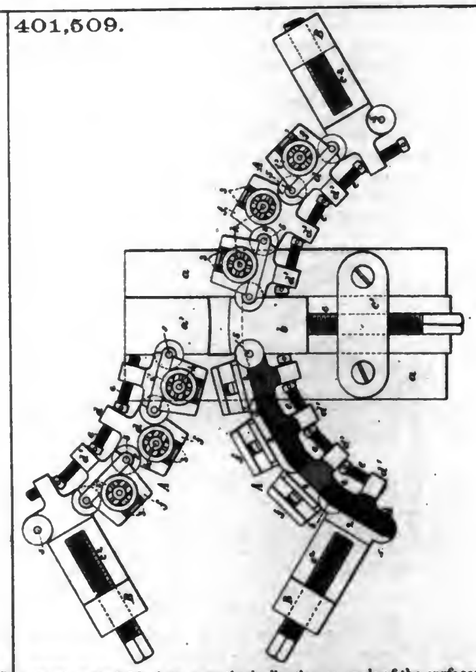
2. In a stove-grate, the combination, with a section having an upright part to form the front of the fire-pot and a horizontal part to form the bottom thereof, of a horizontally-adjustable section overlapping the first-named section and end walls composed of adjustable overlapping plates set between the ribs of said sections, said second section having legs to support the rear of the grate and the front plates of said end walls being each provided with a supporting-leg and a hip or its equivalent, by which it engages said first-named section and supports the latter, all substantially as shown and described.

3. In a stove-grate, a section, A, having an opening, A', and recesses a^2 in the ribs A^2 at each end of said opening A', a dump, C, lying in said opening and having its journals resting in the recesses a^2, the ends of the section A being provided with breaking-grooves to facilitate the breaking away of the outermost ribs, A^2, substantially as shown and described.

4. In a stove-grate, the combination, with a section, A, having the transverse ribs A^2, of end walls, D, having a hip and leg at the front side and seated between said ribs and supporting the front of the section A, while the rear of said section is provided with supports, as legs B^3, independent of said end walls, substantially as shown and described.

5. In a stove-grate, the combination, with a section, A, having the transverse ribs A^2, of end walls, D, having a hip and leg at the front side and seated between said ribs and supporting the front of the section A, while the rear of said section has applied to its lower side a section, B, from which depend legs whereon the rear of the grate is supported, substantially as shown and described.

401,509. MACHINE FOR BENDING RIBS OR FRAMES OF SHIPS. JOHN S. MITCHELL, Milford, assignor to himself, and Charles Coupland Seymour, Conn. Filed June 5, 1888. Serial No. 276,118. (No model.)

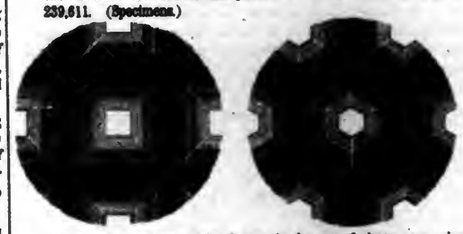


Claim.—1. The range or chain of formers composed of blocks hinged together and the clamping devices at the ends of such chain for holding the rib or other article to be bent, in combination with adjusting-screws, forming stops for determining the curvature to which the chain may be swung in bending the article, substantially as specified.

2. The combination, with the clamp *a' b*, of the range of hinged former-blocks composing the bending-chain, the clamp at the outer end of such chain, and the adjusting-screws passing through flanges on the former-blocks, substantially as set forth.

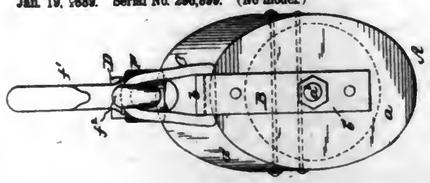
3. The combination, with the bed plate or frame and a stationary head and sliding head connected therewith for holding the article to be bent, of a range of hinged former-blocks secured to one of the heads, each block having a flat or nearly flat face and grooved in the center of the face, substantially as set forth.

4. The combination, with clamps *a' b*, for holding the article to be bent, of a range of hinged former-blocks and an adjustable leaf, *f'*,



401,509.

applied to each block to vary the inclination or angle of the surfaces against which the article is bent, substantially as set forth.



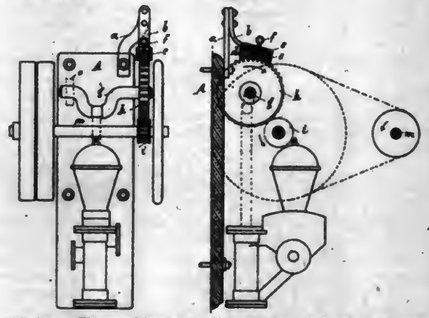
5. The combination, with the horizontal frame and stationary head and a sliding head and adjusting-screw, of formers composed of grooved blocks hinged together and having slightly-curved working-surfaces, a flange to each block, an adjusting-screw passing through the same, toothed sector-frames upon the side of each block, swinging levers pivoted to the blocks *d* at each side of the central groove and having threaded stems on their outer ends, and the toothed blocks *i* and wheels *i'*, for securing the hinged leaves at any desired angle, substantially as set forth.

401,510. TRANSLUCENT FILM FOR USE IN THE ART OF PHOTO-ENGRAVING. CARL A. MÜLLER, New York, N. Y., assignor of one-fourth to Otto Bühler, same place. Filed May 28, 1887. Serial No. 239,611. (Specimens.)

Claim.—A translucent film for use in the art of photo-engraving, provided with a number of small grain-figures, each figure being composed of a series of bands of different shades representing different tints or tones, each band having the same shade throughout its area, and the area of one band being equal to the area of each of the other bands, substantially as described.

401,511. SNATCH-BLOCK. BENJAMIN H. NAVES, Philadelphia, Pa., assignor to Francis Shubert and John C. Cottingham, same place. Filed Jan. 19, 1889. Serial No. 296,899. (No model.)

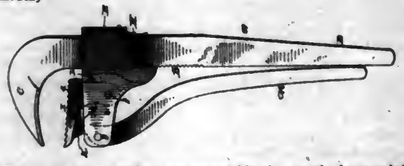
Claim.—1. A snatch-block having fixed strap D secured to and forming a part of one of its cheeks and a vertically-movable cross-head at the top of said strap, having a hook-shaped free end, substantially as set forth.



2. A snatch-block having a strap, D, provided at its lower end with a circular sheave-pin opening, and having at its upper end a separate sliding cross-head, F, with swivel-hook *f'* and hook-shaped free end f^3, substantially as set forth.

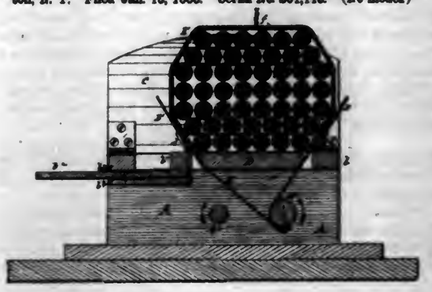
3. A snatch-block having opening *x*, a link, C, the strap D, and a separate sliding cross-head, F, on strap D, said cross-head having a hook-shaped free end for link C, substantially as set forth.

4. In a snatch-block, the link C, combined with a vertically-moving cross head, F, separate from but secured to a strap, D, substantially as set forth.



5. A snatch-block having a fixed strap, D, provided at its upper portion with a slot or opening, *d'*, a cross-head, F, having a hook-shaped free end, f^3, an opposite end, *f*, terminating in an enlargement, f^4, and said end *f* engaging with said slot *d'*, substantially as set forth.

401,512. GEARING FOR PUMPS. EMIL H. C. OEHLMANN, Berlin, Germany. Filed Oct. 10, 1888. Serial No. 287,707. (No model.) Patented in Belgium Oct. 15, 1888, No. 83,363; in France Nov. 9, 1888, No. 193,179; in Germany Dec. 10, 1888, No. 46,457, and in Italy Dec. 27, 1888, No. 24,230.



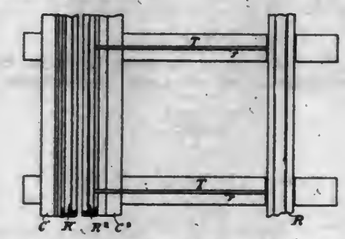
Claim.—The combination, with a driving-shaft, of a pinion on said driving-shaft, a crank-shaft, a cog-wheel on said crank-shaft meshing with said pinion, a spring-actuated brake resting on the teeth of said cog-wheel, and a connecting-rod connecting the crank-shaft with a pump-piston, substantially as set forth.

401,513. WRENCH. CHARLES POMEROY, New York, N. Y., as signor, by mesne assignments, to the Vulcan Manufacturing Company. Filed Feb. 13, 1885. Renewed May 9, 1887. Serial No. 237,588. (No model.)

Claim.—A wrench wherein are combined a toothed wrench-bar carrying the fixed jaw, a head sliding on such bar and having a bearing spring and teeth engaging the teeth of the bar, a jaw pivoted in the sliding head, a spring throwing the pivoted jaw back, and a cam-lever pivoted on the sliding head and acting to throw the pivoted jaw forward, substantially as set forth.

401,514. CIGAR-BUNDLING MACHINE. ALONZO E. PYE, Kingston, N. Y. Filed Jan. 18, 1888. Serial No. 261,118. (No model.)

Claim.—1. The combination, with a supporting-frame, having a back and horns, of a filling-piece between said horns, a loop-shaped belt extending around the filling-piece and provided with a longitudinal opening or slot, a roller to which the ends of the belt are attached, and means for winding the belt on the roller, substantially as set forth.



2. The combination, with a supporting-frame, having a back, a fixed horn, an adjustable horn, and an interchangeable filling-piece between said horns, of a loop-shaped belt passing around the filling-piece, a roller to which the ends of the belt are attached, and mechanism for winding the belt on said roller, substantially as set forth.

3. The combination of a supporting-frame, having a back hinged to said frame, horns also hinged to the frame, stops for retaining the horns in raised position, a filling-piece between the horns, said filling-piece having rounded-off ends, a loop-shaped belt provided with a longitudinal opening or slot, a winding-roller to which the ends of the belt are attached, and mechanism for winding the belt on said roller, substantially as set forth.

4. The combination of a supporting-frame, a hinged back, a hinged horn applied to a fixed piece of the frame, a second horn hinged to a laterally-adjustable piece of said frame, and an interchangeable filling-piece between said horns, substantially as set forth.

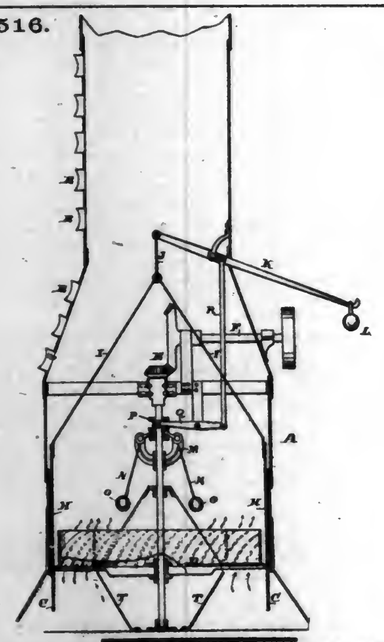
5. In a cigar-bundling block, the combination, with a filling-piece, of a loop-shaped belt having a longitudinal opening or slot, said belt passing around the filling-piece, a roller to which the ends of the belt are attached, and means for winding the belt around said roller, so as to compress the bundle of cigars placed in said belt preparatory to tying the same, substantially as set forth.

401,515. UNDERGROUND CONDUIT FOR ELECTRICAL RAILWAYS. FRED. H. REED, Jersey City, N. J. Filed Oct. 6, 1886. Serial No. 215,472. (No model.)

Claim.—1. The combination of the rail portions R' and R^2, supported continuously throughout their length, forming together a single tread with a slot in the middle thereof and constituting a track-rail, one or more electrical conductors suitably insulated therefrom, and means for completing the circuit from the same to a passing vehicle, substantially as described.

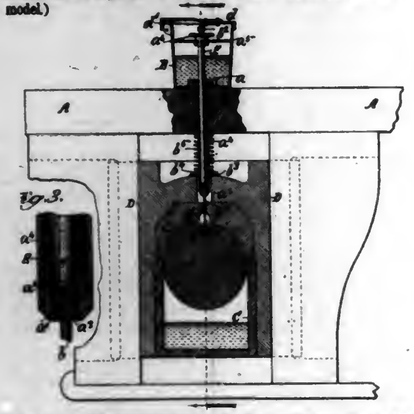
2. The combination of the flanged rail portion R' and R^2, forming together a single tread, with a slot intermediate thereof having its orifice above the level of the way, as shown and described, one or more electrical conductors insulated therefrom, and means extending into said slot for completing the circuit.

3. A track-rail having a single tread with a slot in the middle thereof, rendering the same reversible, and a conduit thereunder, as and for the purpose described.



4. The combination of the following devices forming a combined conduit and rail for an electrical railway, to wit: two conduit-walls continuous throughout, forming the conduit proper, in which one or more conductors are arranged for conveying the current, and a ribbed rail above the level of the way, with a slot in the middle thereof, forming two parts, R' R^2, each secured to and supported by one of said conduit-walls and forming together a single tread for a wheel adapted to travel thereupon.

401,516. CHIMNEY OR STACK PROPELLER AND GOVERNOR. JAMES A. ROBB, San José, Cal. Filed Apr. 14, 1888. Serial No. 270,647. (No model.)

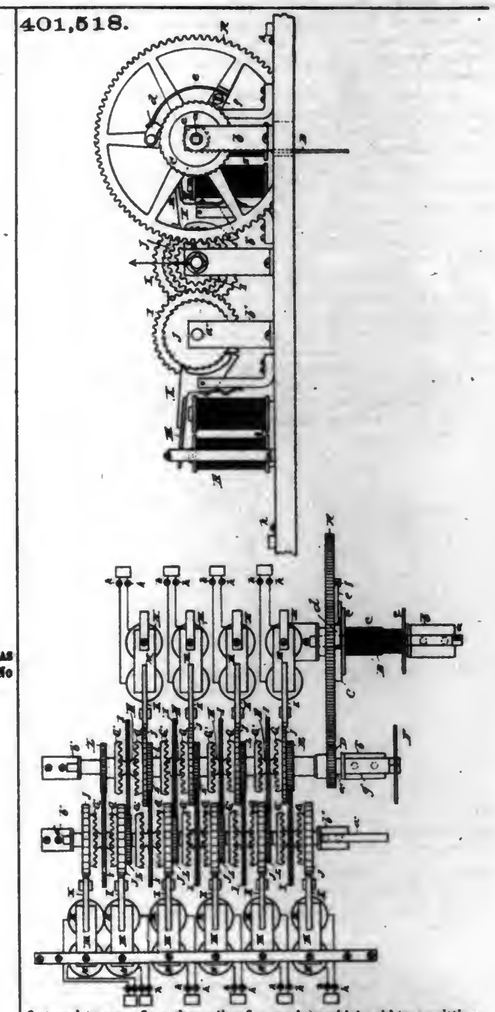


Claim.—1. The combination, with the vertical chimney, of the lenses fixed in the side thereof and concentrating the rays of the sun on the inner side of the stack away from the sun, whereby the upward draft in the stack is increased, substantially as herein described.

2. The wheel journaled to rotate within the vertical shaft or chimney, which has openings at the bottom through which air is admitted to drive said wheel, the interior cone, T, for directing the current of air through the wheel, in combination with a vertically-moving damper for opening and closing the air-supply passages, a governor driven by the wheel, and mechanism, substantially as specified, whereby the governor is connected with the suspending-arms of the damper so as to open and close it, substantially as herein described.

401,516.

401,517. OILING DEVICE FOR LOCOMOTIVE-AXLES. THOMAS J. ROGERS, Chicago, Ill. Filed Feb. 2, 1888. Serial No. 298,469. (No model.)



Claim.—1. The combination, with the axle-frame, of an oil-cup rigidly mounted thereon, an oil-conducting tube leading from the bottom of the cup to and resting on the brass, a second tube starting from the inside of said cup at a point above the oil-line and extending down inside of and stopping short of the lower end of the oil-tube, the plug inserted in the lower end of said oil-tube and provided with a concave seat and a contracted oil-passage, and the wire inserted in the inner tube and having the lower end resting on the axle, substantially as and for the purpose set forth.

2. The combination, with the oil-cup, of the bridge arranged inside thereof, the adjustable tube having a threaded engagement with said bridge and extending down inside of the oil-conducting tube, and the wire inserted in the adjustable tube and having the lower end resting on the axle, the upper end projecting above said tube inside of the cup, substantially as and for the purpose set forth.

401,518. REGISTER. HENRY S. ROSE, New York, N. Y. Original application filed Nov. 2, 1888, Serial No. 289,791. Divided and this application filed Jan. 31, 1889. Serial No. 297,071. (No model.)

Claim.—1. A system of gear-wheels in a registering apparatus, which consists of a pair of gears mounted loosely on a shaft, an intermediate transmitting gear-wheel carrying a loose or running pinion which engages both said gears, an escape-wheel rigidly secured to one or both of said pair of gears, and a small gear-wheel securely

401,518.

fastened to one of another pair of gears, into which said transmitting-wheel meshes, the whole arranged and adapted to receive through either or both of said gears a given amount of motion and to transmit it unaltered by means of said intermediate transmitting gear and pinion, substantially as shown and described.

2. A mechanical registering system which consists of a series of escapements operated from a corresponding series of reporting-stands, an adding-machine composed of a series of systems of gear-wheels and provided with an escape-wheel for each of said escapements, and with a resultant-wheel which receives and sums up the motions given to all of said escapements, and a pointer or other suitable device for registering the amount of said motions, substantially as shown, and for the purposes specified.

3. A mechanical registering system which consists of a series of escapements simultaneously operated from a corresponding series of reporting-stands, an adding-machine composed of a series of systems of gear-wheels and provided with an escape-wheel for each of said escapements, and with a resultant-wheel which receives and sums up the motions given to all of said escapements, and a pointer or other suitable device for registering the amounts of said motion, substantially as shown, and for the purpose specified.

401,519. DATING DEVICE FOR HAND-STAMPS. LOUIS K. SCOTFORD, Chicago, Ill. Filed Aug. 18, 1887. Serial No. 246,615. (No model.)

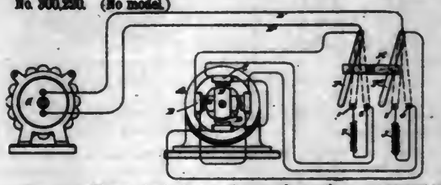
Claim.—1. The combination, with a type-band, of a support sustaining the band at the point of printing, and a plurality of supporting-rollers for the band, two of which engage the face of the band, one at each side of the said support, said rollers, which engage the

401,519.

face of the band, being provided with teeth or projections adapted to engage the spaces between the projecting types upon the band, substantially as described.

2. The combination, with the frame and the revolving die-plate of a self-inking hand-stamp, of a flexible type-band, a support for the band at the point of printing, and a plurality of rollers for sustaining the band mounted upon the die-plate within the space inclosed by the frame, two of which rollers are adapted to engage the printing-face of the band, one at each side of the said support, said two rollers, which engage the face of the band, being provided with projections or teeth engaging the spaces between the projecting types upon the band, substantially as described.

3. The combination, with a type-band, a support for the same at the point of printing, and a plurality of guides or supports for the band embracing two wheels or rollers provided with cogs or teeth engaging spaces between the projecting types of the band, and a notched or cogged wheel engaging both of said cogged wheels or rollers, substantially as described.



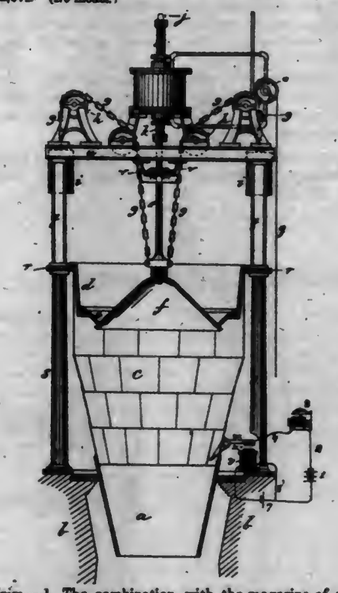
4. The combination, with a type-band and a support for the band at the point of printing, of two supporting-rollers, J J, provided with teeth engaging the spaces between the projecting types of the band, and three supporting-rollers, I K K, engaging the back or rear surface of the band, substantially as described.

5. The combination, with the frame of a dating apparatus, a type-band, and a support for the band at the point of printing, of two rollers, J J, provided with teeth or projections engaging the spaces between the projecting types of the band, supporting-rollers I K K, a shaft, D, for said roller I, and a toothed actuating-wheel mounted upon said shaft D and engaged with said rollers J J, substantially as described.

6. The combination, with the frame of a dating apparatus and a type-band, of a plurality of supports for the band embracing the roller adapted to engage the printing-face of the band, said roller consisting of two disks, and cross-bars attached to and between the same, one of said disks being provided with peripheral cogs, and a toothed actuating-wheel mounted upon the frame and engaging with the cogged disk, substantially as described.

7. The combination, with a dating-device frame and wheels or rollers for supporting a band provided with projections or teeth engaging the space between projecting types upon the band, of a rubber type-band and means for connecting the ends of the band, consisting of integral projections or lugs cast upon the ends of the band, and a metal clasp having prongs engaging the said projections or lugs, substantially as described.

401,520. METHOD OF OPERATING ELECTRO-MAGNETIC MOTORS. NIKOLA TESLA, New York, N. Y. Filed Feb. 18, 1889. Serial No. 300,220. (No model.)

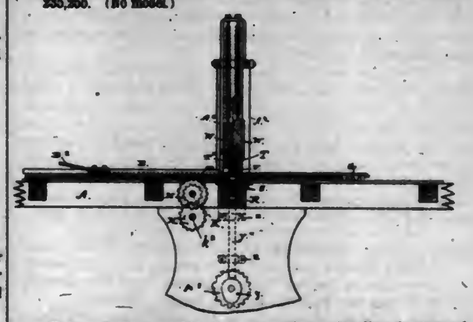


Claim.—1. The method of operating an alternating-current motor herein described by first progressively shifting or rotating its poles or points of greatest attraction and then, when the motor has attained a given speed, alternating the said poles, as described.

2. The method of operating an electro-magnetic motor herein described, which consists in passing through independent energizing-circuits of the motor alternating currents differing in phase and then, when the motor has attained a given speed, alternating currents coinciding in phase, as described.

3. The method of operating an electro-magnetic motor herein described, which consists in starting the motor by passing alternating currents differing in phase through independent energizing-circuits and then, when the motor has attained a given speed, joining the energizing-circuits in series and passing an alternating current through the same.

4. The method of operating a synchronizing-motor, which consists in passing an alternating current through independent energizing-circuits of the motor and introducing into such circuits a resistance and self-induction coil, whereby a difference of phase between the currents in the circuits will be obtained, and then, when the speed of the motor synchronizes with that of the generator, withdrawing the resistance and self-induction coil, as set forth.



401,521. INDICATING DEVICE FOR CHARGING FURNACES. EDWARD WALSH, Jr., St. Louis, Mo. Filed Aug. 16, 1888. Serial No. 282,871. (No model.)

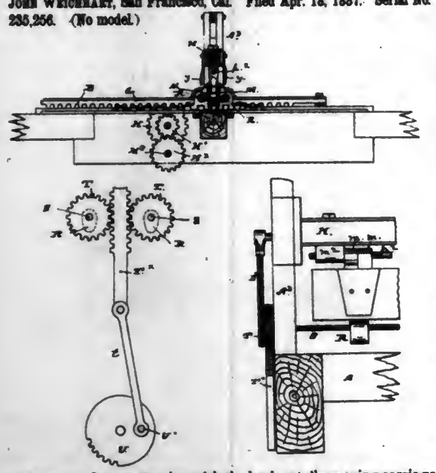
Claim.—1. The combination, with the magazine of a blast-furnace, of an open alarm-circuit and a lever controlled by the charge in the magazine and adapted to automatically close the alarm-circuit, substantially as and for the purposes set forth.

2. In an indicating device for furnaces, the combination, with the magazine, of a pivoted lever, one arm of which projects into the magazine and is operated upon by the material therein, an electro-magnet operating upon the other arm of the lever, and an electric alarm-circuit in which the electro-magnet is located, substantially as and for the purposes described.

401,522. MACHINE FOR FORMING SHEET-METAL LATHING. JOHN WEICHHART, San Francisco, Cal. Filed Apr. 18, 1887. Serial No. 235,255. (No model.)

Claim.—1. In a machine for corrugating or bending sheet metal, the combination of a fixed die, R, having a groove, a bar, S, lying in and forming the bottom of said groove, and means, substantially as described, for elevating said bar by positive mechanical action, a reciprocating die, T, a yielding presser-bar, U, and mechanism, substantially as described, adapted to move said bar and reciprocate said die with respect to each other, as set forth.

2. In a machine for corrugating or bending sheet metal, the combination of a sliding carriage, feed mechanism by which said carriage is moved intermittently step by step, a stationary die having a groove, a vertically-movable bar forming the bottom of said groove, and means, substantially as described, for elevating said bar by positive



mechanical action, a reciprocating die, a spring presser-bar adapted to coact with said die to produce crimps or corrugations in the metal, and mechanism adapted to reciprocate said movable die and move said vertically-acting bar with respect to each other and between the intervals in the feed of the carriage, as set forth.

3. The combination, with the sliding carriage B, of the stationary grooved die or former R, having the faces R' R^2 and the movable bar S between them, the reciprocating die T, composed of two parts or sections, one of which is set to act in advance of the other, the spring presser-bar U, and mechanism, substantially as described, adapted to move the carriage step by step and to actuate the movable die and the bar with respect to each other between the movements of the carriage, as set forth.

4. The combination of a suitable frame or bed, the sliding carriage B, pawl-and-ratchet feed G H I J J^x K K', cross-heads W W, cranks M P X and connecting-rods, the bar y^x, cam *y*, and connecting-gears, substantially as described.

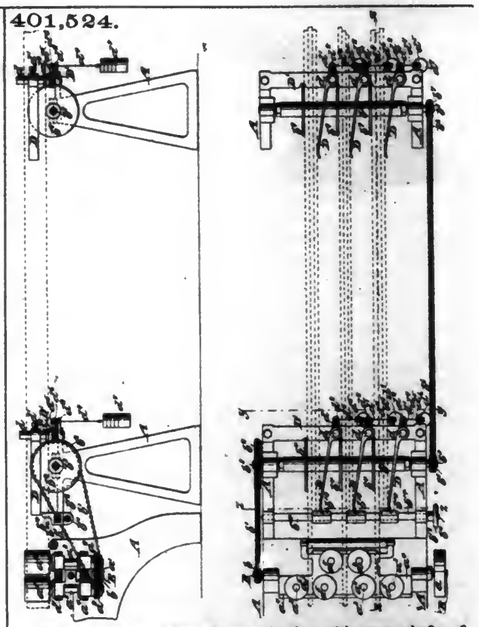
401,523. MACHINE FOR FORMING SHEET-METAL LATHING.

JOHN WEICHHART, San Francisco, Cal. Filed Apr. 13, 1887. Serial No. 235,256. (No model.)

Claim.—1. In combination with the horizontally-moving carriage adapted to present and feed a sheet of metal step by step, the crimping-jaws M M, movable cross-head N, the cranks and connecting-rods, and the cams and actuating mechanism consisting of the gears T T, double rack T^x, connecting-rod *t*, and crank-disk U, substantially as described.

2. In a machine for crimping metal for the manufacture of corrugated metal lathing, the hinged jaws placed for operation, as described, over a traveling work-holding bed or carriage, and having vertical movement to engage with and to clear the work, the cams R R, rotary crank-disk U, gears T T, reciprocating rack T^x, and connecting-rod *t*, as a means for pressing the jaws together against the rack, substantially as described.

3. The herein-described machine for crimping sheet metal, consisting of a suitable bed or frame, A A, traveling carriage B, having intermittent movement at spaced intervals, the feeding mechanism, and means for operating the same, consisting of a ratchet, a pawl working thereon, pivoted arm, a connecting-rod attached to said arm at one end and to a crank at the other on the continuously-rotating shaft D, cross-head N, carrying hinged crimping-jaws, the actuating-crank T^x, connecting-rod D^2, the cam-shafts, cams, gears, racks, and crank-disk U, constructed and combined for operation as set forth.

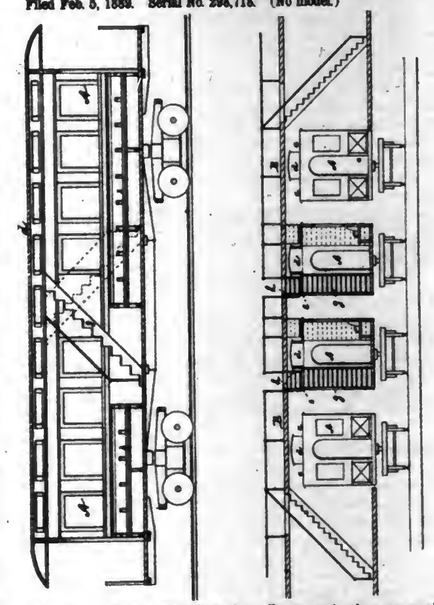


401,524. FEEDING DEVICE FOR PLANING-MACHINES.

JAMES F. WELCH, Brooklyn, and ERNST F. AUTENRIETH, New York, assignors to the Glen Cove Machine Company, (Limited,) Green Point, Brooklyn, N. Y. Filed Nov. 27, 1888. Serial No. 291,961. (No model.)

Claim.—1. In a planing-machine, the combination, with rotary shafts, of feeding-disks mounted on said shafts so as to rotate in vertical planes and having their faces contacting with the board to be fed, and yielding pressers independent of said disks operating to force the board into contact with the disks, substantially as specified.

2. In a planing-machine, the combination, with rotary shafts, of feeding-disks mounted on said shafts so as to rotate in vertical planes and having their faces contacting with the board to be fed, yielding pressers adapted to maintain a number of boards in contact with each other and one of said boards in contact with the feeding-disks, and a stop for preventing a forward movement of any of the boards except the one in contact with the feeding-disks, substantially as specified.

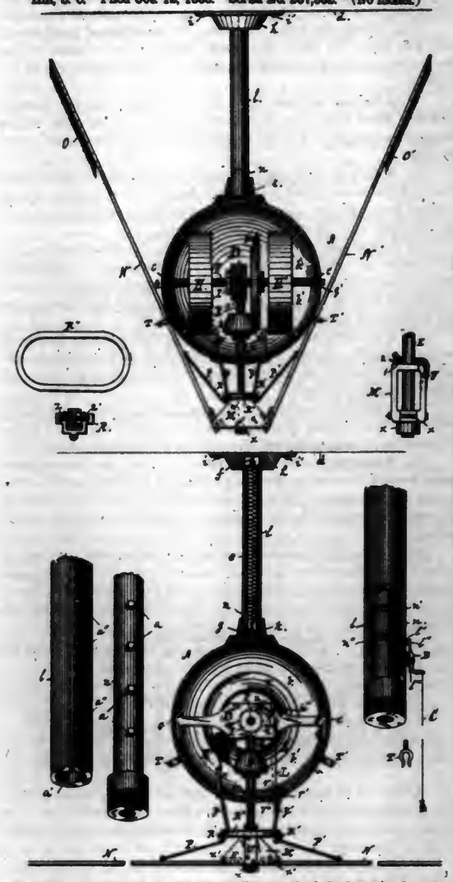


401,524.

3. In a planing-machine, the combination, with rotary shafts, of feeding-disks mounted on said shafts so as to rotate in vertical planes and having their faces contacting with the board to be fed, yielding pressers adapted to maintain a number of boards in contact with each other and one of said boards in contact with the feeding-disks, and an adjustable stop for preventing a forward movement of any of the boards except the one in contact with the feeding-disks, substantially as specified.

401,525. RAILWAY-CAR.

ERNEST WEHGMANN, New York, N. Y. Filed Feb. 5, 1889. Serial No. 298,718. (No model.)



Claim.—1. The combination of a railway-car having an opening in the roof with a door for closing said opening, and with a staircase leading from the roof to the interior of the car, the staircase being supported upon the car-floor and facing toward one of the ends of the car, substantially as specified.

2. The combination of a railway-car having a pair of openings in its roof with two pairs of staircases leading from said openings to the interior of the car, the staircases facing in opposite directions and being located at opposite sides of the aisle, substantially as specified.

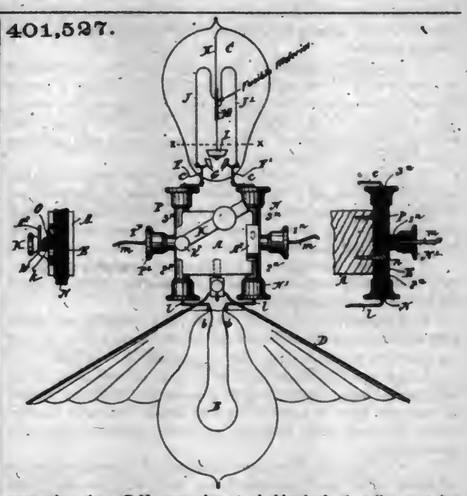
401,526. SUSPENSION FLY-FAN.

WILLIAM C. WHITNER, Rock Hill, S. C. Filed Oct. 12, 1888. Serial No. 287,882. (No model.)

Claim.—1. The combination, with a vertical shaft to the fans provided with a sleeve mounted on the shaft, of the elliptical-shaped track concentric with the shaft and the links connected with the fans and provided with travelers operating on the track, whereby a wave-like motion is imparted to the fans.

2. The combination, with a vertical shaft and the fans provided with a sleeve mounted on the shaft, of the flanged horizontal elliptical track and the travelers connected by links to the fans and provided with double anti-friction rollers operating on the inside and on the outside of the said flanged track.

3. The combination, with the sphere provided with spring-catches T T', vertical shaft E, provided with collar *x*, loose sleeve M, fan-arms N N', having slotted ends, and the pivots *x' x''*, whereby said ends are secured to the sleeve, of the endless track R'' and the travelers R R' and links P P', all arranged for operation substantially as described.



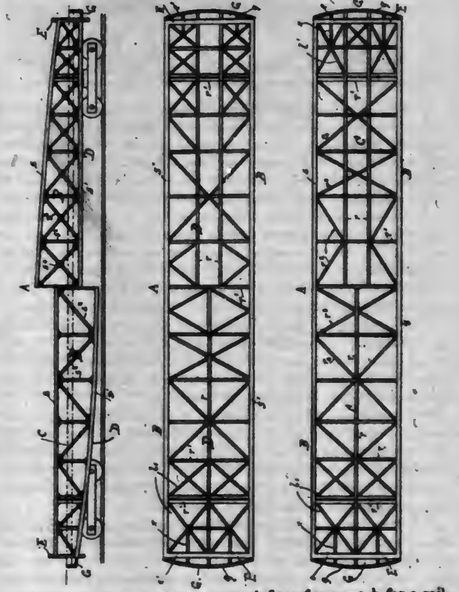
401,527. CUT-OUT FOR INCANDESCENT ELECTRIC LAMPS.

EDWIN R. WHITNEY, St. Johnsbury, Vt. Filed July 21, 1888. Serial No. 280,675. (No model.)

Claim.—1. In combination with an incandescent electric lamp, an independent glass lamp-bulb, contact-pieces, and carbons of a higher resistance than that of the filament in the lamp proper, inclosed in such independent bulb, connections of carbons and contact-pieces with main wires, a wire inclosed in and suspended from top of said independent bulb, a fusible strip forming part of such wire, to which said carbons are connected, and a drop-plug carried by said wire and adapted when dropped to rest on said contact-pieces and form a circuit through them, all as herein set forth, and for the purpose described.

2. In an incandescent electric lamp, the combination, with the main wires *m m* and connecting-strips *l l*, of the three-armed insulated

401,527.



connecting-pieces P N, secured to the holder-body A, split to receive said strips *l l*, and the strips *c c*, connected, respectively, to terminals *b b* and F F', and the screwed sleeves P' N', for securing the several parts firmly in place, as set forth.

3. In an incandescent electric lamp, the combination, with the main wires *m m* and connecting-pieces P N, of stud k^2, communicating with connecting-piece P, coiled spring k^3, latch O, in contact with connecting-piece N, and key K, all carried by holder-body A, as shown and described.

401,528. RAILWAY-CAR.

MAX A. ZORCHER, Phœnixville, Pa. Filed May 25, 1888. Serial No. 275,121. (No model.)

Claim.—1. A statically-constructed floor frame-work for a railway-car, consisting of two or more vertical longitudinal girders, all of the individual members and details of which are rigid and non-adjustable, each having a top and bottom chord and web members throughout, said parts being integrally connected together at or near their tops and bottoms by longitudinal lateral tie-trusses of similar constructions, substantially as described.

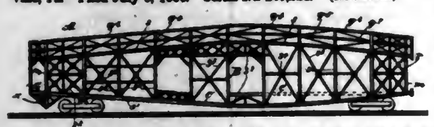
2. A statically-constructed floor frame-work for a railway-car, consisting of two or more vertical longitudinal girders connected together at or near their tops and bottoms by longitudinal trusses adapted to resist lateral strains, in combination with one or more transverse vibration or tie trusses, having its greatest permissible depth at each location, and all of said trusses integrally connected

together in such manner as to be rigid and non-adjustable, substantially as described.

3. A statically-constructed railway-car floor-frame consisting of the combination of the rigid non-adjustable side trusses, B, having top and bottom chords and web members throughout, and one or more transverse tie or vibration trusses or girders, r', similarly constructed, both of said sets of girders having common struts and connecting members s^3, substantially as described.

4. A statically-constructed car-floor frame consisting of side, top, and bottom girders, all of the members and details of which are continuous, rigid, and non-adjustable, the whole being so arranged that the longitudinal top truss or trusses form the support of the car-floor, substantially as described.

5. A trussed floor-frame for a railway-car, consisting of substantially vertical longitudinal trusses having inclined top chords on which the floor rests, substantially as described.



6. A trussed floor-frame for a railway-car, consisting of substantially vertical longitudinal exterior and interior trusses having inclined top chords on which the floor rests, substantially as described.

7. A trussed floor-frame for a railway-car, consisting of substantially vertical longitudinal trusses the top chords of which are inclined to carry the floor, in combination with lateral transverse bracing-trusses, the whole being integrally connected together, substantially as described.

8. A railway-car floor-frame consisting of longitudinal girders or trusses united by a longitudinal top truss or girder and lateral transverse bracing or tie trusses or girders, all of said trusses being constructed and connected together to resist strains in all directions, substantially as described.

9. A railway-car floor-frame consisting of longitudinal girders or trusses united by a longitudinal bottom truss or girder and lateral transverse bracing or tie trusses or girders, all of said trusses being constructed and connected together to resist strains in all directions, substantially as described.

401,529. RAILWAY-CAR FRAME. MAX A. ZORCHER, Phœnixville, Pa. Filed July 6, 1888. Serial No. 279,221. (No model.)

Claim.—1. A railway-car frame having two or more longitudinal trusses or girders extending throughout the length of the car, having increased depth at or near the center of the car, and connected together at or near their upper and lower chords by trussed girders adapted to resist lateral strains, the whole being joined together to form a statically-trussed frame, substantially as shown and described.

2. A railway-car frame consisting of two or more longitudinal supporting trusses or girders having increased depth at or near the center of the car, connected at or near the top and bottom by longitudinal trusses or girders, with one or more intermediate cross or tie trusses or bracing uniting said longitudinal trusses, so as to form a solid or statically-constructed structure, substantially as described.

3. A railway-car frame consisting of an external skeleton body having vertical longitudinal trusses of increased center depth, with one or more vertical transverse statically-constructed overhead roof-trusses having rigid and non-adjustable web members throughout their entire length, substantially as described.

4. A railway-car frame consisting of an external skeleton body having vertical longitudinal trusses of increased depth between the truck-supports, with one or more interior transverse vibration-trusses and one or more vertical transverse statically-constructed overhead roof-trusses having rigid and non-adjustable web members throughout their entire length, substantially as described.

5. A railway-car frame consisting of an external skeleton body whose vertical longitudinal trusses are of increased depth between the truck-supports, with one or more interior longitudinal trusses and one or more vertical transverse statically-constructed overhead roof-trusses having rigid and non-adjustable web members throughout their whole length, substantially as described.

6. A railway-car frame consisting of an external skeleton body, with vertical longitudinal trusses of increased depth between the truck-supports, and one or more interior longitudinal trusses, and one or more interior transverse vibration-trusses, and one or more vertical transverse statically-constructed overhead roof-trusses having rigid and non-adjustable web members throughout their whole length, substantially as described.

7. A railway-car frame having four or more longitudinal external members, any of which may be of irregular shape, with diagonal and normal members connecting the sides of said frame to said longitudinal members, and diagonal and normal members connecting the top and bottom of such frame to said longitudinal members, substantially as described.

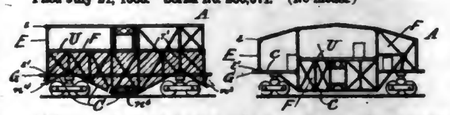
8. A railway-car frame having normal and diagonal braces in its side faces, the latter of variable depth, in combination with diagonal and normal braces in its top and bottom faces, and knee-braces between the sides and top and bottom faces, substantially as described.

9. A railway-car frame consisting of trussed lateral top, bottom, and side faces, the latter of variable depth, in combination with a trussed-roof-supporting frame or auxiliary body, substantially as described.

10. A railway-car frame consisting of trussed lateral top, bottom, and side faces, the latter of variable depth, in combination with a trussed-floor-supporting frame or auxiliary body, substantially as described.

11. A railway-car frame consisting of trussed lateral top, bottom, and side faces, the latter of variable depth, in combination with a trussed floor, and also a trussed-roof-supporting frame forming each an auxiliary body, substantially as described.

12. A statically-constructed railway-car frame wherein any or all exterior or interior faces are each constructed of two or more statically-constructed trusses integrally connected together for each face, so as to form one truss of variable depth and having openings for windows or doors, substantially as described.



13. A statically-constructed railway-car frame having longitudinal girders with a diminished depth at their ends, in combination with top and bottom chords, the arrangement being such as to resist collision strains more evenly.

14. A statically-constructed railway-car frame containing two or more statically-trussed floor-frames, each integrally connected therewith and each constituting the floor-support, substantially as described.

15. A statically-constructed railway-car frame containing one or more trussed floor-frames integrally connected therewith, each constituting a floor-support and any or all inclined in any one or various directions to assist in the discharge of the load, substantially as described.

16. A statically-constructed railway-car frame containing one or more trussed floor-frames integrally connected therewith, having longitudinal trusses, their greatest depth being at or near the center of the car, while the top chords of the floor-girders which sustain the floor are inclined, substantially as described.

401,530. RAILWAY-CAR. MAX A. ZORCHER, Phœnixville, Pa. Filed July 21, 1888. Serial No. 280,671. (No model.)

Claim.—1. A hopper-bottom railway-car body or frame consisting of statically-trussed side, end, and bottom faces and one or more transverse interior girders, all rigidly connected together, substantially as described.

2. A hopper-bottom railway-car body or frame statically constructed and having one or more transverse and longitudinal interior trusses, substantially as described.

3. A hopper-bottom railway-car body statically constructed, having corrugated metal-plate wall and floor linings to retain the load, substantially as described.

4. A hopper-bottom railway-car body or frame whose sides and ends and floor and interior girders consist each of a statically-constructed truss of a corrugated plate-web, substantially as described.

5. A hopper-bottom railway-car body or frame statically constructed, having one or more interior trusses, any of which in connection with any of the exterior sides and ends form the support for an overhead floor to carry load, substantially as described.

6. A hopper-bottom railway-car body or frame statically constructed whose exterior faces, any or all, are inclined, substantially as shown and described.

7. A hopper-bottom railway-car body or frame statically constructed, and having one or more interior girders whose exterior faces, any or all, are inclined, substantially as described.

8. A hopper-bottom railway-car body or frame externally and internally statically constructed, any of whose exterior girders are inclined, the various girders also forming an overhead-floor support to carry load, substantially as described.

9. A hopper-bottom railway-car body or frame statically constructed, any of the chords of the longitudinal sustaining-girders of which are securely held in place by knee-braces, substantially as described.

10. A hopper-bottom railway-car body or frame externally and internally statically constructed with an overhead floor and one or more variously placed and constructed and operated doors, substantially as described.

11. An externally and internally statically-constructed railway-car body or frame whose central compartment is of hopper-bottom construction, and suitable truss-work extending therefrom to transfer said loads to the trucks and to resist impacts, substantially as shown and described.

12. An externally and internally statically-constructed railway-car body or frame whose end compartments are of hopper-bottom construction, and suitable truss-work connecting these two compartments, substantially as shown and described.

13. An externally and internally statically-constructed hopper-bottom car body or frame of maximum permissible car-height, any or all of its girders also forming the support for one or more upper floors, each to carry load, substantially as described.

14. A multiple-deck car having a statically-constructed framework and a pipe or raceway extending downward to enable the filling of the lower compartment and the discharging of the upper, substantially as described.

15. A statically externally and internally constructed compartment-car having a hopper-bottom compartment centrally located and single and multiple deck compartments on either side, substantially as described.

16. A statically externally and internally constructed compartment-car having a hopper-bottom compartment over each truck, and centrally located a single or multiple deck compartment connecting the two, substantially as described.

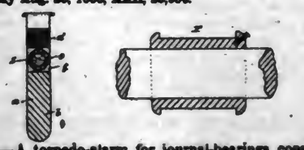
17. A composite multiple-deck railway-car externally and internally statically constructed, having a central compartment partly extending downward between the two trucks, of the greatest permissible dimensions, able to carry maximum loads, substantially as described.

18. A hopper-bottom railway-car frame or body statically constructed, whose longitudinal girders have a bottom chord, r'', substantially as shown and described.

19. A railway-car body or frame consisting of statically-constructed trusses, any or all of which have latticed webs, to which are secured corrugated or buckle plates or sheets adapted to act as linings, and thereby increase the strength of the structure, substantially as described.

20. A railway-car body or frame consisting of statically-constructed trusses combined with corrugated plate and latticed webs, the whole being joined together in such manner as to withstand strains in all directions, substantially as described.

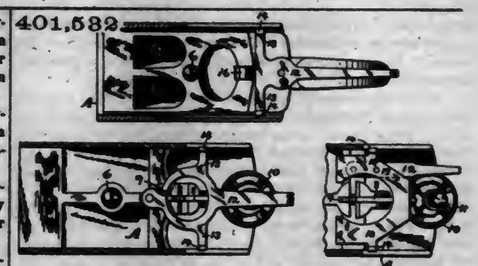
21. A hopper-bottom railway-car body or frame having an externally-trussed body with statically-constructed side girders, said side girders being inclined, substantially as described.



22. A statically-constructed hopper-bottom railway-car body or frame having one or more acting double slide-doors, in combination with a lever and connecting mechanism for operating the same, substantially as described.

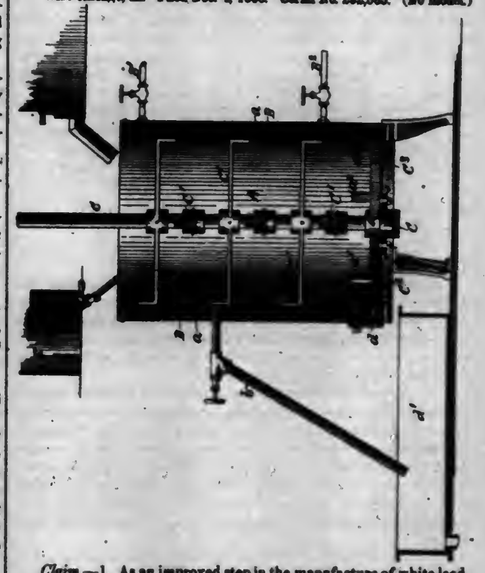
23. A statically-constructed railway-car body or frame having one or more continuous transversely-located stiffening-frames, Z, the whole being so arranged as to give great strength against collisions and accidents due to derailment, substantially as described.

24. A statically-constructed hopper-bottom railway-car body or frame having one or more double-acting sliding doors provided with a lever and connecting mechanism, substantially as described, for operating the same.



25. A statically-constructed car-body having all of its exterior faces trussed except the top face, and having one or more transverse girders, r', and knee-brace s', extending from r' upward, the whole being designed and arranged to operate substantially as described.

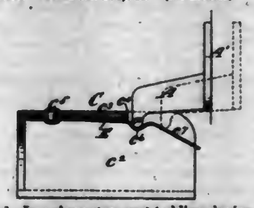
401,531. ALARM. CHRISTIAN ANDERSEN, Copenhagen, Denmark. Filed Oct. 1, 1888. Serial No. 286,904. (No model.) Patented in Norway Aug. 23, 1888, No. 1,081; in France Aug. 23, 1888, No. 190,560; in Belgium Aug. 23, 1888, No. 82,985; in England Aug. 23, 1888, No. 12,184 and in Italy Aug. 23, 1888, XXII, 23,950.



Claim.—A torpedo-alarm for journal-bearings, consisting of a tubular shell closed at the bottom and open at the top, an explosive within said shell, ingredients of an ignition compound within said shell, and an envelope separating said ingredients, said envelope being composed of a material which melts at a comparatively low temperature and permits said ingredients to unite and ignite for setting off the explosive, substantially as described.

401,532. BENCH-PLANE. FRANK M. BAILEY, New Britain, Conn., assignor to the Stanley Rule and Level Company, same place. Filed Dec. 3, 1888. Serial No. 292,540. (No model.)

Claim.—In a bench-plane, the combination of the cutting-bit, a laterally-adjusting lever, the laterally-projecting arms and upwardly-projecting lugs moving laterally with said lever and adapted to engage the outer edges of the cutting-bit, substantially as described, and for the purpose specified.

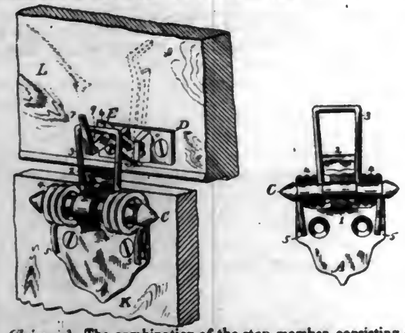


401,533. PROCESS OF MAKING WHITE LEAD. JOHN BALDWIN, Chicago, Ill. Filed Dec. 4, 1888. Serial No. 292,535. (No model.)

Claim.—1. As an improved step in the manufacture of white lead, the method herein described, which consists in grinding the lead with water in the usual manner and transferring the pulp from the mill to a vessel adapted for subjecting the pulp to the action of indirect steam heat, and then adding the oil gradually while the pulp is in a heated condition, substantially as set forth.

2. As an improved step in the manufacture of white lead, the method herein described, which consists in grinding the lead with water in the usual manner and transferring the pulp from the mill to a vessel adapted for subjecting the pulp to the action of indirect steam heat and keeping the mass agitated, next adding the oil gradually while the pulp is in a heated condition, then drawing off the water expelled, and finally disposing of the lead in the usual manner, as set forth.

401,534. DOOR-CHECK. WARREN S. BARLOW, Paterson, N. J.; Chloe H. Barlow executrix of said Warren S. Barlow, deceased. Filed Jan. 20, 1888. Serial No. 261,343. (No model.)



Claim.—1. In a door-stop and holding device, the combination, with a member consisting of an arm, as A, having a tooth or downward projection, a, of the member C, consisting of a box or frame having sides or cheeks c^2, and the top terminating inward of the ends

of the sides or cheeks, and a spring-supported holding device arranged between and shielded by the sides or cheeks c^3, and having a recess, c^4, for engagement of the tooth or projection a, substantially as herein described.

2. In a door-stop and holding device, the combination, with the member A, of the member C, consisting of a box or frame having sides or cheeks c^3, and the top terminating inward of the ends of the sides or cheeks to form a stop, c^4, and the holding device consisting of a spring, E, arranged between and protected by the sides or cheeks, the spring being inserted under the top and secured thereto, and having a recess, c^4, for the engagement of said member A, and forward of the recess an inclined tongue, c^7, on which the member acts to depress the spring, the recess c^4 being entirely forward of the stop c^4, and having an inclined rear wall, serving to arrest the member A by the latter striking it before it can strike said stop, substantially as herein described.

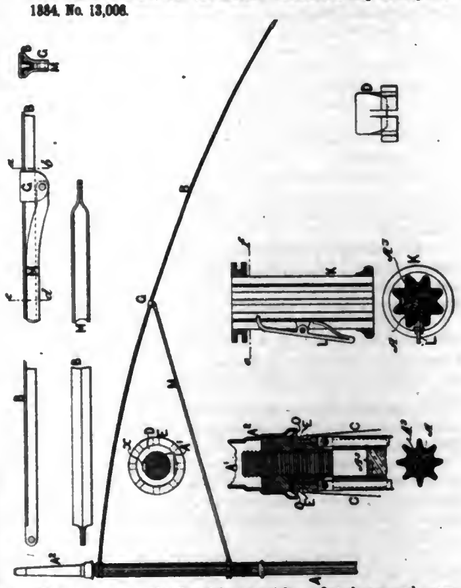
401,535. DOOR-CHECK. MILTON H. BASSETT, New Britain, Conn. Filed Nov. 10, 1886. Serial No. 218,446. (Model.)

Claim.—1. The combination of the stop member, consisting of a pivoted stop and a supporting-frame for said stop, and a buffing member, consisting of an arm-supporting base, a tripping device, and a buffer-arm of wire in the form of a loop, having the cross-bar at its outer end and the reverse spring-coils at its inner end, substantially as described, and for the purpose specified.

2. The combination of the stop member and a buffing member, consisting of an arm-supporting base, a tripping device, a buffer-arm of wire projecting therefrom in the form of a loop with a cross-bar at its outer end and having the series of reverse spring-coils at its inner end, the supporting-bar of a diameter to fill the spring-coils at two separate points for properly supporting the buffer-arm, while other coils are wholly out of contact with said bar when the buffer is in its normal position, substantially as described, and for the purpose specified.

3. The combination of an arm-supporting base, a buffing-arm in the form of a loop with a cross-bar at its outer end which projects from said arm-supporting base, a tripping device separate from the cross-bar of said buffing-arm, and a stop member acting in connection with said tripping device and buffing-arm, substantially as described, and for the purpose specified.

4. The combination of an arm-supporting base, a buffer-arm of wire in the form of a loop with a cross-bar at its outer end and the series of reverse spring-coils at its inner end, the supporting-bar within said reverse spring-coils, a pivoted stop adapted to act against the cross-bar of said buffer-arm, and a tripping device for throwing upward the pivoted stop, substantially as described, and for the purpose specified.



5. The combination of an arm-supporting base, a buffer-arm in the form of a loop with a cross-bar at its outer end, a tripping device connected with said arm-supporting base and separated from the cross-bar of said buffer-arm, and the pivoted stop in the form of a single bar, whereby the entire stop may pass bodily through said buffer-arm, substantially as described, and for the purpose specified.

6. In a door-check, the combination of a buffer-arm in the form of a loop, with the pivoted stop E, having the stop-shoulder 6 on its upper side and the lug 9 projecting from said shoulder at its outer end, with the under face, 7, for being hit by a tripping device, substantially as described, and for the purpose specified.

7. The combination of a buffing member and a pivoted stop adapted to swing freely in its supporting-frame, and having a lug at its outer end adapted to engage said buffing member for limiting the upward movement of said pivoted stop when thrown upward by a tripping device, substantially as described, and for the purpose specified.

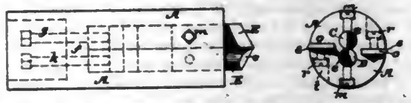
8. The combination of an arm-supporting base and a buffer-arm in the form of a loop with a pivoted stop and its supporting-frame, said stop and the lugs of its supporting-frame being formed and adapted for mounting in relation to the opening within said buffer-arm substantially as described, whereby said stop and lugs may bodily enter the said opening, as specified.

401,536. UMBRELLA-FRAME. WILLIAM W. BOX, Crayford, County of Kent, assignor to Emil Weidlich, Holloway, England. Filed Jan. 8, 1888. Serial No. 259,906. (No model.) Patented in England Sept. 28, 1884. No. 13,006.

Claim.—1. An umbrella-stick comprising a fluted core and a correspondingly-fluted sheath fitted on said core, substantially as and for the purposes specified.

2. An umbrella-stick comprising a core of some light material, a sheathing fitted around said core, and a screw-threaded end plug, A', substantially as and for the purposes specified.

3. In an umbrella, a tubular stick having the plug A', in combination with the shoe or ferrule A^2, substantially as and for the purposes specified.



4. In an umbrella, a fluted stick provided with a depression between two ribs of the fluting, with stop notches or holes, in combination with a correspondingly-fluted runner, and a spring-catch pivoted between two ribs of the fluting and projecting through an aperture in the runner to engage the stop-notches on the stick, substantially as and for the purposes specified.

5. The fluted tubular stick A, having plug A', in combination with the shoe A^2 and top notch, D, substantially as described and shown.

6. The combination, with an umbrella-stick the ferrule end whereof is screw-threaded exteriorly for a portion of its length, said screw-threaded portion being provided with a flat locking-face, the top notch, D, loosely mounted on said threaded end, and the key x, engaging the top notch and said flat face on the threaded portions of the stick to lock said parts against rotation, of the collar E, mounted and held against rotation on the top notch and provided with a peripheral groove, and the shoe or ferrule A^2, screwed onto the threaded end of the stick, substantially as and for the purposes specified.

7. The umbrella-frame consisting of the fluted tubular stick A with screwed plug A', in combination with the top notch, D, grooved collar E, shoe A^2, ribs B, stretchers M, and fluted runner K, with spring-catch L, substantially as described and shown.

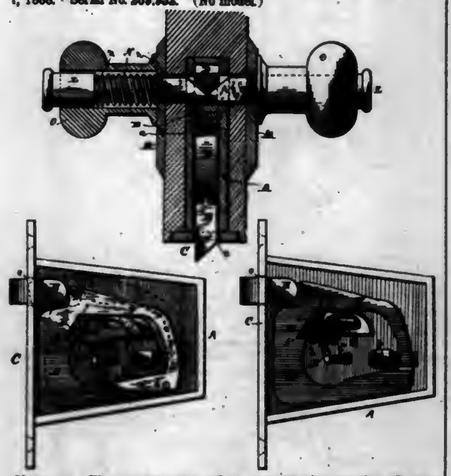
401,537. DRILLING-TOOL. ALEXANDER B. BROWN, Cleveland, Ohio. Filed Jan. 2, 1889. Serial No. 295,228. (No model.)

Claim.—1. A drilling-tool comprising two or more separate cutters, the operative edges of which exactly meet (at their inner ends) at a point which lies in the axis of motion of the tool, all substantially as and for the purpose set forth.

2. In a drilling-tool of the kind shown and described, the combination, with the tool-stock A, having formed therein suitable seats or receptacles for the same, of two tool pieces or cutters, E E, each formed of a semi-cylindrical piece of steel having its working ends beveled or tapered in two directions, substantially as and for the purposes hereinbefore set forth.

3. In combination with the tool-stock A, two or more cutters or tool-pieces having their working ends projected beyond said tool-stock, and means for adjusting said pieces endwise and also securely clamping them in place laterally, all substantially as and for the purposes hereinbefore set forth.

401,538. CAST-METAL BRACE-CHAIR FOR GIRDER-RAILS. WILLIAM M. BROWN, Johnstown, Pa., assignor to The Johnson Steel Street Rail Company, of Kentucky. Filed Feb. 15, 1888. Serial No. 264,124. (No model.)



Claim.—A rail-chair for girder-rails, provided with a filler making a splice-bar fit with the rail and formed with a feather, as f, in combination with a vertical key, as K', whereby the chair is adapted to be secured to the rail without bolts or other similar fastenings, substantially as and for the purposes set forth.

401,539. CONCRETE PAVEMENT AND FLOOR. PRESTON M. BRUNER, St. Louis, Mo. Filed Nov. 24, 1888. Serial No. 291,773. (No specimens.)

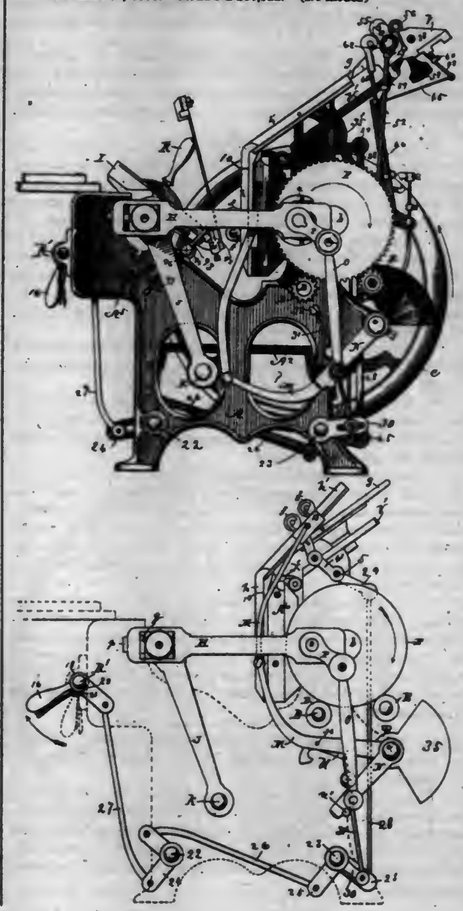
Claim.—A concrete pavement, &c., having a temporary facing composed of some quick-setting material that may be removed from the pavement after the latter has become hardened.

401,540. LATCH AND LOCK COMBINED. JOHN A. CAMPBELL, Ellis, Kans., assignor to himself and F. J. Best, same place. Filed Apr. 7, 1888. Serial No. 269,932. (No model.)

Claim.—1. The combination of the gravitating tumbler D, pivoted at its lower inner corner and having a latch-head at its upper outer corner and shouldered on its interior edge, substantially as described, with an adjustable locking-tumbler within the gravitating tumbler adapted to engage the shoulder thereof to lock the same, and a spindle for oscillating the gravital tumbler, substantially as specified.

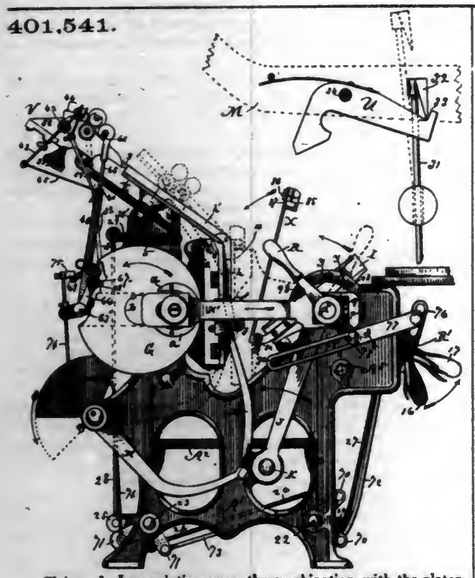
2. The combination of the pivoted tumbler D, with a knob-spindle having a beveled end engaging said tumbler and adapted to oscillate the tumbler when pushed inward, and the spring for retracting said spindle, substantially as described.

3. In a lock, the combination of the pivoted tumbler D and movable tumbler G, located inside said tumbler, with a sliding knob-spindle, L, engaging tumbler D, and the spring controlling said spindle, all substantially as and for the purpose described.



4. The combination of the pivoted weighted tumbler D and its latch-head with the slotted sliding tumbler G, and the spring-plate J, mounted on and adapted to lock said tumbler G, all constructed and arranged substantially as described.

5. In a lock, the combination of the casing having lug F, the pivoted tumbler D, latch-head E, and the slotted tumbler G, mounted on lug F, and its spring-plate J, with the knob-plates M M, the spring-controlled knob-spindles L L, and knobs O, all constructed and arranged to operate substantially in the manner and for the purpose described.



6. The combination of the casing having a lug, b, and the pivoted hollow tumbler D therein, with the knob-spindles L L, having flattened and beveled inner ends bearing against the lug b and engaging tumbler D when pushed inward, and the springs controlling said spindles, all substantially as and for the purpose described.

7. The combination of the casing having a lug, F, and a tumbler, D, pivoted at its lower inner corner in the casing and having a latch at its upper outer corner and shouldered on its interior near said latch, with the sliding toothed locking-tumbler G, mounted on lug F, and the spring-plate J on lug F, adapted to lock tumbler G, and the spindles for oscillating tumbler D, all substantially as specified.

401,541. PRINTING-PRESS. ALTON B. CARTY, Frederick, Md. Filed Mar. 17, 1888. Serial No. 267,522. (No model.)

401,541.

Claim.—1. In a printing-press, the combination, with the platen, of a frisket-frame pivoted at its lower edge to the platen and provided with an arm at one side, and a spring-operated rod and a tripper, all arranged so that when the platen returns the spring returns the grippers and the rod until arrested by the latter striking the tripper, as herein set forth.

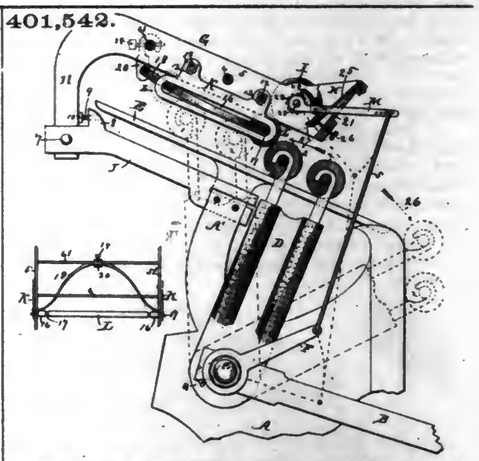
2. In printing-presses, the roller-ways consisting of a vertical or form portion adjustable to or from the form by set-screws, and an inclined or plate portion hinged to the vertical or lower portion and supported in position by hinged arms operated by levers, as herein set forth.

3. In printing-presses, the combination of an auxiliary arm loosely connected to the shaft of the form-roller-operating arms by a spring-latch, U, and stud or pin *u'*, and a rod, 31, provided with a detent, 32, by which said form-roller-operating arms may be disengaged from the auxiliary arm, as and for the purposes herein set forth.

4. In printing-presses, the plate-roller mechanism consisting of two vertical oscillating arms, 46, rigidly secured to shaft 63 and provided with guide-lugs 60 for rod of plate-roller, said shaft 63 carrying upon one end a loosely-connected arm, 66, adapted to engage with cam-wheel G, and a stud or pin, 68, in combination with spring-hook 69, pivoted to one arm, 46, as herein set forth.

5. In combination with the plate-roller mechanism above claimed, the detent 75, rod 74, bell-crank levers 70 and 71, connecting-rods 72 and 73, and handled lever 17, as herein set forth.

6. In a printing-press, the system of levers 16, 24, 25, and 29 and their connecting-rods 26, 27, and 28, and pivoted roller-ways adjacent to the ink-disk, whereby the roller-ways may be elevated above the ink-disk, as herein set forth.

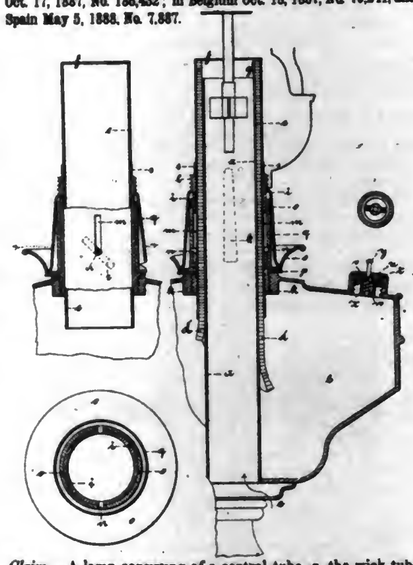


7. In a printing-press, the combination of arm 30, shaft 23, rod 31, detent 32, and spring-hook U, pivotally connected to one of the form-roller-operating arms, and auxiliary arm N, loosely secured to shaft *e*, balance-weight 35, and the system of levers 16, 24, 25, and 29 and their connecting-rods 26, 27, and 28, whereby the roller-ways are elevated and the form-rollers carried up and rested therein, as herein set forth.

8. In a printing-press, two handled levers, 16 17, connected by spring-pawls to shaft R', arm 76 of shaft R', rigidly secured thereto, platen-lever R, secured to eccentric pin *d'* of platen-shaft, and slotted bar 77, whereby the roller-ways may be elevated, the form-rollers rested thereon, the plate-roller rested above the ink-disk, and the impression taken off, all simultaneously and by one movement of lever R, as herein set forth.

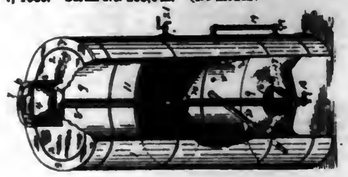
401,542. INK-FOUNTAIN FOR PRINTING-PRESSES. ALTON B. CAREY, Frederick, Md. Filed May 21, 1888. Serial No. 274,506. (No model.)

Claim.—1. In a printing-press inking device, the combination of the form-rollers and the fountain-roller with an intermediate transfer-roller and a spring bearing laterally against the transfer-roller, whereby the latter is held with a yielding pressure against the fountain-roller and removed therefrom by the contact of the traversing form-rollers as set forth.



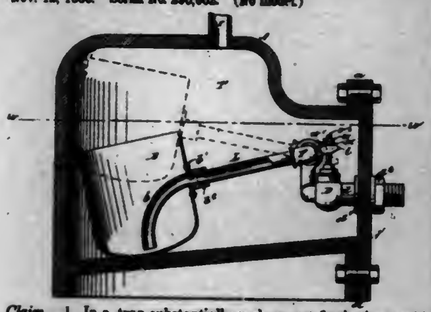
401,542.

2. In a printing-press inking device, a transfer-roller, in combination with its supporting-plates K, adjustable and having the slotted ways 14, whereby the parallelism of the roller-ways with the inking-disk of the device can be preserved, as set forth.



3. The combination of a pivotal-supported ink-fountain for printing-presses, as herein set forth, with ratchet-wheel 22, spring-pawl 24, lever M, rod 5, arm F, and rock-shaft C of a printing-press, as and for the purposes herein set forth.

401,543. OIL-LAMP WITH ANNULAR BURNER. ARTHUR CAUTIUS, Tilsit, Prussia, Germany. Filed Jan. 10, 1888. Serial No. 260,270. (No model.) Patented in England Oct. 8, 1887, No. 13,664; in France Oct. 17, 1887, No. 186,432; in Belgium Oct. 18, 1887, No. 79,241, and in Spain May 5, 1888, No. 7,887.

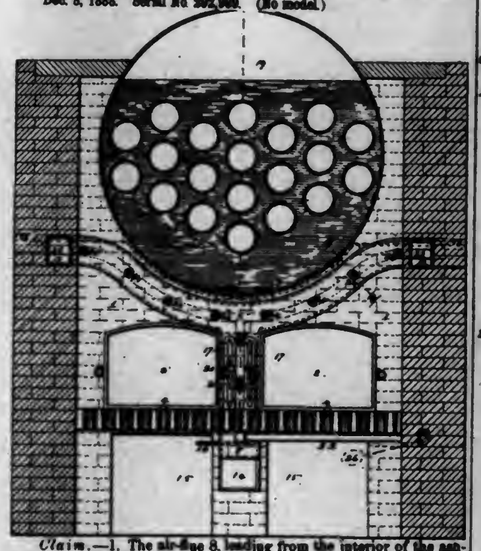


Claim.—A lamp consisting of a central tube, *a*, the wick-tube *c*, provided with projecting pins, the tube *i*, encircling the tube *c* and slotted, as described, the tube *o*, having inclined slots engaging with the pins of the tube, the cap *q* and disk *p*, and the hand-disk *o'* for rotating the tube *o*, substantially as described.

401,544. OIL-FILTER. ALBERT G. DARRAGH, Allegheny, Pa. Filed Jan. 7, 1889. Serial No. 295,642. (No model.)

Claim.—In a combined filter and reservoir, the combination of a shell, a receiver containing a funnel with a strainer and having a short pipe-section projecting from its base, a stand-pipe extending from said receiver into a funnel, provided with a strainer at the base of the filter, a guide supporting said funnel, a wash-cock at the bottom of the filter, and a filter-disk forming the bottom of the reservoir and separating said reservoir from the water-chamber, all substantially as and for the purposes set forth.

401,545. STEAM-TRAP. GEORGE ISHAM, Jersey City, N. J. Filed Nov. 12, 1888. Serial No. 290,602. (No model.)



Claim.—1. In a trap substantially such as set forth, the combination, in the inclosed chamber T, of the open float B, drain-pipe *b*, hollow lever L, and hollow fulcrum F, with the discharge-valve D, interposed in the discharge-passage and operated by the short arm *l* of the lever L, substantially in the manner and for the purpose described.

2. In a trap substantially such as designated, the combination of the closed chamber T, open float B, hollow lever L, having the hollow fulcrum F, communicating with the discharge-passage, and the short arm *l*, for raising the valve-disk *v* from its seat *v'*, and the valve D, interposed in the discharge-passage and provided with the retractile spring v^3, for closing the valve, substantially in the manner and for the purpose described.

3. In a trap substantially such as described, the combination of the closed chamber T, open bucket B, hollow lever L, short arm *l*, hollow fulcrum F, passage d^2, valve-disk *v*, stem v^2, retractile spring v^3, valve-seat *v'*, and discharge-passage *d*, the whole arranged and operating substantially in the manner and for the purpose described.

4. In a trap substantially such as set forth, the combination, in the closed chamber T, of the open bucket B, drain-pipe *b*, hollow lever L, hollow fulcrum F, and short arm *l*, with the discharge-valve D, interposed in the discharge-passage and formed with the retractile spring v^3 and adjustable shoulder M upon the valve-stem v^2, substantially in the manner and for the purpose set forth.

401,546. FURNACE. MICHAEL A. FOSTER, St. Louis, Mo. Filed Dec. 8, 1888. Serial No. 292,969. (No model.)

Claim.—1. The air-flue 8, leading from the interior of the ash-pit up the front of the fire-chamber and having side branches, 9, and having nozzles discharging into the fire-chamber.

2. The grate-bearing bar having a flange for support of the ends of the grate-bars, an aperture for the passage of an air-flue reaching from the interior of the ash-pit in front of the fire-chamber and having nozzles discharging from the flue into the fire-chamber.

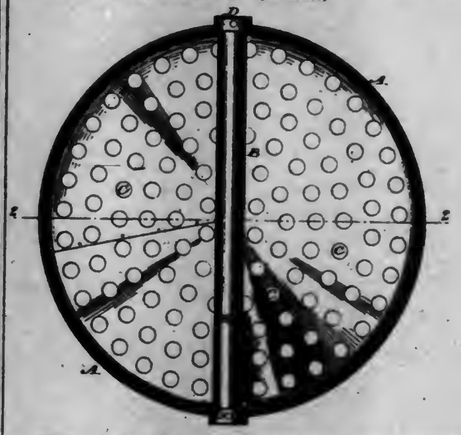
3. The combination, with a grate-bearing bar and an air-flue extending from beneath the fire in front of the fire-chamber and discharging therein, of brackets adjustably attached to the flue and resting on the bearing-bar, substantially as and for the purpose set forth.

4. The air-flue opening beneath the fire within the ash-pit, extending upwardly in front of the fire-chamber and having nozzles discharging into the fire-chamber, and a steam-pipe having steam-nozzles within the air-nozzles forming injectors, by which the air is mixed with the steam and injected into the fire-chamber, substantially as set forth.

5. The air-flue extending from beneath the fire and upward in front of the fire-chamber and having side branches, the upright pipe and branches having nozzles discharging into the fire-chamber, and a steam-pipe extending through said flue and its branches and having steam-nozzles within the said air-nozzles and forming with such nozzles injectors forcing air mixed with steam into the fire-chamber.

6. The combination, with a boiler-furnace, of the upright flue 8 branch flues 9, and longitudinal flues 12, with valves 13 and 16 to govern the air-supply, and discharge-nozzles extending from the flue to the fire-chamber, and a steam-pipe passing through the upright and branch pipes and having nozzles within the nozzles of the air-flues 8 and 9, substantially as and for the purpose set forth.

7. The combination, with the vertical air-heating flue in the front of a fire-chamber having nozzles discharging into said chamber, and a port, 14, opening into the ash-pit, and a steam-pipe within said flue having steam-jet nozzles within the air-discharge nozzles, substantially as and for the purpose set forth.



8. The combination, with the furnace-wall, of a vertical flue in said wall having nozzles projecting through said wall into the furnace, a grate-bearing bar let into said wall and having an aperture for the passage of the flue and grooves or channels 6, and the grate-bars 4, having hooks resting in said groove, substantially as set forth.

401,547. TURF-FIBER SURGICAL DRESSING. VICTOR FRANCKEN and JOSEPH PIERRAY, Liege, Belgium. Filed Sept. 4, 1888. Serial No. 284,550. (Specimens.)

Claim.—The disintegrated fibrous product from peat herein described.

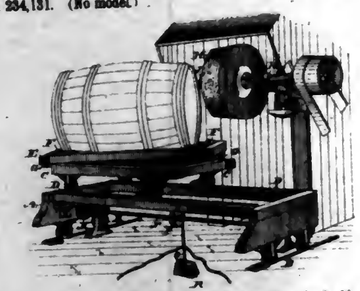
401,548. SIFTER. JOHN H. FREDERICK, Lock Haven, Pa. Filed Jan. 17, 1889. Serial No. 296,623. (No model.)

Claim.—A sifter whose sides are composed of a single perforated annular band of sheet metal, combined with a perforated sheet-metal

disk slitted and overlapped, so as to form a circular convex bottom, the disk and annular band being joined by infolding together at X, substantially as set forth.

401,549. SURGEON'S KNIFE. HENRY E. GENRIS, Philadelphia, Pa. Filed Sept. 15, 1888. Serial No. 285,490. (Model.)

Claim.—1. A knife-handle consisting of two separate parts and a fastening device with lips adapted to embrace the outer sides of the said parts at their ends, substantially as and for the purpose set forth.



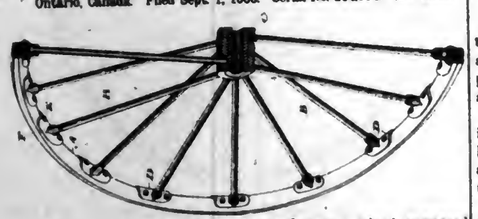
2. In a knife, substantially as described, a fastening formed with a tongue for engagement with a recess in the blade and with lips for clasping or embracing the sides of the handle, as stated.

3. In a knife formed of detachable parts, substantially as described, a blade having recesses in opposite sides of its heel, and a fastening device provided with a tongue which engages with either recess in closed or open position of the blade and lips which embrace the detachable sides of the handle, thus keeping the members of the knife intact, the parts being combined as stated.

4. In a knife formed of detachable parts, consisting of a separable handle, a blade, and a fastening device, the pivot-pins 1 3 and stop-pin 2, connected with one part of the handle, said parts of the handle being held intact by the fastening device, all combined substantially as described

5. The fastening C, having a heel, C', which is adapted to press against the blade and open the same, substantially as described.

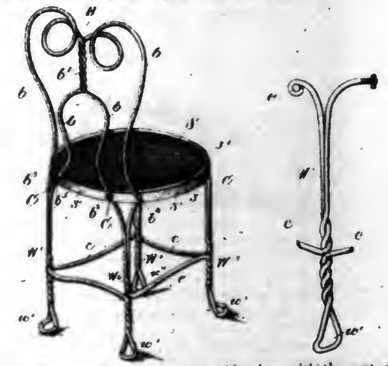
401,550. APPARATUS FOR SHAVING BARRELS, &c. WILLIAM GIBSON and ROBERT RAY, Philadelphia, Pa. Filed Apr. 8, 1887. Serial No. 234,131. (No model.)



Claim.—1. In a barrel-grinding device, the shaft N, suitably mounted on standards adapted to be secured to a floor, in combination with the pinions M and pulley P, mounted on said shaft, the weighted cord Q, secured to said pulley, the truck A, having racks L on its under face, the track B, the truck C on truck A and adapted to move at right angles to track B, the cradle E, pivoted to the truck C, and a grinding-wheel, with means, substantially as described, for operating the same, substantially as described.

2. In a barrel-grinding device, a truck having means for automatically moving the same, a second truck mounted on the first truck and adapted to move thereon at right angles to the direction of movement of the first truck, a cradle centrally pivoted to said second truck and provided with the wheels G, and the rollers F, the latter journaled in said cradle at the ends thereof and having the barrel to be operated on resting thereon, substantially as described.

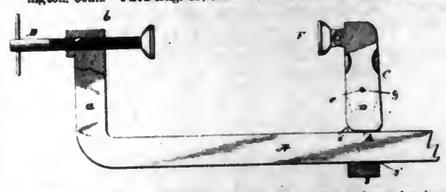
3. In an apparatus for grinding barrels, &c., the truck A, having a rack connected therewith, in combination with a pinion mounted on the floor, a pulley on the pinion-shaft, and a weighted cord connected with said pulley, substantially as described.



401,551. WHEEL. ALEXANDER GILLIES, West Toronto Junction, Ontario, Canada. Filed Sept. 1, 1888. Serial No. 284,354. (No model.)

Claim.—1. As a new article of manufacture, a wheel composed of the hub C, formed of two concentric tubes, a metal tubular frame, A, and tubular spokes B, the latter being screwed into the outer tube of the hub C, and connected at their opposite ends to the rim A by means of the clips D, substantially as and for the purpose specified.

2. The wheel described, consisting of a tubular metal frame or felly, A, the clips D, shaped to fit said felly and provided with screw-threaded sockets, the tire shaped to fit the felly, the hub, and the tubular spokes B, screwed directly into said hub at one end, and at the other end into said socket, substantially as shown and described



401,552. IRON CHAIR. ALEXANDER M. GJESTVANG, Christiania, Norway. Filed Sept. 28, 1888. Serial No. 286,641. (No model.) Patented in Norway May 5, 1888, No. 398; in France May 17, 1888, No. 190,639, and in England Aug. 24, 1888, No. 12,230.

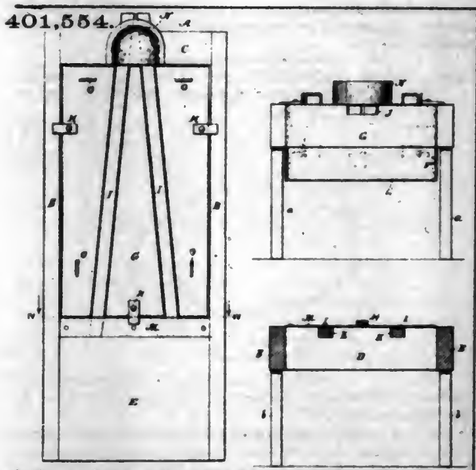
Claim.—1. In a chair, the combination, with the seat, of legs composed of doubled wires twisted together to form a foot and braced by connecting one branch of each leg-wire with a branch of another leg-wire, so that both branches of a wire form the lower portion of a leg, while one of said branches will form a cross-brace for a pair of legs, the terminals of said wires being connected to the seat, substantially as and for the purposes specified.

2. In a chair, the combination, with the seat, of legs composed of a doubled wire twisted together to form a foot, one branch of such wire being connected by twisting it with one branch of another leg-wire above the twisted foot portion, the terminals of said wires being connected to the seat, substantially as and for the purposes specified.

401,553. WOOD-WORKING CLAMP. ERNEST F. GODFREY, Southington, Conn. Filed Aug. 15, 1888. Serial No. 282,766. (No model.)

Claim.—1. The combination, in a wood-working clamp having a straight smooth-edged bar, A, terminating on one end in an arm having a clamping-screw, of the yoke C, provided with parallel arms *d d*, and a transverse connecting portion beveled to afford a biting angle, *s*, and a pivotal jaw, D, provided at its lower end with a front rounded portion and a rear flat gripping portion, substantially as specified.

2. The combination, with the bar A, having an arm at one end provided with a clamping-screw, of an adjustable arm consisting of the yoke C, having an acute angular biting portion, *s*, formed on it, and a gripping-jaw pivoted to said yoke and adapted to impinge directly upon the upper edge of said bar A, as specified.



401,554. CORPSE-DRESSING TABLE. CASPER GREEN, Dublin, Ind. Filed July 28, 1888. Serial No. 281,284. (No model.)

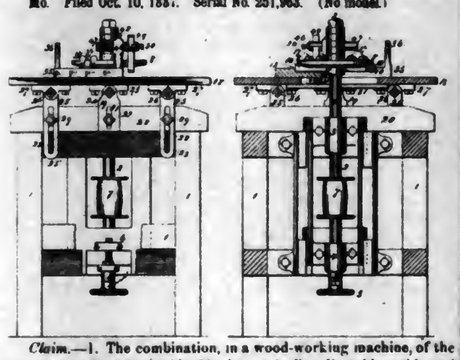
Claim.—1. A table having an opening in its top, slide-bars extending lengthwise of said opening and supported by the table, and a lowering support below said bars, said bars being adapted to support a corpse when the lowering support is lowered, substantially as and for the purpose set forth.

2. A table having an opening in its top, removable bars extending across said opening and supported by the table, and a support below the bars for supporting a corpse when said bars are removed and adapted to be moved away from said bars, substantially as and for the purpose set forth.

3. A table having an opening in its top, removable bars supported by the table across its opening, a head-rest above the upper ends of

401,554.

the bars and supported by the table, and a support below the bars for supporting a corpse independently of said bars and adapted to be moved away from said bars, substantially as and for the purpose set forth.



4. A table having an opening, bars I, extending lengthwise of said opening and angularly with respect to each other, and a recessed block above the meeting ends of said bars to afford a rest for the head, as set forth.

5. A table having an opening, removable bars extending lengthwise of said opening, a movable portion occupying said opening, and fixed supports extending from side to side of and below the table, whereon the movable portion is adapted to be lowered, and means for supporting the movable portion in said opening, substantially as set forth.

6. A table having an opening, bars I, extending lengthwise of said opening and supported by the table, and a board, G, fitting in said opening and provided with grooves for receiving said bars, said board being adapted to be lowered below the table, substantially as set forth.

7. A table having an opening, a movable board having buttons for supporting it in said opening by engagement with the sides of the table, corpse-supporting bars above the said board, and means for supporting the board when lowered, as set forth.

401,555. PANEL-RAISING MACHINE. JOHN GREEN, St. Louis, Mo. Filed Oct. 10, 1887. Serial No. 251,963. (No model.)

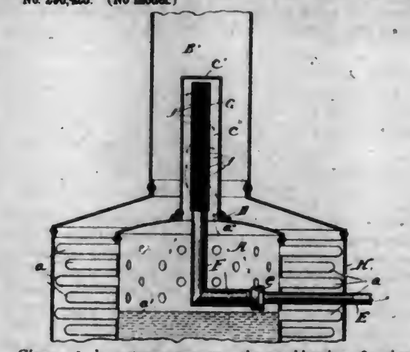
Claim.—1. The combination, in a wood-working machine, of the transversely-adjustable guide 35, the vertically-adjustable guide and chip-breaker 41, and the adjustable bar 32, all constructed and connected substantially as set forth.

2. The combination, with the main frame and table, of the brackets 27, secured to said table, the links or supports 26, hinged to said brackets, having slots, and bolts passing through said slots and securing said supports to the main frame, as set forth.

3. The combination, with the table and the cross-bars 20, of supports hinged to each corner of said table and having vertical slots therein, bolts passing through said slots and securing said supports to the cross-bars 20, recesses in said cross-bars, slotted standards set in said recesses and hinged to the table, and bolts passing through the slots in said standards and into said cross-bars 20, as set forth.

4. In a wood-working machine, the combination, with the table and the rotary cutter-head, of the combined guide-bar and chip-breaker 41, having the upwardly-projecting ends 42, adjustably secured to the table and adjustable to and from the cutter-head and adapted to serve as a side guide for the material, substantially as described.

5. The combination, with the guide-pieces 35 35 and the rotary cutter-head, of the combined guide-bar and chip-breaker 41, arranged between the ends of and having slot-and-screw connection with said guide-pieces 35 35, whereby said guide-bar and chip-breaker 41 is adjustable to and from the cutter-head, substantially as set forth.



6. The combination, with the cutter-head and the guide-pieces 35 35, of posts secured to said guide-pieces, and the guide-bar and chip-breaker 41, having extensions 42, adjustably secured to said posts, substantially as set forth.

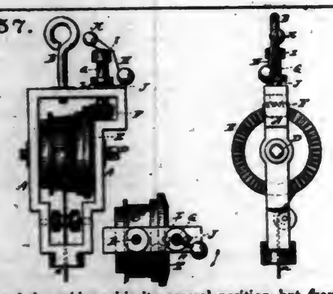
7. In a wood-working machine, the combination of the bar 32, adapted to support the stuff, vertically-adjustable screws upon which said bar is mounted, springs adapted to bear upon the stuff above said bar, and supports for holding said springs, substantially as set forth

8. In a wood-working machine, the combination, with the guide-pieces 35 35 and the bars 31, of standards carried by said pieces, a bar, 32, adjustably supported on said bars 31 and adapted to support the stuff, and springs adjustably secured to said standards and adapted to rest upon the stuff, substantially as set forth.

9. The combination, with the cutter-head, the table, and the guide 35 35, having slot-and-screw connection with said table, of the combined guide-bar and chip-breaker 41, having the vertical slot-and-screw connection with said guide 35 35, whereby said guide-bar and chip-breaker 41 is adjustable vertically and longitudinally to and from the cutter-head, as set forth.

401,556. SEPARATOR. CHARLES HALLETT, Chicago, Ill., assignor to Francis Carll Hallett, River Head, N. Y. Filed Jan. 15, 1889. Serial No. 296,425. (No model.)

Claim.—1. In a steam-separator, the combination of a pipe having one end thereof closed, perforations in the pipe, and metal cloth wound one or more times around the perforated pipe in close contact therewith, whereby steam entering the perforated pipe must pass through the meshes of the cloth, all substantially as described.

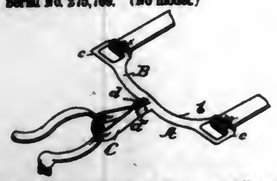


2. In a separator for steam-generating boilers, a pipe having perforations therein placed in the steam collector or dome of said boiler formed by a tubular extension thereon of less diameter than said boiler, in combination with a metal wrapping having small perforations therein wound around the perforations in said pipe, and a steam-outlet pipe passing from said dome or collector through the furnace of said boiler, whereby steam generated in said boiler passing through said separator in leaving said boiler by said steam-outlet pipe shall pass through the furnace of said boiler above the fire-box thereof, all substantially as described.

3. In a steam-separator, a pipe having perforations therein placed within a steam-generating boiler above the water-line thereof, in combination with metal cloth wrapped around the pipe and over the perforations therein, and a steam-outlet pipe passing from and a continuation of the perforated pipe and extending through the furnace surrounding the boiler above the fire-pot therein, all substantially as described.

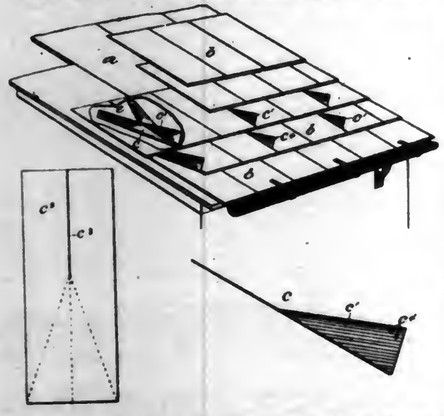
401,557. SUSPENSION DEVICE FOR LAMPS. WILLIAM E. HAMMOND and JOSEPH G. MERRIAM, Meriden, Conn., assignors to Edward Miller & Company, same place. Filed Oct. 15, 1888. Serial No. 288,125. (No model.)

Claim.—1. In a suspension device, the combination of a frame, an axle, a spring-actuated drum arranged thereon, a shaft in connection with the drum, but so as to receive a revolution from the drum more rapid than that of the drum, and a pawl hung to said shaft and so as to partake of its revolution, the said pawl adapted to swing toward and from its center of revolution, with one or more stationary stops



401,557.

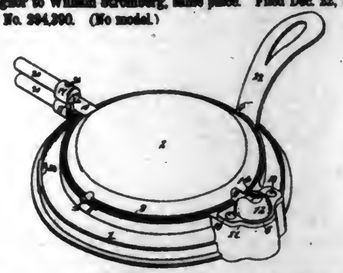
in the path of the said pawl in its normal position, but from which stop the said pawl will swing under centrifugal force imparted to it through the shaft which carries it, substantially as described.



2. In a suspension device, the combination of a frame, a stationary axle therein, a spring-actuated drum on said axle, a gear-wheel on said drum revolving therewith, a vertical shaft carrying a pinion, and so that said vertical shaft receives a revolution from the drum, but more rapid than that of the drum, a pawl hung to said shaft so as to swing in a vertical plane, but so as to revolve with said shaft in a horizontal plane, and one or more stationary stops on the frame in the path of the pawl when in its normal position, substantially as described, and whereby under the rapid revolution of the shaft carrying the pawl the centrifugal force imparted to the pawl will cause it to fly outward and assume a path outside of said stop, substantially as described.

401,558. OVERDRAW CHECK-SPREADER. SAMUEL R. HARSH, Wabash, Ind., assignor of one-half to John M. Harter, same place. Filed June 1, 1888. Serial No. 275,709. (No model.)

Claim.—A checkrein-spreader consisting, essentially, of a single continuous integral bar provided with rigid loops on its ends, and in the same plane a pair of parallel ears formed integral with said bar and extending rearwardly from the central portion of the rear edge of the bar, the inner faces of said ears being smooth and located a distance apart, and the edge of the bar between the same forming a square shoulder, the flexible loop composed of a single piece of flexible material having its ends squared and located between said ears and bearing against said shoulder, and a pin passing through the ears and said ends, substantially as set forth.



401,559. SNOW AND ICE GUARD. SAMUEL R. HAWTHORNE, Middlebury, Vt. Filed Nov. 30, 1888. Serial No. 292,344. (No model.)

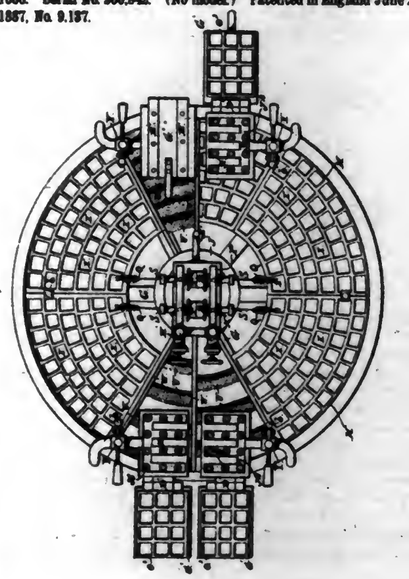
Claim.—1. The improved snow-guard consisting of the sheet-metal forked base with the integral rib projecting upward from the base at the line of union of the legs, all substantially as described.

2. In combination with the roof *a* of a building, the slates *b*, and the snow-guard consisting of the forked sheet-metal base with the integral triangular rib projecting upward from the base, all substantially as described.

401,560. WAFFLE-IRON. EDWARD HOTHEIMER, St. Louis, Mo., assignor to William Stromberg, same place. Filed Dec. 22, 1888. Serial No. 294,200. (No model.)

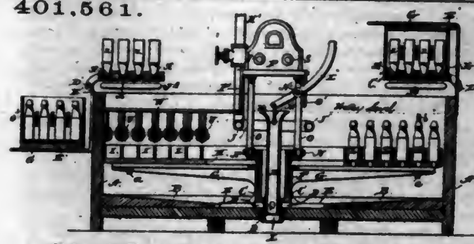
Claim.—1. In a waffle-iron attachment, a ball-and-socket universal-bearing bed on which the pan is turned, substantially as and for the purpose set forth.

2. In a waffle-iron attachment, the combination of the sectional ball and sectional socket bed-plate forming the universal-movement bearing on which the pan is turned, substantially as and for the purpose set forth.



3. In a waffle-iron attachment, the combination of the sectional ball, the globular core 10, the concave bed-section of the socket bed-plate in which said ball works in a universal movement, and the concave cap of the socket-bed, substantially as and for the purpose set forth.

4. In a waffle-iron attachment, the combination of the sectional ball, the globular core 10, the concave bed-socket plate in which said ball is seated, and the concave cap that surmounts the ball provided with a curvilinear slot, 14, substantially as and for the purpose set forth.



5. In a waffle-iron attachment, the combination of the sectional ball, the globular core 10, the socket bed-plate in which said ball works, the concave cap-plate that surmounts said ball, provided with the curvilinear slot 14, the sectional combined pan and cover, and the sectional neck 9, the sections of which each relatively connect its section of the combined pan and cover with the corresponding section of the ball, substantially as and for the purpose set forth.

6. In a waffle-iron attachment, the combination of the sectional ball, the globular core 10, the socket bed-plate and cover within which said ball works, the sectional combined pan and cover, the sectional handle by which the waffle-iron is operated, and the projecting lugs 24, that couple the sections of the handle together, substantially as and for the purpose set forth.

401,561. BOTTLE WASHING AND BRUSHING MACHINE. CHARLES B. INMAN, Leeds, County of York, England. Filed Mar. 10, 1888. Serial No. 266,542. (No model.) Patented in England June 28, 1887, No. 9,137.

401,561.

Claim.—1. The combination of a vat, pipes for supplying the same with water, a stand-pipe opening through the vat-bottom, an overflow-tube in the stand-pipe having its upper end opening at the water-level, radial arms journaled on the stand-pipe, bottle-carrying boxes supported by and moving around with the radial arms, and suspended brushes between which the bottles are carried by the bottle-boxes, substantially as described.

2. The combination of a vat, pipes for supplying the same with water, a stand-pipe having lateral water-passages and opening through the vat-bottom, a vertically-movable overflow-tube having a valve at its lower end to open and close the lateral water-passage in the stand-pipe, radial arms journaled on the stand-pipe to travel in a circular path, bottle-carrying boxes on the radial arms, and cleaning-brushes between which the bottles are carried by the bottle-boxes, substantially as described.

3. The combination, with a vat for washing bottles having an orifice in its bottom, of a stand-pipe, C, opening through the vat-bottom, having lateral orifices D and provided with the bore L, the rising-and-falling overflow-tube M, having its lower end adapted to said bore, and a pivoted swinging lever, L', connected with the tube for raising and lowering it in a vertical plane, substantially as described.

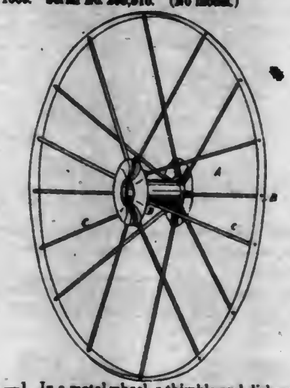
4. The combination, with a vat, of a central stand-pipe, C, a flanged ring, N, on the pipe, standards O, carried by the ring or frame P on the uprights, the rotary brushes Q on the frame, the supports W, connected with said frame, the brushes U, suspended from the supports, and traveling bottle-boxes for moving the bottles between the suspended brushes, substantially as described.

5. The combination, with a vat, of a stand-pipe, C, rotary arms journaled on the pipe and having bottle-boxes moving therewith, and the overflow-tube M, located in the stand-pipe and having its upper end arranged to carry off the matter floating on the surface of the water in the vat, substantially as described.

6. The combination, with the vat, of the covers C', hinged thereto, the rinsing-nozzles X, the hinged brackets E', for supporting the bottle-boxes O^3, and pipes Y, for supplying the rinsing-nozzles with water, substantially as described.

7. The combination, with a vat and traveling bottle-carrying boxes therein, of the cell-case A^3, the horizontally-sliding plate B^3 in the said case, and means for raising and lowering the cell-case, substantially as described.

8. The combination, with the vat, of the stand-pipe C, the rotary sleeve F, carrying the box-supporting arms G, the flanged ring N on the upper end of the stand-pipe, standards O, secured to the flanged ring, and the frame P, mounted on the standards and carrying the revolving brushes Q, substantially as described.

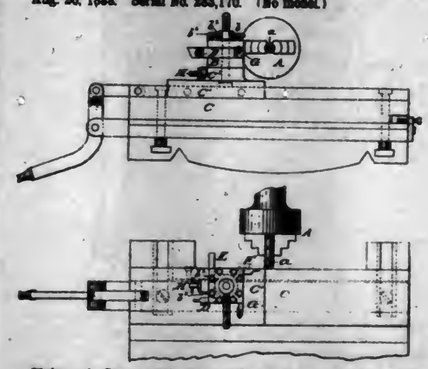


9. The combination, with the vat, of the stand-pipe C, the traveling arms G, carrying the bottle-holding boxes H, the flanged ring on the stand-pipe above the traveling arms, the standards O, secured to the flanged ring and provided with the hangers P', the bars W, supported at their inner ends by the hangers, and the suspended brushes U, hung from the bars, substantially as described.

401,562. PLOW. STEPHEN KAUBLE, Clay City, Ill. Filed Jan. 16, 1889. Serial No. 296,488. (No model.)

Claim.—As an improvement in plows, the landside having upwardly-projecting apertured ears, and the plow-point and cutter integral with or secured to said landside, in combination with the standard having a flange or seat, the mold-board, and the long and short handles, substantially as set forth.

401,563. METAL WHEEL. ALPHEUS KEEFE, Toledo, Ohio. Filed Jan. 3, 1889. Serial No. 295,816. (No model.)



Claim.—1. In a metal wheel, a thimble and disks upon each end thereof, having arched bearings upon which the bent portions of the spokes engage, in combination with lugs upon the disks adapted to be bent upon the spokes, as and for the purpose set forth.

2. In a metal wheel, disks formed with radial channels terminating in a curved shoulder, the channels being adapted to be closed by bending a portion of the projecting metal which forms the same, in combination with bent spokes resting within the channels and engaging the shoulder, as and for the purpose set forth.

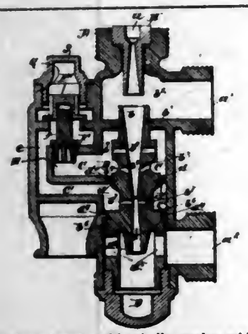
3. A metal wheel comprising a box having radial flanges, and disks formed with U-shaped bearings, a portion of which are of a depth to overlap the bearing, in combination with spokes held within the bearings by the overlapping portions and the radial flanges of the box, as and for the purpose set forth.

401,564. LATHE-TURRET. CHARLES I. KING, Madison, Wis. Filed Aug. 20, 1888. Serial No. 283,170. (No model.)

Claim.—1. The combination, with a lathe-turret, of a tool having its working-point in a line parallel with and out of the radius of the turret.

2. A lathe-turret provided with tangentially-arranged tool-seats.

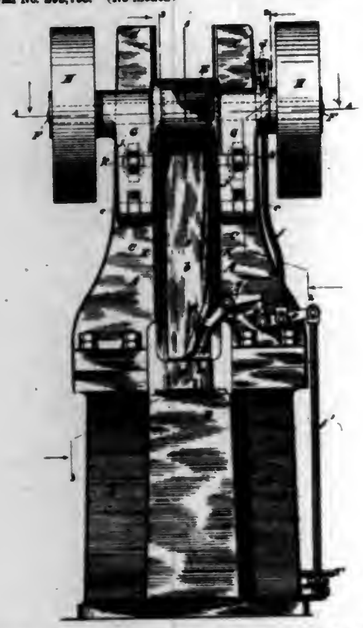
3. A lathe-turret provided with lateral grooves for tool-seats, and set-screws threaded through the top ledges of the grooves.



4. The combination, with a lathe-turret provided with a tool-seat, of a tool having its rear end inclined, and an adjusting-screw having its end projected into bearing upon the inclined end of the tool and movable in a direction transverse to the length of the tool.

5. The combination, with a rotatable lathe-turret, its stationary support, and tools so arranged in the turret as to impose tangential pressure upon the turret, of a spring-actuated pin radially mounted in the stationary support of the turret, and having its inner end tapered to enter and fill a suitable hole provided in the turret.

401,565. STEAM-INJECTOR. ALBERT LAMBERT, Wadsworth Ohio. Filed Sept. 12, 1888. Serial No. 285,222. (Model.)



Claim.—In an injector, the combination of the casing having the upper and lower overflow-chambers, *c c'*, the overflow arm or branch formed at one side of said casing, the passage-ways E *e*, leading from said overflow-chambers, the lower valve, F, having a projecting spin-

401,565.

die, and the upper valve wherein said spindle works, said valve being seated over the respective openings of the passage-ways E *e*, substantially as set forth.

401,566. DROP-HAMMER. FRANK M. LEAVITT, Brooklyn, N. Y., assignor to the E. W. Bliss Company, same place. Filed Dec. 6, 1888. Serial No. 292,793. (No model.)

Claim.—1. The combination, with the hammer and its lifting mechanism, of a wedging incline arranged in connection therewith to act by the ascent of the hammer to its highest position to disengage said lifting mechanism.

2. The combination, with the hammer and its lifting mechanism, of a wedging incline and a coacting part arranged to be displaced by said incline upon the ascent of the hammer and connected to the lifting mechanism, so that upon being so displaced it throws the latter out of action.

3. The combination, with the hammer and revolving friction-rollers for lifting it, of a movable bearing-frame carrying one of said rollers, and a wedging incline arranged in connection with the hammer and said bearing-frame and adapted upon the ascent of the hammer to displace said bearing-frame and move its roller out of action.

4. The combination, with the hammer and revolving friction-rollers for lifting it, of a pivoted lever-frame carrying one of said rollers, and a wedging incline arranged in connection with the hammer and said lever-frame and adapted upon the ascent of the hammer to force said lever-frame outwardly and move its roller out of contact with the hammer.

5. The combination, with the hammer and its lifting mechanism and supporting-frame, of reciprocally-wedging surfaces carried, respectively, by the hammer and frame and arranged to be wedged together by the ascent of the hammer to its highest position and thereby to hold the hammer suspended.

6. The combination, with the hammer and its lifting mechanism and supporting-frame, of reciprocally-wedging parts carried, respectively, by the hammer and frame and arranged to be wedged together by the ascent of the hammer to its highest position, and a spring against which one of said parts is seated, so that it yields to the wedging action of the other of said parts.

7. The combination, with the hammer and its lifting mechanism and supporting-frame, of reciprocally-wedging parts carried, respectively, by the hammer and frame and arranged to be wedged together by the ascent of the hammer to its highest position and thereby to hold the hammer suspended, and a releasing mechanism for retracting one of said parts from the other in order to drop the hammer.

8. The combination, with a vertically-moving hammer and its lifting mechanism and supporting frame, of a wedging incline and a friction-shoe, the one connected to the hammer and the other arranged relatively thereto to be wedged against it by the ascent of the hammer to its highest position, whereby the hammer is held suspended by their frictional contact.

9. The combination, with the hammer and its lifting mechanism and supporting-frame, of a frictional projection carried by the hammer and opposite frictional parts carried by the frame and between which said projection enters, said frictional projection and parts constructed to reciprocally wedge together as the hammer ascends to its highest position and thereby to hold the hammer suspended, and a releasing mechanism for retracting said parts from frictional engagement to drop the hammer.

10. In a drop-hammer, the combination, with the hammer and revolving friction-rollers for lifting it, of springs arranged to press said rollers together with a force sufficient to give the requisite tractive adhesion to lift the hammer between them.

11. In a drop-hammer, the combination, with the supporting-frame, the hammer, and revolving friction-rollers for lifting it, of a lever-frame in which one of said rollers has its bearings pivoted to said frame and movable toward and from the opposite roller, and a spring acting against said frame and pressing its roller against the opposite roller with a force sufficient to give the requisite tractive adhesion to lift the hammer between them.

12. The combination, with the supporting-frame, the hammer, and revolving friction-rollers for lifting it, of two lever-frames carrying the respective friction-rollers pivoted to the supporting-frame and movable toward and from each other, and springs acting against said lever-frames for pressing the rollers together.

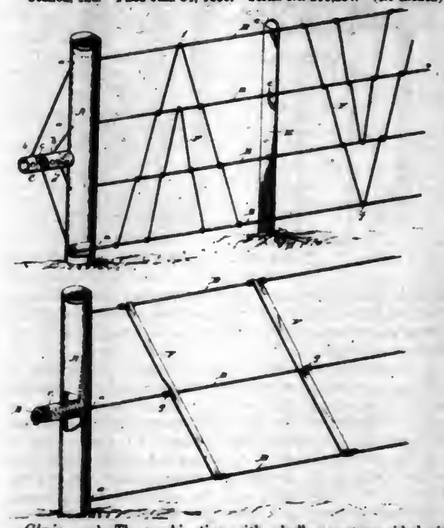
13. The combination, with the supporting-frame, the hammer, and revolving friction-rollers for lifting it, of two lever-frames carrying the respective friction-rollers pivoted to the supporting-frame and movable toward and from each other, and springs arranged each to react in opposite directions against the opposite lever-frame for pressing the rollers together.

14. The combination, with the supporting-frame, the hammer, and revolving friction-rollers for lifting it, of two lever-frames carrying the respective friction-rollers pivoted to the supporting-frame and movable toward and from each other, springs acting against said lever-frames for pressing the rollers together, and the hammer arranged relatively to said lever-frames, as described, so that in its ascent its momentum is utilized to force them apart and disengage said rollers from the hammer.

15. The combination, with the supporting-frame, the hammer, and revolving friction-rollers for lifting it, of two lever-frames carrying the respective friction-rollers pivoted to the supporting-frame and movable toward and from each other, springs acting against said lever-frames for pressing the rollers together, and reciprocal opposite wedging inclines in connection with said hammer and lever-frames respectively constructed to come into engagement during the ascent of the hammer and thereby to force said levers and rollers apart.

16. The combination of the hammer formed with opposite wedging inclines, its frictional lifting-rollers, lever-frames carrying said rollers and arranged to be thrust apart by said inclines upon the ascent of the hammer to its highest position, and springs acting against said lever-frames for pressing the rollers together.

17. The combination of the hammer formed with opposite wedging inclines, its frictional lifting-rollers, lever-frames carrying said rollers, and friction-shoes borne by said lever-frames and arranged to bear against said inclines and to be thrust apart thereby upon the ascent of the hammer to its highest position, and springs acting against said lever-frames for pressing the rollers together.

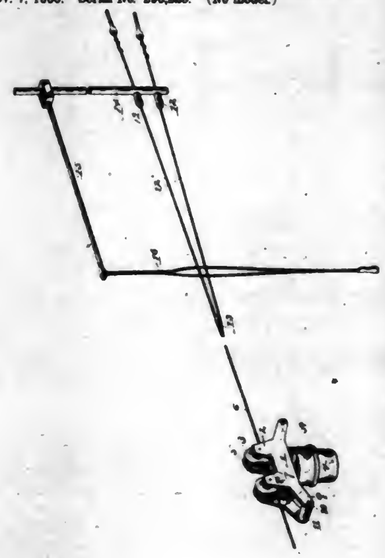


18. The combination, with the supporting-frame, the hammer, and revolving friction-rollers for lifting it, of two lever-frames carrying the respective friction-rollers pivoted to the supporting-frame and movable toward and from each other, and springs acting against said lever-frames for pressing the rollers together, and a releasing mechanism consisting of toggle-links acting, upon being straightened, to force said frames apart.

19. The combination, with the hammer, revolving friction-rollers for lifting it, springs for forcing said rollers together, and a releasing mechanism for pressing said rollers apart, of a catch for holding said releasing mechanism in order to prevent the re-engagement of the rollers during the fall of the hammer, and a projection on the hammer arranged to displace said catch on the striking of the hammer, whereby it is immediately relifted.

20. The combination, with opposite revolving friction-rollers, of the hammer-body projecting between them and constructed with detachable plates on its opposite sides to receive the tractive bearing of said rollers.

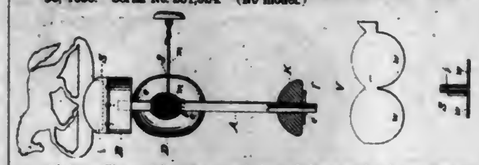
21. The combination, with opposite revolving friction-rollers, of the hammer-body projecting between them and constructed with vertical dovetailed recesses on its opposite sides, and plates fastened in said recesses to receive the tractive bearing of said rollers.



401,567. WIRE FENCE. JOSEPH N. LEHMAN and NEAL LEHMAN, Goshen, Ind. Filed Jan. 31, 1889. Serial No. 298,237. (No model.)

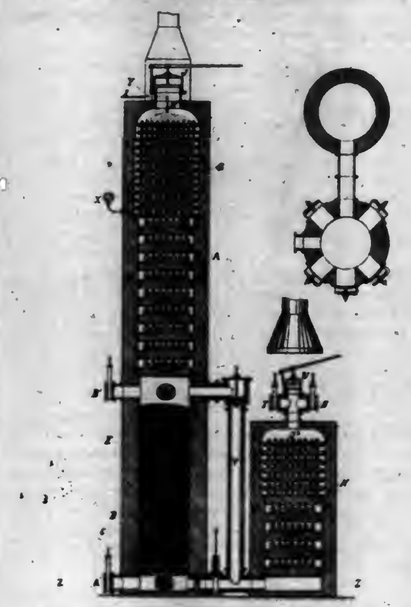
Claim.—1. The combination, with a hollow post provided with openings, as shown, and the lateral tube projecting from said post, of the longitudinal wires passed through said openings and engaging means on said tube, substantially as shown and described.

2. The combination, with the hollow post and the tube projecting laterally therefrom, of the longitudinal wires passed into said post and into the tube and engaging turning devices on the said tube, substantially as shown and described.



401,568. CASH-CARRIER. DAVID LIPPY, Mansfield, Ohio. Filed Nov. 7, 1888. Serial No. 290,223. (No model.)

Claim.—1. In a cash-carrier apparatus, the combination, with the track having its diverging arms 12 passed through and supported near the lower end of the arm 14, and provided with separate bumpers on the diverging arms of the track, which bear against the lower end of the arm 14, of the cash-car comprising the frame provided with wheels mounted on the track, and provided, also, with flexible rollers 11, forming bumpers on the cash-car for engaging the bumpers on the diverging arms of the track, substantially as specified.



2. In a cash-carrier apparatus, the combination, with the track having its diverging arms passed through and supported in the arm 14, and provided with bumpers 12 12, bearing against said arm 14, of the starting-rope 16, suspended from the arm 15, and the carrier mounted on the track, whereby the bumpers 12 12 will prevent the carrier from being driven against the depending arm 14, substantially as specified.

401,569. TOY. DAVID W. LOSE, Springfield, Ohio. Filed July 26, 1888. Serial No. 281,324. (No model.)

Claim.—The twirling toy consisting of the stem having at its one end the block, upon which is secured the socket having parallel sides and lateral wings, the metallic ellipsoidal shell having bearings for the stem and a lateral opening, and the cord wound around said stem and extending through said opening, substantially as set forth.

401,570. APPARATUS FOR THE MANUFACTURE OF GAS. THADDEUS S. C. LOWE, Norristown, Pa., assignor to the Guarantee Trust and Safe Deposit Company, trustees, of Pennsylvania. Filed Nov. 12, 1884. Serial No. 147,764. (No model.)

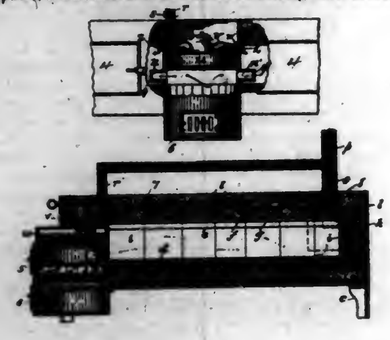
Claim.—1. In an apparatus for making water-gas, a generator comprising in one casing or stack a steam-generator, a superheater, and a decomposing-chamber, to wit: a casing or stack lined with fire-bricks or other refractory materials containing a fuel or decomposing chamber, a mass of fire-bricks or other refractory materials loosely piled immediately above said fuel-chamber, a mass of metal in bars or pieces loosely piled above said last-mentioned refractory materials, a spraying-nozzle or atomizer, a damper or valve at or near its top, and a fuel-supply door, substantially as set forth.

2. In an apparatus for making water-gas, a heat-restorer consisting of a lined casing containing fire-bricks, metal bars or other refractory materials loosely piled in the lower part thereof, and above these a mass of metal in bars or pieces loosely piled, an air-inlet, one or more gas-outlets, and a flue connecting said casing with the gas-generator, substantially as set forth.

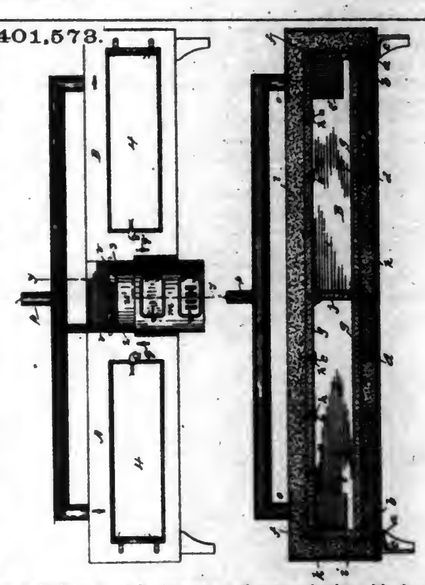
3. In an apparatus for making water-gas, the gas-generator A, containing the fuel or decomposing chamber D, the fire-bricks or other refractory materials F, piled loosely above said chamber, the metal bars G, piled loosely above the refractory materials F, a water-inlet, H, top valve, J, and fuel-charging door K, in combination with a heat-restorer consisting of the lined casing N, containing loosely-piled fire-bricks or other refractory materials O', and the loosely-piled bars or pieces of metal O², and provided with a top valve, U, air-inlet T, and gas-outlet S, said generator and heat-restorer being connected by a fine, all substantially as set forth.

401,571. CLOTHES-POUNDER. LEWIS H. MARTIN, Leavenworth, Kans. Filed June 6, 1888. Serial No. 276,192. (No model.)

Claim.—In a clothes-pounder, the combination of the casing having a handle, hoods attached to the outside of the casing, tubes secured to the casing beneath the hoods, valves at the lower ends of the tubes, disks located within the casing and supported by the tubes, said disk having an air-space surrounding it between its edge and the inner side of the casing, and the spider or valve support, substantially as and for the purpose set forth.



401,572. SHIRT. HORACE W. MESSER, Berlin, Ontario, Canada. Filed Dec. 24, 1888. Serial No. 294,471. (Model.)

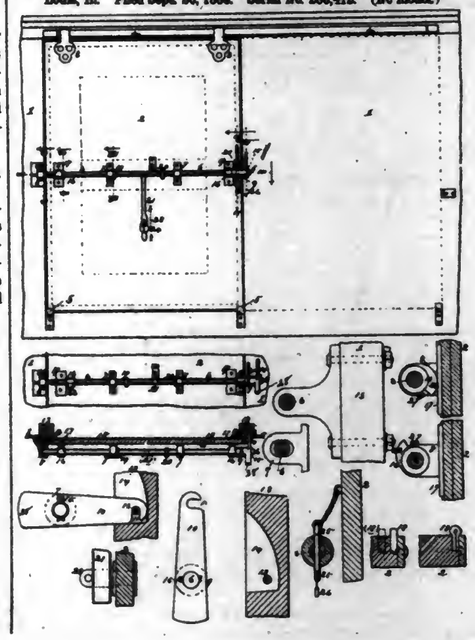


Claim.—A shirt open at the back and provided with the under yoke, and back yokes independent of the under yoke, and having its neckband formed in two separate independent parts, one part permanently connected to the under yoke and bridging the space between the ends of the part of the neckband attached to the back yokes and the other to the back yokes, independent of the under yoke, substantially as shown and described.

401,573. PORTABLE OVEN. JOSEPH MIDDLEBY, Gibson, Kans. Filed Feb. 8, 1888. Serial No. 263,249. (No model.)

Claim.—1. An oven combined with a heating device communicating with the oven and adapted to supply heat thereto, dampers for cutting off the supply of heat to the oven, a pipe or exit-port connected with the heater, and dampers connected with said pipe or exit-port to cut off direct communication between the heater and outside atmosphere, and a boiler or similar device for holding water connected

401,573.



with the heater and having means of communication with the oven independent of the heating device, and dampers or similar devices for shutting off communication between the boiler and the oven, substantially as described.

2. The combination, with the dual or double portable oven, of the heating apparatus intermediate of and communicating with both ovens, the boiler secured on said heating apparatus for holding water, the rotary disks 2 3, and the angular pipes secured to said disks and opening into said oven, substantially as described.

3. The combination, with the dual or double portable oven herein described, consisting of a skeleton metallic frame and brick or tiling supported by said frame, of the heating apparatus located in front of and communicating with both ovens, the side flues, *n n'*, extending from said heating apparatus into said ovens and having dampers, the rear exit-pipes secured to said ovens, and the dampers therefor, substantially as described.

401,574. CAR-DOOR FASTENING. PETER H. MURPHY, East St. Louis, Ill. Filed Sept. 26, 1888. Serial No. 286,412. (No model.)

Claim.—1. The combination, with a car-door, of a shaft having bearings at each side of the door and having a cam bearing against the door, for the purpose set forth.

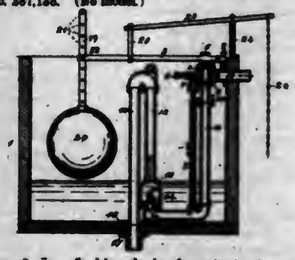
2. The combination, with a car-door, of a shaft having a cam bearing against the door and supported in a fixed box, and a detachable box connected to the car-body at opposite sides of the door, for the purpose set forth.

3. The combination, with a car-door, of a shaft extending across the door having bearing in boxes attached to the car-body at opposite sides of the door, a cam on the shaft adapted to bear against the outer side of the door, and a box connecting the shaft to the door, substantially as set forth.

4. The combination, with a sliding car-door, of a shaft having bearing in boxes attached to the car-door and to the car-body each side of the door, and carrying a cam adapted to press the door inward by the rotary motion of the shaft, and a handle upon the shaft by which the shaft is turned and also held in position, substantially as set forth.

5. The combination, with a sliding car-door, of a cam-shaft extending across the door having cam bearing against the door and turning in boxes supported on the car-body at opposite sides of the door, substantially as and for the purpose set forth.

6. The combination, with a sliding car-door, of a cam-shaft having cam bearing against raised plates 17 upon the door and turning in boxes attached to the door and to the body of the car each side of the door, said shaft being capable of endwise motion upon the door to carry a cam, as 16, out of line with a bearing-plate, 17, substantially as and for the purpose set forth.

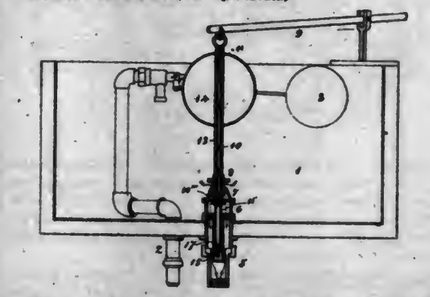


7. The combination, with a sliding car-door, of bearing-boxes fixed to the door and the car-body at one side of the door and a detachable box at the opposite side of the door, a cam-shaft turning in said boxes and having a cam bearing upon the outer side of the door in a given position of the shaft, the shaft and one of the boxes being traversed in such position by a perforation adapted to receive a locking-pin, substantially as and for the purpose set forth.

8. The combination, with a sliding car-door, of the cam-shaft having a cam bearing against the outer side of the door, boxes fixed to the door in which the shaft has rotary and endwise bearing, collars upon the shaft limiting its endwise movement on the door, a box fixed to the car-body at one side of the door adapted to receive the end of the shaft in closing the door, and a box, as 9, turning freely on the shaft and having a projection adapted to engage the car-body, substantially as and for the purpose set forth.

9. The combination, with a sliding car-door, of a shaft having bearing in boxes fixed to the car-door and to the car-body at one side of the door, and a box at the other side of the door turning upon the shaft and attachable to the car-body, the shaft having endwise movement in the fixed boxes independently of the movement of the door, cams on the shaft adapted to bear upon plates projecting from the face of the door, the said plates, handle upon the shaft acting by gravity to hold the shaft in a locking position, and stripe 18, forming a tight joint when the door is in locked position, substantially as and for the purpose set forth.

10. The combination, with a sliding car-door, of a shaft having bearing in boxes connected to the car-body at each side of the car-door, cams upon the shaft adapted to force the door inward against the car-body, a handle on the shaft, and a lug, 23, extending from the face of the door and passing through an orifice in the handle when the handle is depressed, substantially as and for the purpose set forth.

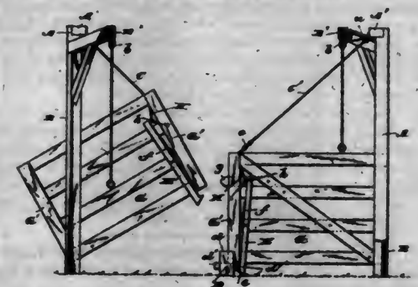


401,575. FLUSHING DEVICE FOR URINALS. RICHARD MURPHY and CHARLES W. ATKINSON, Cincinnati, Ohio. Filed Oct. 4, 1888. Serial No. 287,138. (No model.)

Claim.—1. In a flushing device for urinals, the combination of the automatic and the manual means for discharging water from the tank, consisting substantially of the following elements, to wit: a ball-cock, 2, having a plunger, 5, which is guided by lugs 4, and port 6, which operates at regulatable intervals of time to admit for a short space of time a spurt of water through main supply-pipe 11 into the siphon 12, for the purpose specified, a lever, 23, for manual operation of said ball-cock, a siphon, 12, the siphon-jet 15, a by-pass, 7, through which passes the normal supply, and a set-screw, 8, for controlling the flow into said by-pass, and a stem, 19, provided with perforations 21, as and for the purposes set forth.

2. In a flushing device for urinals, water-closets, &c., a siphon having its longer arm passing through and secured to the tank-floor and having upon the shorter arm an enlarged mouth-piece which is provided at its upper end with a small orifice for the purposes set forth, said enlarged mouth-piece also carrying a perforated cross-bar which receives the siphon-jet of the main supply-pipe, and a chambered projection in the U-shaped coupling for receiving jets of water from the siphon-jet, as and for the purpose set forth.

401,576. FLUSHING DEVICE FOR WATER-CLOSETS, &c. RICHARD MURPHY and CHARLES W. ATKINSON, Cincinnati, Ohio. Filed Oct. 31, 1888. Serial No. 289,503. (No model.)

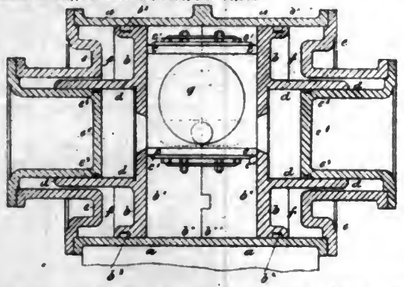


Claim.—1. In a flushing device for water-closets, the combination, with auxiliary float 14 and a submerged flush-passage, 5, of the following elements, to wit: the open-crowned valve proper, 7, the auxiliary valve 8, constituting a cap thereto, and which it normally closes, and a sleeve, 13, which surrounds the stem 10 of the valve proper and connects said cap to said float.

2. In a flushing device for water-closets, the combination of the following elements, to wit: the open-crowned valve proper, 7, having the tubular stem 10, the operating-lever 9, the dash-pot 17, the submerged stand-pipe 6, the flush-pipe or nozzle 5, which communicates therewith and constitutes the seat of the said open-crowned valve proper, 7, whose tubular stem 10 carries the said operating-lever 9 and contains the ports 11 11' and the regulatable port 12, the auxiliary valve 8, with its float 14, and the sleeve 13, which surrounds said stem and which connects the said valve with its said float.

3. In a flushing device for water-closets, the combination, with the automatically-operated auxiliary valve 8, of the open-crowned valve proper, 7, and a rubber seat, 10''', constituting a double seat to said auxiliary valve.

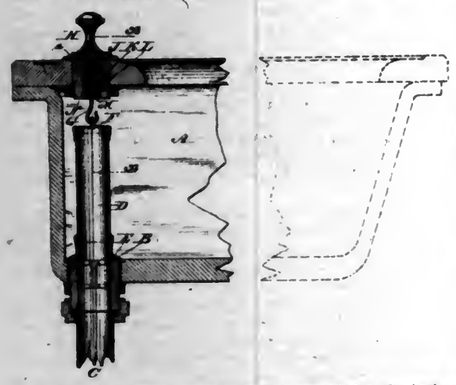
4. In a flushing device for water-closets, the combination of the following elements, to wit: the submerged overflow consisting of the stand-pipe 6, extending through and secured to the tank-floor, and to whose lower end is secured the flushing-nozzle 5, having the automatic auxiliary float 14, the auxiliary valve 8, and the sheath 13, having the manually-operated lever 9, stem 10, and valve proper, 7, and a dash-pot, 17, containing a fluid and having the hollow plunger 10', said plunger being provided with channeled set-screw 15, which allows the fluid to flow from dash-pot into plunger when valve proper descends, and vice versa when valve proper ascends, for the purposes set forth.



401,577. TILTING GATE. MILFORD A. NELSON, La Monte, Mo. Filed Feb. 14, 1888. Serial No. 263,822. (No model.)

Claim.—In combination with a pivoted gate provided with operating-cords, a pivoted spring-latch bar, E, having a staple or guide, A, near its upper end, a cord rigidly attached at one end to the gate, passed from thence through the staple attached to the upper end of the latch-bar and through the gate and connected to the operating-

cords C and C', and a block, D, having a projection, *d'*, with which the lower end of the latch-bar engages, the parts being organized substantially as shown, and for the purpose set forth.

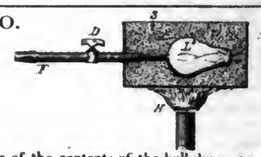


401,578. MOTOR-ENGINE. GEORGE W. NEWALL, Manor Park, County of Essex, and JAMES F. BLYTH, Sydenham, County of Kent, England. Filed May 7, 1888. Serial No. 273,084. (No model.) Patented in Belgium Mar. 13, 1888, No. 81,006.

Claim.—1. In a motive-power engine driven by steam or other fluid, a crank-shaft formed with inlet and outlet ports operating with an inner circular piston and an outer circular piston having corresponding ports, said inner piston and outer piston being contained and working one within and at right angles to the other and all within one outer circular cylinder, substantially as set forth.

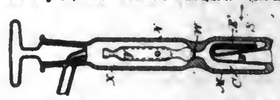
2. A crank-shaft, *g*, provided with ports for passage of fluid, rotating within a correspondingly-ported circular opening in an inner circular piston working within an outer circular cylinder, the one circular piston working at right angles to the other circular piston, and all within one outer circular cylinder, arranged and operating substantially as set forth.

401,579. BASIN OR BATH WASTE AND OVERFLOW. WILLIAM H. NEWELL, Philadelphia, Pa. Filed Jan. 11, 1888. Serial No. 260,403. (No model.)



Claim.—1. An operating device for a stand-pipe of a bath or basin waste or overflow, consisting of a detachable guide with horizontal flange at its upper portion and screw-threaded lower end, and having on its interior wall an inclined shoulder and a horizontal projecting pin, a handle with inclined lower edge and shoulder bearing on the inclined shoulder of the guide, and a vertical depending pin, the hook G, with shank-screw, and the screw *a* in the side of the handle and with point below the shank-screw, said parts being combined substantially as and for the purpose set forth.

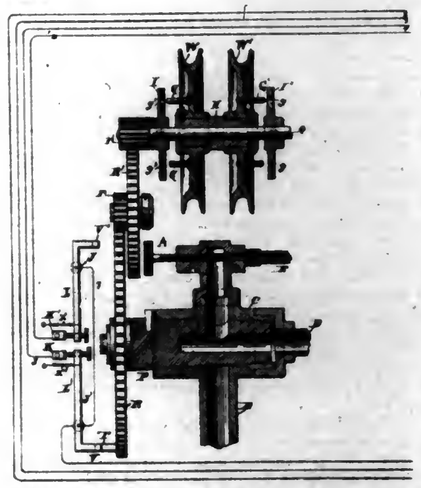
2. In a device of the character described, a stand-pipe forming a valve, a rotary plug connected with said stand-pipe and having an inclined under face and a vertical pin projecting therefrom, a hollow guide having an inclined shoulder on which the inclined under face of said rotary plug bears, and a horizontal pin projecting across the path of said vertical pin, said pins being within said plug and guide, said parts being combined substantially as described.



401,580. METHOD OF EXHAUSTING ELECTRIC-LAMP BULBS. JAMES W PACKARD, New York, N. Y. Filed Apr. 6, 1888. Serial No. 269,810. (No model.)

Claim.—A method of producing a vacuum in the bulb of an incandescent light, which consists, first, in the partial exhaustion by a mechanical pump of the vapors and gases in the bulb, while at the same time the bulb is subjected to heat; second, in the completion of

the exhaustion of the contents of the bulb by a mercury-pump, substantially as described.



401,581. MERCURY AIR-PUMP. JAMES W. PACKARD, New York, N. Y. Filed May 19, 1888. Serial No. 274,437. (No model.)

Claim.—1. In a mercury-pump, the combination of the siphon-chamber, the siphon in said chamber sealed by a quantity of mercury, a valve-chamber above the siphon-chamber, and a floating valve seated within said valve-chamber, substantially as described.

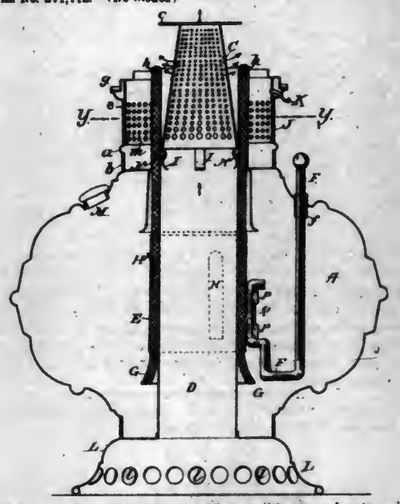
2. In a mercury-pump, the combination, with the valve-chamber, a valve seated in said chamber, the siphon-chamber below said valve-chamber, the siphon within the siphon-chamber, and the vacuum-bulb below the siphon, the valve-chamber, siphon-chamber, siphon, and vacuum-bulb all made in one piece, substantially as described.

401,582. VALVE-ACTUATING APPARATUS. JAMES W. PACKARD, New York, N. Y. Filed Sept. 11, 1888. Serial No. 285,125. (No model.)

Claim.—1. The combination, with a two-way cock which connects an air-tight chamber alternately with the atmosphere and with a vacuum-pump, of an electrical switch, a pressure-gage connected with the electrical switch and operated by the varying pressures in the air-tight chamber, a magnet excited by the currents controlled by the said switch, the continuously-revolving pulley, and the clutch which intermittently connects the revolving pulley with the two-way cock and is controlled by the magnet, substantially as described.

2. The combination, with a two-way cock which connects an air-tight chamber alternately with the atmosphere and with a vacuum-pump, of an electrical switch, a pressure-gage connected with the electrical switch and operated by the varying pressures in said air-tight chamber, opposing magnets alternately excited by currents under control of the said switch, continuously and oppositely revolving pulley-wheels, and clutches operated by the opposing magnets which throw the two-way cock alternately into gear with one or the other of the oppositely-revolving pulley-wheels, substantially as described.

3. The combination, with a two-way cock which connects an air-tight chamber alternately with the atmosphere and with a vacuum-pump, of an electrical switch, a pressure-gage connected with the electrical switch and operated by the varying pressures in said air-tight chamber, opposing magnets alternately excited by currents under control of said switch, continuously and oppositely revolving pulley-wheels, and clutches operated by the opposing magnets which throw the two-way cock alternately into gear with one or the other of the oppositely-revolving pulley-wheels, together with a spring which



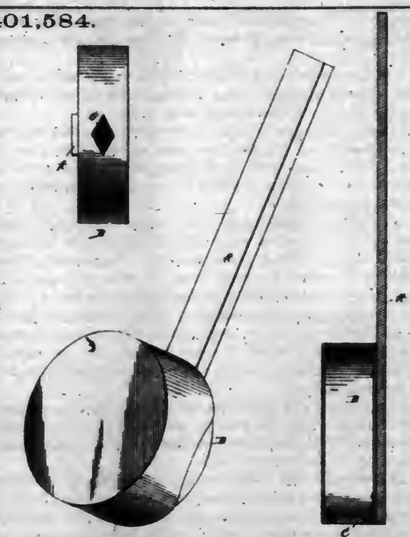
normally holds the clutch in its central position out of gear with both the revolving pulley-wheels, substantially as described.

4. The combination, with an intermittently-operated valve, of a continuously-revolving pulley, an electrically-controlled clutch for intermittently connecting the valve with the continuously-revolving pulley, an automatically-controlled electrical switch, a relay, a second switch operated by the relay to open and close the circuits which control the clutch, and a circuit-breaker in each of said circuits, which circuit-breaker is positively operated by the movement of the valve itself, substantially as described.

5. The combination, with a pressure-gage, of a vibrating arm or indicator for the same, suitable contact-pieces against which the arm strikes, one or more electrical circuits which have the said contact-points and the vibrating arm for terminals, together with a double relay controlled by said circuits, and a positively-controlled vibrating armature for said double relay, which armature can remain at rest only at one or the other extremity of its arc of vibration, substantially as described.

6. In an electrical apparatus for controlling intermittent motion, the combination of an intermittently revolving or reciprocating element, a continuously-moving element, a system of magnets which throw the said intermittently-moving element into gear with the continuously-moving element, the electrical circuit which excites the magnet, the automatically-operated switch which closes the circuit, and the circuit-breaker in the circuit which is positively operated by the intermittently revolving or reciprocating element, substantially as described.

401,583. LAMP. DEXTER W. PARKER, Meriden, Conn., assignor to The Charles Parker Company, same place. Filed Apr. 24, 1888. Serial No. 271,712. (No model.)



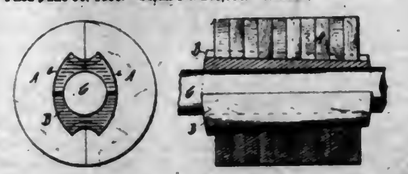
Claim.—1. In combination with the usual inner and outer wick-tubes of an Argand-burner lamp and a suitable wind-guard or air-distributer for supplying the outer draft, the non-adjustable but removable perforated air-distributer, (for supplying the inner draft to the tubular flame,) and means which opperate to hold said air-distributer and the inner wick-tube in a given relative position against casual misplacement, all substantially in the manner and for the purposes hereinbefore set forth.

2. In combination with the inner and outer wick-tubes of an Argand burner and suitable means for supplying air to the outside tubular flame, a removable perforated air-distributer having its lower portion arranged interiorly of the upper portion of the inner wick-tube, an annular seat or support, N, formed in said inner wick-tube, and spring-catches at the base of said perforated air-distributer, which engage with said annular seat N, all in the manner and for the purposes hereinbefore described.

3. The combination, with the inner and outer wick-tubes of an Argand burner and a suitable air-distributer for supplying the outer draft to the flame, of a removable perforated air-distributer for supplying the inner draft, having its perforations graduated either as to size or as to number, so as to supply the air in greater volume at the vicinity of its base than at the vicinity of its upper portion, substantially in the manner and for the purpose hereinbefore set forth.

401,584. HAND-SEEDER. TRUMAN B. PARRY, Manatee, Fla. Filed Jan. 4, 1889. Serial No. 295,402. (No model.)

401,584.



Claim.—The improved hand-planter herein described and shown, comprising a handle and a hopper secured to the lower end of the handle, and consisting of two semi-cylindrical boxes provided with discharge-openings in their sides and one moving upon the other, as specified.

401,585. SHOE. CHARLES H. PEABBALL, Brooklyn, N. Y. Filed Nov. 14, 1888. Serial No. 290,784. (No model.)

Claim.—In a shoe, the combination, with two side flaps, *b d*, having disconnected lower ends, and horizontal button-holes in one of said flaps to engage buttons on the other, of the button *i* on the shoe proper, and of a vertical button-hole, *j*, in one of the flaps to engage said button *i*, as specified.

401,586. SPLIT PULLEY. JAMES M. POLLARD, Washington, D. C. Filed June 30, 1888. Serial No. 278,630. (Model.)

Claim.—1. In a split pulley, the two-part rim and two-part bushing provided with interlocking ribs and grooves adapted to draw and lock the half-rims together as they are forced endwise upon the bushing, substantially as and for the purpose specified.

2. A split or separable pulley consisting of two duplicate portions constituting the rim and two duplicate portions constituting the hub

or bushing, and having inclined or wedge surfaces whereby it is made self fastening and tightening by the act of forcing the parts together, as set forth.

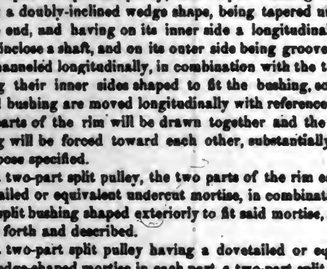
3. A split or separable pulley having interior doubly-inclined mortises, and a separable bushing having exterior doubly-inclined surfaces and bored to fit over or upon a shaft, as set forth.

4. In a split or separable pulley, the two-part rim and the wooden bushing adapted to hold the rim parts together, having the grain of its wood at right angles to the shaft-opening in the bushing and to the plane of division of the rim into its two parts, substantially as and for the purpose shown.

5. In a split or separable pulley, the two-part bushing with each part having a doubly-inclined wedge shape, being tapered uniformly from end to end, and having on its inner side a longitudinal groove to partially inclose a shaft, and on its outer side being grooved, dovetailed, or channeled longitudinally, in combination with the two half-rims having their inner sides shaped to fit the bushing, so that as the rim and bushing are moved longitudinally with reference to each other the parts of the rim will be drawn together and the parts of the bushing will be forced toward each other, substantially as and for the purpose specified.

6. In a two-part split pulley, the two parts of the rim each having a dovetailed or equivalent undercut mortise, in combination with a two-part split bushing shaped exteriorly to fit said mortise, substantially as set forth and described.

7. In a two-part split pulley having a dovetailed or equivalent undercut wedge-shaped mortise in each part, a two-part split bushing shaped exteriorly to fit said mortise and bored to fit over or upon a shaft, the construction being such that when the bushing and other parts of the pulley are being put together the bushing draws and holds the two parts of the rim forcibly together and the rim draws and holds the two parts of the bushing firmly upon the shaft, as shown and described.



8. In a split or separable pulley, in combination with the two halves of the pulley-rim, formed of layers of wood glued and pressed together, the grain of the alternate layers crossing each other and having undercut wedge-shaped mortises in each half, a separable bushing formed of wood and having the longitudinal fibers or grain crossing the bore at a right angle thereto, whereby the tensile strength of the wood of the bushing is available for drawing the two parts of the rim together or toward each other, and the tensile strength of a part of the wood composing the rim is available for drawing the two parts of the bushing toward each other, as shown and described.

9. A split or separable pulley made in two equal or like halves united and held together solely by a split or separable bushing.

10. A split or separable bushing made in two equal and like halves, in combination with a rim, also made in two equal and like halves, the bushing forming the sole connection between the two halves of the rim, and the rim forming the sole connection between the two parts of the bushing, as set forth.

11. In a split pulley, in combination with the tapering bushing divided longitudinally into two parts, each part provided on its outer side with a longitudinal groove or channel diminishing in width toward the smaller end of the bushing, the pulley-rim divided into two parts on a longitudinal plane at right angles to the plane of division of the bushing, each part rim being provided on its inner side with ribs to engage the opposite sides of the grooves in the outer sides of the bushing, substantially as and for the purpose described.

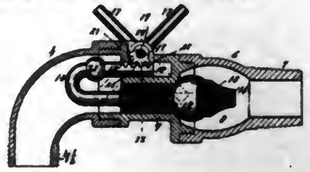
401,587. SELF-LOCKING PRESS FOR BUNDLE-WRAPPING. EDWARD R. FORTER, Cincinnati, Ohio. Filed Sept. 13, 1888. Serial No. 285,329. (No model.)

Claim.—1. In a self-locking press for bundle-wrapping, the combination of two pairs of plates or followers, 12 25, members carrying said plates or followers and adapted to slide one on the other, and a lock for holding said members in any position to which they are set, substantially as set forth.

2. In a self-locking press for bundle-wrapping, the combination of the mutually-dependent members 1 5, the plates or followers 12 25, carried thereby, the springs 21, for forcing said members apart, and a lock for holding said members in any position to which they may be set, substantially as set forth.

3. In a self-locking press for bundle-wrapping, the combination of the plates or followers 12 25, the members 1 5, sliding one upon the other, a rack, 11, attached to one of the members, springs 21, for forcing said members apart, and a pawl or trigger upon the other member for engagement with said rack, so as to lock or hold said members in any position to which they may be set, as set forth.

4. In a self-locking press for bundle-wrapping, the combination of the member or sliding plate 5 with the other member or standard, 1, the plate or follower 12, attached to the standard, the plate or follower 25, attached to the sliding plate, springs 19, for forcing said standard and sliding plate apart, rack 11 upon the sliding plate, a pawl or trigger, 8, upon the standard for engagement with said rack, a spring, 9, for automatic engagement of said pawl with said rack, and a pin, 24, projecting into a groove, 23, in the sliding plate for preventing separation of the sliding plate and standard by the springs 19, as set forth.



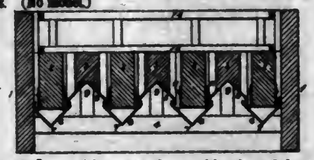
5. The self-locking press for bundle-wrapping, consisting of the two similar disconnected halves, each half consisting substantially of a channeled standard, 1, a sliding plate, 5, capable of sliding in channel of said standard and carrying a rack, 11, a pawl or trigger, 8, upon the standard adapted to automatically engage with said rack, the springs 21, for projecting said sliding plate upward upon disengagement of said pawl and said rack, and the plates or followers 12 and 25, attached to the standard and the sliding plate, respectively, for the purposes set forth.

6. A self-locking press for bundle-wrapping, consisting of the two similar disconnected halves, each half having the sliding plate 5, adapted for sliding in a channel or excavation, 2, of the standard 1, having its outer surface flush with the surface of the standard, for the purpose specified, and provided with tongues 4 4, which engage in grooves in the sides of said excavation, a rack, 11, and the grooves 23, in which engages the pin 24, for limiting the upward motion of said sliding plate, as set forth.

7. A self-locking press for bundle-wrapping, consisting of the two similar disconnected halves, each half having, in combination, the following elements, to wit: the channeled standard 1, having a hole, 6, lugs 7 7, and a pawl or trigger, 8, fulcruming upon said lugs and whose point 10 lies in said hole, a spring, 9, whose office is to keep said trigger in engagement with rack 11 of the sliding plate 5, grooves 3 3, the pin 24, and the detachable plate or follower 12, secured to the lower standard, as set forth.

8. In a self-locking press, the combination of the standard, a leg, 15, secured to said plate, two similar rods, 19, shrunk into holes 20 in said plate, the sliding plate 5, whose dimensions correspond to the dimensions of excavation or channel 2 of the standard, and which slides in said excavation, having the tongues 4 4, which engage with said grooves 3 3, rack 11, groove 23, into which projects the pin 24, the two similar orifices 18, which receive springs 21, that surround said rods 19, a detachable plate, 25, secured to the upper end of the sliding plate, and the block 27, all substantially as described, and for the purposes set forth.

401,588. COCK OR FAUCET. FRANK B. RAY, Kansas City, Mo. Filed June 28, 1888. Serial No. 278,481. (No model.)



Claim.—1. In a cock or faucet, the combination of the body having a water-passage and a chamber located over the water-passage, a valve-stem fitting in said passage, and a return-bend inclosed by the outer section of the body and extending into the chamber above the passage, a valve operated by the stem to control the flow of water through said passage, and means for moving the stem to operate the valve, substantially as and for the purpose set forth.

2. In a cock or faucet, the combination of the body having a water-passage and a chamber located over the passage, a stem having guide-wings fitting in said passage and having a return-bend fitting in said chamber and inclosed by the outer section of the body, a valve secured to the stem to control the flow of water through said passage, and means for engaging the stem to open and close the valve, said valve fitting upon an extension, 13, of the stem and secured to the said stem, substantially as and for the purpose set forth.

3. In a faucet, the combination of the section 9, having a water-passage through it and the chamber 16 therein, a U-shaped valve-stem having its legs fitting in said chamber and water-passage, means for reciprocating said stem, a valve on each of the legs of said stem, said valves being adapted to close said chamber and water-passage alternately, and a removable nozzle secured to said section 9, completely inclosing said valve-stem.

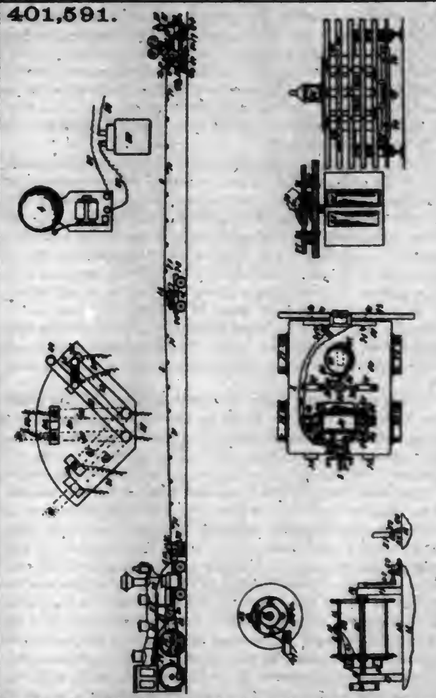
4. In a faucet, the combination, with the valve-chamber having a valve, 12, therein, the section 9, connected with said chamber and having the water-passage and chamber 16, and a U-shaped valve-stem having its legs inserted in said passage and chamber 16, adapted to unseat valve 12, of a valve, 23, on one leg of said stem adapted to close the chamber 16, and a nozzle or section secured to section 9 and completely inclosing said valve-stem, substantially as set forth.

401,589. REFRIGERATOR ICE-HOLDER AND WATER-ESCAPE. ULRICH REUTER, Kansas City, Mo. Filed July 27, 1888. Serial No. 281,172. (No model.)

Claim.—1. In a refrigerator, the combination of the box, a series of ice-supporting bars placed crosswise of said box, troughs, one attached to and arranged under each alternate bar, and water-sheds, one attached to and arranged under each intervening bar and projecting over said troughs, substantially as and for the purposes set forth.

2. In a refrigerator, the combination, with the box, of a series of ice-supporting bars placed within the box, troughs, one arranged directly under each alternate bar, straps 11, attached to each alternate bar and to the inside of the trough below, and water-sheds, one attached to and arranged under each intervening bar and projecting below the edges of said troughs, and a conducting-trough into which the said troughs drain, substantially as set forth.

3. In a refrigerator, the combination, with the box, of the cleats 4 and 5 in said box, the ice-supporting bars 2, supported upon cleat 5, troughs beneath said bars and attached thereto and resting upon cleat 4, the ice-supporting bars 3, water-sheds beneath said bars and attached thereto, the standards 9, resting upon one of said cleats and supporting said bars 3 at one end, and the extensions 10, attached to said bars 3 and resting upon the other cleat, substantially as set forth.



4. In a refrigerator, the combination, with the box, of the bars 2 3, arranged alternately across said box, the bars 3, having longitudinal grooves, the troughs 6, arranged below the bars 2, the straps 11, attached to bars 2 and to the inside of said troughs, water-sheds fitted in said longitudinal grooves and projecting downwardly beyond the edges of said troughs, the cleat 4, having notches in which said troughs rest, the cleat 5, upon which said bars rest, and the standards 9, substantially as set forth.

401,590. CURTAIN-POLE SOCKET. HENRY REUBEL, New York, N. Y. Filed Dec. 3, 1888. Serial No. 292,962. (No model.)

Claim.—A socket for curtain-poles, consisting of a bracket recessed at the upper part, a spring-catch applied on the inside of said bracket and extending at its free end through an opening of the bracket, and a tubular sheath or band having an aperture that is engaged by the projecting end of the spring-catch, substantially as set forth.

401,591. ELECTRIC-ALARM ADVANCE CAR. HARRY RIBSENBERG, St. Louis, Mo. Filed Dec. 1, 1888. Serial No. 292,305. (No model.)

Claim.—1. In a rail-train alarm to prevent collisions, &c., the combination of the advance pilot alarm-car 2, driven by a dynamo that is run by an endless belt or chain connection with the drive-wheel gearing of the locomotive, the cable 3, through which the current from the dynamo is transmitted to said pilot-car, the intermediate cable-supporting car, 12, and the reel on said car to which said cable is attached, substantially as and for the purpose set forth.

2. In a rail-train alarm to prevent collisions, &c., the combination of the advance pilot alarm-car, the cable 3, that connects said car to the locomotive, the said car propelled by the current generated by a dynamo on the locomotive, the means of driving said dynamo by the running-gears of the locomotive, the insulated wires that convey the current from the dynamo to the switch-board 30, the said switch-board, the insulated wires that convey the current from the switch-board to the cable, through said cable, and transmit it to the motor 27 on the pilot-car, substantially as and for the purpose set forth.

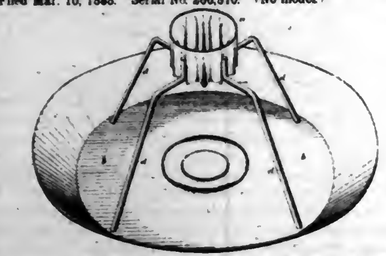
3. In a railway-train alarm to prevent collisions, &c., the combination of the advance pilot alarm-car driven sufficiently in advance of the locomotive to give timely warning for the arrest of the train before meeting obstructions on the track, the said car driven by the current generated by a dynamo on the locomotive that is operated by the running-gears of said locomotive, the insulated wires and insulating-cable *via* which said current is conveyed to the motor on the pilot-car, through which the current passes to drive said car, the said motor, the pulley-belt or chain-gearing that communicates motion from the axle of said motor to the rear axle of the pilot-car, on which its rear wheels have tight bearings, the revolving pedestal 74, surmounted by alarm-disks, the pulleys, respectively, on the foot of said pedestal and on the rotary fore axle of the car, and the belt or chain gearing that transmits its motion from said axle to said pedestal and turns the same, substantially as and for the purpose set forth.

4. In a railway-train alarm to prevent collisions, &c., the combination of the advance pilot alarm-car driven by the motor on said car that is operated by the current from a dynamo on and worked by the running-gear of the locomotive, the belt-pulley gearing that transmits motion from the axle of the motor to the drive-axle of said car, the revolving pedestal surmounted by alarm-disks, the rotary front axle of the pilot-car, the pulleys on the foot of said pedestal and on said rotary front axle, the twisted belt or chain gearing that transmits power from one pulley to the other to drive the revolving pedestal, the alarm-gong 81, the pedestal on which said gong is mounted, the spring trip-hammer 83, and the stud 84, that projects from the side of the revolving pedestal and trips said hammer, substantially as and for the purpose set forth

5. In a railway-train alarm to prevent collisions, &c., the combination of the electric alarm-bell, the battery, the insulated wires and cable on the line of circuit, the advance pilot alarm-car with which said circuit communicates, the dash of rubber or other non-conductive material, the commutation-plates 90 and 92, the screw-bolts 91, that couple said plates, the pendent impulsive metallic detector-bars 97, the bolts 98 on which said bars work with loose bearings, said bolts screwed at their upper ends beneath the dash, the spiral resectionary springs on said bolts, and the metal studs that surmount and are integral with said detector-bars, and which studs, when said bars are pressed upward by the pilot-car running over an obstruction, come in contact with the forward commutation-plates on the dash, close the circuit, and consequently ring the alarm-bell in the engineer's cab, substantially as and for the purpose set forth.

6. In a railway-train alarm to prevent collisions, &c., the combination of the electric alarm-bell, the battery, the insulated wires and

cable on the line of circuit, the advance pilot alarm-car with which said circuit communicates, the dash of rubber or other non-conducting material, the coupled commutator-plates 90 92, the foot vertically-impulsive bar, 97, and the series of horizontally-impulsive bars 93, adapted to form electrical connection with the alarm-bell in the engineer's cab when the pilot-car collides with or runs over an obstruction, whereby the engineer is warned of any danger, substantially as and for the purpose set forth.

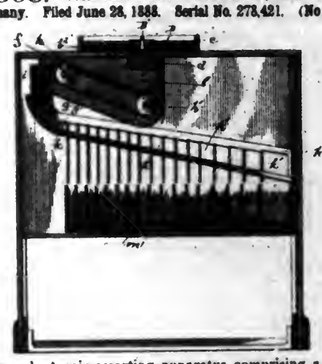


7. In a railway-train alarm to prevent collisions, &c., the combination of the advance pilot alarm-car driven by the current generated by a dynamo on the locomotive, the insulated wires and insulating-cable that carry said current, the cable-supporting car 12, the reel on said car that supports the intervening stretch of cable, and to which it is secured, the insulated wires 29, that convey the current from the dynamo to the switch-board, the said switch-board, the switching-arms 47, the stations arranged on said switch-board for switching the current, respectively, to the pilot-car 48, to the cable-supporting car 12, to wind the reel, or to the ground-circuit for the exhaust 54, and the insulated wires that carry said current from said station to their said operative and exhaust points, substantially as and for the purpose set forth.

8. In a railway-train alarm to prevent collisions, &c., the combination of the pilot alarm-car driven by the current generated by a dynamo on the locomotive, the insulated wires and insulating-cable that convey said current, the intermediate cable-supporting car, the reel on said car to which said cable is secured, the switch-wires from and to said cable immediately in front of its attachment to the reel, the positive and negative concentric rings 32, with which said wires connect, the rubber or other insulating disk-head, 33, of the reel, to which said rings are secured, the brushes 37, the rubber base 38, on which said brushes are secured, the electric motor on said car, the insulated wires which transmit the current between said brushes and said motor, the pulleys on the axle of the motor and that of the reel, and the endless band or chain that transmits motion from the motor-pulley to the reel-pulley, all arranged so that when the current is switched at the switch-board to said motor to turn the reel, wind the cable around it, and simultaneously retrograde the advance pilot-car to the cable-supporting car and the latter to the locomotive, substantially as and for the purpose set forth.

9. In a railway-train alarm to prevent collisions, &c., the combination of the advance pilot-car, the cable-supporting car, the cable between the locomotive and said cars, the reel 14 on the latter car, to which said cable is secured, the crank-handle 57, to wind said reel, the hook 58, to hold said handle captive when inoperative, and the rubber buffer-heads 73 on the locomotive, the cable-supporting car and the advance pilot-car, and the belay-pin-handled screws that secure the cable respectively to the locomotive at its rear end and to the pilot-car at its forward end, substantially as and for the purpose set forth.

10. In a railway-train alarm to prevent collisions, &c., the combination of the electric energy-producing dynamo driven by the locomotive, the insulated wires conducting said energy to the switch-board in the cab, the said switch-board, the switching-arms 47, the pilot alarm-car, the motor on said car, the insulated wires that conduct electric energy to the motor on said pilot-car, the cable that insulates said wires, the intervening car that supports said cable, the electric motor on said car, the insulating rubber dash of the pilot-car, the series of horizontally-impulsive bars, the vertically-impulsive bar, the insulated wires that connect with the battery and alarm-bell in the engineer's cab, the said battery and alarm-bell arranged, when obstructions are met along the track, to give the alarm in the engineer's cab, substantially as described, and for the purpose set forth.



401,592. CANDLESTICK. ANTHONY ROKLOFF, Philadelphia, Pa. Filed Mar. 10, 1888. Serial No. 266,870. (No model.)

Claim.—1. The combination of the base of the candlestick, the legs projecting upward therefrom, and an elevated candle-holder mounted upon said legs, and consisting of a rigid tube having internal vertical ribs gradually flattened toward their upper ends, so as to form a flaring mouth for the holder, all substantially as specified.

2. The combination of the base of the candlestick, having indentations therein, with the elevated candle-holding tube having internal vertical ribs and supporting-legs therefor inclined outward from the tube to the base, and having their lower and outermost ends secured in the indentations in the base, thereby serving as rigid supports for the said candle-holding tube, all substantially as specified.

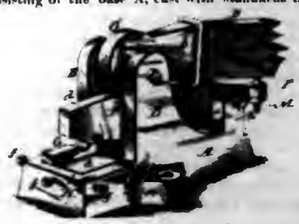
401,593. COIN-ASSORTER. JOSEF ROSSY, Saar Louis, Prussia, Germany. Filed June 28, 1888. Serial No. 278,421. (No model.)

Claim.—1. A coin-assorting apparatus comprising a horizontal rotatory coin-receiving table, an inclined channel extending from the periphery of said table, an arm to guide the coin on the table into said channel, and an inclined and angularly-placed sorting-bar upon the upper end of which the coin from said channel is discharged, said bar being provided with a series of different-sized apertures and separate compartments beneath the apertures.

2. In a cash-receptacle, the combination, with a receiver, of a rotatory receiving-table provided with a stationary annular flange around its outer edge extending above its upper face and having a discharge-opening and channel, and a guide-piece on the upper face of said table tapering toward said discharge-opening in the annular flange.

3. In a cash-receptacle, the combination of a rotatory receiving-table mounted upon a vertical spindle, an annular flange provided with a discharge-opening and forming an edge around and extending above the upper face of the table, a driving-shaft, and gearing connecting the shaft and spindle, whereby the table can be rotated.

4. A coin-assorter comprising a horizontal rotatory coin-receiving table mounted upon a vertical spindle, a discharge-channel to receive the coin from the table, and a stationary arm extending over the table and adapted to guide the coin toward the periphery of the table into said channel, substantially as described.



5. A coin-assorter comprising a rotatory coin-receiving table, a conveyer upon which the coin from the table is discharged, a sorting-bar upon which the conveyer discharges the coin, and a receiver located beneath the sorting-bar, substantially as described.

6. In a coin-assorter, a rotatory receiving-table mounted upon a vertical spindle and provided with a guide, a belt-conveyer upon which the money from the table is discharged, in combination with a horizontal shaft provided with a handle, a pulley mounted on the shaft on which the conveyer is mounted, and gearing connecting the shaft and vertical spindle, whereby the conveyer and table are simultaneously operated, substantially as described.

7. In a cash-receptacle, the combination, with the rotatory receiving-table and the belt-conveyer upon which the money from the table is discharged, of the driving-shaft connected with and simultaneously operating the conveyer and table.

401,594. COMBINED PUNCH, SHEARS, AND SAW-GUMMER. JAMES SCROFIELD, Petoskey, Mich. Filed Sept. 17, 1888. Serial No. 285,563. (No model.)

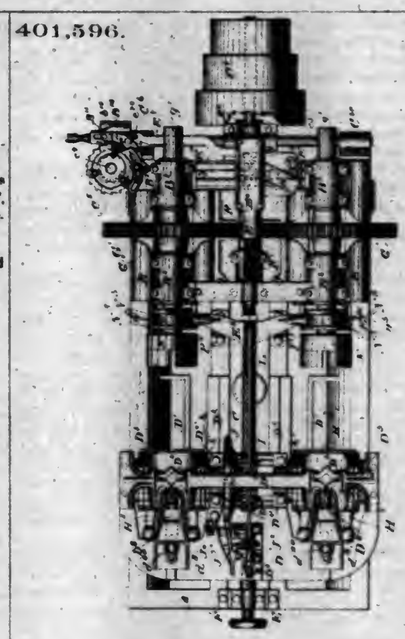
Claim.—1. The combination, with a set of reversible and detachable tools, of a frame to which the tools may be interchangeably connected, consisting of the base A, cast with standards B E, and seat

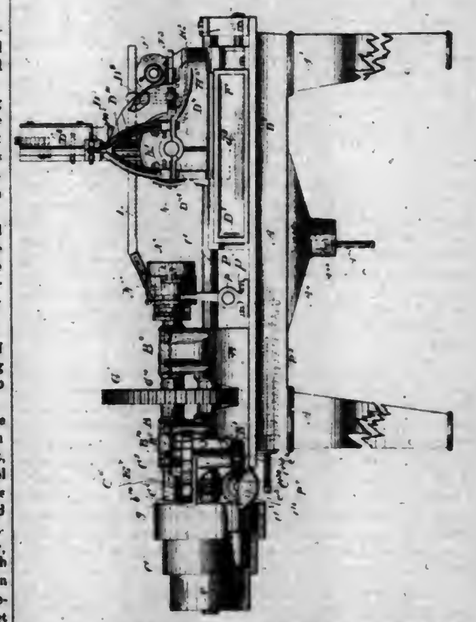
401,594.

H, and ears *a*, and the cam-lever C, pivoted to the standard B, substantially as and for the purpose set forth.

2. The combination, with the frame constructed substantially as described and provided with a cam-lever, of the reversible blade F, detachably connected to the frame, substantially as and for the purpose set forth.

401,595. CULTIVATOR. JAMES SHOOLBRED, Eastover, S. C. Filed Dec. 6, 1888. Serial No. 292,808. (No model.)





Claim.—1. In combination, the frame having teeth and a draft-beam swiveled to said frame and carrying the handle-bars, the said beam being adjustable to horizontally change the line of draft, and holding devices for said beam, substantially as described.

2. In combination, the frame composed of a series of bars having teeth, said bars being pivoted at their forward ends, the adjustable bars at their rear ends, whereby the said bars may be spread apart or set close together, and a draft-beam pivoted to one of said bars and having movement in a horizontal plane, and holding means therefor, substantially as described, whereby the toothed bars may be drawn longitudinally or laterally, as desired.

3. In combination with the beam, a tooth having a flattened lower portion or blade with a cutting-edge in a vertical plane, the angular and bent shank for said blade adapted to a socket in the beam, whereby the blade may be adjusted into the line of draft or across the same and the inclination of said vertical cutting-edge may be varied, substantially as described.

401,596. MACHINE FOR CUTTING THE SCREW-THREADS ON BOLTS. JOHAN M. SIMPSON, Chicago, Ill., assignor to William Deering & Company, same place. Filed Apr. 26, 1888. Serial No. 271,992. (No model.)

Claim.—1. In a bolt-cutting machine, in combination with the main driving-shaft and the cutter-head, and the train of mechanism which communicates rotary motion to the cutter-head from the shaft, a slide-bar connected to the cutter-head having slide-bearings parallel with the axis of said head, a bar having slide-bearings at right angles to those of the first-mentioned bar, a plate having slide-bearings, and a block adapted to travel in said bearings, one secured to the first-mentioned slide-bar and the other secured to the second-named bar, the said plate being adjustable in its securement to the bar to which it is fastened to change the direction of its slide-bearings, and a train of mechanism from the main driving-shaft to the second-named slide-bar, whereby it is actuated in its slide-bearings, substantially as set forth.

2. In a bolt-cutting machine, in combination with the driving-shaft and the revolving bolt-cutter head, and the train whereby said shaft communicates rotary motion to the cutter-head, the rack-bar E^7 and connections from it to the cutter-head, the wheel C^8 and the train of gear whereby the main driving-shaft rotates it, said wheel engaging the rack-bar E^7, the lever C^{30}, pivoted on the frame and engaging said bar, a cam on said lever, and a trip-block on the wheel C^8 in position to engage the cam and actuate thereby the lever to disengage the rack-bar from the wheel, substantially as set forth.

3. In combination, substantially as set forth, the revolving and longitudinally-movable cutter-head and connections therefrom to the rack-bar E^7, whereby the longitudinal movement of said rack-bar longitudinally actuates the cutter-head, the wheel C^8, engaging the rack-bar, the lever C^9, pivoted on the frame and connected to the rack-bar, the trip E^{31} on the wheel C^8, and the cam C^{30}, secured to the levers C^9 and adjustable thereon to expose a greater or less portion of its face to the action of the trip, substantially as set forth.

4. In combination, substantially as set forth, the bar E^7, wheel C^8, lever C^9, and cam C^{30}, secured to said lever, the wheel C^8, having one or more trip-blocks adjustably and removably attached thereto in the same circle, whereby the bar E^7 may be disengaged from the wheel as frequently and at such intervals as desired in each revolution of the wheel by varying the number and position of said trip-blocks.

5. In combination, substantially as set forth, the bar E^7, wheel C^8, lever C^9, cam C^{30}, adjustably secured thereon, and the trip-blocks E^{31}, adjustably and removably secured to the wheel C^{30}, whereby a greater or less number may be employed at once, the cam C^{30} being adjustable to expose a greater or less portion to the action of the trip-blocks, whereby the bar E^7 may be disengaged from the wheel C^8 as

frequently and at such intervals and held out of engagement as long as desired, and the point of re-engagement determined at will.

6. In combination with the longitudinally-movable cutter-head, the wheel O^3, and the rack-bar E^7, engaged by it, and connections from said rack-bar to the cutter-head, the cam and trip mechanism which disengages said wheel and bar, and the spring P^2 and the connections therefrom to the cutter-head, whereby said spring reverses said cutter-head and the bar E^7, substantially as set forth.

7. In a bolt-cutting machine, the cutter-head, the bolt-feed tube, and the bolt-carrying head, the bolt-carrying head having journal-bearings at right angles to its cavity and revoluble in said bearings, the cutter having its axis, and the feed-tube having its longitudinal axtent in the plane of rotation of the bolt-cavity and at an angle to each other, substantially as set forth.

8. In a bolt-cutting machine, in combination with the cutter-head, the bolt-feed tube, the bolt-carrying head, and the clamp-cam, the cutter-head and feed-tube being both located in a plane at right angles to the revolution of the bolt-carrying head and at an angle to each other, said head having a bolt-cavity transverse with respect to its axis and the train which revolves the carrying-head, whereby the bolt-cavity is alternately in line with the feed-tube and with the cutter-head, and clamping mechanism adjacent to the bolt-cavity in the carrying-head and having a portion protruding from said head, and the clamping-cam fixed with respect to the bearings of the bolt-carrying head and located adjacent to the path in which the protruding portion of the clamping mechanism is carried by the revolution of said head and at the point in said path which is reached by said portion, where the bolt-cavity is in line with the cutter-head, substantially as set forth.

9. In a bolt-cutting machine, in combination, the cutter-head, the bolt-carrying head, and the bolt-feed tube, the bolt-carrying head being journaled in horizontal bearings and having the bolt-cavity at right angles to such bearings, and the cutter-head and feed-tube being both located in a plane also at right angles to said bearings, the feed-tube being vertical and at an angle to the cutter-head and the train which revolves the bolt-carrying head, whereby the bolt-cavity is vertical twice in each revolution and in the interval is in line with the cutter-head, substantially as set forth.

10. In a bolt-cutting machine, in combination with the cutter-head, the bolt-feed tube, the clamping-cam, and the bolt-carrying head, the bolt-carrying head being journaled in horizontal bearings and having the bolt-cavity at right angles to said bearings, and bolt-clamping mechanism in said head adjacent to such cavity and protruding from the bolt-carrying head, the cutter-head and feed-tube being also located in a plane at right angles to the bearings of the bolt-carrying head, the feed-tube being vertical and at an angle to the cutter-head, the train which revolves the cutter-head, whereby the bolt-cavity twice in each is vertical and thereby in line with the feed-tube and in one of the intervals is in line with the cutter-head, and the clamping-cam fixed with respect to the bearings of the bolt-carrying head and located adjacent to the path of the protruding part of the clamping mechanism and at the point in said path reached by said protruding part when the bolt-cavity is in line with the cutter-head, substantially as set forth.

11. In a bolt-cutting machine, in combination with the cutter-head, the bolt-carrying head having journal-bearings transverse to the axis of the cutter-head, and a bolt-cavity transverse to said journal-bearings, the bolt-feed tube located in the plane of rotation of the bolt-cavity and at an angle to the cutter-head, and the train which revolves the bolt-carrying head, whereby the bolt-cavity is alternately in line with the cutter-head and with the bolt-feed tube, a clutch-wheel in said train, and the tripping mechanism which disengages the clutch and locks the bolt-carrying head, said tripping and locking mechanism being located and timed to engage the wheel when the bolt-cavity is in line with the cutter-head, whereby the bolt-carrying head is held stationary at that position, substantially as set forth.

12. In a bolt-cutting machine, the cutter-head and its advancing and retracting mechanism, the bolt-carrying head journaled transversely to the line of advance and retreat of the cutter-head, and the train which revolves the cutter-head in said bearings, comprising a clutch-wheel, tripping mechanism which actuates the clutch-wheel to force it into engagement, and a connecting-rod from the cutter-head to the tripping mechanism, whereby the retreat of the cutter-head actuates the tripping mechanism to cause it to engage the clutch-wheel with the remainder of the bolt-carrying-head-driving train, substantially as set forth.

13. In combination with the cutter-head, the mechanism which retracts it, the bar connected to and longitudinally actuated by said retracting mechanism, the wheel J^3, engaged and actuated by said bar in its retreating movement, the shifting-lever J^3, actuated by said wheel, the bolt-carrying head journaled transversely to the line of advance and retreat of the cutter-head, and the clutch-wheel J in the train which rotates the bolt-carrying head actuated by the lever J^3 out of engagement with the remainder of the bolt-carrying-head-driving train, substantially as set forth.

14. In combination, substantially as set forth, the bolt-carrying head, its actuating clutch-wheel J, the lever J^3, pivoted on the bearings of the clutch-wheel and having one end engaging the hub and the other resting upon the rim of said wheel, a spring tending to actuate the lever to disengage the clutch-wheel, said clutch-wheel rim having the notch j^{31}, adapted to receive the arm of the lever J^3, which rests upon said rim, whereby said rim detains the lever in position to hold the clutch-wheel in engagement with the train, and said notch allows it to be forced by the spring out of such engagement, by engaging the lever-arm, and locks the said clutch-wheel and bolt-carrying head stationary.

15. In combination with the bar L, the wheel J^5, having its ratchet engaged by said bar and having the cam J^{51}, the lever J^3, contacting the cam, and the clutch-wheel J, engaged by the lever and having the rim J^4, serving as a delay-surface for the same, substantially as set forth.

16. In combination with the cutter-head and its advancing mechanism and the adjustable mechanism which controls the duration of the advance movement, the bar L, connected to and actuated by the cutter-head-advancing mechanism, the wheel J^5, having a ratchet over which the bar L advances and adapted to be engaged by said bar in its retreat, the cam J^{51}, which actuates the clutch-shifting mechanism adjustably secured on said wheel J^5, whereby the instant of engagement of said clutch may be made to coincide with the completion of the retreating movement of the cutter-head, substantially as set forth.

17. In a bolt-cutting machine, in combination with the cutter-head having a part (as the collar N^2) whose retraction opens the jaws, the retracting mechanism having as a part of it the pin N^7, engaging said collar, whereby the retracting movement of the retracting mechanism first retracts the collar and opens the jaws, substantially as set forth.

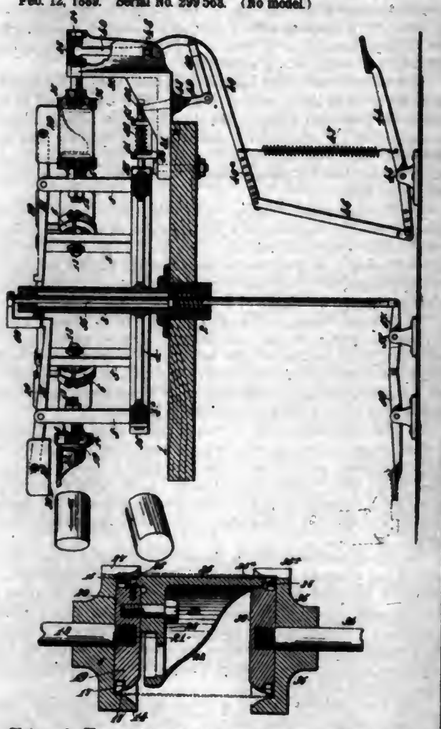
18. In a bolt-cutting machine, in combination with the cutter-head having a part (as the collar N^2) whose retraction opens the jaws, the retracting mechanism having as a part of it the pin N^7, engaging said collar, and the cam projection N^8, engaging the pin to disengage it from said collar before the limit of the retracting movement is reached, substantially as set forth.

19. In a bolt-cutting machine, in combination with the cutter-head having a part (as the collar N^2) whose retraction opens the jaws, the retracting mechanism having as a part of it the pin N^7, engaging said collar, the cam projection N^8, engaging the pin to disengage it from said collar before the limit of the retracting movement is reached, said cutter-head having beside the collar N^2 other means of engagement with the retracting mechanism, as the flange N^9, and a suitable stop to arrest the collar N^2 after the disengagement of the pin while the retracting mechanism further retracts the cutter-head, whereby the jaws are closed during the last part of the retracting movement, substantially as set forth.

20. In combination with the bar L, the wheel J^5, having the cam J^{50}, the lever J^3, actuated by said cam, the clutch-wheel J, actuated by the lever and having the cam projection j^{31}, the spring J^6, engaging and tending to reverse the wheel J^5, the plunger D^{21} and the connections by which the cam projection j^{31} actuates it, whereby the ratchet-wheel J^5 is released from the bar L after the clutch is engaged, and the spring J^6 is allowed to restore said wheel to its initial position, substantially as set forth.

21. In combination with the plunger D^{21}, the cam D^{25}, having the notch d^{24} to receive and form a seat for the foot of the plunger, the form of said notch being angular, as described, whereby one side of it is stopped against the plunger while the other side stops the plunger, substantially as set forth.

22. In combination with the bolt-feed tube and the transverse slides D^{23} and D^{23} therein, the mouth of each slide having a larger and smaller portion, the larger portion of each mouth being in line with the smaller portion of the other, and the bar which reciprocates said slides transversely to bring the larger and smaller portions of each mouth alternately into the bolt-channel of the bolt-feed tube, substantially as set forth.



23. In combination with the bolt-feed tube, the transverse slides D^{23} and D^{23} therein, having their mouths comprising larger and smaller portions arranged, respectively, substantially as described, the slide-bar D^{24}, having the oblique slots which engage the slides D^{23} D^{23}, (as at their necks d^{23},) the rock-shaft having the lever-arms M' M^3, and the bolt-carrying head having the cam projection A^{29}, which engages the arm M' and causes the arm M^3 to actuate the bar D^{24} and the spring D^{25} to reverse the movement of the said bar, substantially as set forth.

24. In combination with the bolt-carrying head having the bolt-clamps and the levers which actuate them protruding from the head, the cam D^5, contacted by said levers and having its cam-faces converging toward the bolt-carrying head and adjustable toward and from said head, substantially as set forth.

25. In a bolt-carrying head, in combination with the body, the clamp-blocks H^4, having similar concavities on their proximate faces, diminishing from the receiving end toward the middle, and the plates H^9, having the bolt-emerging aperture formed by the notches A^{31} on their proximate edges, said plates being laterally adjustable to vary the size of the aperture formed by the notches, and the adjusting-screws A^{40}, to limit adjustably the separation of the clamp-blocks H^4, whereby the aperture between them may be adjusted to correspond with the bolt-emerging aperture, substantially as set forth.

26. In the bolt-carrying head, in combination with the body, the clamp-blocks H^4, having the outer portion of their cavities H^{41} enlarging toward the outer end, and the plates H^9, having the bolt-emerging apertore formed by the notches A^{31} in their proximate edges lapping over and partially closing the opening between the said clamp-blocks, substantially as and for the purpose set forth.

401,597. MECHANISM FOR FORMING AND SIZING SHEET-METAL VESSELS. ALEXANDER SLATEMAN, Baltimore, Md., assignor to himself, Augustus E. Clarson, and John O'Ferrall, same place. Filed Feb. 12, 1889. Serial No. 299,563. (No model.)

Claim.—1. The combination of a rotating support having a standard carrying a bolt, a guide-nut fixed on the bolt, a sectional expansible die mounted on the bolt and having a cup-shaped recess containing the guide-nut, a can-body former rigidly secured to the guide-nut in the recess of the die, a lengthwise-movable mandrel arranged on a stationary support, a sectional expansible sizing-die mounted on the mandrel and having a cup-shaped recess, a guide-nut located in the recess of the sizing-die and fixed to the mandrel, a pivoted vibrating lever connected with the mandrel, and a treadle connected with the vibrating lever to move the mandrel and retract the sizing-die and its inclosed guide-nut from the end of the can carried by the body-former, substantially as described.

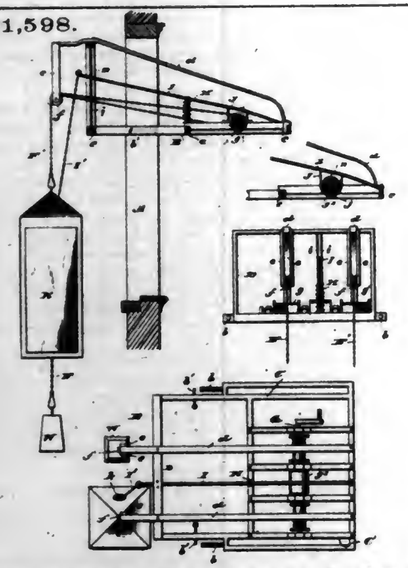
2. The combination of a revolving support having a series of standards, a tubular arbor carrying the support, a bolt projecting from each standard, a sectional expansible die arranged on each bolt and having a cup-shaped recess, a guide-nut located in the recess of each die and mounted on a bolt, a cylindrical body-former rigidly secured to each nut in the recesses of the expansible dies, a lever pivoted on each standard and having a clamp at one end, a vertically-movable rod extending through the tubular arbor and having a lug at its upper end to act successively on the other ends of the clamp-carrying levers, a treadle connected with the rod for depressing it, a mandrel having a guide-nut, a sectional expansible sizing-die having a cup-shaped recess containing the guide-nut on the mandrel, a pivoted vibrating lever connected with the mandrel, and a treadle connected with the vibrating lever for moving the mandrel and retracting the sizing-die and its guide-nut from the end of the can carried by the body-former, substantially as described.

3. In a machine for sizing the bodies of sheet-metal cans, the combination, with a rotating support provided at intervals with standards, of a sizing-die mounted on each of said standards, a body-former projecting radially from the outer face of each sizing-die, a clamp carried by a lever pivoted on each standard and adapted to descend upon the top of the body-former to hold the meeting edges of the can-body, a reciprocating sizing-die co-operating successively with the revolving sizing-dies, a reciprocating lug lifting the clamp-lever successively and operated by a foot-lever upon one side of the table carrying the support, a foot-lever upon the opposite side of said table operating the lever which retracts the reciprocating sizing-die, a stop-bar retracted by a device connected to the latter lever, and a spring connecting said lever and its foot-lever and throwing the reciprocating sizing-die into engagement, substantially as described.

4. In a machine for sizing the bodies of sheet-metal cans, the combination, with a sizing-die having a marginal sizing-flange, of a cleft ring arranged within said flange, a guide-nut having the form of a frustum of a cone, the base of which overlies said ring and is provided with a boss or projection lying within but not in contact with said ring, and a bolt lying loosely in a cavity in the die and tapped into said guide-nut, substantially as described.

5. In a machine for sizing the bodies of sheet-metal cans, the combination, with a sizing-die having a marginal flange, of a cleft compressible ring lying within said flange and having a peripheral face which expands constantly toward the flat face of the die at the foot of the outwardly-flaring inner face of the marginal flange, a guide-nut having a boss lying within but out of contact with said ring and provided with a frustrum-shaped portion partly overlying the peripheral face of said ring, the expanding face of said nut forming a guide to the expanding face of the ring, and a bolt passing through the die from the rear and entering the guide-nut, substantially as described.

6. In a machine for sizing the bodies of sheet-metal cans, the combination, with a sizing-die consisting of two similar adjustable semicircular parts each having a marginal flange and provided with lugs connected by bolts and nuts, of a cleft compressible ring lying within said flanges, a guide-nut having the shape of the frustum of a cone, the expanding face of which forms a guide to the expanding face of the ring, and a body-former composed of a cylindrical shell having its flat end mounted upon the flat outer face of the guide-nut, substantially as described.

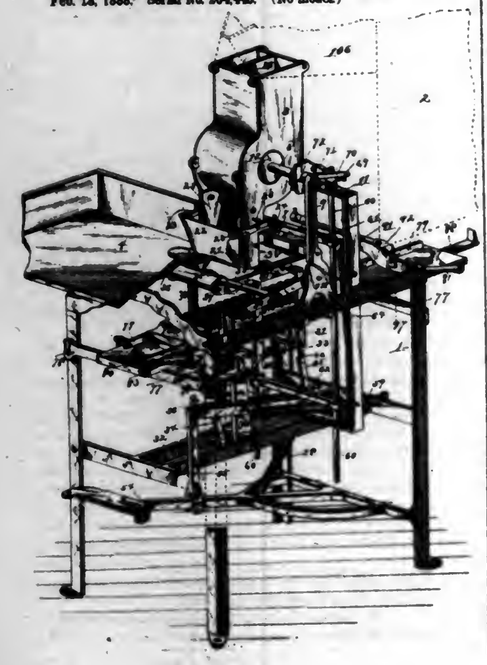


8. In a machine for sizing the bodies of sheet-metal cans, the combination, with a circular sizing-die having a marginal flange projecting at right angles to the flat face of said die and having an interior contracting surface, of a cleft compressible ring having an expanding peripheral face lying within said flange and having contact with the base thereof, a guide-nut having the form of the frustum of a cone, the expanding face partly overlying the peripheral face of the ring, a body-former consisting of a cylindrical shell, its end mounted on the flat face of the guide-nut, the top of said shell provided with a raised strip lying in the plane of the bottom of a notch cut in the flange of the die as deep as the inner face of said flange at its base, and a clamp mounted on a lever pivoted on a support above said die, said clamp having a straight edge adapted to engage the surface of said strip, substantially as described.

9. In a machine for sizing and forming the bodies of sheet-metal cans, the combination, with a circular sizing-die formed in two adjustable parts and having a cleft compressible ring lying within the contracting surface of said die, said ring having an expanding peripheral face engaging said surface, a guide-nut having an expanding face which partly overlies said ring, a body-former mounted on said nut and provided with a raised strip on its top, the projecting end thereof lying in a notch in the guide-nut, a rotating support carrying said parts, a clamp having a straight edge resting upon said strip, a lever carrying the clamp, a reciprocating sizing-die carried by a mandrel and having a cleft ring and guiding-nut, a stop-bar holding the revolving support, a lever retracting the mandrel and stop-bar, a lever upon the opposite side of the revolving support raising the clamp, and a spring throwing the reciprocating sizing-die into engagement, substantially as described.

401,598. FIRE-ESCAPE. SAMUEL H. SPRAGUE, Beloit, Kans. Filed Jan. 17, 1889. Serial No. 296,599. (No model.)

Claim.—1. The combination, in a fire-escape, of a suitable frame, B, having a shaft journaled therein, projecting bars *d d*, carrying



401,598.

pulleys *f f*, a brake-bar, l, secured to the inner side of said frame and provided with a spring, H, guide-bars *i i* therefor, flexible connections F and F', wound in different directions upon the shaft and provided at their ends with a cage and weight, and a flexible connection, I', extending from the projecting end of the brake-lever into the cage, so that the descent of the case can be regulated, the parts being organized substantially as shown, and for the purpose set forth.

2. The combination, substantially as described, of the frame, the chain-drums fixed on a shaft journaled therein and provided with car-chains, the brake-drum fixed to the same shaft and provided with peripheral recesses, the brake-bar overhanging the brake-drum and provided with a pull-rope, and a band secured to the brake-bar to encircle the brake-drum and provided with a lug to engage the recesses in the drum.

401,599. CIGAR-MAKING MACHINE. WILLIAM M. STEHLE, Pittsburg, assignor of one-half to John Bowman, Allegheny, Pa. Filed Feb. 13, 1888. Serial No. 264,445. (No model.)

Claim.—1. The combination of a feed-hopper the sides of which are extended downward to form a chute, a shaft journaled in bearings upon the rear side of said extensions, three arms upon said shaft, one of which is adapted to be operated automatically, and a door secured to the other arms, the lower end of which engages with said chute, substantially as set forth.

2. The combination of a feed-hopper, a feed-roller therein provided with recesses and having an adjustable head, a vertical slide above the roller, two rods secured to said slide and projecting through one side of the hopper, a vertical bar secured to the outer ends of the rods, and a screw through the bar and the side of the hopper, substantially as set forth.

3. The combination of a frame, two uprights secured thereto carrying a cross-piece, a feed-hopper having a lug upon its rear portion, a set-screw projecting through the lug into the cross-piece, a shaft journaled in the upper ends of the uprights extending through the feed-hopper, and a feed-roller upon the shaft, substantially as set forth.

4. The combination of a frame, a swinging cigar-rolling table therein, two slotted legs secured to the sides of the frame, two supports pivotally secured to the legs at one end and to the uprights at the other end, a bunching-roller journaled at its ends in the supports, and an apron secured at its ends to the table and passed over the bunching-roller, substantially as set forth.

5. The combination, with a cigar-rolling table, of a bunching-roller above the table, an apron passing over the roller and secured at its ends to the table, two blocks at the rear end of the table, the inner faces of which are concaved, the rear block being narrower than the other one, a guide yieldingly secured at the top of the narrower block, and a vertically-moving plunger passing between the blocks, substantially as set forth.

6. The combination of a cigar-rolling table, a pair of blocks secured to its rear end, the inner faces of which are concaved and act as guides, one of which is narrower than the other one, a guide secured to the narrower block, a wing secured to one end of the guide, a vertically-moving plunger, and a stop against which the wing is caused to strike, substantially as set forth.

7. The combination, with a swinging cigar-rolling table, of a pair of blocks secured at its rear end, the inner faces of which are concaved and act as guides, and one end of each of which is provided with a sharp cutting-edge, an apron on the table, a bunching-roller, and a vertically-moving plunger, one end of which passes close to the cutting-edge of the blocks, substantially as set forth.

8. The combination, with a swinging cigar-rolling table, of a pair of blocks secured at its rear end, the inner faces of which are concaved and act as guides, and one end of each of which is inclined and provided with a sharp cutting-edge, an apron on the table, a bunching-roller, and a vertically-moving plunger passing between the blocks with one end near the cutting-edge of the blocks, substantially as set forth.

9. The combination, with a frame, of a swinging cigar-rolling table, a pair of blocks at the rear end of the table, the inner faces of which are concaved and act as guides, one end of each of which is provided with a sharp cutting-edge, an apron on the table, a bunching-roller, a vertically-moving plunger passing between the blocks, and a scraper secured at one end to the frame and having its free end projecting over the ends of the blocks provided with the cutting-edges, substantially as set forth.

10. The combination, with a frame, of a bunching-roller, arms of unequal length pivotally secured within the frame, a swinging cigar-rolling table pivotally secured upon said arms, and means for connecting the arms, whereby one end of the table approaches nearer the bunching-roller than the other one as the table moves forward and back below the bunching-roller, and an apron on the table, substantially as set forth.

11. The combination, with a frame, of three arms, a lever, and a cigar-rolling table, the table being pivotally secured to the upper ends of two of the arms and the lever being pivotally secured at the middle of one of the said arms and connected at its ends with the other two arms, a bunching-roller above the table, and an apron upon the table, substantially as set forth.

12. The combination, with a frame, of two forked arms, a cigar-rolling table pivoted to the upper or forked ends of said arms, a pair of parallel brace-pieces across the frame of the machine, a lever pivotally secured at its middle to one of the arms and at one end to the lower end of the other arm, and an additional arm pivotally secured at its upper end to the lever and at its lower end between the braces in front of the pivotal point of the lower end of one of the forked arms, substantially as set forth.

13. The combination, with a frame, of arms pivotally secured thereto, a cigar-rolling table pivotally secured to the upper ends of the arms, a treadle, a lever secured near the lower end of one of the arms, and a link secured to the treadle and to the end of the lever, substantially as set forth.

14. The combination, with a frame, of arms pivotally secured thereto, a cigar-rolling table pivotally secured to the upper ends of the arms, a treadle and lever pivotally secured near the lower end of one of the arms, having a bolt at the rear of the arm, and a link for connecting the lever and the treadle, substantially as set forth.

15. The combination, with the main frame, of a vertical frame secured thereto, two rods adapted to slide within the frame, two cross-pieces secured to the rods, a plunger secured to the upper cross-piece, a latch pivoted at its lower end to the main frame, having a pin at that end and a shoulder at its upper end, a treadle, and a spring secured to the pin and to the treadle, substantially as set forth.

16. The combination, with the main frame, of a vertical frame secured thereto, two rods adapted to slide within the frame, two cross-pieces secured to the rods, a plunger secured to the upper cross-piece, a latch pivoted at its lower end to the main frame having a shoulder at its upper end adapted to engage with the lower cross-piece, a lever, the rear end of which engages with the lower cross-piece, and a bolt near the end of the lever adapted to engage with the face of the latch, substantially as set forth.

17. The combination, with a frame, of two vertically-sliding rods, a cross-piece near their lower ends, a latch having a shoulder at its upper end adapted to engage with cross-piece, and a lever, the rear end of which is rounded upon its upper edge and adapted to engage with the cross-piece and latch, the length of the lever between its pivotal point and its rear end being a trifle greater than the distance between the cross-piece when secured upon the shoulder of the latch and the pivotal point of the lever, substantially as set forth.

18. The combination, with a main frame, of two vertically-sliding rods, a cross-piece secured near their lower ends, a latch having a shoulder at its upper end adapted to engage with the cross-piece and pivotally secured at its lower end to the main frame of the machine, an arm pivotally secured to the machine, a lever pivotally secured to the lower end of the arm, the rear end of which is adapted to engage with the cross-piece, and a bolt upon the lever at the rear of the point at which the lever is pivoted to the arm, said bolt being adapted to engage with the rear face of the arm as the rear end of the lever is moved out of engagement with the cross-piece, substantially as set forth.

19. The combination, with a frame, of an arm having a table secured upon its upper end, a lever pivotally secured near the lower end of the arm, a treadle, a link for connecting the end of the lever with the treadle, and two springs, one of which is secured to the main frame and the arm and the other one to the treadle and to the frame, substantially as set forth.

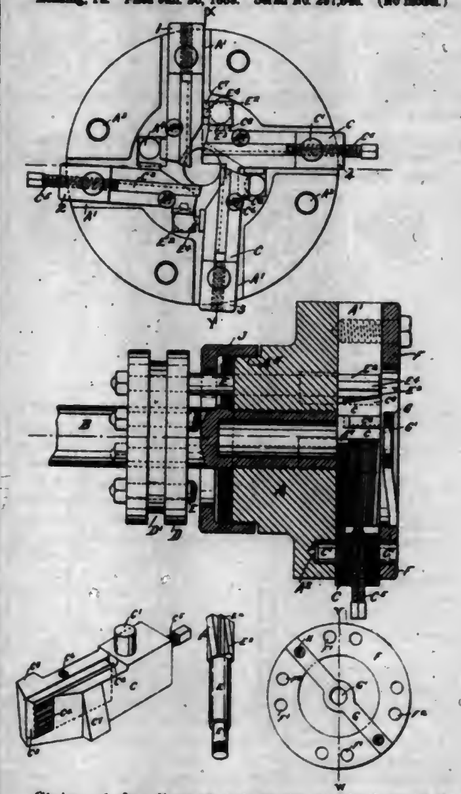
20. The combination, with the main frame, of a vertical frame therein, a feed-hopper upon the frame in front of the vertical frame, a bracket upon the rear side of the hopper, the legs of which are adjustably secured to the top of the vertical frame, and a feed-roller within the feed-hopper having pockets in its periphery, the cutting-edges of which pockets engage with the lower edge of the front wall of the hopper, substantially as set forth.

21. The combination, with a frame, of a platform, a guide secured to one side of the platform and a lever secured to the other side of the platform, a clamp pivotally secured to an arm and to the lever, a latch-lever secured to the lever having a notch near one end, a spring secured to the clamp and to the lever, and a hook secured to the opposite end of the latch-lever and to the spring, substantially as set forth.

22. The combination, with a frame, of a platform secured thereto having lugs upon one of its sides, a spring-actuated lever and an arm pivotally secured to the lugs, a clamp pivotally secured to the inner ends of the lever and the arm, a guide upon the opposite side of the platform, and a stop-pin secured to the rear ends of the platform, against which the arm engages, substantially as set forth.

23. The combination, with a frame, of a platform secured thereto, a reciprocating pawl pivotally secured above the platform, having a lug or projection upon its pivoted end, and a set-screw in the frame, one end of which engages with the lug of the pawl, substantially as set forth.

24. The combination, with a frame, of a platform secured thereto, a feed-hopper above the platform, a swinging cigar-rolling table between the bottom of the hopper and the top of the platform, two brackets adjustably secured to the rear portion of the frame of the machine, a rock-shaft journaled in the brackets connected with and operated by the table, an arm upon the shaft, and a pawl upon the end of the arm above the platform, substantially as set forth.



25. The combination, with a frame, of a swinging cigar-rolling table, a platform, a shaft adjustably secured above the platform, two arms upon the shaft, a pawl at the lower end of one of the arms, and a connecting-rod secured to the end of the other arm and to the table-operating mechanism, substantially as set forth.

26. The combination, in a cigar-making machine, of a supply-hopper secured at the rear of the same, the bottom of which is vertically movable, a shaft across the upper and lower ends of the hopper, each of which is provided with a spur-wheel, and a chain through the bottom of the hopper and over said wheels, substantially as set forth.

27. The combination, in a cigar-making machine, of a supply-hopper having a vertically-movable bottom, shafts across the upper and lower ends of the hopper, each having a spur-wheel near its middle and the lower one having a ratchet-wheel at one end, a chain passing through the bottom of the hopper and around the spur-wheels, and a lever carrying a pawl for operating the ratchet-wheel, substantially as set forth.

28. The combination of a frame, a swinging table therein, a pair of blocks at the rear end of the table, a movable guide secured to the rear block, and a stop secured to the frame and adapted to engage with the guide when the table is drawn forward, substantially as set forth.

401,600. SCREW-CUTTING MACHINE. JAMES H. STEINBERGER, Reading, Pa. Filed Jan. 26, 1889. Serial No. 297,848. (No model.)

Claim.—1. In a die stock or head, the combination, with the movably-secured cutter-holders, of separate bars passing through the head and having ends engaging said holders, and means for simultaneously operating said bars, all substantially as set forth.

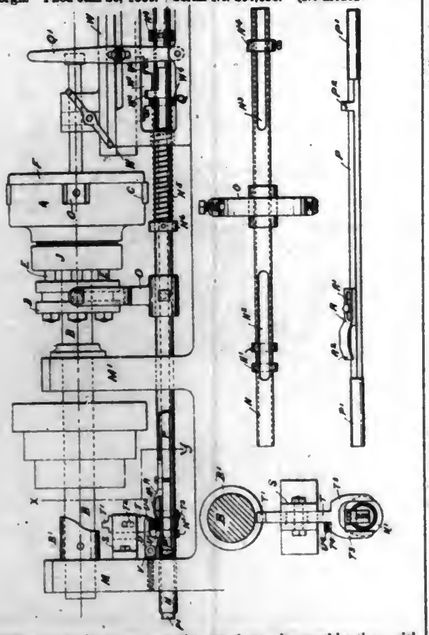
2. In a die stock or head, the combination, with the pivoted cutter-holders, of separate bars passing through the head, the front end of each bar engaging opposite sides of two adjacent holders, and means for simultaneously operating said bars, all substantially as set forth.

3. In a die stock or head, the combination, with the movably-secured cutter-holders, of separate bars connected to a sliding sleeve and passing through the head, the free ends of said bars engaging said holders, and all adapted to operate substantially as set forth.

4. In a die stock or head, pivoted cutter-holders, each having a beveled side, in combination with axial bars passing through said die-head, and each having a beveled surface engaging the beveled side of a holder, and means for simultaneously operating said bars, substantially as and for the purpose set forth.

5. In a die stock or head, pivoted cutter-holders having oppositely-beveled sides, substantially as described, in combination with axial bars passing through said die-head and having correspondingly-beveled surfaces, each of which engages a beveled side of a holder, and means for simultaneously operating said bars, substantially as and for the purpose set forth.

6. In a die stock or head, the cutter-holders with inclined slots C^3, pivoted to said head by trunnions, and the rectangular longitudinally-grooved cutters adjustably secured in said slots, substantially as described, in combination with means for oscillating said holders, substantially as and for the purpose set forth.



7. In a die stock or head, the cutter-holders with trunnions C', pivoted to the head and provided with cutters and adjusting-screws, in combination with a retaining-ring secured to the head and having bearings for said trunnions, all substantially as set forth.

8. In a die stock or head, the combination, with cutter-holders secured thereto and a retaining-ring, of a guard, G, with central opening, removably secured to said ring, substantially as and for the purpose set forth.

9. In a die stock or head, the combination, with the adjustable cutter-holders secured thereto, and a sliding sleeve and connected mechanism for operating said holders, of a stop for said sleeve, adjustably secured to the head, substantially as and for the purpose set forth.

10. In a die stock or head, the combination, with the adjustable cutter-holders secured thereto, and a sliding sleeve and mechanism, substantially as described, for operating said holders, of a nut, J, adapted to serve as a stop for said sleeve, substantially as and for the purpose set forth.

401,601. SCREW-CUTTING MACHINE. JAMES H. STERNBERGH and ROBERT PEMBERTON, Reading, Pa.; said Pemberton assignor to said Sternbergh. Filed Jan. 26, 1889. Serial No. 297,653. (No model.)

Claim.—1. In a screw-cutting machine, the combination, with the die-head, sliding sleeve, and tail-carriage, of a sleeve-operating rod, a lever engaged by said sleeve-rod, and a lever-rod moving with the carriage and arranged to throw said lever into engagement with the machine-spindle, substantially as and for the purpose set forth.

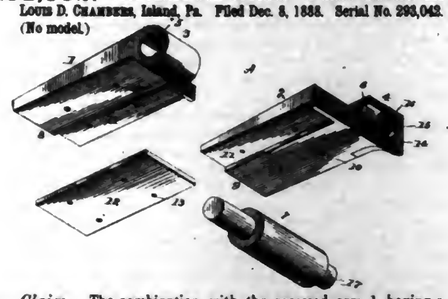
2. In a screw-cutting machine, the combination, with the die-head, sliding sleeve, tail-carriage, and cam on the machine-spindle, of a sleeve-operating rod, a pivoted lever engaged by said sleeve-rod, and a lever-rod and connected mechanism, substantially as described, arranged to throw said lever into engagement with said cam, all substantially as and for the purpose set forth.

3. In a screw-cutting machine, the combination, with the die-head, sliding sleeve, and tail-carriage, of a sleeve-operating rod, a lever engaged by said sleeve-rod, a lever-rod arranged to throw said lever into engagement with the machine-mandrel, and a stop-latch, also operated by said lever-rod, all substantially as and for the purpose set forth.

4. In a screw-cutting machine, the combination, with the die-head, sliding sleeve, and tail-carriage, of the sleeve-operating rod and pivoted lever, a lever-rod arranged to throw said lever into engagement with the machine-spindle, a stop-latch operated by said lever-rod, and a spring arranged to move said sleeve-rod, all substantially as and for the purpose set forth.

5. In a screw-cutting machine, the combination, with the die-head, sliding sleeve, and tail-carriage, of a slotted tubular sleeve-operating rod with collars N', a pivoted lever engaging said collars, a lever-rod within said tubular rod provided with an adjustable lifter and attached to the carriage, and a cam on the machine-spindle, all arranged and adapted to operate substantially as set forth.

6. In a screw-cutting machine, the combination, with the die-head, sliding sleeve, and tail-carriage, of a slotted tubular sleeve-operating rod with collars N', a pivoted lever engaging said collars, a lever-rod within said tubular rod provided with an adjustable lifter and attached to the carriage, a cam on the machine-spindle, a spring arranged to move said sleeve-rod, and a stop-latch, all adapted to operate substantially as set forth.



7. In a screw-cutting machine, the combination, with the die-head, sliding sleeve, and tail-carriage, of a sleeve-operating rod with lever-collars N' and carriage-collar N^4, a pivoted lever, a lever-rod provided with an adjustable lifter and attached to the carriage, and a cam on the machine-spindle, all arranged and adapted to operate substantially as set forth.

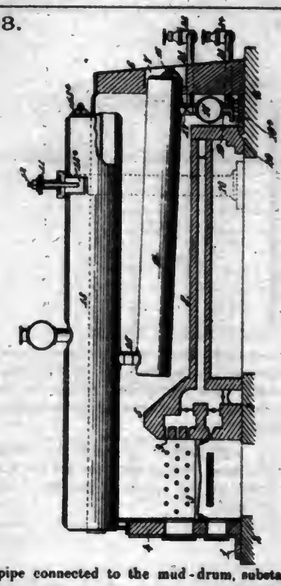
8. In a screw-cutting machine, the combination, with the die-head, sliding sleeve, sleeve-operating rod, and tail-carriage, of a spring adapted to press said carriage and rod in opposite directions, all arranged substantially as and for the purpose set forth.

9. In a screw-cutting machine, the combination, with the die-head, tail-stock, and carriage, of a spring located in said tail-stock and adapted to retract said carriage, substantially as set forth.

10. In a screw-cutting machine substantially as described, the combination, with the sleeve-operating rod, the lever engaging said rod, and the lever-rod attached to the carriage, of a lifter adjustably secured to said lever-rod and provided with a spring, all adapted to operate substantially as set forth.

401,602. STOP-PLATE FOR BUGGIES. R. HAYS STEWART and LOUIS D. CHAMBERS, Island, Pa. Filed Dec. 8, 1888. Serial No. 293,042. (No model.)

Claim.—The combination, with the recessed arm 1, having a shoulder and an open bearing on the same end, and the roller 7, provided with shouldered ends, of the recessed arm 2, provided with the shoulder 4, having its opening provided with an internally-disposed spring-pressed washer bearing against the end 17 of the roller 7, substantially as specified.



401,603. STEAM-BOILER. WILLIAM W. SUTCLIFFE, New Orleans, La. Filed Dec. 27, 1888. Serial No. 294,739. (No model.)

Claim.—1. The combination, with an inclosing furnace structure having a rear wall provided with a through-orifice, of a flue-boiler, an underhanging boiler connected at its forward end only with the flue-boiler, inclined downward in a rearward direction, and having its rear extremity extended back of the flue-boiler into the orifice in the rear furnace-wall and there provided with a man-hole accessible through said orifice, and a mud-drum located under and connected with the rear end of the underhanging boiler and adapted to slide or move on a supporting-base, substantially as described.

2. The combination, with an inclosing furnace structure having a fire-box, a bridge-wall, and a rear wall provided with a through-orifice, of a flue-boiler, an overhanging boiler connected at its forward end only with the flue-boiler behind the bridge-wall and having its rear extremity extended beyond the rear end of the flue-boiler into the orifice in the rear furnace-wall, and a mud-drum located under and connected with the rear end of the underhanging boiler and provided with a leg or shank loosely sustained by a supporting-base to permit the mud-drum to slide, substantially as described.

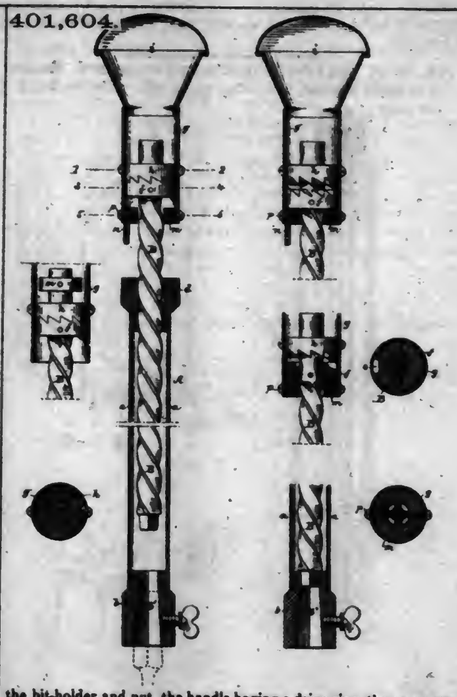
3. The combination, with an inclosing furnace structure having a rear wall provided with a through-orifice, of a flue-boiler supported at its front end by the front furnace-wall, supporting-columns having a beam or girder provided with pendent bolts by which the rear end of the flue-boiler is suspended, an underhanging boiler connected at its front end with the flue-boiler, and having its rear end extended beyond the rear end of the flue-boiler, and provided with a man-hole accessible through the orifice in the rear end of the underhanging boiler, and having a leg or shank resting on a supporting-base, and a feed-water pipe connected to the mud-drum, substantially as described.

401,603.

4. The combination, with an inclosing furnace structure having a rear wall provided with through-orifices, of a series of flue-boilers resting at their front ends on the front furnace-wall and suspended at their rear ends, a series of underhanging boilers connected at their front ends only with the flue-boilers and having their rear ends extended beyond the rear ends of the flue-boilers, and each provided with a man-hole accessible through one of the orifices in the rear furnace-wall, a mud-drum located transversely under the rear ends of the underhanging boilers and having connections therewith and provided with legs or shanks loosely sustained by a supporting-base, and a feed-water pipe connected to the mud-drum, substantially as described.

5. The combination, with an inclosing furnace structure having a rear wall provided with through-orifices, of flue-boilers, underhanging boilers connected, respectively, at their front ends only with the flue-boilers, inclining downward in a rearward direction, and having their rear ends extended back of the rear ends of the flue-boilers and provided with man-holes accessible through the orifices in the rear furnace-wall, a mud-drum located transversely under and connected with the rear ends of the underhanging boilers and provided with a leg or shank loosely sustained by a supporting-base, a feed-water pipe communicating with the upper portion of the mud-drum, and a blow-off pipe communicating with the lower portion of the mud-drum, substantially as described.

6. The combination, with a furnace structure, of a main boiler, an underhanging boiler connected at its front end to the main boiler and having its rear extremity extended beyond the rear end of the main boiler and provided with a man-hole, a mud-drum located under and connected with the rear end of the underhanging boiler, a rolling expansion support for the mud-drum, and a feed-water pipe communicating with the upper portion of the mud-drum, substantially as described.



7. The combination of a furnace structure, a main boiler resting on the front furnace-wall, the columns having a girder provided with pendent bolts by which the rear end of the main boiler is suspended, an underhanging boiler connected at its front end with the main boiler, a mud-drum located under and connected with the rear end of the underhanging boiler, and a rolling expansion support for the mud-drum, substantially as described.

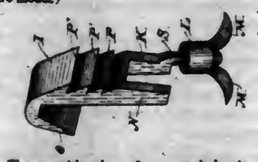
8. The combination of a furnace structure, a main boiler, the columns having a girder provided with pendent bolts by which the rear end of the main boiler is suspended, an underhanging boiler connected at its front end with the main boiler, a mud-drum located under and connected with the rear end of the underhanging boiler, a rolling expansion support for the mud-drum, and a feed-water pipe communicating with the lower portion of the mud-drum, substantially as described.

401,604. BRACE. GILBERT T. SUTTERLEY, Philadelphia, Pa. Filed Nov. 12, 1888. Serial No. 290,577. (No model.)

Claim.—1. The combination of the shank of the brace having

401,604.

the bit-holder and nut, the handle having a drive-ring, the screw-stem having a driving-collar for engagement with said ring, and a stop-ring for limiting the longitudinal movement of the handle on the stem, all substantially as specified.



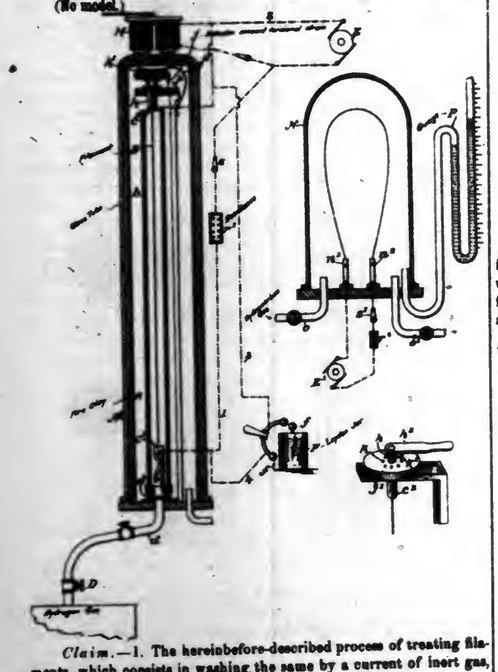
2. The combination of the shank having a bit-holder and nut, the screw-stem engaging with the nut and having a driving-collar at the upper end, and the handle having an internal drive-ring and stop-ring, one above and the other below the driving-collar on the stem, all substantially as specified.

3. The combination of the shank having a bit-holder and nut, the screw-stem engaging with said nut, a driving-collar, a drive-ring and a stop-ring, and the handle comprising the hollow spun head, and a tube containing and inclosing said rings and collar, all substantially as specified.

4. The combination of the shank of the implement having a bit-holder and nut, with the screw-stem engaging with said nut and having its lower end formed for engagement with an opening in the bit-holder, all substantially as specified.

5. The combination of the shank having a bit-holder and nut, the screw-stem engaging with the nut and having a driving-collar, and the loose handle having a drive-ring and stop-ring, and a locking-bolt for securing the handle to the driving-collar independently of the drive-ring, all substantially as specified.

401,605. PIPE-GRIPPING ATTACHMENT FOR WRENCHES. CHARLES H. THOMAS, Hancock, Wis. Filed Dec. 14, 1888. Serial No. 293,606. (No model.)



Claim.—1. The combination of a wrench having a shank, B, a fixed jaw, D, and traveling jaw E, with a removable plate, I, said plate being provided with a hook, O, downwardly-turned teeth P P' P'', a long screw-threaded tang, K, and a short tang, N, and a thumb-nut, L, turning on the screw-threaded tang K against shank B, all substantially as and for the purpose described.

2. The combination of a wrench having a shank, B, a fixed jaw, D, a head, C, and a traveling jaw, E, with a removable plate, I, having a hook, O, a series of downwardly-projecting teeth, P P' P'', a long screw-threaded tang, K, a short tang, N, and a shoulder, S, and a thumb-nut, L, the inner tooth, P, being the shortest one and each

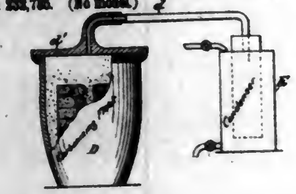
outer tooth being longer than the next inner tooth, all substantially as described.

401,606. MANUFACTURE OF CARBON FILAMENTS. EDWARD P. THOMPSON, Elizabeth, N. J. Filed Feb. 4, 1887. Serial No. 226,585. (No model.)

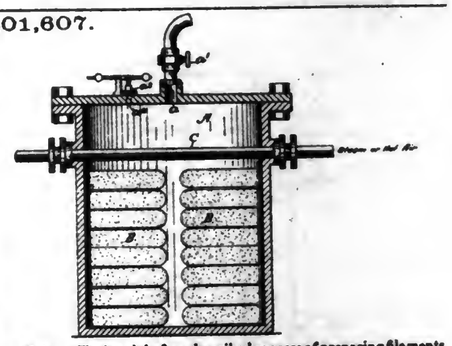
Claim.—1. The hereinbefore-described process of treating filaments, which consists in washing the same by a current of inert gas, heating the filament while being so washed, and in sending a static charge to said filament while being so washed.

2. The hereinbefore-described process of treating filaments, which consists in removing the loose particles of carbon from the filament by a static charge of electricity and in building up the filament by a deposit of carbon upon the filament, substantially as described.

3. The hereinbefore-described process of treating filaments, which consists in washing the filament by an inert gas, heating the filament to incandescence while being so washed, throwing off the loose particles by one or more static charges, and in subsequently building up the filament by a deposit of carbon.



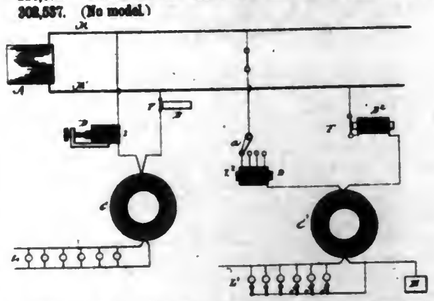
4. The hereinbefore-described process of treating filaments, which consists in washing them with gas while incandescent, subsequently placing them under torsion, and breaking them while under torsion



5. The hereinbefore-described process of treating filaments, which consists in washing them with gas while incandescent, subsequently placing them under torsion, and in heating them by an increased current until they break.

6. In an apparatus for treating filaments for incandescent electric lamps, the combination, with an inclosing-case, of clamps for supporting the filament, a revolving support for one of the clamps, an armature carried thereby, and an electro-magnet outside of said case for revolving the armature.

7. In an apparatus for treating filaments for incandescent electric lamps, the combination, with an inclosing-case, of clamps for supporting the filament, a revolving support for one of the clamps, an armature carried thereby, an electro-magnet outside of said case for revolving the armature, and a spring acting in opposition to the longitudinal pull of said electro-magnet.



401,607. MANUFACTURE OF INCANDESCING CARBON FILAMENTS. EDWARD P. THOMPSON, Elizabeth, N. J. Filed Mar. 28, 1887. Serial No. 232,795. (No model.)

Claim.—The hereinbefore-described process of preparing filaments for incandescent electric lamps, which consists in winding the filaments upon carbon blocks, displacing the occluded gases in the blocks and filaments, filling the pores of the blocks and filaments with an inert fluid, and carbonizing the filaments.

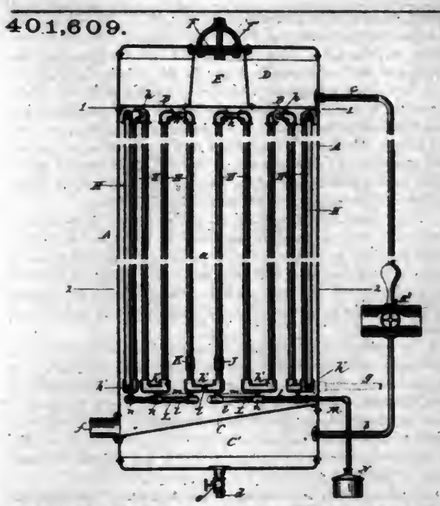
401,608. DISTRIBUTION OF ELECTRIC CURRENTS. ELIHU THOMSON, Lynn, Mass. Original application filed Dec. 6, 1886, Serial No. 220,850. Divided and this application filed Mar. 8, 1889. Serial No. 302,537. (No model.)

Claim.—1. The combination, in a system of electric distribution, of a main or principal circuit, a local or independent circuit, interposed apparatus for transforming the electric energy in the main into electric energy in the local without contact between the circuits, a fusible plug or safety-strip in the connection from the main to said apparatus, and means, as described, for rupturing an arc at the fusible plug, as and for the purpose described.

2. The combination, in a system of electric distribution, of a main or principal circuit, local independent circuits, induction apparatus interposed between the local circuits and the main, and fed in multiple arc from the latter, fusible plugs or safety-strips in the multiple-arc connection, and arc-rupturing devices for said strips or plugs, as and for the purpose described.

3. In an alternating or rapidly-varying current system in which induction-coils are used, the combination of primaries fed in multiple from the mains, secondary circuits feeding local lighting or other devices, a fusible plug in the primary circuit, and means of rupturing an arc thereat, as described.

4. The combination, with a safety strip or fuse in a system of electric distribution, of an arc-rupturing device, substantially as described.



5. The combination, with a safety strip or wire fusible by excess of current, of a magnet whose pole or poles are in proximity to said strip or wire.

401,609. APPARATUS FOR TREATING VEGETABLE SUBSTANCES. JOHN D. TOMPKINS, Brainard, assignor to the Tompkins Paper Stock Company, Albany, N. Y. Filed Feb. 9, 1888. Serial No. 263,502. (No model.)

Claim.—1. In apparatus for making paper-stock, the combination, with a digester, of a circular series of vertically-arranged pipes extending the entire length of the digesting-chamber and arranged in pairs a short distance from the interior walls thereof, the neighboring pipes of the several pairs being connected at their lower ends by couplings, and the pairs at their upper ends, as described, a plug in one of the lower couplings, and the live-steam inlet and bent pipes connected with the adjoining pipes, separated by the plug *i*, substantially as described.

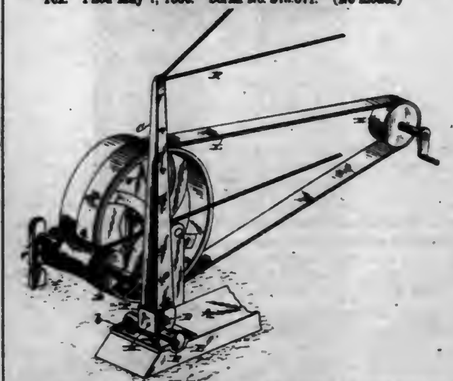
2. The combination, with the digesting-chamber, of the circular series of pipes connected above in pairs, the couplings *k'*, connecting the neighboring pipes of the adjoining pairs below, the plug *i* in one

401,609.

of the couplings *k'*, the inlet and bent pipes J K, a circular condensed-steam pipe connected with the couplings *k'*, and a pipe, M, connected with said condensed-steam pipe for carrying off the water of condensation.

401,610. APPARATUS FOR TREATING VEGETABLE SUBSTANCES. JOHN D. TOMPKINS, Brainard, assignor to the Tompkins Paper Stock Company, Albany, N. Y. Filed Feb. 9, 1888. Serial No. 263,503. (No model.)

Claim.—1, In an apparatus for treating vegetable substances for making paper-stock, the combination, with the digesting-vessel and a liquor-circulating pump, of a series of perforated chambered rings which are at intervals apart within the upper portion of the digesting-chamber and neighboring the wall of the same, and a corresponding series of branch pipes leading from a main pipe connecting with the inlet of the pump to said perforated rings, and a main circulating-pipe which leads from or is connected with the outlet of the pump and the lower end of the digester, substantially as and for the purposes set forth.



2. The combination, with the digesting-vessel and the two systems of liquor-circulating pipes, of a single pump having at its inlet a two-way valve and at its outlet a similar valve, these valves being operated at will and effecting within the digesting-chamber alternating upward and downward circulation of the cooking-liquor through the body of the material being treated, substantially as and for the purposes set forth.

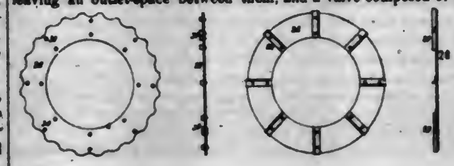
3. The combination, with the digesting-vessel and a single pump, of two systems of liquor-circulating pipes, one connecting with the upper portion of the digesting-vessel and the other with the lower portion of the same, a two-way valve between each system of said pipes and the pump and which can be operated at will, and a heating-coil between the said pump and one of the two-way valves, whereby the pump, revolving in one direction, will force the water continuously through the heating-coil in one direction to be introduced into the digesting-vessel from below or from above and the reverse at will, substantially as and for the purposes set forth.

4. The combination, with the digesting-vessel and a single pump operating between the two main pipes, which connect, respectively, with the opposite ends of the said vessel, of the two-way valves L L', respectively, between said main pipes and the pump, and pipes N and M, substantially as and for the purposes and operations set forth.

5. The combination, with the digesting-vessel and the coiled pipe contained within the steam heating-drum, of the two sets of liquid-circulating pipes connected each with an opposite end of the said vessel, a single pump between said coiled pipe and one of said sets of pipes, the two-way valve L_1 connecting both sets of pipes with the inlet of the pump, and the two-way valve L', connecting said two sets of pipes with the coiled pipe, all substantially as and for the purposes set forth.

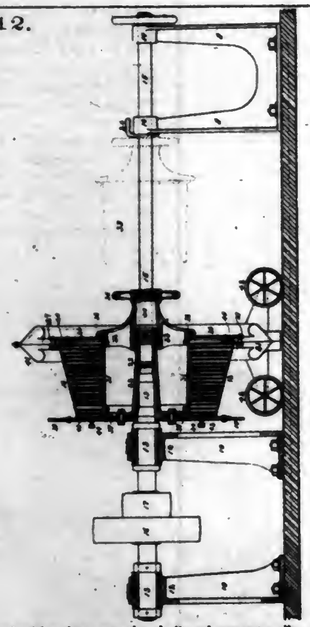
401,611. FOOT FOR SAND-LEVERS. CHARLES VEHE, Denison, Tex. Filed May 7, 1888. Serial No. 273,071. (No model.)

Claim.—In a foot or casting for sand-levers, the combination of the semi-cylindrical bearing having an aperture formed in its center, a cylindrical body working in the said bearing and having a square intermediate portion adapted to fit in the said aperture, upward-extending wings made integral with the body and forming a socket, and a lever fitting in the said socket, substantially as described.



401,612. APPARATUS FOR MOLDING AND REFINING SUGAR. HUGH W. WALKER and THOMAS L. PATTERSON, Greenock, County of Renfrew, Scotland. Filed Feb. 4, 1888. Serial No. 263,011. (No model.) Patented in England Mar. 24, 1887, No. 4,307; in France Dec. 31, 1887, No. 187,910; in Belgium Dec. 31, 1887, No. 80,143; in Germany Jan. 9, 1888, No. 44,747; in Canada Mar. 1, 1888, No. 26,505, and in Austria-Hungary May 13, 1888, No. 3,062 and No. 13,025.

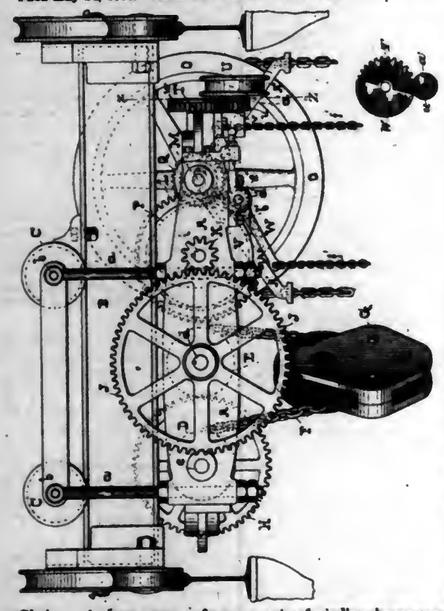
Claim.—1. Apparatus for molding and refining sugar, comprising, in combination, a driving-shaft, a mold in the form of a truncated cone and carried by the shaft, with an imperforate circumferential shell, an annular cover which is carried by the shell and through the center of which the mold can be charged, the mold having a circumferential outlet closed when charging and open when draining or drying, and a central cover and inner shell, substantially as set forth.



2. The combination of a rotary mold having an imperforate shell with a number of flat annular plates at right angles to the axis of the mold and having distance projections to keep them apart, and having passages between their outer edges and the inner face of the shell for the escape of the sirup, substantially as set forth.

3. The combination of a rotary sugar-mold having an imperforate circumferential shell and dividing-plates, leaving spaces between the edges of the plates and the shell, with an annular cover having an outlet between it and the edge of the shell and a valve in the said outlet, substantially as herein set forth.

4. A rotary sugar-mold having an imperforate shell and cover, leaving an outlet-space between them, and a valve composed of an



401,612.

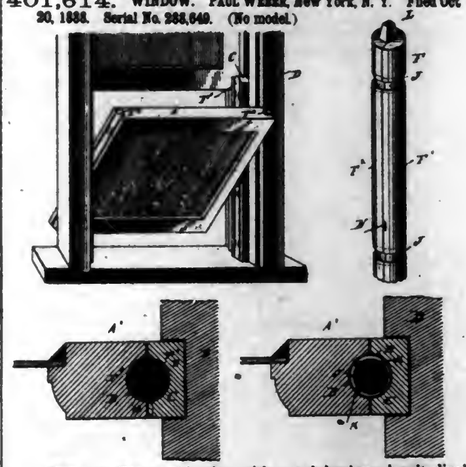
annular lip of rubber between the shell and cover to allow the escape of liquid when the machine is in operation, substantially is set forth.

401,613. TRAVELING CRANE. JOHN WALKER, Cleveland, Ohio. Filed May 24, 1888. Serial No. 274,940. (No model.)

Claim.—1. In a crane, a frame, a pair of winding-drums connected by a lifting-chain arranged to wind or unwind at different speeds, and gearing to effect this movement, the said drums having chain-grooves of different pitches, whereby the pulley-block suspended by the said chain maintains a central position during the lifting and lowering operations, substantially as and for the purpose specified.

2. In a crane, a frame, a pair of winding-drums of a common diameter having chain-grooves of different pitches, as described, combined with gearing whereby the said drums are revolved at different speeds, and a lifting-chain the ends of which are connected to the said drums, substantially as and for the purpose specified.

3. In a crane, a longitudinally-moving hoisting-shaft and sleeves in which the said shaft is confined endwise, and which are adapted to have a longitudinal motion only in the frame carrying the same, whereby the bearings or journals of the said shaft are protected from the action of dust, substantially as and for the purpose specified.



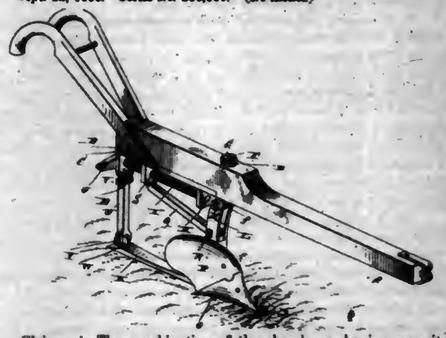
4. In a crane, a longitudinally-moving hoisting-shaft and sleeves in which the said shaft is confined endwise, and which are adapted to have a longitudinal motion only in the frame carrying the same, combined with a crank the pin of which rests in a groove in the said sleeve, whereby the said sleeve and its contained shaft may be moved endwise to change the speed of the hoisting mechanism or to detach the same, substantially as and for the purpose specified.

5. In a crane, a hoisting-shaft, a sleeve on the said shaft carrying a claw, and a crank adapted to move the said sleeve and shaft in an endwise direction to change the speed of the hoisting mechanism or detach the same, combined with a shaft carrying wards which in one position lock the said claw and in another release the same, and thereby allow of the endwise motion aforesaid, substantially as and for the purpose specified.

6. In a crane, a hoisting-shaft, a sleeve on the said shaft carrying a claw, and a crank adapted to move the said sleeve and shaft in an endwise direction to change the speed of the hoisting mechanism or detach the same, combined with a shaft carrying wards, by means of which the said claw may be locked and unlocked, and a brake-shoe adapted to control the rotation of a shaft comprised in the hoisting mechanism, whereby in the unlocking of the said claw the brake is applied, substantially as and for the purpose specified.

7. In a crane, the combination of the crank-shaft S, carrying the gear T, having the semicircular flange *w*, the shaft *v*, carrying the pinion *u*, with the flange *d'* and the chain-pulley U, substantially as and for the purpose specified.

401,614. WINDOW. PAUL WEBER, New York, N. Y. Filed Oct 20, 1888. Serial No. 288,649. (No model.)



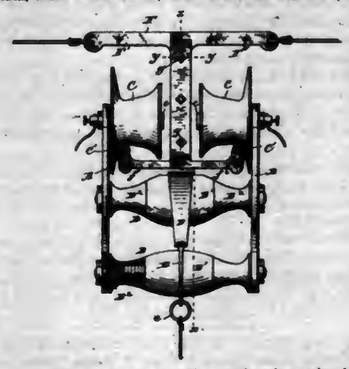
Claim.—1. The combination, with a sash having a longitudinal semicircular groove in the outer edge of each side bar, of sliding rails in the window-frame having longitudinal semicircular grooves in the edge adjacent to the side edges of the sash, and a split key-rod mounted to turn in said grooves, substantially as set forth.

2. The combination, with a sash having a longitudinal groove in the outer edge of each side bar, of sliding rails in the window-frame, each having a longitudinal semicircular groove in that edge adjacent to the side edge of the sash, a split key-rod in the two adjacent grooves of the sash and rail, and guide-pins projecting from said grooves into the grooves in the key-rod, substantially as set forth.

3. The combination, with a sash having a longitudinal semicircular groove in the outer edge of each side bar, of sliding rails in the window-frame, each having a longitudinal semicircular groove in that edge adjacent to an edge of the sash, a key-rod composed of two semi-cylindrical sections in each pair of grooves at each side of the sash, pins passing from the grooves in the sash and sliding rail into grooves in the semi-cylindrical sections of the key-rod, and a pin or pivot on each key-rod section in the sash, which pins can pass into grooves in the key-rod sections in the grooves of the sliding rails, substantially as set forth.

4. The combination, with sliding rails and a sash having longitudinal grooves in each side edge, between which rails the sash can swing, of a split key-rod composed of two semi cylindrical sections, which key-rod is placed in grooves formed in the sash and rails, each key-rod being provided at its upper ends with a head countersunk in the top of the sash, substantially as set forth.

401,615. PLOW. JOSEPH W. WEBSTER, Little Rock, S. C. Filed Sept. 22, 1888. Serial No. 286,066. (No model.)



Claim.—1. The combination of the plow-beam having upon its rear end an under-cut, the metallic plate having downwardly-bent rear portion, said portion being provided with a smooth bore and terminating in a reduced bifurcated part, the perforated lug or shoulder depending from said metallic plate, the adjusting-screw having reduced smooth ends, the rear end thereof being provided with a handle, the bolt having flat lower end, the standard-bar pivotally secured to the flat-headed bolt, the arm pivoted to the standard and having a screw-threaded perforation in its upper end, through which the adjusting-screw passes, the pivoted rear arm, the shoe pivotally secured at each of its ends to the rear arm and lower end of the standard-bar, respectively, and the plowshare, substantially as set forth.

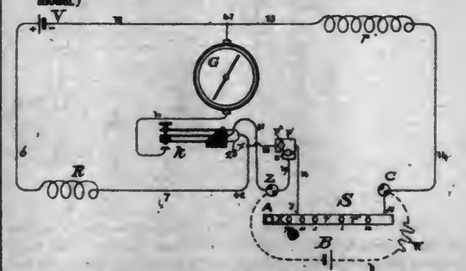
2. The combination, with the standard provided with a series of perforations and having an upper bifurcated portion and formed or provided with a lower bearing-surface or breast-piece, said bearing-surface having its inner edge provided with a triangular-shaped notch, of the plowshare secured to said bearing-surface or breast-piece and formed or provided on its inner edge with a shoulder adapted to fit in said triangular-shaped notch, and the mold-board, substantially as set forth.

3. The combination, with the plow, of the standard provided with a series of perforations and having upper bifurcated portion and formed or provided with a lower bearing-surface or breast-piece, said bearing-surface having its lower inner edge provided with a triangular-shaped notch, the plowshare formed or provided on its inner edge with a notch, and on its upper edge with a recess, and the mold-board provided on its lower edge with a curved lug or projection adapted to fit in the recess of the plowshare, substantially as set forth.

401,616. SYSTEM OF ELECTRIC LOCOMOTION. FRANK WHEELER, Meriden, Conn. Filed Jan. 14, 1889. Serial No. 296,301. (No model.)

Claim.—1. The combination, with two electric conducting-wires, of a trolley having its contact-rollers supported from the outside of said wires, substantially as described.

2. The combination, with two electric conducting-wires, of supports therefor, the arms of said supports extending from the center outward, and a trolley having its contact-rollers supported from the outside of said wires, substantially as described.



3. A trolley having a frame carrying inwardly-projecting axles for the contact-rollers and two braces connecting the sides of the frame and consisting of insulating-blocks with metallic end thimbles, substantially as described.

4. In combination with two electric conducting-wires and the supporting-brackets therefor, a trolley having an arch-shaped guide for guiding the said trolley when passing a conductor-bracket, substantially as described.

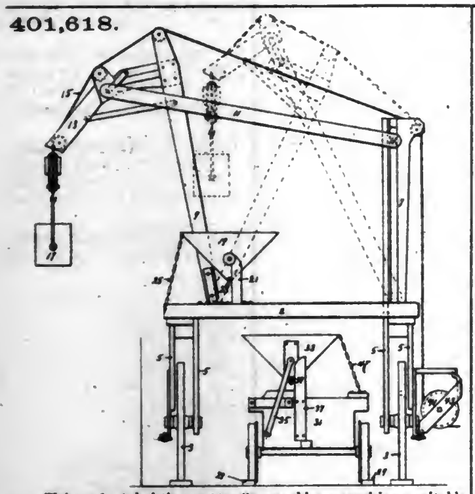
5. In combination with a two-wheeled trolley and a draft-cord for connecting it with a car, an intermediate connection between the cord and the trolley-frame extending to the front or rear of the said frame for steadying the trolley while being drawn in either direction, substantially as described.

6. A bracket for electric conducting-wires, consisting of two metallic pieces connected by bolts or rivets passing through enlarged holes therein and through insulating material, the said metallic pieces being rabbeted to partially receive the insulating material, substantially as described.

401,617. ELECTRICAL MEASUREMENT APPARATUS. ANTHONY C. WHITE, Boston, Mass. Filed Nov. 21, 1888. Serial No. 291,446. (No model.)

Claim.—1. An ammeter consisting of the combination, in a single instrument, of a direct-reading voltmeter and an adjustable shunt therefor having a series of resistances arranged in geometrical progression in the ratio of ten, and provided with circuit-changers for introducing any of the said resistances into circuit at will, the said shunt being connected or adapted to be connected across the voltmeter-terminals, whereby the reading of the voltmeter may be caused to indicate also the current strength in ampères, substantially as hereinbefore described.

2. The combination, in an electrical measurement apparatus, of a direct-reading voltmeter consisting of a test-circuit, a galvanometer in a bridge thereof dividing the said circuit into two divisions, a standard battery and fixed resistance in one division, and in the other a variable resistance, and terminals for connection of a generator or circuit to be tested in such manner that its current will pass through the galvanometer in a direction opposing that of the standard battery, and means for closing the circuit of both generator and galvanometer when a test is to be made, with an adjustable shunt connecting the said terminals of the generator or circuit to be tested and containing a series of resistances, either of which may at will be introduced, the said resistances being, respectively, unity and values in decreasing and increasing geometrical progression therefrom in the ratio of ten, whereby the reading of the voltmeter may be caused to indicate also the strength of current, substantially as herein specified.



3. The combination, substantially as hereinbefore described, of a direct-acting voltmeter adapted for the measurement of low electromotive forces, an ammeter attachment therefor, whereby the readings of the voltmeter may be caused to indicate the value of the current strength also in direct terms, the said ammeter attachment comprising a resistance or series of resistances with a value of unity, or unity multiplied or divided by ten or powers of ten, shunting the said voltmeter, and a supplementary voltmeter attachment formed, as described herein, and connected with the ammeter, whereby high and low electro-motive forces may be measured with the same instrument.

4. In an electrical measurement apparatus, the combination of two independent resistances in series with one another, one of which is small and the other comparatively great, and the sum of which shall equal ten or some larger number in geometrical series therewith having ten for its ratio, and terminals for the attachment of a generator or appliance to be tested, with a direct-reading voltmeter looped round the smaller resistance, substantially as described.

5. In an electrical measurement apparatus, the combination of a direct-reading voltmeter, an adjustable shunt therefor containing a series of resistances in geometrical progression with the number ten for a ratio, an additional circuit-terminal electrically connected with the said shunt-circuit, and a high resistance included between the said shunt and the said extra terminal, the said high resistance having such a value that when added to a determined one of the shunt-resistances the sum shall be one thousand ohms, or a greater or less number in the same geometrical progression and having the same ratio.

401,618. HOISTING AND LOADING MACHINE. DAVID S. WHITE, Minneapolis, Minn. Filed May 3, 1887. Serial No. 236,930. (No model.)

401,618.

Claim.—1. A hoisting and loading machine comprising a suitable carriage constructed with depending standards having a clear space between them adapted to permit a car to be passed beneath the carriage, standards fixed upon said carriage, a receptacle pivoted in said standards and adapted to dump its contents into a car beneath said carriage, and a hoisting apparatus mounted on said carriage and adapted to raise material and deposit it in said receptacle, substantially as described.

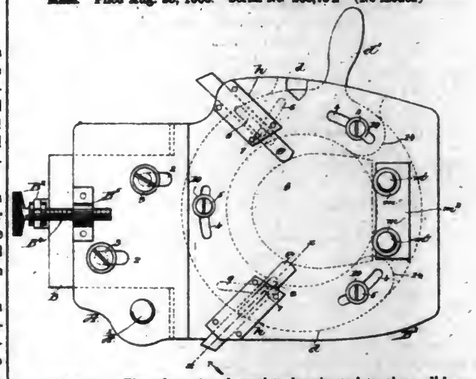
2. The combination, in a machine of the class described, of a suitable carriage constructed with depending standards having a clear space between them adapted to permit a car to be passed beneath the carriage, standards fixed upon said carriage, and a receptacle pivoted in said standards and adapted to dump its contents into a car beneath the carriage, substantially as described.

3. The combination, with a suitable carriage constructed with depending standards and adapted to permit a car to be passed beneath it and between said standards, of standards fixed upon said carriage, a receptacle, 19, pivoted in said standards and arranged to dump its contents into a car beneath said carriage, a hoisting-bucket, and a hoisting apparatus adapted to raise said bucket and carry it over said receptacle 19, substantially as described.

4. The combination, with the carriage 2, constructed with depending standards and adapted to permit a car to be passed beneath said carriage and between said standards, of the standards 21, mounted thereon, and a receptacle, 19, pivoted in said standards and adapted to dump its contents into a car beneath said carriage, substantially as described.

5. The combination, with a suitable carriage constructed to permit a car to be passed beneath it, of a box or receptacle pivoted in standards upon said carriage and provided with stops 23, that strike against the standards and limit the movement of the box in one direction, and a locking device adapted to hold said box in its filling position.

6. The combination, in a machine of the class described, with the carriage provided with depending standards at each side and having a clear space between said standards, through which a car may be passed, and supporting-wheels mounted upon axles in said standards, of a hoisting apparatus mounted on said carriage and adapted to overhang one side of the carriage, and a receptacle mounted upon said carriage and adapted to receive material from said hoisting apparatus and to hold it and to be dumped at will to deposit said material in a car beneath said carriage.



7. The combination, with the carriage 2, constructed to permit a car to be passed beneath it, of the standards 21, having the offset portions at their upper ends, the hopper-shaped receptacle 19, pivoted in said offset portions of said standards and provided with the stops 23, adapted to encounter said standards when the box is in filling position, and a securing device for holding said receptacle in such position.

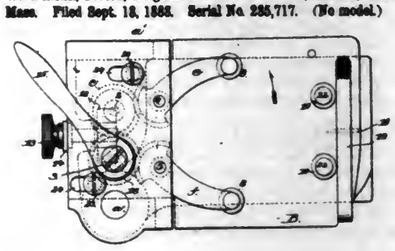
8. The combination, with a carriage constructed to permit a car to be passed beneath it, of a standard, as 7, secured to the carriage near one side thereof, a movable block adapted to overhang the opposite side of the carriage, a support secured upon the carriage and constructed to permit said block to be drawn back to a position over the carriage, a hoisting-bucket, a hoisting rope or chain passing over sheaves on said movable block and over a sheave on said standard, standards 21 on said carriage, and a receptacle pivoted in said standards and adapted to receive material from said bucket and to dump its contents into a car beneath the carriage.

9. A hoisting and loading machine comprising a carriage constructed with depending wheeled standards having a clear space between them adapted to permit a car to be passed longitudinally beneath the carriage, a fixed standard, as 7, secured upon the carriage, a hoisting apparatus mounted and supported upon said carriage and provided with a movable block adapted to overhang one side of the carriage, a hoisting-bucket and a rope or chain passing from said bucket over said movable block and over a sheave on said standard, a receptacle on said carriage between said standard and the opposite side of the carriage, and a car adapted to pass beneath said carriage and receive material from said receptacle, substantially as described.

10. A hoisting and loading apparatus comprising a suitable carriage constructed to permit a car to be passed beneath it, a hoisting mechanism on said carriage adapted to raise material and carry it to a point over said carriage, standards fixed upon said carriage, a hopper pivoted in said standards and adapted to receive material from said hoisting mechanism and dump it beneath said carriage, and a car adapted to pass beneath said carriage and receive material from said receptacle, substantially as described.

401,619. TOP-LIFT CARRIER FOR HEELING-MACHINES. HENRY W. WEBSTER, Boston, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Aug. 25, 1888. Serial No. 283,734. (No model.)

Claim.—1. The plate A, adapted to be pivoted to the nail-box, and the connected plate B', combined with sliding fingers to act against the edges of the top lift, and with the adjusting-plate to move the said fingers longitudinally, substantially as described.



2. The plate A, adapted to be pivoted to the nail-box, and the connected plate B', combined with sliding fingers to act against the edges of the top lift, and with the adjusting-plate to move the said fingers longitudinally, and with the stops for the breast end of the heel, substantially as described.

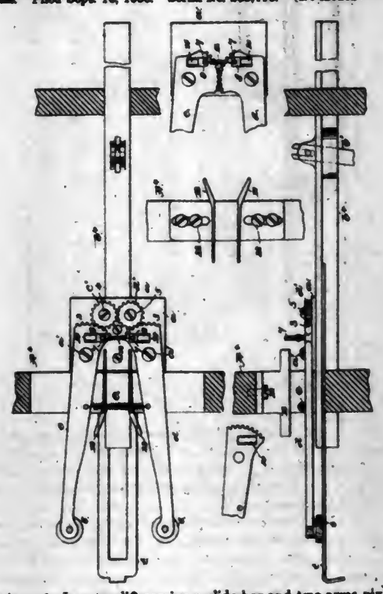
3. The nail-box, the pivoted plate A, the plate B', carried by the said pivoted plate, means, substantially as described, to adjust the plate B' longitudinally, and the guides *h*, combined with the sliding fingers and the adjusting-plate to actuate them, substantially as described.

4. The nail-box, the pivoted plate A, combined with the top-lift plate B', fitted to slide in the plate A, and with a screw to adjust the plate B longitudinally with relation to the pivoted plate A, substantially as described.

5. The nail-box, the plate A, pivoted to it, and the plate B and screw to adjust it longitudinally with relation to the said pivoted plate, substantially as described, combined with the breast-gage attached to the top-lift plate for the breast of the top lift and movable in unison with the said plate B, substantially as described.

401,620. TOP-LIFT HOLDER FOR HEELING-MACHINES. HENRY W. WEBSTER, Boston, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Sept. 18, 1888. Serial No. 285,717. (No model.)

401,620.



Claim.—1. The top-lift or swinging plate and plate *a'*, and arms having teeth, and gears engaging the said teeth, combined with a friction device to retain the said arms in adjusted position, substantially as described.

2. The top-lift plate B, the plate *a'*, nail-box, pivot *a*, and gears *c d* and arms *e f*, combined with gages, as 10, on the plate B, to act against the breast of the heel, substantially as described.

3. The nail-box and the top-lift plate above it adapted to swing about a pivot, combined with the horizontally-arranged latch pivoted upon and movable with the plate B about the said pivot, substantially as described.

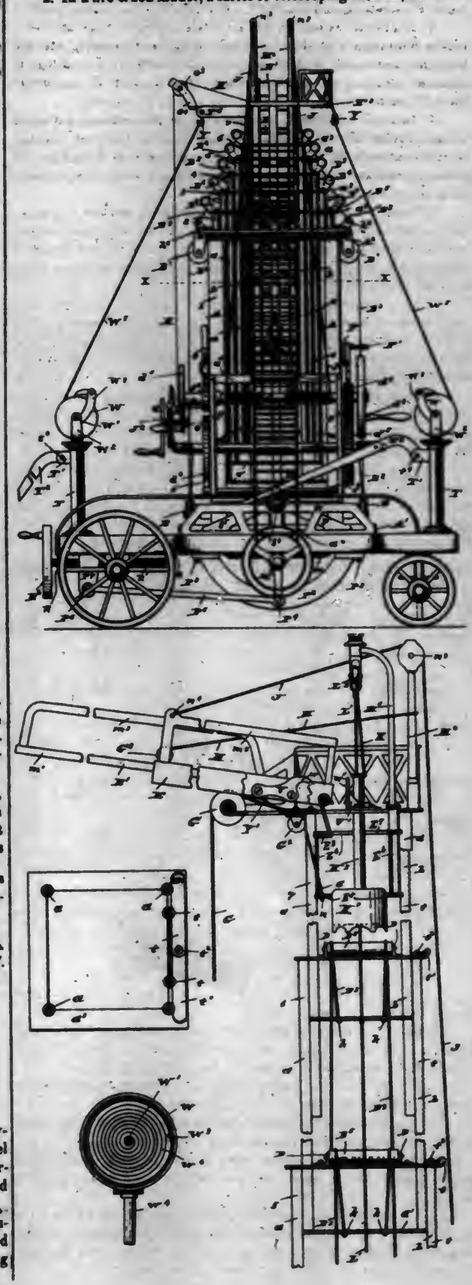
401,621. TOP-LIFT HOLDER FOR HEELING-MACHINES. HENRY W. WEBSTER, Boston, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Sept. 18, 1888. Serial No. 285,718. (No model.)

Claim.—1. In a top-lift carrier, a slide-bar and two arms pivoted thereon and provided with gear-teeth and geared together, substantially as described, combined with arm-spreading devices to turn the said arms, the said teeth insuring the movement of the said arms together in opposite directions positively for like distances, substantially as described.

2. The pivoted arms *c d*, provided with teeth and geared together, the spring *e*, and the sliding spring-connected studs 7, combined with the arm-spreading devices, co-operating with the said studs to effect the opening of the jaws as they are being retracted, substantially as described.

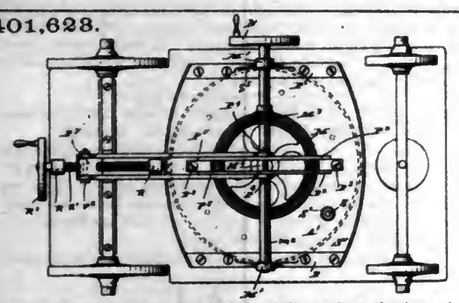
3. In a heel-nailing machine, the pivoted arms having teeth, as 2 3, combined with the gears *c d*, engaging the said teeth and engaged each with the other, substantially as described.

401,622. INSECT-DESTROYING SYRINGE. FREDERICK L. ZITSCHER, New York, N. Y. Filed Feb. 6, 1889. Serial No. 299,887. (No model.)



Claim.—1. The combination, with a sheet-metal screw-cap having a supply-opening in its top part, of a syringe on said cap, the barrel of which communicates with the opening in the cap, and a nozzle arranged at right angles to the barrel of the syringe at the delivery end of the same, substantially as set forth.

2. The combination, with a receptacle for insect-destroying solution, of a screw-cap for closing said vessel, a syringe-barrel arranged on the top of the cap, said barrel communicating through an opening in the cap with the interior of the vessel, a piston guided in said barrel and provided with a piston-rod having a ring-shaped handle, and a nozzle arranged at right angles to the barrel at the delivery end of the same, substantially as set forth.



401,623. FIRE-TRUCK LADDER. CHARLES ALBERT, Cincinnati, Ohio. Filed Feb. 13, 1888. Serial No. 264,474. (No model.)

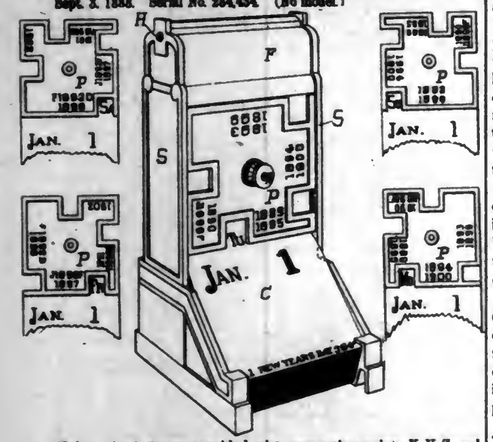
Claim.—1. In a fire-truck ladder, a series of telescoping sections, the lower section being attached to a movable platform, rollers B^3, cross-pieces B^4, ropes and winding mechanism, substantially as set forth, for elevating said sections, and mechanism for revolving said sections, consisting of shaft M^2 and gear-wheels M and M^3, and suitably supported, substantially as set forth.

2. In a fire-truck ladder, a series of telescoping sections, the lower

401,628.

section being attached to the platform of the truck, mechanism, substantially as set forth, for raising and lowering said sections, and mechanism for inclining said sections, consisting of arms P^3 P^3, rods P^5 P^5, block P^7, screw R, and wheel R^2, substantially as set forth.

3. In a fire-truck ladder, a series of telescoping sections, and mechanism, substantially as described, for raising and lowering said sections, in combination with revolving corner-posts, as T, and legs T^3, pivotally attached to said posts T and revolving with them, substantially as set forth.



4. In a fire-truck ladder, a series of telescoping sections, and mechanism, substantially as set forth, for raising and lowering said sections, in combination with guide-ropes, as W^3, and drums W, said drums W automatically winding up the guide-ropes when the sections are being lowered, substantially as set forth.

5. In a fire-truck ladder, a series of telescoping sections, and mechanism, substantially as described, for raising and lowering said sections, each of said sections having a ladder notched at *t*, in combination with plates, as *t'*, pivoted on the top plates of each section, substantially as set forth.

6. In a fire-truck ladder, a series of telescoping sections, and mechanism for raising and lowering said sections, said sections being united at the top by top plates, a^2, having cross-rods B^4, and rollers B^5, and bottom plates, *a'*, and ropes B^3, substantially as set forth.

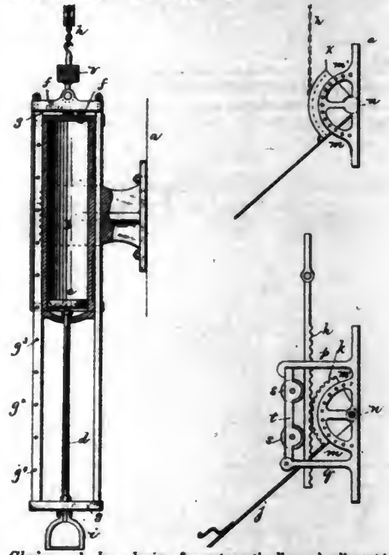
7. In a fire-truck ladder, a series of telescoping sections, and mechanism, substantially as described, for raising and lowering said sections, in combination with auxiliary ladders E E', ladder E, having pulley G^2, and rope H, suitably connected at one end to ladder E' and at the other end to uprights H^2, substantially as set forth.

401,624. CALENDAR. SAMUEL W. BALCH, Yonkers, N. Y. Filed Sept. 3, 1888. Serial No. 284,434. (No model.)

Claim.—1. A frame provided with supporting-points X Y Z and a pocket in its upper portion, in combination with a calendar bound in book form, substantially as and for the purpose set forth.

2. In a calendar, the combination of a frame and movable plate having notches in its edge, for the purpose set forth.

3. The combination of the side frames, S S, the supporting-points X Y Z, and hinged front F, substantially as described.



4. The combination of the book C, the supports X Y Z, the hinged front F, and a pocket, substantially as and for the purpose set forth.

5. In a calendar, the combination of a page having all the days of the week, a month, and a day of the month printed upon it with an adjustable plate to designate on which day of the week the date falls and the year for which it is correct, as set forth.

6. A calendar bound together in book form having the days printed on both sides of each leaf and arranged so that successive days will appear on the corresponding sides of successive leaves, substantially as described.

7. A calendar in which all the days of the week are repeated with each day of the month and arranged so that successive days of the week appear in the same relative position with successive days of the month, for the purpose set forth.

401,625. DEVICE FOR OPERATING DAMPERS FOR FIRE-PLACES, &c. AXEL V. BAY, Nakskov, Denmark. Filed Jan. 30, 1888. Serial No. 262,311. (No model.)

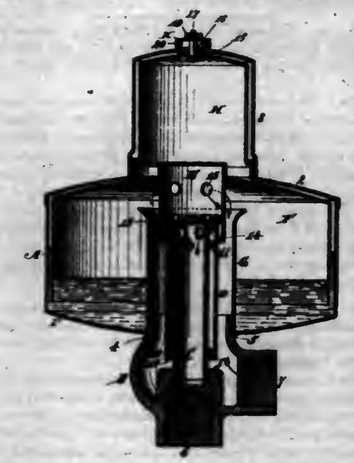
Claim.—1. In a device for automatically and adjustably operating dampers for fire-places, &c., the combination of a cylinder having an inlet-valve and an outlet at one end, and a piston sliding in the cylinder and having its rod connected to the damper, as shown, and for the purpose specified.

2. In a device for automatically and adjustably operating dampers for fire-places, &c., the combination of a cylinder having an inlet-valve and an outlet-cock at the upper end and having a perforated lower head, a frame having rods traveling in ways in the sides of the cylinder and having the lower end provided with a stirrup, the piston-rod and piston in the cylinder, the lower end of the rod being secured to the lower end of the frame, and the damper-operating chain having weights and secured to the upper end of the frame, as shown, and for the purpose specified.

3. In a device for automatically and adjustably operating dampers for fire-places, &c., the combination of the cylinder *b*, having the inlet-valve *f* and cock *f'*, the piston *c*, having the rod *d*, the frame having the end pieces, *g*, and side pieces, *g'* and g^3, the piece g^3 having the perforations g^4 and pin g^5, the stirrup *i*, and the damper-operating chain *h*, having the weights *v*, as shown, and for the purpose specified.

4. In a device for automatically and adjustably operating dampers for fire-places, &c., the combination of the damper *j*, having pivotal rod *n* and cogged segments *k*, sector-shaped guides *m*, having perforations and stop-pins *m'*, the operating-rod having the rack-bar *k'*, engaging the cogged segment, the bracket *g*, the hinged piece *t*, having the guide-rollers *s*, and the hinged hook *p*, as shown, and for the purpose specified

401,626. GAS-GOVERNOR. HAROLD J. BELL, Gloucester City, N. J. assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed July 2, 1888. Serial No. 278,737. (No model.)



Claim.—1. In a gas-governor or gas-regulating burner, the combination, with the regulator-shell having a tubular perforated stem

closed at its upper end and provided with a guide, of a cup or annular chamber surrounding said stem near its lower end, and a flaring or conical float-valve surrounding the stem above said cup and provided with an internal perforated tube to control the gas-openings in said stem, substantially as described.

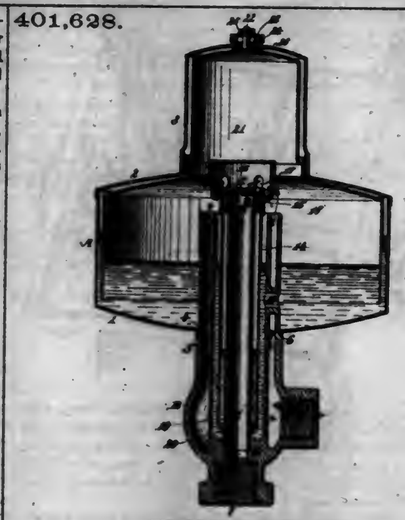
2. In a gas-governor or gas-regulating burner, the combination of the two-part shell 1 and 2, having tabular perforated stem 7, cup 9, having opening 11, the adjusting-screw 6, the float-valve 13, having a perforated tube, 14, and the gas-passages 10 and 21, substantially as described.

401,627. GAS-GOVERNOR. HAROLD J. BELL, Gloucester City, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Jan. 16, 1889. Serial No. 296,516. (No model.)

Claim.—1. In a gas-governor, the combination of a central governor inlet-tube having a closed top and lateral gas-exits and provided with a valve-seat, a balanced gas-valve surrounding said governor inlet-tube, a gas-chamber attached to the balanced valve and provided with lateral gas-exits, a bell-shaped float attached to said gas-chamber and dipping in a liquid contained in the governor-casing, an air-valve located in the upper part of said casing, and a tube surrounding the balanced gas-valve and communicating with the governor-outlet, substantially as described.

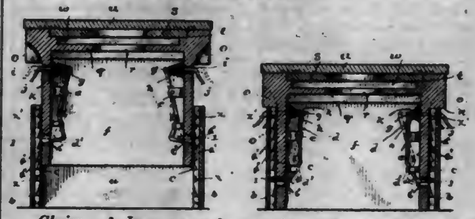
2. In a gas-governor, the combination, with a governor-casing containing a liquid and a balanced gas-valve having a float that dips into said liquid, of an air-valve having a float suspended within the upper part of the governor-casing and provided with a perforated cap on the outside of said casing, substantially as described.

3. In a gas-governor, the combination of the casing A, the fitting B, having an inlet and an outlet, the governor inlet-tube C, having lateral gas-exits and upper and lower valve-seats, the tubular balanced gas-valve D, having a gas-chamber, E, provided with lateral gas-exits, the float F, connected with said valve, the tube G, surrounding the tubular gas-valve, and an air-valve located in the upper part of the governor-casing, substantially as described.



4. In a gas-governor, the combination, with the casing having an air-opening, 16, in its upper part, the gas-valve, and the gas-valve float, of the bell-shaped float H, having a stem, 17, passed through air-opening 16, the valve-washer 18, located on the float-stem beneath said opening, and the perforated cap K, secured to the stem above the air-opening, substantially as described.

401,628. GAS-GOVERNOR. HAROLD J. BELL, Gloucester City, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Jan. 16, 1889. Serial No. 296,517. (No model.)

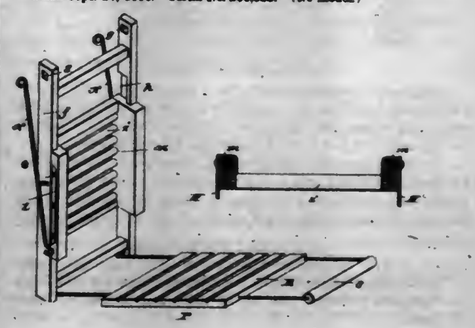


Claim.—1. In a gas-governor, the combination, with the governor-casing having an air-valve in its upper part, of a gas-fitting having an inlet and an outlet and provided with concentric tubes projecting vertically into the governor-casing and connected by a short horizontal tube, a gas-inlet tube supported centrally in said fitting and provided with a closed top and lateral gas-passages, and a tubular balanced valve surrounding the gas-inlet tube and provided with a perforated gas-chamber and a bell-shaped float, substantially as described.

2. In a gas-governor, the combination, with the casing A, inlet-tube 11, tubular valve 14, and bell-shaped float 18, of the fitting B, having an inlet and an outlet, and provided with the concentric tubes 5 and 10, connected by a tube, 19, substantially as described.

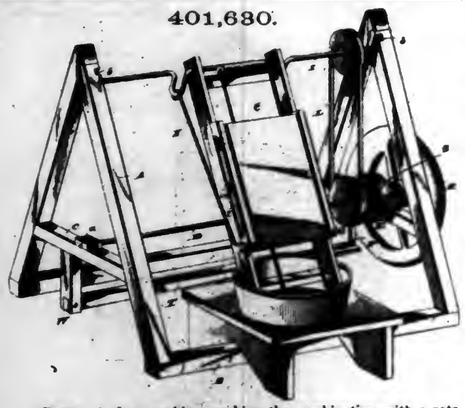
401,628.

401,629. COMMODE. JOHN A. BELL, Naperville, Ill. Filed Dec. 21, 1888. Serial No. 294,251. (No model.)



Claim.—1. In a commode, a stationary base provided with ratchet-bars, in combination with a vertically-movable seat provided with spring-pawls having cross-bars upon their lower extremities and catches upon the opposite ends of said bars, arranged in the manner and for the purpose described.

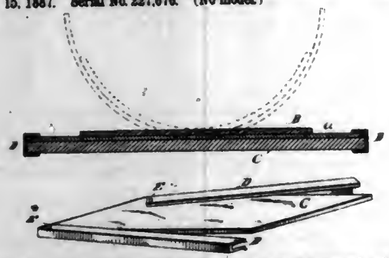
2. In a commode, a stationary base having ratchet-bars upon its interior, in combination with a sliding seat portion provided with spring-actuated pawls having cross-bars upon their lower extremities, and pulls for releasing said pawls, substantially as described.



3. In a commode, a stationary base portion provided with ratchet-bars upon opposite sides thereof, in combination with an inner sliding seat-section having a pair of levers pivoted thereto and pivoted to each other, the free end of one of said levers engaging the ratchets of the base portion, substantially as described.

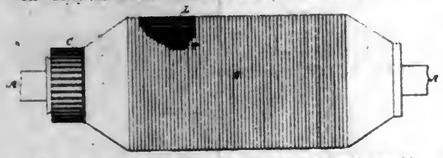
4. In a commode, a stationary base portion provided with ratchets, in combination with a sliding seat-section having a pair of levers pivoted thereto and also pivoted to each other, one of said levers acting as a pawl to engage said ratchets, and the other being provided with a pull for releasing said pawl, in the manner and for the purpose set forth.

401,630. WASHING-MACHINE. WILLIAM F. BELTON, Greenville, Pa.; Jesse C. Belton administrator of said William F. Belton, deceased. Filed Sept. 27, 1888. Serial No. 286,525. (No model.)



401,630.

Claim.—1. In a washing-machine, the combination, with a rotative crank-shaft, of a frame journaled thereon, a reciprocating roller or rubber-frame supported on the said main frame, pitmen connecting the cranks of the said shaft with the reciprocating frame, and a hinged clamping-frame adapted to turn upon the said reciprocating frame, substantially as specified.



2. In a washing-machine, the combination, with a rotative crank-shaft, a frame journaled thereon, a reciprocating frame supported on the main frame and having friction-rollers and grooves to prevent lateral displacement, the hinged corrugated frame having a handle, and pitmen connecting the cranks of the said shaft with the reciprocating or rubbing frame, substantially as specified.

401,631. FORMING CURVED ELECTROTYPES. GILBERT H. BENEDICT, Ellenville, and PATRICK M. FURLONG, Troy, N. Y. Filed Feb. 15, 1887. Serial No. 227,676. (No model.)

Claim.—The combination of a curved elastic plate and a flat bed provided with hinged and movable clamps for holding said elastic plate in a flat position upon said bed while a matrix-bed is being formed thereon, an impression taken, the form removed from the matrix, and the same fully perfected for its use in the electrotype-vat before being allowed to resume its curved form, substantially as set forth and described.

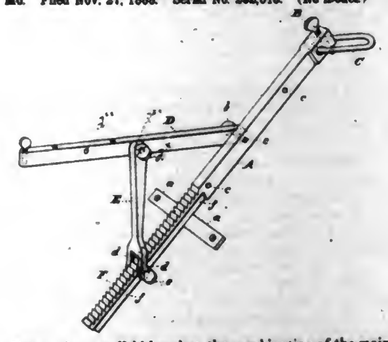
401,632. DYNAMO-ARMATURE. CARL O. C. BILLBERG, Philadelphia, assignor to Thomas H. Dallett and George A. Dallett, Thornbury, Pa. Filed Oct. 1, 1888. Serial No. 286,816. (No model.)

Claim.—1. An armature-core for a dynamo-electric machine or electric motor, having an iron core with polar projections or teeth and a divided iron sheath around the outside of the armature throughout the length or part of the length of the polar projections.

2. An armature for a dynamo-electric machine or electric motor, having a divided iron core with polar projections and a divided iron sheath composed of iron wire wrapped around the armature circumferentially throughout the length or part of the length of the polar projections.

401,633. ALIZARINE-BLUE GREEN. RENÉ BOHN, Ludwigshafen on-the-Rhine, Bavaria, assignor to the Badische Anilin and Soda Fabrik Mannheim, Germany. Filed Oct. 13, 1888. Serial No. 288,430. (Specimens.)

Claim.—As a new product, the coloring-matter or dye-stuff (alizarine-blue green) hereinbefore described, and having the following characteristics: With much boiling water it forms a blackish-purple solution, which, by the addition of a very large quantity of water, assumes a blue-green color; in concentrated or rectified sulphuric acid it dissolves with a bright red or crimson color; in fuming sulphuric acid containing about twenty-three per cent. of free anhydride it forms a blue-green solution; with caustic alkalies it forms bright-green solutions which are not precipitated by adding thereto a large excess of these solvents; its bisulphite-of-sodium compound is particularly useful for printing cotton fabrics, the shades produced being of a considerably greener hue than the corresponding shades of alizarine-blue; the colors produced with the aid of chrome, nickel, or zinc mordants are partly distinguished by their bright blue-green tint.



401,634. CARBAZOL-YELLOW. RENÉ BOHN, Ludwigshafen-on-the-Rhine, Bavaria, assignor to the Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Oct. 18, 1888. Serial No. 288,433. (Specimens.)

Claim.—As a new product, the yellow coloring-matter or dye-stuff hereinbefore described, which results from the combination of one molecule of tetrazo-carbazol with two molecules of salicylic acid; and which has the following properties: In its uncombined state it forms a powder of a dark bluish-green color which is insoluble in water, but dissolves in concentrated sulphuric acid with a bright bluish-purple color; its sodium salt when dried forms a powder of a brown color, and in its alkaline solution it imparts to cotton a bright and intense yellow color without the aid of mordants; it dyes wool and other animal fiber a bright and fast yellow either in a neutral or acidified bath.

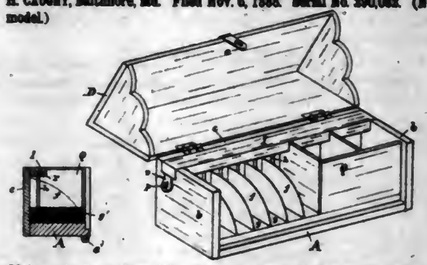
401,635. ALIZARINE-GREEN SULPHO-ACID. RENÉ BOHN, Ludwigshafen-on-the-Rhine, Bavaria, assignor to the Badische Anilin and Soda Fabrik, Mannheim, Germany. Filed Oct. 31, 1888. Serial No. 289,677. (Specimens.)

Claim.—As a new product, the coloring-matter or dye-stuff (alizarine-green sulpho-acid) which is produced by the action of moderately-strong fuming sulphuric acid at an elevated temperature upon alizarine-green, and the chemical constitution and general behavior of which correspond to those of a true and stable sulphonated derivation of alizarine-green having the following characteristics: In its solid state it has the appearance of a crystalline powder consisting of small needle-shaped crystals possessing a metallic luster; its aqueous solution has a bluish-green color, which changes into red upon the addition of mineral acids; alkaline carbonates produce blue saline compounds, while with caustic alkalies it forms green alkaline salts which are not precipitated from their aqueous solutions by adding thereto an excess of caustic alkali; its solution in concentrated sulphuric acid has a dingy-brown color, and its solution in fuming sulphuric acid containing about twenty-three per cent. of free anhydride has a grass-green color; upon chrome-mordanted wool it produces green shades.

401,636. SCAFFOLD-BRACKET. EVERETT A. BRACE, Moberly, Mo. Filed Nov. 27, 1888. Serial No. 292,013. (No model.)

Claim.—In a scaffold-bracket, the combination of the main beam having the rack and the groove, the lateral projections on said beam, the fastening at its upper end, the adjustable pivoted base-beam, and the adjustable brace having the bifurcated end and the projection to engage in the groove of the main beam, substantially as specified.

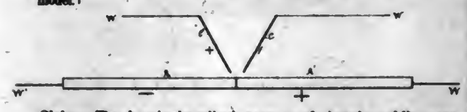
401,637. HAND-MOTOR. CHARLES E. BRONWELL, Helena, Ark. Filed June 19, 1888. Serial No. 277,005. (No model.)



Claim.—A motor consisting of the portable frame-work A, having at one end the standards B, the crank-shaft C, supported thereby and carrying the beveled wheel D, the vertical shaft F, having the beveled wheel E attached to its upper end and at its lower end the beveled wheel G, combined with the shaft I, having beveled wheel H

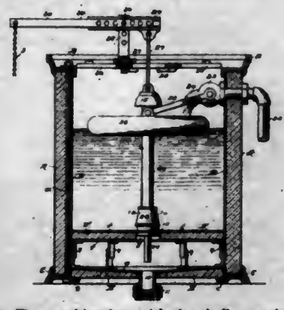
401,637.

and worm J, the worm-wheel K, meshing with said worm, the gear-wheel M, the shaft N, and its pinion and wheel, the pinion O, and shaft P, the clutch Q, link R, and lever S, all substantially as and for the purposes set forth.



401,638. TICKET-BOX FOR STREET-RAILWAY CARS. SAMUEL H. CAUGHY, Baltimore, Md. Filed Nov. 6, 1888. Serial No. 290,062. (No model.)

Claim.—1. In a fare-ticket box, the combination, with the box provided with partitions *f*, forming spaces *g*, with pins *h*, of the bar I, inclosing the upper ends of the pins, said bar being hinged at one end of the box and adapted to be locked at the other, as set forth.



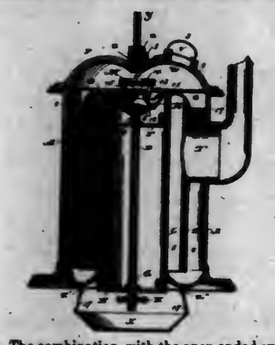
2. The combination, in a fare-ticket box, of the transverse partitions *f*, having intervening spaces *g*, the pins *h*, located in said spaces and extending above the upper edges of the partitions, and the longitudinal locking-bar I, hinged to the box at one end and provided at the other end with fastening devices, the under side of the locking-bar being provided with a recess adapted to set over the upper ends of the pins, whereby the tickets impaled on said pins may be held in security, substantially as specified.

401,639. PROCESS OF ELECTRIC WELDING. CHARLES L. COFFIN, Detroit, Mich. Filed Sept. 18, 1888. Serial No. 285,741. (No model.)

Claim.—The herein-described process of electric welding, consisting in submitting the joint to be welded simultaneously to the action of manifold arcs instead of a single arc, substantially as and for the purposes set forth.

401,640. TANK FOR WATER-CLOSETS. PATRICK CONNOLLY, Brooklyn, N. Y., assignor to Martin Dease, same place. Filed May 29, 1885. Serial No. 167,044. (No model.)

Claim.—1. The combination, with the shell or casing A, having the metal lining D and the bottom E, of the frames B C, the former of said frames being arranged to fit over the upper end of the casing A, and the latter to fit over the bottom end of said casing, and also to support the bottom E, substantially as described.



2. The combination, with the shell or casing A, having the metal lining D and the bottom E, of the frames B C, the former of said frames being arranged to fit over the upper end of the casing A and the latter to fit over the bottom end of said casing, and also to support the bottom E, and the tie-rods *a*, for holding the frames B C together, substantially as described.

3. The combination, with the lever 50 and the standard 28, of the adjustable plate 35, whereby the position of the lever can be varied, substantially as described.

4. The combination, with the tank and the outlet-valve 25, located in the tank, of the operating-lever 50, fulcrumed on top of the tank and having the adjustable arm 30, whereby the position of the chain or rod 31 can be varied, substantially as described.

5. The combination, with the outlet-valve 25, of the operating-lever made in two parts, 29 30, the standard 28, and the adjustable plate 35, whereby the position of the lever and the length of its long arm can be varied, substantially as described.

401,641. GAS OR OIL STOVE. BENJAMIN G. DEVOE and THOMPSON A. DULL, Lima, Ohio. Filed Nov. 13, 1887. Serial No. 255,533. (No model.)

Claim.—1. The combination, with the open-ended cylinder C, having base R, of the cylinder B, having a hood to fit over the top of cylinder C, and the cylinder A, fitting on base R, as and for the purpose set forth.

2. The combination of air-cylinder C, drip-pan K, and the pipe D, and means whereby the same may be raised or lowered to regulate the amount of air admitted to the fire, as and for the purpose set forth.

3. In an oil-stove, the combination, with the oil-pipe Y, of the air-valve L and mixer M, as and for the purpose set forth.

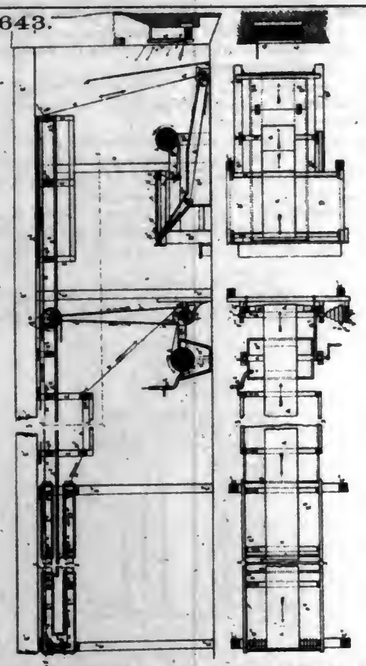
4. The combination, with cylinders A B C and burner or mixer M, of the adjustable top or dome P and pipe Y, as and for the purpose set forth.

5. The stove having the dome P, provided with the air-passage, in combination with the drip-pipe Y and mixer M, located within the stove and beneath the pipe, as and for the purpose set forth.

401,642. BELTING. ROBERT DICK, Greenhead, Glasgow, County of Lanark, Scotland. Filed July 9, 1887. Serial No. 243,901. (No model.) Patented in England Oct. 14, 1885, No. 12,253, and June 25, 1887, No. 9,043.

Claim.—1. A solid round band or rope composed of flat webs of canvas or other fabric impregnated with a gutta-percha solution and rolled upon itself, substantially as set forth.

2. A composite solid round band or rope composed of alternate layers of canvas and gutta-percha compound rolled upon itself, substantially as set forth.



3. A composite solid round band or rope composed of alternate rolls of canvas or gutta-percha compound with a layer of cloth on the outer surface, as and for the purpose set forth.

401,643. METHOD OF MAKING FLAT BELTS. ROBERT DICK, Greenhead, Glasgow, County of Lanark, Scotland. Filed July 9, 1887. Serial No. 243,902. (No model.) Patented in England Oct. 14, 1885, No. 12,254, and June 25, 1887, No. 9,043.

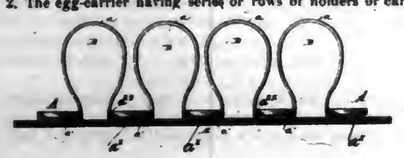
Claim.—1. The herein-described method of preparing flat belts or bands, said method consisting in impregnating a web of canvas or other fabric with a gutta-percha solution, then partially heating it, folding the web into a belt or band of the desired width, heating the folded web, and passing it between pressure-rolls, substantially as set forth.

2. The herein-described method of making composite flat belts or bands by first impregnating webs or canvas or other fabric with a solution of gutta-percha, then subjecting the impregnated webs to

401,643.

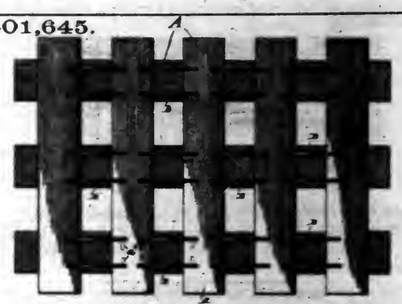
heat, then folding the webs into belts or bands of the desired width, and then applying to the belts or bands thus impregnated and folded elastic layers or sheets of gutta-percha compound, substantially as set forth.

401,644. GRAIN-BINDER. WALTER W. EASTMAN and HERBERT R. POTTER, Milford, Iowa. Filed Oct. 18, 1888. Serial No. 288,499. (No model.)



Claim.—1. The combination of the supporting-bars L, the beams Q, connecting the same, the upper beam Q being secured to the harvester-frame and the lower beam being secured to the binder-frame, the movable deck mounted on the bars L, mechanism for reciprocating said deck, and the strip S, secured to the bars L and projecting up over the upper edge of the deck, as set forth.

2. The combination of the bars L, the beams Q, connecting the same, one of said beams being secured to the harvester-frame and the other one being secured to the binder-frame, the longitudinally-slotted strips K, secured on the bars L, the movable deck, the studs depending from the deck and engaging the slots in said strips K, the crank-shaft mounted on the bars L, the [illegible] between connecting said shaft with the under side of the deck, and mechanism for rotating said shaft, as specified.



401,645. EGG-CARRIER. CHARLES F. A. EDDY, Greenfield, Mass. Filed Feb. 9, 1889. Serial No. 299,256. (No model.)

Claim.—1. The egg-carrier consisting of the reticulated frame or base, and the holders or carriers proper extended outward into arms, said arms having lateral extensions which are interposed between the crossing-pieces of the frame or base, substantially as set forth.

2. The egg-carrier having series or rows of holders or carriers

401,645.

proper, each consisting of two continuous wires formed into loops having outward-extended arms provided with lateral extensions, substantially as set forth.

401,646. INCANDESCING ELECTRIC LAMP. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Aug. 7, 1882. Serial No. 68,617. (No model.)

Claim.—An exhausted and sealed incandescent electric lamp provided with a tube or vessel containing a gas-absorbing material—such as charcoal—such tube or vessel being connected with the exhausted chamber of the lamp and embedded in the base of the lamp, substantially as set forth.

401,647. VALVE. ROBERT FOSTER, Indianapolis, Ind., assignor to Frank R. Jennings, Walter B. Harris, and James A. Dixon, all of same place. Filed Sept. 22, 1888. Serial No. 286,114. (No model.)

Claim.—1. The combination, with the shell and seat, of a valve connected to its stem by a swivel-joint and formed with a central perforation, and a supplemental valve on the lower end of said stem which has its seat in said perforation, an aperture for the passage of the gas being provided leading from the interior of the main valve to the space in said shell on the discharge side of the seat, substantially as set forth.

2. The combination of the shell, the seat therein, the main valve secured to its stem by a swivel connection and formed with a central perforation, a supplemental valve at the lower end of said stem arranged to have its seat in said perforation, and a spring interposed between said valve and stem, substantially as set forth.

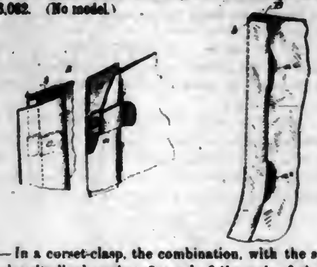
401,648. FARM-GATE. CALVIN M. GITT, Stanberry, Mo. Filed Dec. 28, 1888. Serial No. 294,883. (No model.)

Claim.—1. The combination, with the gate mounted on a pin at its inner lower end, of the connection, as the wires G, interposed between the front portion of the gate and the gate-post, and the lever J, pivoted to the gate and extending obliquely, and adjustably connected with the gate at its upper end and having the said connection engaged therewith, substantially as and for the purpose described.

2. The combination of the gate mounted on a pin at its inner lower end, the posts B and B', the plates C, connecting the upper ends of the posts, the wires G, the clevis adjustably connected with the plates C and supporting the inner ends of the wires, the latch-bar having the wires G connected therewith, the stirrup I, engaged with the said wires and adjustable on the gate, and the oblique lever J, weighted at its upper end and adjustable on the gate and having engagement with the said wires, substantially as described.

401,649. HOLDER FOR THE HAIR. JOHN I. HACKETT, Rochester, N. Y. Filed Oct. 18, 1888. Serial No. 288,489. (No model.)

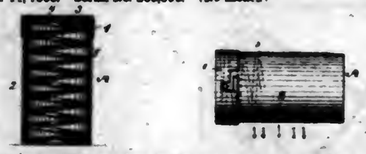
Claim.—1. A holder for the hair, consisting of a spring bent substantially to the form of a circle and having its ends turned to extend within the circle, substantially as shown.



2. A device for fastening or holding the hair, comprising a spring bent to substantially a circular form and to the form of a spiral, with inwardly-turned ends, substantially as shown and described.

3. A fastening device for the hair, consisting of a spring bent substantially to the form of a circle, having its ends made to overlap each other and turned inwardly, substantially as shown.

4. A holder for the hair, consisting of a spring bent substantially to a circular form and having its ends turned inwardly, in combination with a head or ornament secured to said spring, substantially as described and shown.



5. A device for holding the hair, consisting of a spring substantially of a circular form, in combination with a head or ornament secured to said spring, and a bow of ribbon held between said spring and head, substantially as shown and described.

401,650. CORSET-CLASP. JOSEPH H. HAVILAND, Jackson, Mich., assignor to William F. McGee, same place. Filed Aug. 18, 1888. Serial No. 283,062. (No model.)

Claim.—In a corset-clasp, the combination, with the steel A, inclosed in a longitudinal pocket formed of the web of the corset at one of the meeting edges thereof, and the curved lips *a*, secured to the outer edges of the steel A, standing therefrom over the adjacent portion of the outer side of the corset-web, and provided with the bends or bulges *a'*, of the steel B, inclosed in the longitudinal pocket *b*, formed on the meeting edge of the corset opposite that on which is formed the pocket inclosing the steel A, and provided with openings a^3 at its inner edge, opposite the lips *a*, for the reception of said lips, which openings are made by leaving unstitched portions of said inner edge, substantially as specified.

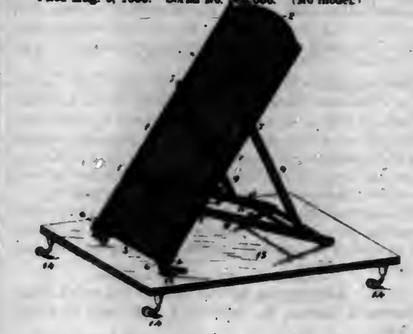
401,651. DREDGE-BOX. JAMES W. IVORY, Philadelphia, Pa. Filed Jan. 11, 1888. Serial No. 260,390. (No model.)

Claim.—1. A dredge-box having an opening in its lid and perforations in its side, an inside coil-spring, and a washer closing said opening in the lid, said parts being combined substantially as described.

2. A dredge-box having a body with side perforations, a lid with an opening, a movable washer covering said opening, and a coiled spring within said box, said parts being combined substantially as described.

3. A dredge-box having side perforations, a lid, and an interior coil which is operated from said lid, said parts being combined substantially as described.

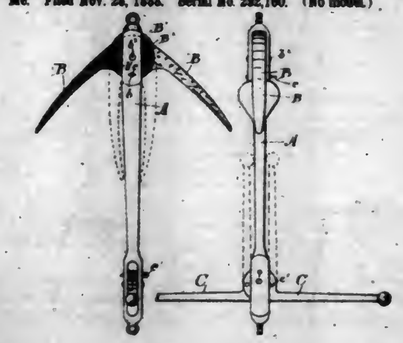
401,652. HYDRANT. JOHN KAISER, Seneca Falls, N. Y. Filed Nov. 17, 1888. Serial No. 291,128. (No model.)



Claim.—1. In a hydrant, the combination, with the tubular body having the drainage-ports 5 and a valve-seat and the hollow valve in said body having the circumferential flanges 15, completely filling said body, and perforations between said flanges, of a loose packing-band having its ends overlapping located between said flanges over said perforations, as set forth.

2. In a hydrant, the combination, with the tubular body having the drainage-ports 5 and a valve-seat and the hollow valve B, having the circumferential flanges 15, and perforations between said flanges, of a loose packing-band located between said flanges and secured at one end to said valve, as set forth.

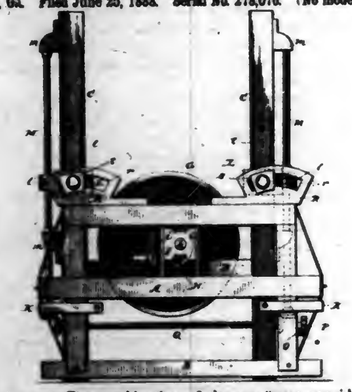
3. In a hydrant, the combination, with the tubular body having the drainage-ports 5 and the valve-seat and the hollow valve B, having circumferential flanges 15, and perforations between said flanges, of a loose packing-band located between said flanges and coiled around said valve more than once, as set forth.



4. In a hydrant, the combination, with the tubular body having a valve-seat and the drainage-ports 5, and the hollow valve B, having the circumferential flanges 15, and perforations between said flanges, of a loose packing-band completely filling the space between said flanges and coiled around said valve more than once and having one end secured thereto, as set forth.

401,653. DISPLAY-RACK. ROBERT KAUFMANN, Cincinnati, Ohio. Filed Aug. 6, 1888. Serial No. [illegible]. (No model.)

Claim.—The display-rack consisting of the stiles 1 1, connected by arch 2 and rundle 3, the latter being journaled in the stiles, the fabric 5, secured at top to the arch and wound at bottom on the rundle, the pins 6, for securing the rundle, the prop 8, having notches 10, and prop 9, having cross-piece 11, which rests in the notches, said props being hinged, as at 7, substantially as herein explained.

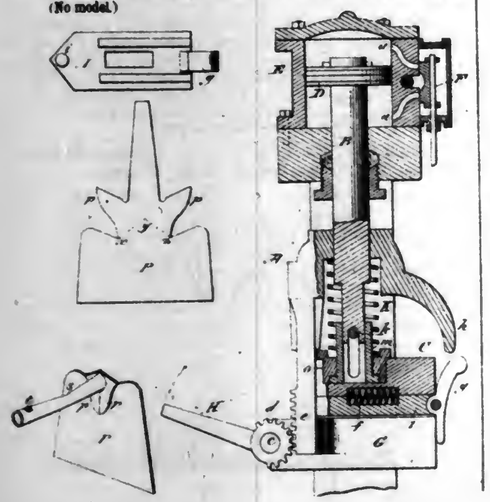


401,654. FOLDING ANCHOR. THOMAS S. LAUGHLIN, Portland, Me. Filed Nov. 28, 1888. Serial No. 292,160. (No model.)

Claim.—1. The herein-described folding anchor having the independent arms and stock pivoted to the shank by means of a rule-joint, holes through said joint-sections, located to coincide with corresponding holes in the shank for the admission of a pin when the parts are opened, and holes located to coincide in like manner when the parts are closed, combined with a pin adapted to enter said holes to retain said parts in an open or closed position, substantially as described.

2. The herein-described folding anchor having the two independent arms pivoted to the shank by means of a rule-joint, holes through said joint, located to register with holes in the shank for the admission of a pin to retain said arms when open, and registering holes in said joint and shank to admit a pin for retaining said arms in a closed position, substantially as described.

401,655. **STONE-SAWING MACHINE.** JAMES W. MALOY, Marietta, Ga. Filed June 25, 1888. Serial No. 278,076. (No model.)



Claim.—1. The combination of the saw-frame provided with vertical guideways, a stationary frame upon which it is supported, a shaft provided with a crank or wrist pin, and a slide mounted upon the said crank-pin and moving between the said ways, whereby upon the rotation of the shaft the frame is reciprocated, substantially as described.

2. The combination of the saw-frame provided with vertical guideways, a stationary frame, the blocks upon which the saw-frame is supported and slides as it is reciprocated movable vertically upon the stationary frame, a shaft provided with a crank-pin, a slide mounted upon the said crank-pin and movable between the ways on the saw-frame, and mechanism driven from the said shaft for moving vertically the saw-frame-supporting blocks, substantially as described.

3. The combination, with the stationary frame, of a reciprocating saw-frame provided with segmental slots, and tilting bearing-blocks S, carried by the stationary frame and fitting the said slots, substantially as described.

401,656. **MACHINE FOR MAKING HOES AND SHOVELS.** HENRY E. MARCHAND, Pittsburg, Pa. Filed Oct. 9, 1883. Serial No. 108,533. (No model.)

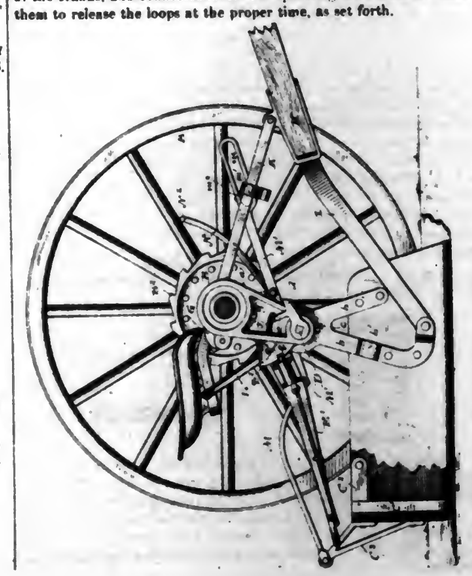
Claim.—1. In a metal pressing and shaping machine, the combination of the anvil G, the self-adjusting die C, the sliding former I, and the folding device H, substantially as described.

2. In a metal shaping and pressing machine, the combination of an anvil, a yielding die, a sliding former adapted to be moved along the pressing-face of said die, a pivoted folding device, and suitable operating mechanism, substantially as described.

3. In a metal pressing and shaping machine, the combination of an anvil, a yielding die, a sliding former adapted to be moved along the face of said die, a pivoted folding device, a vertically-movable frame provided with suitable shaping devices and having means for operating the folder and former, and a piston for actuating the frame and die, substantially as described.

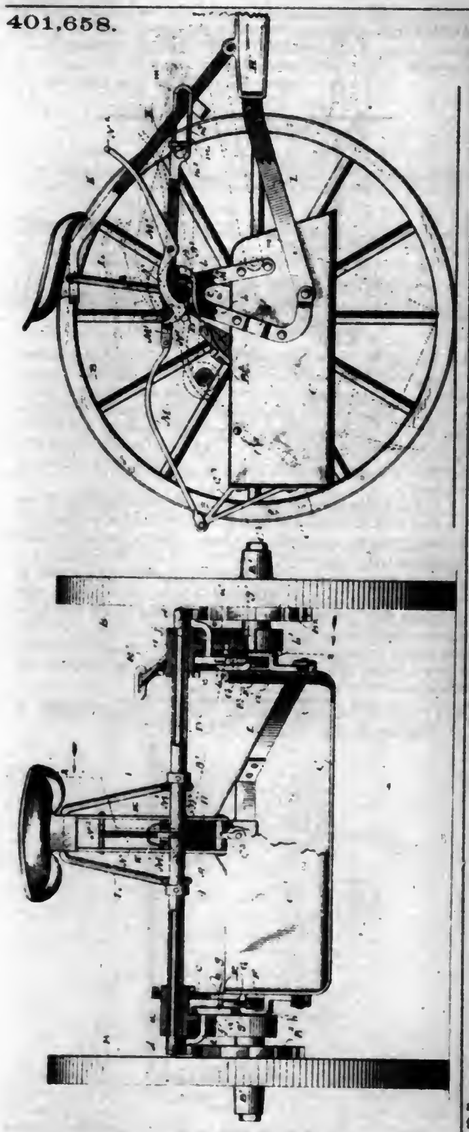
4. In a metal pressing and shaping machine, the combination of an anvil having bearings for a rock-shaft, a folding device carried by said rock-shaft, a yielding die, a sliding former adapted to move along the face of the die, said former being provided with a pointed end and carrying a vertical mandrel, a vertically-movable frame having a vertical mandrel and shaping devices and provided with means for operating the folder and the sliding former, a steam-cylinder, and a piston for actuating the frame and die, substantially as described.

5. In a metal pressing and shaping machine, the combination of the die C, the sliding former I, and the anvil G, the faces of said die and anvil being inclined at any suitable angle, substantially as described.



401,657. **METHOD OF MAKING SOLUBLE BONBONS.** LEONHARD OBERNDORFER, Würzburg, Bavaria, Germany, assignor to A. Grossenbach & Company, Milwaukee, Wis. Filed July 16, 1888. Serial No. 280,066. (No specimens.) Patented in Germany Sept. 12, 1885, No. 34,973.

Claim.—The hereinbefore-described method of making soluble bonbons, consisting of moistening the powdered sugar and other ingredients with slightly-diluted alcohol, and subjecting the mass to a very slight pressure in metal forms heated sufficiently to cause the contents next to the heated metallic surfaces to melt slightly and form a thin sugar-glazing over the powdered interior of the bonbons, substantially as set forth.



401,658. **WHEELED SCRAPER.** FRANK A. RATHBUN, Beloit, assignor to the Rathbun Manufacturing Company, Milwaukee, Wis. Filed June 21, 1888. Serial No. 277,802. (No model.)

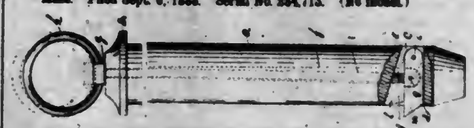
Claim.—1. In an earth-scraper, the combination, with the wheels and the hubs thereof, the latter having toothed peripheries, of a hollow axle the journals whereof are cranked thereto, a scoop hung from the outer hubs of the cranks, a rock-shaft running through the hollow axle, pawls carried by said rock-shaft for engaging the teeth of the hubs, and a lever and connections for operating the rock-shaft, substantially as described.

2. The combination, with the hollow cranked axle of a scraper and its suspending-straps, the latter hung from the outer hubs of the axle-cranks, of a prong and latch carried by each of the inner hubs of the cranks, and connected levers for operating the latches to cause them to release the loops at the proper time, as set forth.

401,658.

3. The combination, with the scoop, cranked axle, and wheels having toothed hubs, of straps for suspending the scoop to the axle, a prong and latch for engagement with a loop in each suspending-strap, a rock-shaft extending across the machine, and pawls carried by said rock-shaft, and means for operating the said rock-shaft and latch, substantially as described.

4. In a scraper, the combination, with the cranked axle and the rock-shaft running through it, of levers pivoted each to a crank-arm of the axle, pawls carried by the rock-shaft, one at each end, a toothed hub on each of the wheels, and connections between each of said pawls and the lever adjacent to it, whereby both pawls may be lifted or dropped by a movement of one of the said levers, substantially as described.



5. The combination, with the wheels and their toothed hubs, of a hollow axle cranked to its journals, a rock-shaft and pawls carried thereby, one on each end, a lever pivoted to each crank-arm, an arm extending from each pawl through a slot in the adjacent crank-arm, and another slot in the adjacent lever at substantially a right angle to the slot in the crank-arm, and means for locking one of said levers, substantially as described.

6. The combination, with the cranked axle, of the scoop hung therefrom and a standard pivoted on the axle, a seat pivoted on the standard, and a strut secured to the seat at one end and hinged to the tongue at the other end, and means for locking the axle in its raised position, substantially as described.

7. The combination, with the axle and tongue, of the toggle-support for the seat, and a bar connecting the axle with the foot-rest and serving to limit the forward movement of the axle when the machine is scraping, substantially as described.

8. The combination, with the cranked axle and toggled seat-supports, of the bar M, pin m^3, latch-lever N, the scoop and its door, ball I, and tongue H, substantially as described.

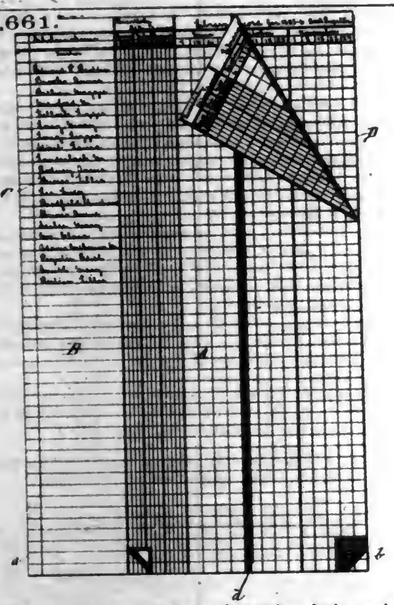
401,659. **COUPLING-PIN.** FRANK I. REMINGTON, New Bedford, Mass. Filed Sept. 6, 1888. Serial No. 284,713. (No model.)

Claim.—A coupling-pin consisting of the pin *a*, having head *s*, transverse slot *e*, longitudinal opening *f*, tapering toward the head of the pin, the latch *m*, having one end rounded and the other chamfered, and provided with the recess *r* and pivoted in slot *e*, and the rod *g*, provided with ring *h*, extending from the head of the pin through the opening *f* to the latch *m*, where it is pivoted in the recess *r*, all as shown and described.

401,660. **BOX-COVER.** WILLIAM SCHARFWEBER, Chicago, Ill., assignor of two-thirds to Henry H. Mann and Richard J. Elliott, same place. Filed July 2, 1888. Serial No. 278,801. (No model.)

Claim.—1. A box with a groove in its walls, in combination with a cover fitted thereinto and containing a wedge-shaped piece and a filling-piece divided into sections, as and for the purpose stated.

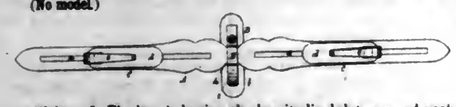
2. A box provided with a groove in its inside walls, in combination with a cover fitted into said groove and composed of a central wedge-shaped portion and two filling portions divided into sections, as and for the purpose set forth.



3. A box with a groove in its inside walls, in combination with a cover fitted thereinto containing a wedge-shaped portion and a filling portion, so arranged that the grain of the wood in the filling portion will run crosswise of the grain in the wedge-shaped portion, as and for the purpose stated.

4. A box with a groove in its walls, in combination with a cover fitted thereinto and composed of a wedge-shaped piece and two filling-pieces divided into sections, and so arranged that the grain of the wood in the filling-pieces shall run crosswise of the grain in the wedge-shaped piece, as and for the purpose set forth.

401,661. **RECORD.** HORACE C. SEELY, Philadelphia, Pa., assignor of one-half to James Arnold, same place. Filed June 10, 1886. Renewed July 2, 1888. Serial No. 278,881. (No specimens.)



Claim.—In a record or register, the combination, with a main sheet adapted and designed to receive a list of names or other entries, of a series of supplemental folded sheets attached or fastened to the main sheet near the outer edge thereof and adapted, and designed to

401,661.

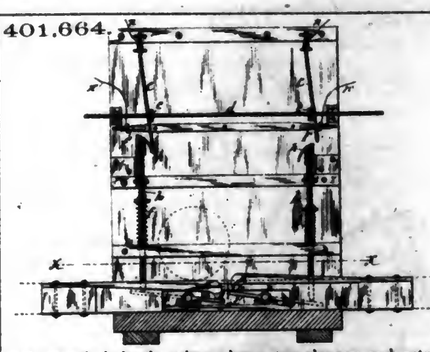
be successively turned over and to receive entries referring to the list on the main sheet, substantially as shown and described.

401,662. SHEET-MUSIC SUPPORT FOR PIANO-FORTES. EVERETT J. SNOW, Penobscot, Me. Filed June 23, 1887. Serial No. 242,252. (No model.)

Claim.—1. The bar A, having the longitudinal slots *a a* and neck *h*, in combination with the spring-clips C C, located in said slots, and the spring-clip B, located at the neck, as set forth.

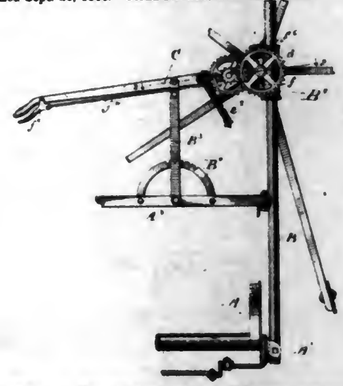
2. The bar A, having the longitudinal slots *a a* and the neck *h*, in combination with the clips C C, consisting of the slides *d d*, having the tongues *f f*, the plates *g g*, and the springs *e e*, and the clip B, consisting of the piece of wood *b* and the spring *c*, the clips C C being located at the slots *a a* and the clip B at the neck *h*, as set forth.

401,663. COFFIN-FASTENER. WILLIAM A. SPARKS, Rochester, N. Y., assignor to the Stein Manufacturing Company, same place. Filed Nov. 4, 1886. Serial No. 217,935. (No model.)



Claim.—1. The combination, with the interlocking members of a concealed lid-fastener for burial-caskets, of a locking-spring for automatically securing the aforesaid interlocking members in their locked position, the said spring having a finger-piece projecting underneath the overlapping edge of the lid, whereby the lid may be released from the casket, substantially as and for the purpose set forth.

2. The combination, with the inclined interlocking hook of a concealed coffin-lid fastener, of a flat locking-spring secured to the lid, having a recess back of its free end and a laterally-projecting finger-piece extending outward near the marginal edge of the under side of the lid, a plate secured to the casket-body provided with a slot or recess for engaging the inclined interlocking hook, and a locking device consisting of a pin or lug secured to the upper edge of the casket to engage the spring, all substantially as and for the purpose set forth.

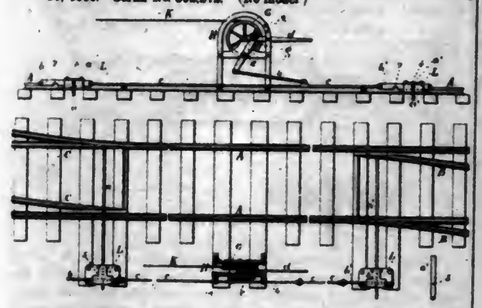


401,664. RAILWAY TRACK-INSTRUMENT. GEORGE C. STEERSBERG, Syracuse, N. Y. Filed Aug. 8, 1888. Serial No. 282,266. (No model.)

Claim.—1. A railway track-instrument comprising two primary levers lying in opposite directions along the side of the track-rail to be successively depressed by the car-wheels passing over said lever, supplemental levers operating independently of each other and actuated respectively by the primary levers, two plungers each actuated by one of the supplemental levers, movable electrodes carried in opposite direction from each other by the plungers, stationary electrodes in the path of the movable electrodes, a push-bar transmitting motion from the first actuated electrode to the second electrode and throwing the latter out of the path of the plunger, and electric conductors extended from the respective electrodes, substantially as described and shown.

2. The within-described track-instrument consisting of the levers *a a*, lying with their free ends toward each other and in proximity to and higher than the track-rail, the two two-armed levers *l l*, each having one arm under the free end of one of the levers *a*, the plungers *b b*, resting on the second arm of the respective levers *l l*, and provided at their upper ends with the beveled heads *h h*, the metallic spring-rods *c c*, having their free ends over the said heads, the slide *d*, having the collars *e e* between the said spring-rods, metallic contacts *f' f'* in the path of the spring-rods, and electric conductors extended from the aforesaid spring-rods and contacts, substantially as described and shown.

401,665. HARVESTER-REEL. JOHN F. STEWARD, Chicago, Ill. Filed Sept. 29, 1888. Serial No. 286,724. (No model.)

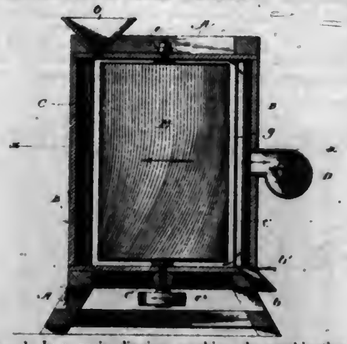


Claim.—1. The reel-post and the sliding reel-sustaining bracket thereon, in combination with the adjusting-lever pivoted to the bracket, the pawl pivoted to the bracket at a point eccentric to the lever-pivot and curved in a line substantially concentric with said lever-pivot, and the latch-controlling rod mounted on the lever and arranged to slide on the curved portion of the pawl, whereby said rod is enabled to adjust itself to suit the variable angle between the lever and bracket.

2. The reel-post, the sliding bracket thereon, and the reel-shaft mounted in said bracket and provided with the driving-gear, in combination with a bracket-adjusting lever pivoted thereto concentric with the reel-shaft, and a driving-gear mounted on said lever and engaging the gear on the reel-shaft, whereby the lever is enabled to sustain the driving-gear and to adjust the reel without disturbing the operative relation of said gears.

3. The reel-post and the sliding bracket thereon, the reel-shaft mounted in the bracket and provided with the gear *d*, the adjusting-lever pivoted to the bracket concentric to the reel-shaft, the concentric gears d^2 and d^3, mounted on the lever in rear of the reel-post, the pinion E', also mounted on the lever, the universal joint connected to said pinion, and the driving-shaft connected to said joint, whereby the driving-shaft is permitted to stand in rear of the reel-shaft, as and for the purposes described, and the adjustment of the reel permitted without disturbing the operative relation of the gears.

401,666. INTERLOCKING SIGNAL APPARATUS FOR RAILWAY-SWITCHES. FRANK H. TREACY, Poughkeepsie, N. Y., assignor to the Palmer Torpedo Railway Signal Company, Plainfield, N. J. Filed Nov. 30, 1888. Serial No. 292,272. (No model.)



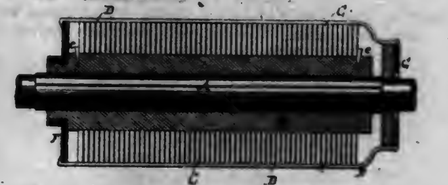
Claim.—1. The combination, with the lever *d* and connection for a railway-signal, of the lever *e*, notched bars, and connection *c* and *4* from one notched bar to the lever *e*, substantially as set forth.

2. The combination, with the bars *a* and *b*, notched and crossing each other, of the cast block L, having T-shaped flanges and slots of varying depth at right angles to each other for receiving and supporting the bars *a b*, and a removable retaining-cover, substantially as set forth.

3. The combination, with the signal-lever *d*, wheel G, and connection from the same for a railway-signal, of the lever *e*, frame H, upon which the lever *e* is pivoted, the crank-pin *g* from the lever *d* and within the slot in the lever *e*, the notched switch-bar *a*, the notched bar *b*, and the connection from the bar *b* to the lever *e*, and the slotted block L, within which the respective bars *a* and *b* are received and cross each other at right angles, substantially as set forth.

401,667. GRAIN-CLIPPING MACHINE. ROSIA W. WELCH, Baltimore, Md., assignor of one-half to John M. Knight, same place. Filed July 31, 1888. Serial No. 281,535. (No model.)

Claim.—1. In a grain-clipping machine, the combination of an external vertical cylinder, and an internal rotary cylinder having on its surface a series of ribs, the upper ends of which extend vertically, while the lower ends are curved forward in the direction of rotation

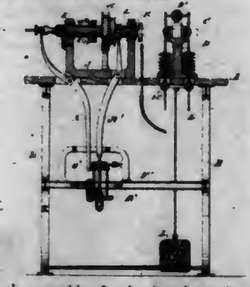


2. In a grain-clipping machine, the combination of the following elements: a stationary external casing, an internal perforate cylinder, an exhaust-fan communicating with the space between said cylinder and casing, and an internal vertical rotary cylinder provided with ribbed plates, each rib extending from the upper end of the cylinder downward in a vertical direction about one-third of its length, and trending thence forward in the direction of rotation to the lower end of the cylinder.

401,668. DYNAMO-ELECTRIC MACHINE. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Sept. 22, 1882. Serial No. 72,475. (No model.)

Claim.—In a dynamo-electric machine, the combination, with the shaft, of a cylinder or hub of insulating material secured thereon iron plates or rings strung over said hub, and plates or sheets of insulating material interposed between said rings, these parts being constructed and combined in substantially the manner set forth for the reception of the coils.

401,669. DYNAMO-ELECTRIC MACHINE. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Original application filed Sept. 22, 1882, Serial No. 72,475. Divided and this application filed Nov. 14, 1882. Serial No. 76,757. (No model.)



Claim.—1. A core for electrical generators operating by inductive action, composed of alternate sections, plates, or disks of magnetic and insulating materials, in combination with insulated coils wound thereon, as set forth.

2. A core for electrical generators operating by inductive action, composed of iron plates, sections, or disks, with interposed plates or sections of insulating material, in combination with insulated coils wound thereon at right angles to the planes or lines of the insulating sections, as set forth.

3. A core for electrical generators operating by inductive action, composed of iron sections, plates, or disks, with interposed plates or sections of insulating material, in combination with means for binding and holding the same together and insulated coils wound thereon at right angles to the planes or lines of the insulating sections, as set forth.

401,670. MACHINE FOR MAKING VIALS. CHARLES A. WISCHERT and RICHARD GABRIELSKY, Brooklyn, N. Y.; Lizzie F. Wischert administratrix of said Charles A. Wischert, deceased. Filed June 18, 1888. Serial No. 277,469. (No model.)

Claim.—1. In a machine for shaping glass tubes, the combination of a support for holding the heated glass tube and separable dies adapted to shape the tube and having spiral reciprocation thereon.

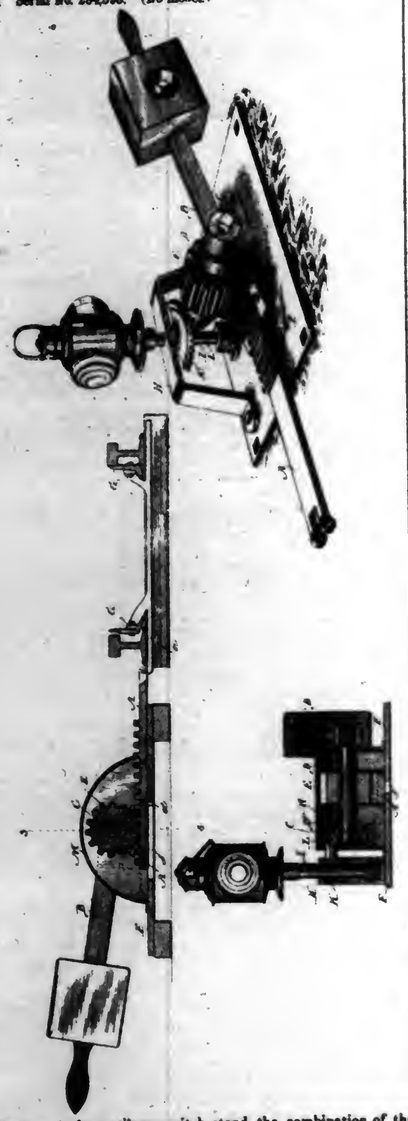
2. In a machine for shaping glass tubes, the combination of a support for holding the heated tube and intermittingly-closing dies adapted to receive the tube and shape the same and having spirally-reciprocating motion upon the tube

3. In a machine for shaping glass tubes, the combination of a support for holding the tube and separable opening and closing dies for shaping the tube, which are carried upon a spirally-reciprocating support, whereby the dies are longitudinally reciprocated and at the same time gradually closed on the tube.

4. In a machine for shaping glass tubes, the combination of a tube-holding support, separable automatically-closing and spirally-reciprocating dies adapted to shape the tube, and a support for the heated end of the tube arranged within the dies and supporting the heated end of the tube as it is being shaped by the dies.

5. In a machine for shaping glass tubes, the combination of opening and closing spirally-reciprocating shaping-dies and an internal support for holding the heated end of the tube while it is being properly operated upon by the dies.

6. In combination, the tube-shaping dies mounted upon the levers S and within the spirally-reciprocating cylinder L, the lever A', operated by the said cylinder, the ratchet B' and cam G', and the lever X, provided with the wedge W, arranged substantially as and for the purpose set forth.

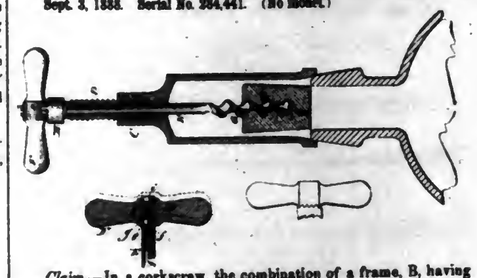


7. In combination, the screw-threaded-die-carrying cylinder L, the collar M, the spring-drum N, longitudinally movable on the said

cylinder, and the eccentric connection P P', with the driving-shaft Q, all arranged substantially as and for the purpose set forth.

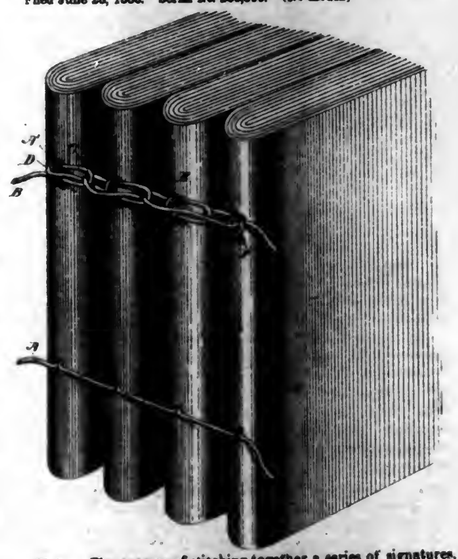
8. In combination, the spirally-reciprocating cylinder L, the dies R and levers S, the spring-levers U, the support V, and the die-closing wedge W, all arranged substantially as and for the purpose set forth.

9. In combination, the reciprocating die-carrying cylinder L, the wedge W and lever X, the collar Z and lever A', the ratchet-wheel B' and ratchets D' E', and the cam G', all arranged substantially as and for the purpose set forth.



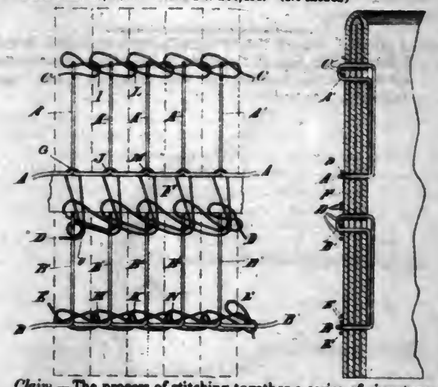
401,671. **RAILWAY-SWITCH STAND.** CHARLES ALKINS, Muskegon, Mich., assignor to Henrietta Alkins, same place. Filed Sept. 5, 1888. Serial No. 284,593. (No model.)

Claim.—1. In a railway-switch stand, the combination of the sliding rack-bar, a cog engaging the same, and a stop device arranged for determining the extent of throw on the part of the rack-bar and consisting of a lug on the rack-bar engaging in a slot in the base of the stand, substantially as set forth.



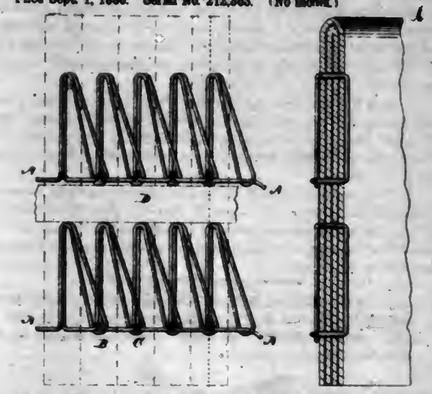
2. In a railway-switch stand, the combination of the sliding rack-bar which is to connect with the switch, the cog for operating the rack-bar, and the lever connected with the cog, said rack-bar being provided with a stud which extends into a channel in the base-plate of the switch-stand, substantially as and for the purpose described.

401,672. **CORKSCREW.** SETHOUR L. ALVORD and EDWARD E. BROWN, West Winsted, Conn.; said Brown assignor to said Alvord. Filed Sept. 3, 1888. Serial No. 284,441. (No model.)



Claim.—In a corkscrew, the combination of a frame, B, having a socket, A, at its lower end, adapted to rest upon the neck of the bottle, and having a neck, C, at its upper end, the said neck internally screw-threaded with a left-hand thread, a tubular sleeve, D, through said neck and correspondingly left-hand screw-threaded, the spindle E, corresponding in diameter to the internal diameter of the sleeve D, but of a length greater than the length of said sleeve D, the lower end of the said spindle terminating in a right-hand-threaded corkscrew, G, as an integral part thereof, a handle, F, upon the upper end of said spindle, the spindle extending through the handle, a portion, *f*, of the spindle within the handle made of angular shape, and a corresponding portion of the opening through the handle made of corresponding angular shape, the portion of the spindle above said angular shape *f* within the handle being of cylindrical shape, the upper end of the spindle constructed with a head, *i*, a spring, *m*, in the handle below and so as to yieldingly bear against the head *i*, and so that said handle may engage the angular portion of the spindle and impart its rotation thereto, or, disengaged from such angular portion, may have a rotation of its own independent of the spindle, the upper end of the left-hand screw-threaded sleeve and the corresponding surface of the handle constructed of irregular shape, whereby contact between the handle and the said sleeve causes the said sleeve to partake of the rotation of the handle, all substantially as described.

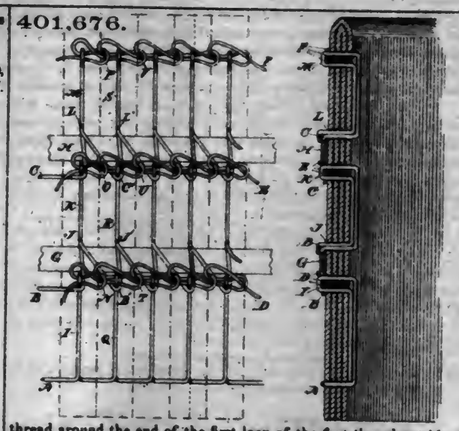
401,673. **METHOD OF BOOK-STITCHING.** HORACE L. ARNOLD, Hartford, Conn., assignor to Robert S. Woodruff, trustee, Trenton, N. J. Filed June 23, 1886. Serial No. 206,399. (No model.)



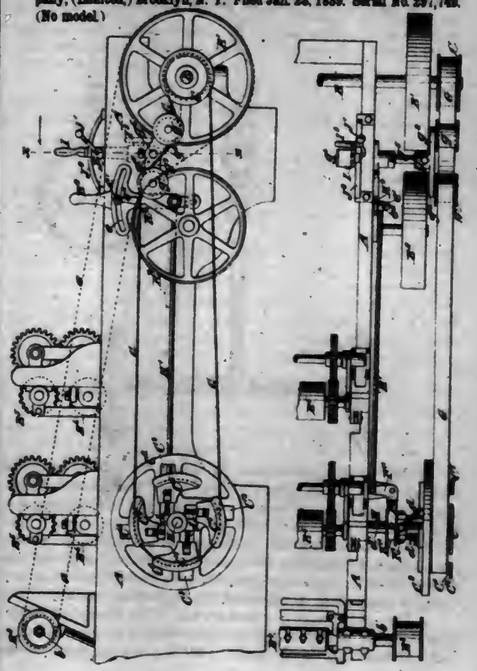
Claim.—The process of stitching together a series of signatures, which consists in carrying a loop of one thread through the back of one signature from the outside thereof, and then bringing it out through the same back at another place, and then carrying a loop of another thread through the end of the first loop outside of the signature, and then carrying another loop of the first thread through the back of another signature from the outside thereof, and then bringing it out through the same back at another place, and then carrying another loop of the second thread through the first loop of that thread and through the end of the second loop of the first thread, and then repeating the operation, if necessary, till all the signatures in the series are stitched together, all substantially as described.

401,674. **METHOD OF STITCHING BOOKS.** HORACE L. ARNOLD, Hartford, Conn., assignor to Robert S. Woodruff, trustee, Trenton, N. J. Filed June 23, 1886. Serial No. 206,400. (No model.)

Claim.—The process of stitching together a series of signatures, which consists of forming a portion of a thread into a loop and extending that loop lengthwise along the back of a signature, and then carrying a loop of a second thread through the back of that signature from the outside thereof, and then bringing it out through the same back at another place adjacent to the first loop, and also carrying a loop of a third thread through the end of the first loop of the first thread, and then through the back of the signature at a third place, and then bringing it out through the same back at a fourth place, and then carrying a loop of a fourth thread through the end of the first loop of the third thread outside of the signature, and then carrying a second loop of the first thread through the first loop of the second thread and through the first loop of the first thread, and thence laterally to the back of a second signature, and thence lengthwise of the back of that signature, and then repeating the operation until all the signatures in the series are stitched together, all substantially as described.



401,675. **METHOD OF STITCHING BOOKS.** HORACE L. ARNOLD, Hartford, Conn., assignor to Robert S. Woodruff, trustee, Trenton, N. J. Filed Sept. 1, 1886. Serial No. 212,363. (No model.)

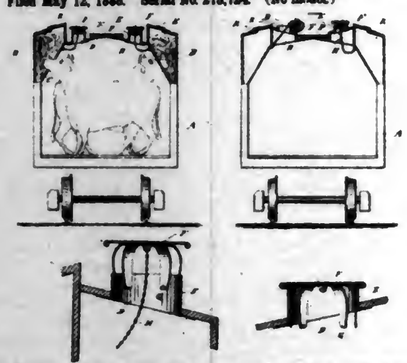


Claim.—The method of stitching together a series of signatures, which consists in carrying a loop of a thread through the back of one signature from the outside thereof, and then bringing it out through the same back at another place, and then carrying another loop of that thread through the first loop thereof and then through the back of another signature from the outside, and then bringing it out through the same back in another place, and then repeating the operation, if necessary, until all the signatures in the series are stitched together, all substantially as described.

401,676. **METHOD OF STITCHING BOOKS.** HORACE L. ARNOLD, Hartford, Conn., assignor to Robert S. Woodruff, trustee, Trenton, N. J. Filed Sept. 1, 1886. Serial No. 212,364. (No model.)

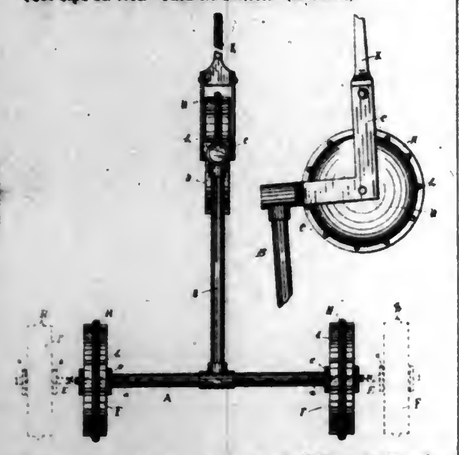
Claim.—The process of stitching together a series of signatures, which consists in carrying a loop of one thread through the back of one signature from the outside thereof, and then bringing it out through the same back at another place, and then carrying a loop of a second thread around the end of the first loop of the first thread outside of the signature and thence through the back of the first signature from the outside thereof at a third place, and then bringing it out from the same back at a fourth place, and then carrying a loop of a third thread through the end of the first loop of the first thread outside of the signature and over the second thread, and also carrying a loop of a fourth thread through the end of the first loop of the second thread outside of the signature, and then carrying a second loop of the first thread through the back of another signature from the outside thereof, and then bringing it out through the same back at another place, and then carrying a second loop of the second thread around the end of the second loop of the first thread outside of the signature and thence through the back of that signature from the outside thereof at a third place, and then bringing it out through the same back at a fourth place, and then carrying a second loop of the third thread through the first loop of that thread and through the end of the second loop of the first thread and over the second thread, and also carrying a second loop of the fourth thread through the first loop of that thread, and then through the end of the second loop of the second thread, and then repeating the operation, if necessary, until all of the signatures in the series are stitched together, all substantially as described.

401,677. **BELT-TIGHTENER FOR PLANING-MACHINES.** ERNST F. AUTENRIETH, New York, assignor to the Glen Cove Machine Company, (Limited,) Brooklyn, N. Y. Filed Jan. 28, 1889. Serial No. 297,749. (No model.)



Claim.—1. The combination, with pulleys, of a belt passing about said pulleys, a belt-tightener, a rock-shaft upon which said belt-tightener is mounted, a worm-wheel on said rock-shaft, a worm engaging said worm-wheel, and a lever mounted upon the rock-shaft in which said worm is journaled, substantially as and for the purpose specified.

2. The combination, with pulleys, of a belt passing about said pulleys, a belt-tightener, a rock-shaft upon which said belt-tightener is mounted, a lever for operating said rock-shaft, and a main frame, said main frame and lever, the one being provided with a binding surface and the other with a cam, constituting a lock adapted to bear upon said binding-surface to lock the lever in a position into which it has been adjusted, substantially as specified.

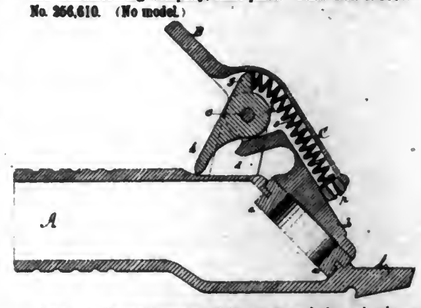


3. The combination, with pulleys, of a belt passed about said pulleys, a belt-tightener, a rock-shaft upon which said belt-tightener is mounted, a lever for operating said rock-shaft, and a main frame, said main frame and lever, the one being provided with a binding-surface and the other with a weighted cam adapted to bear upon said binding-surface to automatically lock the lever in a position into which it has been adjusted, substantially as specified.

401,678. CAR FOR LIVE STOCK. HUGH BAIRD, Brooklyn, N. Y. Filed May 12, 1888. Serial No. 273,734. (No model.)

Claim.—A cattle-car constructed, as described, with elevated hay-rack in the roof, elevated ventilation-ducts contiguous thereto, and movable caps to protect said ducts and permit observation of the interior through the same, as explained.

401,679. LAND-MARKER. WILLIAM H. BOGGS, Covington, Ohio. Filed Sept. 20, 1888. Serial No. 285,886. (No model.)

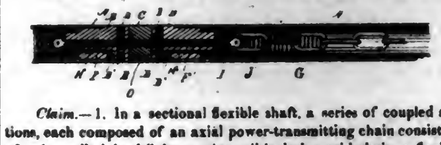


Claim.—1. In a land-marker, the wheels F F and D, formed or provided with a central circumferential flange in which are equidistant perforations, in combination with removable marking-pins *h h*, all substantially as and for the purpose specified.

2. In a land-marker, the combination of a hollow axle with two arms adjustably secured in the opposite ends of said axle and the marker-wheels on the outer extremities of said arms, constructed and arranged substantially as described, for the purpose specified.

3. The combination, in a land-marker, of the forward or central marking-wheel, journaled in an L-shaped bracket pivotally attached to the forward end of the frame, with the rear marking-wheels mounted on adjustable arms, all substantially as and for the purpose set forth.

4. The within-described land-marker, consisting of hollow axle A, adjustable arms E E, marking-wheels F F, set-screws *a a*, T-joint and bar B, L-joint, bracket C, and handle or tongue K, all constructed and arranged to operate substantially in the manner as and for the purpose described.



401,680. VALVE FOR PNEUMATIC PIPES OR TUBES. EDWARD S. BOYNTON, New York, N. Y., assignor to the Campbell Printing Press and Manufacturing Company, same place. Filed Dec. 1, 1887. Serial No. 256,610. (No model.)

Claim.—1. In combination with an external pivoted valve, a compressive helical spring inclosed within a tubular guide formed upon or attached to the valve, substantially as and for the purposes set forth.

2. In combination with an external pivoted valve, a self-closing device consisting of a compressive helical spring held within a tubular guide formed upon or attached to said valve between one end of said guide and a stop at the pivotal point of the valve, substantially as and for the purposes set forth.

401,681. FLEXIBLE POWER-SHAFT. OSCAR J. BROWN, Black River Falls, Wis. Filed July 17, 1888. Serial No. 280,187. (No model.)

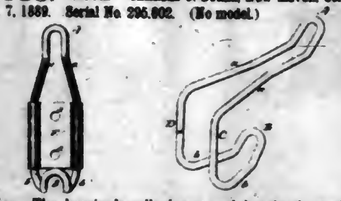
Claim.—1. In a sectional flexible shaft, a series of coupled sections, each composed of an axial power-transmitting chain consisting of universally-joined links, a wire coil inclosing said chain, a flexible sleeve enveloping said coil, metallic blocks secured to both said sleeve and coil in the ends thereof, and rods attached to and rotating with the end links, respectively, of said chain and passing axially through said blocks.

2. In a flexible shaft, the combination, with two stationary sections having a rotary rod projecting axially from their adjacent ends, of a block interposed between said ends, engaging both said rods and rotating therewith, whereby power may be transmitted from one section to the other.

3. The combination, with the power-transmitting chain J and its inclosing-sleeve A G, of the blocks B, provided with the oil-ducts H and the packing-chambers O, closing the ends of said sleeves, and the rods F F', connected to said chain and projecting through said blocks substantially as set forth.

401,682. ELECTRO-THERAPEUTIC SPECTACLES. CASPAR BRUNI, Schlossgasse No. 6/2, Haidhausen, Munich, Germany. Filed Feb. 14, 1888. Serial No. 264,031. (No model.) Patented in England Oct. 27, 1885, No. 12,921.

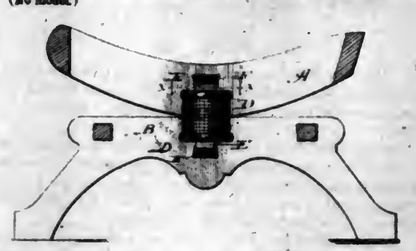
Claim.—1. As an improvement in devices for imparting electricity to the human body, a pair of spectacles comprising the copper frame-work embodying the side arms having openings or perforations in their end portions and the nose or bridge piece, in combination with the plates of zinc secured in and corresponding to said openings and the strip of zinc secured to the under side of the nose-piece, substantially as set forth.



2. As an improvement in devices for imparting electricity to the human body, the spectacle-frame formed of copper and comprising the rims, connecting nose-piece, and side arms flattened at their end portions and formed with an opening or aperture in said flattened portions, in combination with the zinc plates secured in and corresponding to said openings and the zinc strip secured to the under side of the nose-piece and corresponding in curvature thereto, substantially as set forth.

3. In spectacles of the class described, the combination, with the side arms formed of copper and provided with a flattened portion having an opening or aperture, of a zinc plate set in the said opening, substantially as and for the purpose set forth.

4. In spectacles of the class described, a nose-piece formed of copper and comprised in the frame and carrying a zinc plate secured thereto, substantially as and for the purpose set forth.

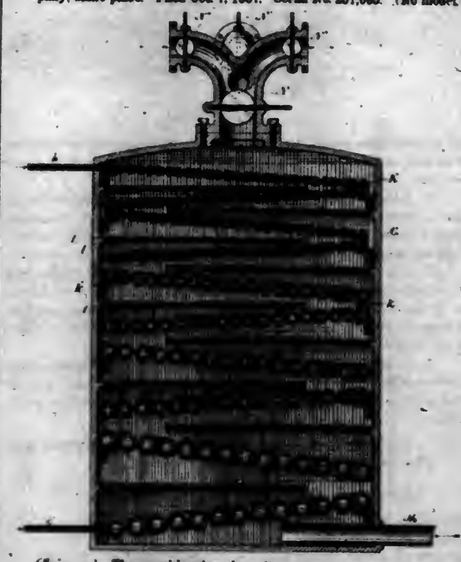


5. In devices for imparting electricity to the human body, the combination, with a spectacle-frame formed of copper and carrying zinc plates or strips secured thereto, of a coating, as at *f*, of lacquer, varnish, or the like, substantially as and for the purpose set forth.

401,683. HOOK. CHARLES O. BURLL, New Haven, Conn. Filed Jan. 7, 1889. Serial No. 295,902. (No model.)

Claim.—The herein-described coat and hat hook, made from a single piece of wire bent to form two parallel uprights, D C, the said uprights turned outward at their upper ends to form two converging branches, *a a*, the said branches coming together at their outer end, and turned upward to form the hook A, the lower ends of the uprights turned outward, forming two converging branches, *b b*, united at their outer ends and turned upward to form the coat-hook B, combined with a sheet-metal base, E, its two ends closed around the respective uprights C D, and so as to form a web-like connection between the said two uprights, and pierced between the said uprights as a means for securing the hook, substantially as described.

401,684. SPRING ATTACHMENT FOR ROCKING-CHAIRS. WILLIAM I. BUNKER, Chicago, Ill. Filed Mar. 12, 1888. Serial No. 267,051. (No model.)



Claim.—1. In a platform rocking-chair, recessed rockers and base-rails, in combination with coiled-spring attachments arranged vertically at the side of the rockers and base-rails at or near the center of oscillation of the chair-seat and provided with projections or attaching portions extending from their ends sidewise, said projections or attaching portions being arranged to enter the recesses in the rockers and base-rails when drawn apart against the drawing tension of the spring and to be held and locked in such recesses when released, substantially as described.

2. In a platform rocking-chair, a rocker and base-rail, one of which is provided with a recess, in combination with a coiled-spring attachment arranged vertically at or near the center of oscillation of the chair-seat, and provided with a projection or attaching portion extending from its end sidewise, said projection or attaching portion being arranged to enter the recess in the recessed rocker or base-rail when drawn out against the drawing tension of the spring and to be held and locked in such recess when released, substantially as described.

3. In a platform rocking-chair, the combination of a base-rail having a recess in its side extending partially through the rail, a rocker having a recess in its side extending partially through the rocker, and a coiled spring having its ends formed into shape to fit the recesses in the rocker and base-rail and connecting them together by engagement therewith at the side of the spring, substantially as described.

401,685. HEATING SYSTEM. WILLIAM W. CANFIELD, New York, N. Y., assignor, by mesne assignments, to the National Heating Company, same place. Filed Oct. 7, 1887. Serial No. 251,685. (No model.)

Claim.—1. The combination, in a hot-water or steam heater, of a casing, as G, having air ingress and egress openings in its top and bottom, respectively, a radiator consisting of separate sections, each of said sections being composed of a series of communicating hollow pipes or bars, said sections communicating at alternate sides of the casing, and diaphragms, as L, arranged alternately and between said sections at equal distances therefrom, whereby air in passing from the bottom to the top of the casing is compelled to pass around the diaphragms and in contact with the entire surface of each of the pipes or bars of the separate sections, substantially as shown and described.

2. The combination, in a steam or hot-water heater, of a casing, as G, having air ingress and egress openings at its bottom and top, respectively, a radiator consisting of separate sections composed of a series of hollow pipes or bars, said sections communicating at alternate sides of the casing, and diaphragms, as L, arranged between said sections, the pipes or bars of which the sections of the radiator are composed increasing in size from the top to the bottom, substantially as shown and described.

3. A radiator consisting of separate sections of hollow pipes or bars, said sections being arranged in planes one above the other, and the pipes of said sections increasing in size from the top to the bottom, substantially as shown and described.

4. The combination, with a hot-air casing, as G, of a radiator consisting of separate sections composed of a series of hollow pipes or bars arranged one above the other, the pipes of which said sections are composed increasing in size from the top to the bottom, substantially as shown and described.

5. In a hot-water or steam heater, the combination, with a casing, as G, having air ingress and egress openings in its bottom and top, respectively, of a radiator consisting of separate sections composed of a series of communicating hollow pipes or bars, said sections being arranged in inclined or oblique planes one above the other, and communicating at alternate sides, and the diaphragms, as L, arranged alternately between said sections at equal distances therefrom, substantially as shown and described.

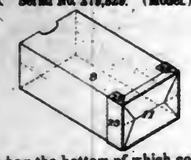
6. A hot-water or steam radiator consisting of separate sections of hollow pipes or bars, said sections being arranged in planes one above the other, the pipes of said sections increasing in size from the top to the bottom, and the egress opening for the steam or hot water being smaller than the pipes or bars of the lower section of the radiator, substantially as shown and described.

401,686. SUPPORT FOR SPINNING-SPINDLES. EDGAR J. CARROLL, Worcester, assignor to George Draper & Sons, Hopedale, Mass. Filed Aug. 22, 1887. Serial No. 247,557. (No model.)

Brief.—The invention has for its object to improve the supports for spindles, whereby the latter may be run at greater speed with less gyration.

Claim.—1. The combination, with a sleeve-whirl spindle and a case or support having therein a rigid bolster-bearing for the spindle,

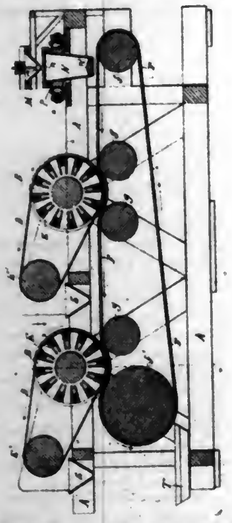
401,686.



of a detachable cup or nut, constituting a step-case, and an oil-reservoir and containing a loose step for the spindle, substantially as described.

2. A sleeve-whirl spindle, a bolster-case, and rigid bolster therein, and a chambered cup or nut at the lower end of the case, combined with a loosely-held step to support the pintle of the spindle, and with locking means to restrain the rotation of the step with the spindle.

3. A sleeve-whirl spindle, a bolster case or support, a bolster held rigidly therein in vertical position by means of adjusting or set screws, as *d*, and a cup or nut, combined with a loosely-held step, and with means to restrain the rotation of the step with the spindle, substantially as described.



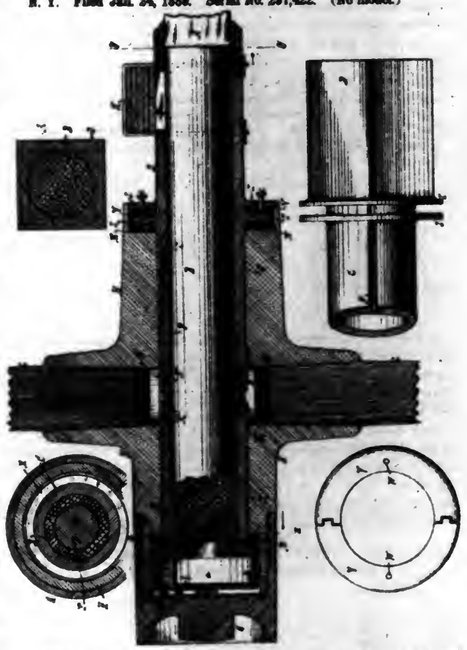
4. A spindle and a bolster-case containing a rigid bolster-bearing, combined with a detachable cup or nut containing a loose step for the spindle-support in said cup or nut, to operate substantially as described.

401,687. PAPER BAG. EDWARD E. CLAUSEN, Hartford, Conn. Filed July 13, 1888. Serial No. 279,829. (Model.)

Claim.—A paper bag the bottom of which consists of a separate rectangular piece of paper larger in all its dimensions than the cross-section of the bag, and the borders of which rectangular piece of paper are pasted to unequal extents to the lower borders of the sides of the bag, and the corners of which rectangular piece of paper are folded over and pasted to sides of the body of the bag, substantially as described in the foregoing specification, and shown in Figs. 9, 12, 28, 32, 48, and 49 of the accompanying drawings.

401,688. MAGNETIC ORE-SEPARATOR. CHANDLER C. COATS, Newark, N. J. Filed July 18, 1888. Serial No. 280,271. (No model.)

Claim.—1. The combination of the magnet-wheel of an ore-separator and a belt passing around it, with a traveling feed-belt, substantially as described.



2. The combination of the magnet-wheel of an ore-separator and a belt passing around it, with a feed-belt traveling in a curved path around a portion of the circumference of the magnet-wheel and adjacent thereto.

3. The combination of the magnet-wheel and its belt with a traveling feed-belt and disks to keep the feed-belt in proper relation to the magnet-wheel.

4. The combination of the magnet-wheel of an ore-separator with a traveling feed-belt having on its face, near each edge, a rib or strip, as and for the purpose set forth.

5. The combination of the magnet-wheel of an ore-separator with a traveling feed-belt having on its face, near each edge, a rib or strips, and rotary disks to bear on the ribs or strips to keep the belt in proper relation to the wheel.

401,689. VEHICLE HUB AND AXLE. JOHAN R. COLE, New York, N. Y. Filed Jan. 24, 1888. Serial No. 297,422. (No model.)

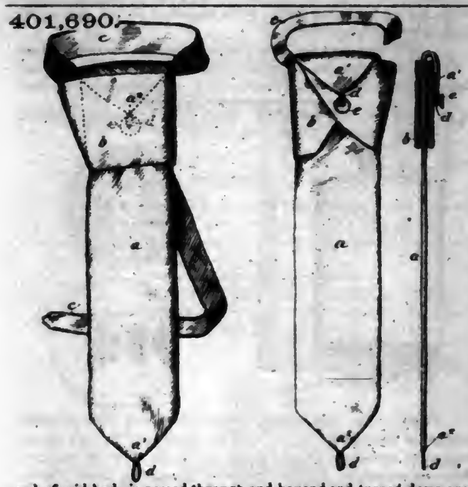
Claim.—1. The combination, with an axle, a hub or wheel, and a spring-seat, K, supported by the axle, of a sleeve secured to said axle and extended back beneath said spring-seat, substantially as described.

2. The combination, with an axle and a hub or wheel, of a sleeve, C, secured to the axle and provided at a point between the axle and the inner end of the hub with collars I I, and the rotary collar V, made in two parts and held between the collars I I by the projecting inner end of the hub, substantially as described.

3. The combination, with an axle and a sleeve secured to said axle and provided with grooves F and X, of a hub having a lubricating-chamber, N, communicating with said grooves and located between the spokes and said sleeve, substantially as described.

4. The combination, with an axle, of a hub provided with a lubricating-chamber, N, located between the spokes and the axle, and with a cushion, U, to prevent escape of the lubricant and to secure a firm seat for the spokes, substantially as described.

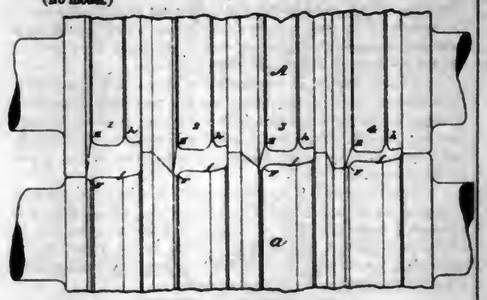
5. The combination, with an axle and a hub or wheel, of a retaining-nut, E, for said hub, said nut being provided with a lubricant-chamber, *a*, and with a supply-opening, Y, and outlet Z for said chamber, and said axle having a channel, F, for leading the lubricant to the hub, substantially as described.



6. The combination, with an axle and a hub or wheel, of a sleeve for said axle, a nut, E, for retaining the hub in place, and a key, P, for locking the nut, the sleeve, and the axle, substantially as described.

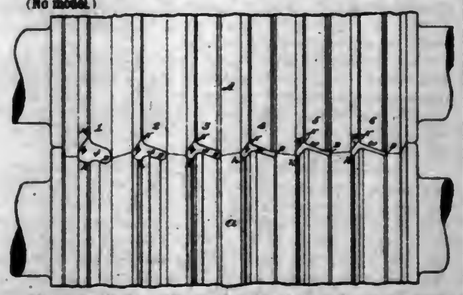
7. The combination, with an axle and a hub or wheel, of a sleeve for said axle, a nut, E, for retaining the hub in place, and a key P, for locking the nut, the sleeve, and the axle, said nut being provided with washers or cushions *b* for the key, substantially as described.

401,690. NECKSCARF. LOUIS COLE, Chicago, Ill. Filed Jan. 12, 1889. Serial No. 296,215. (No model.)



Claim.—In a scarf, an independent knot, *b*, provided with neck-band, in combination with an independent removable body, *a*, whereof each of its front and back sides and each of its ends are finished so as to be reversible face for face and end for end, and of which the upper

401,690.

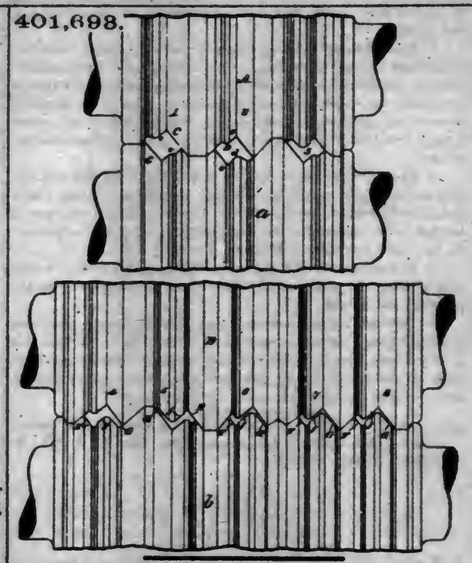


end of said body is passed through and beyond and turned down over the upper back edge of said knot and fastened to the back side thereof, substantially as specified.

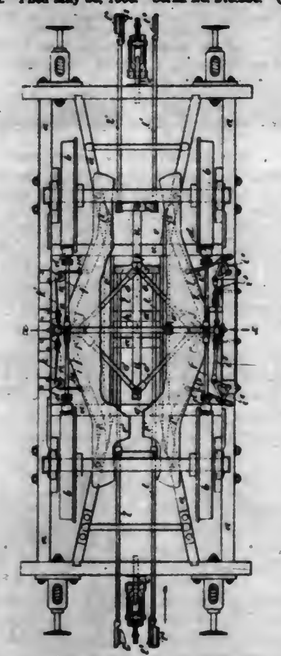
401,691. ROLLS FOR ROLLING THREE-FLANGED SLOT-RAILS. FREDERICK COLLEY, Johnstown, Pa., assignor to The Johnson Steel Street Rail Company, of Kentucky. Filed Nov. 16, 1888. Serial No. 290,966. (No model.)

Claim.—Rolls for rolling three-flanged slot-rails, provided with passes having conformations substantially of the forms described, for the purposes set forth.

401,692. ROLLS FOR ROLLING BULB-WEBBED SLOT-RAILS. FREDERICK COLLEY, Johnstown, Pa., assignor to The Johnson Steel Street Rail Company, of Kentucky. Filed Nov. 16, 1888. Serial No. 290,967. (No model.)



Claim.—Rolls for rolling bulb-webbed slot-rails, provided with passes having conformations substantially of the forms described, for the purposes set forth.



401,693. ROLLS FOR ROLLING Z-SHAPED SLOT-RAILS. FREDERICK COLLEY, Johnstown, Pa., assignor to The Johnson Steel Street Rail Company, of Kentucky. Filed Nov. 16, 1888. Serial No. 290,968. (No model.)

Claim.—Rolls for rolling Z-shaped slot-rails provided with passes having conformations substantially of the forms described, for the purposes set forth.

401,698.

401,694. BRAKE APPARATUS FOR RAILWAY-VEHICLES. THOMAS COWBURN, Modling, and FLORIAN TRITSCHERT, Vienna, Austria-Hungary, assignors of one-half to Arthur Charles Bonsall, Wyldewoods, England. Filed May 28, 1888. Serial No. 275,322. (No model.)

Claim.—1. In continuous-brake apparatus for railway-vehicles, a lever or levers having inwardly-curved ends pivoted centrally and beneath the vehicle, and connected with the brake-blocks, as set forth, either arm respectively of the lever being similarly and equally acted upon, and whereby, when moved upon such central pivot or fulcrum, its motion will be transmitted through its connections (according to the direction in which the vehicle is traveling) to the brakes.

2. The combination, with a pivoted lever or levers, i, pivoted beneath the vehicle and arranged in connection with the brake-blocks, of a series of bars jointed together in the form of a parallelogram or half-parallelogram, the lateral angles or angle of which are or is adapted to bear upon the pivoted levers or lever, while the other angles are respectively connected with rods extending through the end of

the vehicle most remote therefrom, substantially as and for the purpose specified.

3. In continuous-brake apparatus for railway-vehicles, a series of bars jointed together in the form of a parallelogram or half-parallelogram, in combination with push-rods extending through the ends of the vehicle and respectively connected with the angle of the parallelogram or half-parallelogram most remote from the end of the vehicle through which they extend, substantially as and for the purpose described.

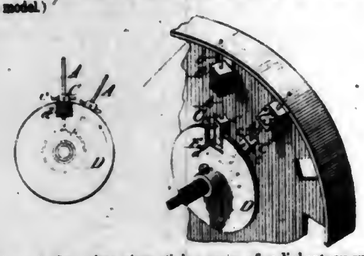
4. The improved means for uniting the ends of the adjacent connecting brake-rods, consisting of the two bars, the one having a solid part, f^3, and the other having a recess, f^4, into which said solid part is adapted to fit, combined with a hinged cap, f^4, adapted to close over the bars after they have been united.

5. In combination with a fixed guide-bar, *y*, and lever, *i*, a half-parallelogram, *o o'*, connected to rods *l l'*, the combination being and operating as set forth.

6. The described improved continuous-brake apparatus, consisting of the following elements in combination, namely: brake-blocks *d*, rods *f*, lever-arms *g*, arm *u*, shaft *h*, lever-bars *i*, having inwardly-bent ends, ropes or chains *k k'*, or their described equivalents, arm *l*, guide-pulleys *n n*, bars *o o'*, cross-bar *s*, rods *t t'*, and cross-bar *s'*.

401,695. JETTY. WILLIAM M. DOUGLAS, Galveston, Tex., assignor of one-third to Charles L. Benske, same place. Filed May 3, 1888. Serial No. 272,647. (No model.)

Claim.—The combination, in a jetty or similar structure, of a core or hearting of clay, piling along the sides of the core, and a stone envelope upon the sides of the core, substantially as set forth.



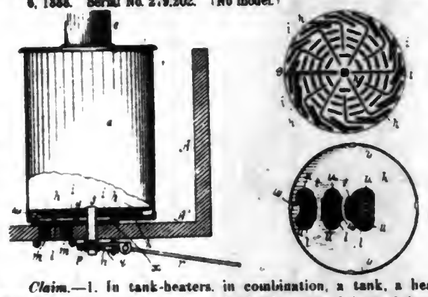
401,696. LAWN-MOWER. FRANK ENOS, Jr., Norwich, Conn. Filed Sept. 24, 1888. Serial No. 286,294. (No model.)

Claim.—1. In combination with a rotary cutter having spiral knives, a yielding shearing-blade parallel or approximately parallel with the axis of said rotary cutter and pressing against its knives, substantially as set forth, and for the purpose specified.

2. In combination with a rotary cutter having spiral knives, a shearing-blade substantially parallel with the axis of said cutter and pressing against its knives, said blade being formed of sheet metal, arranged as described, so that the cutting-edge may yield to follow the cutting-edge of said rotary cutter, substantially as and for the object specified.

401,697. TIME-PIECE DIAL. MARTIN V. B. SYBRIDGE, Boston, Mass., assignor of two-thirds to John Swann, New York, N. Y., and Henry B. Waite, West Newton, Mass. Filed June 20, 1888. Serial No. 277,634. (No model.)

Claim.—1. In a time-piece dial, a series of radial rotary spindles carrying turnstiles, in combination with a single notched disk or plate and a projecting pin or arm thereon, substantially as described.



2. In a time-piece dial, the combination of a series of radial rotary spindles having turnstiles thereon, a disk secured to the hour-hand sleeve and having a single notch in its periphery, and a projecting arm or pin upon the disk, substantially as described.

3. In combination with one or more radial spindles of a time-piece dial, said spindles being provided with projecting pins thereon, a notched disk and a pin or arm projecting from said disk, substantially as described.

4. In a time-piece dial, the combination of a series of radial rotary spindles carrying turnstiles, a disk secured to the hour-hand sleeve having a notched flange, and a projecting pin or arm on the disk, substantially as described.

5. In a time-piece dial, the combination, with a series of radial rotary spindles carrying turnstiles, of the disk D, notched at *d*, and the pin or arm E, projecting from the disk, substantially as described.

401,698. TANK-HEATER. FRANK FUHR, Decatur, Ill. Filed July 6, 1888. Serial No. 279,202. (No model.)

Claim.—1. In tank-heaters, in combination, a tank, a heater secured to the bottom of the tank, the heater and the tank having coincident openings, a grate in the heater having ribs on its under surface, and a shaft for the grate extending through the heater and the tank, as and for the purpose set forth.

2. In tank-heaters, in combination, a tank, a heater secured to the bottom of the tank, the heater and the tank having coincident openings, a grate in the heater having deflected ribs on its under surface, and means for rotating the grate, as and for the purpose set forth.

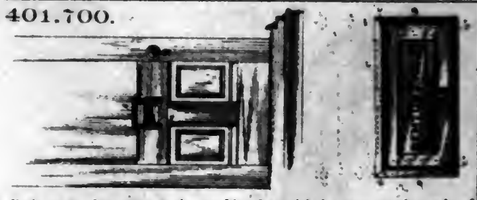
3. In tank-heaters, in combination, a tank, a heater having a portion of its bottom depressed and secured to the bottom of the tank, coinciding vents in the depression of the bottom of the heater and in the bottom of the tank, a grate in the heater, a shaft for the grate extending through the heater and through the tank, and a lever to actuate the shaft, as and for the purpose set forth.

4. In tank-heaters, in combination, a tank, a heater secured to the bottom of the tank, the heater and the tank having coincident openings, a grate in the heater, a shaft for the grate extending through the heater and the tank, a ratchet-wheel on the lower end of the shaft, and a lever carrying a pawl adapted to actuate the ratchet, as and for the purpose set forth.

5. In tank-heaters, in combination, a tank, a heater in the tank secured to the bottom thereof, the heater and tank having coincident openings, a removable lid for the heater, a smoke-stack fixed to the lid and provided with handles, a grate in the heater, a shaft for the grate extended through the heater and the tank, and means below the tank for rotating the shaft, as set forth.

401,699. PROCESS OF MAKING SODA. FREDERICK H. GOSSAGE, Widnes, County of Lancaster, England, assignor of one-half to Thomas Train Mathiesen, same place. Filed Dec. 4, 1888. Serial No. 292,652. (No specimens.) Patented in England Mar. 2, 1888, No. 3,218.

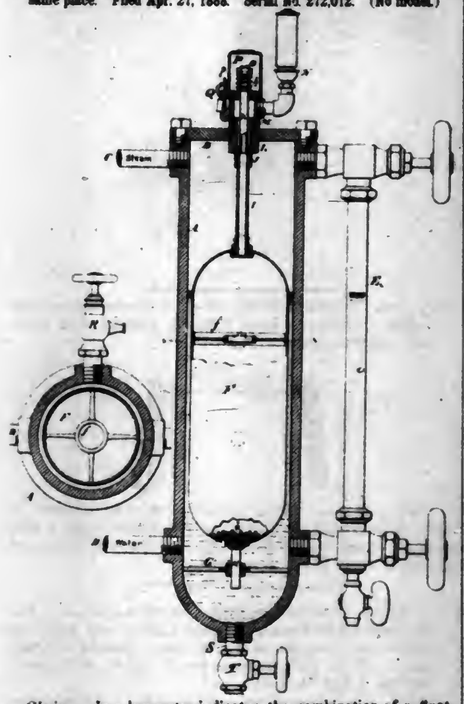
Claim.—1. The improvement in the manufacture of sulphide of sodium or sulphide of potassium which consists in adding to a mixture of sulphate of soda or sulphate of potash and carbonaceous matter a quantity of sodium or common salt, in about the proportion of eight parts, by weight, of such salt to every twenty parts, by weight, of the sulphate during reduction.



2. In the manufacture of sulphide of sodium or sulphide of potassium, adding to a mixture of sulphate of soda or sulphate of potash and carbonaceous matter a quantity of sodium or common salt, in about the proportion of eight parts, by weight, of such salt to every twenty parts, by weight, of the sulphate during reduction, the mixture after cooling then being lixiviated.

3. In the manufacture of sulphide of sodium or sulphide of potassium, adding to a mixture of sulphate of soda or sulphate of potash and carbonaceous matter a quantity of sodium or common salt, in about the proportion of eight parts by weight, of such salt to every twenty parts, by weight, of the sulphate during reduction, the mixture after cooling then being lixiviated, and after this, in order to obtain bicarbonate of soda, mixing with the sulphide a solution of a corresponding chloride or sulphate, the whole then being subjected to the action of carbonic-acid gas.

401,700. NAME AND LETTER-DROP PLATE. WILLIAM GRAHAM, Cleveland, Ohio. Filed June 30, 1888. Serial No. 278,067. (No model.)



Claim.—A door provided with an opening for the introduction of mail, a name-plate, C, having beveled edges *c*, stops c', limiting the downward movement of the plate, recesses c^3, matching with shoulders in the keepers, and projections c^2 on the back of the plate to

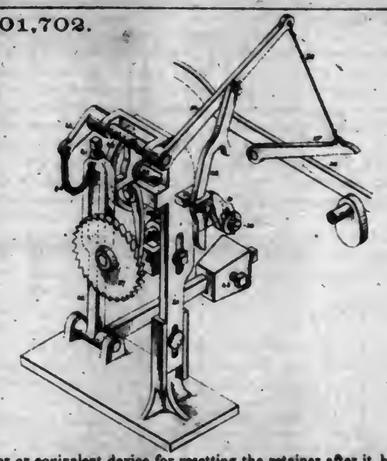
401,700.

limit upward movement, in combination with keepers at the ends of the plates C, having dovetail grooves *d*, shoulders d', flat portion d^4, with cut-away portion d^5 and screw-holes d^6, all adapted to parts of the name-plate, substantially as set forth.

401,701. LOW-WATER INDICATOR FOR STEAM-BOILERS. PHILIP J. GRAU, Philadelphia, Pa., assignor to Jeremiah G. Donoghue, same place. Filed Apr. 27, 1888. Serial No. 272,012. (No model.)

Claim.—In a low-water indicator, the combination of a float-chamber, a head therefor, a valve-seat and whistle carried thereby, a float, a valve-stem extending from the top of the float and connected to said head, and a valve on said stem adapted to work with the valve-seat, whereby the float, valve, and all of their appendages may be simultaneously removed with the removal of the head.

401,702. SHUTTLE-BOX-PATTERN MECHANISM FOR LOOMS FOR WEAVING FABRICS HAVING END BORDERS. FRANK HERDIS, Philadelphia, Pa. Filed Jan. 24, 1889. Serial No. 297,391. (No model.)



Brief.—An improvement on the devices presented in Letters Patent No. 399,613, dated March 12, 1889.

Claim.—1. The combination of the drop-box-chain-operating rod and its arm, a retainer for holding said arm out of operative position, a tripper for said retainer, a weighted lever or equivalent resetting device for said retainer, a connection between the resetting device and the retainer, a cam for governing the action of said resetting device, and means for operating the tripper and cam, substantially as specified.

2. The combination of the drop-box-chain-operating rod and its arm movable into and out of operative position, a rock-shaft having a lever connected to said arm and provided with a retainer for holding the arm in inoperative position, a tripper for said retainer, a weighted lever connected to an arm on the rock-shaft, a cam for acting on said weighted lever, and means for operating the tripper and cam, substantially as specified.

3. The combination of the drop-box-chain-operating rod and its arm movable into and out of operative position, a retainer for holding said arm in inoperative position, a tripper for said retainer, a weighted

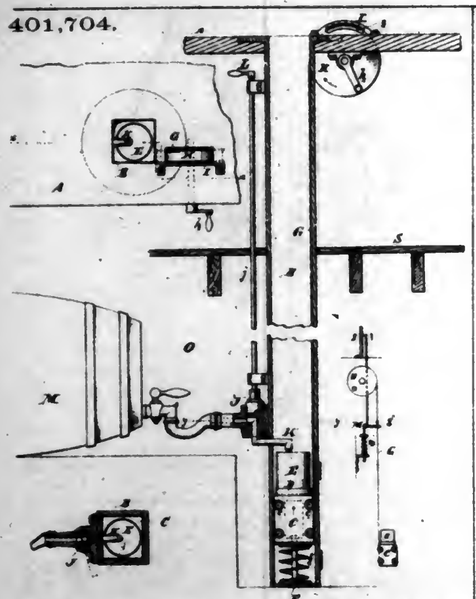
401,702.

lever or equivalent device for resetting the retainer after it has been tripped, a connection between the resetting device and the retainer, a cam for governing the operation of said resetting device, a set-screw on the resetting device for engaging with said governing-cam, and means for actuating the tripper and cam, substantially as specified.

401,703. SPINDLE FOR SPINNING-MACHINES. JAMES HOGG and ALFRED H. ROBINSON, Lawrence, Mass. Filed Jan. 5, 1888. Serial No. 259,836. (No model.)

Claim.—A lifter plate or rail, a spindle-support, *b*, secured to the plate or rail and provided with an inclined frictional seat for the bobbin-carrying tube, a spindle provided at its upper end with an inclined shoulder or offset and having a screw-threaded connection with and vertically adjustable in said support *b*, a bobbin-carrying tube provided at its upper end with a plug, *k*, of anti-friction metal, and having a hole formed therein, said plug resting on the inclined shoulder or offset of said spindle, the bobbin-carrying tube being also provided with a base, *i*, conforming to the inclined frictional seat on support *b*, and a check-nut, *f*, on the lower end of the spindle, adapted to be screwed up against the lower face of the support *b*, all combined, arranged, and operating substantially as set forth.

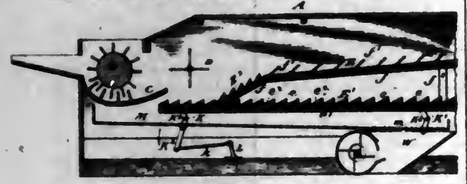
401,704. APPARATUS FOR DELIVERING LIQUIDS. SYLVESTER JENKINS, Lansdale, Pa., assignor of one-half to William R. Dean, Jr., same place. Filed Aug. 31, 1888. Serial No. 284,233. (No model.)



Claim.—1. The combination, with an elevator-shaft or guideway extending from one room to another, of a carriage movable therein, provided with a hollow bottom, a spring secured to said bottom, a downwardly-extending stem or support secured to said spring and adapted to be received into said hollow bottom as the receptacle descends, when the weight of the carriage is increased, and power devices to raise and lower said carriage in the guideway.

2. The combination, with an elevator-shaft or guideway extending from one room to another, of a carriage movable therein, provided with a hollow bottom, a spring secured to said bottom, a downwardly-extending stem or support secured to said spring and adapted to be received into said hollow bottom as the receptacle descends, when the weight of the carriage is increased, and power devices to raise and lower said carriage in the guideway, a measuring device, and a connection between said measuring device and the carriage.

3. The combination, with an elevator-shaft or guideway extending from one room to another, of a carriage movable therein, provided with a hollow bottom and having anti-friction rollers on its sides, a spring secured to said bottom, a downwardly-extending stem or support secured to said spring and adapted to be received into said hollow bottom as the receptacle descends, when the weight of the carriage is increased, and power devices to raise and lower said carriage in the guideway.



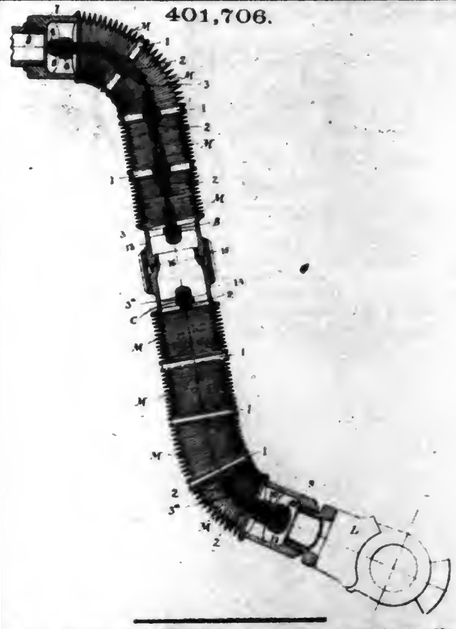
4. The apparatus comprising an elevator-shaft or guideway ex-

401,704.

tending from an upper to a lower room, a receptacle movable in said elevator-shaft, a liquor-reservoir at the lower part of said elevator-shaft, a spigot or valve connecting with said reservoir, said spigot adapted to be laterally moved into and out of said shaft and to be opened or closed by said movement, and a substantially vertical torsional rod connected with said valve and extending upward substantially to the top of said elevator-shaft.

401,705. THRASHING-MACHINE. WILLIAM KING, St. James, Minn. Filed July 25, 1888. Serial No. 280,963. (No model.)

Claim.—In a thrashing-machine, the shaker consisting of the angularly and transversely slatted floors E' E² and the longitudinally-slatted carrier E, rigidly mounted thereon, the floor E' being horizontal and the floor E² and carrier E inclined, as shown, the shaker E extending over the floor E' and being provided with rearwardly-inclined pins *f'*, combined with the shafts K K', arms K² K³, mounted on said shafts, a crank, and a connecting-rod, substantially as set forth.



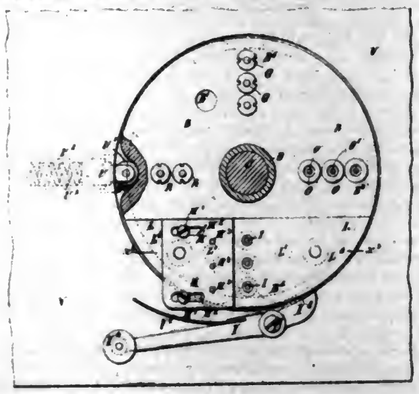
401,706. FLEXIBLE PIPING FOR AIR-BRAKES. DIMIRÉ M. LEGAT, Paris, France. Filed Sept. 14, 1888. Serial No. 285,406. (No model.) Patented in Germany May 17, 1887, No. 41,626; in France July 6, 1888, No. 191,635; in Belgium Aug. 10, 1888, No. 82,852; in England Aug. 13, 1888, No. 11,648, and in Italy Aug. 23, 1888, XLVII, 223.

Claim.—1. In a flexible piping, the combination of a set of membranes, M, a set of rings, 1, tubes 2, secured severally to the bore of each ring, and a wire rope extending through said tubes and serving to prevent expansion of the membranes, substantially as shown and described.

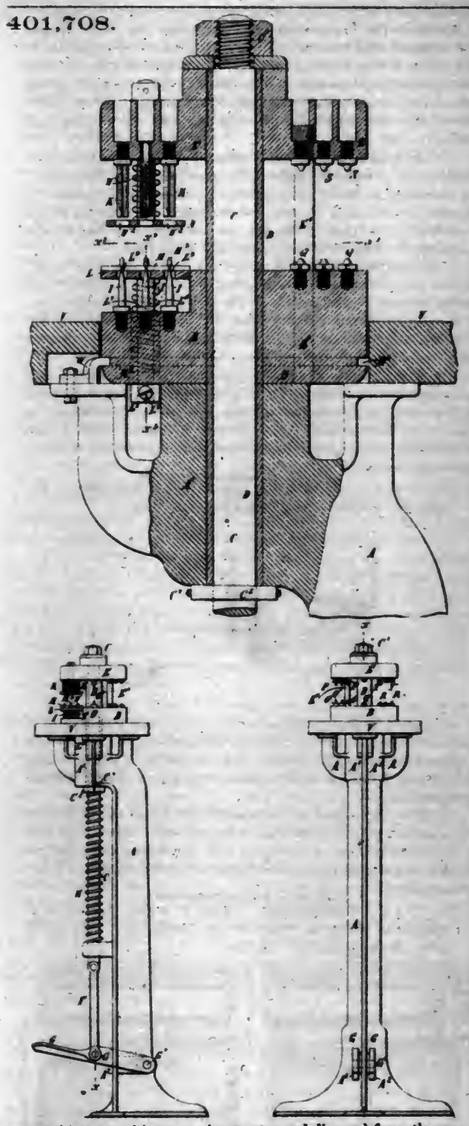
2. In a flexible piping, the combination of a set of membranes made substantially as shown and described, a series of rings, 1, interposed between each two adjacent membranes, and provided with bosses, as set forth, a series of tubes, 2, severally secured to said bosses, and wire rope extending centrally through the series of membranes, rings, and tubes, and fastened at its extremities, substantially as shown and described, and for the purposes set forth.

3. In a flexible piping having a set of membranes, M, the combination, with such membranes, of a wire rope extending through the same, a perforated boss, 10, through which the separated strands at the ends of the wire are passed, and a nut serving to fasten such ends to the boss, all substantially as shown and described.

401,706.



401,707. BARREL-COVER. GEORGE W. LINDSEY, Baltimore, Md., assignor of one-third to Joseph B. Budding, York, Pa. Filed Nov. 6, 1888. Serial No. 290,100. (No model.)



Claim.—A cover made in two sections which are connected by hinges, and one section provided on its under side with clips to take astride of the barrel-rim, and also provided with fastening-hooks whose ends may be driven into the barrel-staves.

401,708. RIVETING-MACHINE. HIRAM S. MAXIM, London, England, assignor to the Maxim Gun Company, (Limited,) same place. Filed Aug. 24, 1888. Serial No. 283,632. (No model.) Patented in England Aug. 20, 1886, No. 10,686; in France May 27, 1887, No. 183,853, and in Italy Aug. 8, 1887, No. 22,144.

Claim.—1. In an eyeleting or riveting machine, the combination, with one or more upwardly-projecting conical punches, each adapted to receive an eyelet, and a perforated spring-seated plate through which the punches extend, of a corresponding die or dies movable toward the punches and adapted to receive the punches and the eyelets thereon, whereby the punches will perforate the cloth or other

401,708.

material interposed between the punches and dies and force the eyelets therein, as set forth.

2. In an eyeleting or riveting machine, the combination, with a series of punches with conical ends adapted to receive eyelets upon them, a spring-seated perforated plate through which the punches extend, and corresponding dies for operating conjointly with the punches to perforate the cloth or other material and insert the eyelets therein, of a series of anvils or devices for riveting or clinching the eyelets previously inserted in the cloth by the punches, all of said devices being connected to simultaneously-moving supports, whereby the insertion of eyelets and the riveting of others are performed by one operation, as set forth.

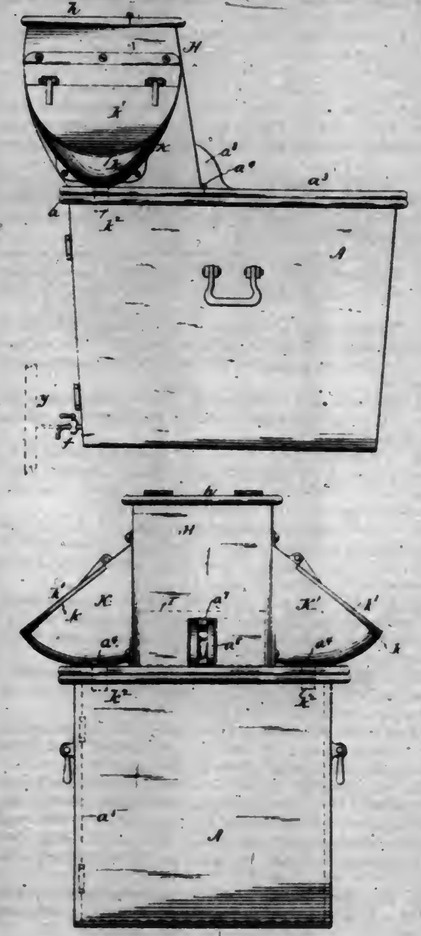
3. In an eyeleting or riveting machine, the combination of two rotating disks or heads provided, respectively, with studs or punches and corresponding dies and also with clinching or riveting devices, one of said disks being movable toward and away from the other, as set forth.

4. In an eyleting or riveting machine, the combination, with the disks or heads, one movable toward and away from the other, of studs or punches set in one of the disks, and dies in the other, and spring-seated plates with perforations through which the studs and dies project, as and for the purpose set forth.

5. In an eyleting-machine, the combination, with a perforating stud or punch, of a tubular die slit longitudinally and into which the stud projects when the machine is operated, as set forth.

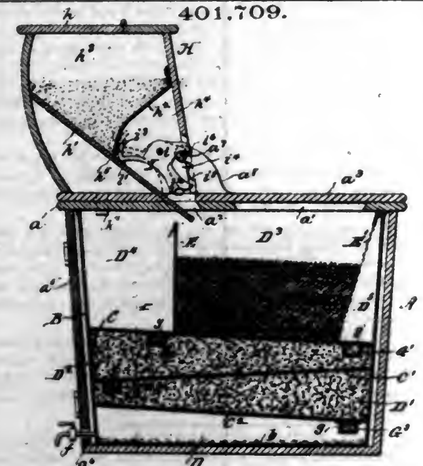
6. In an eyeleting or riveting machine, the combination of a series of dies, a disk or head below the same, perforating studs or punches fixed therein, a spring-seated plate with perforations therein through which the studs project, and means, substantially as described, for locking or retaining the said plate when forced down against the force of the springs, as set forth.

7. The combination, with the movable heads or disks B E, of the anvils O, and the spring-seated rods or pins O', working in the same and set in one of said heads, and the dies P, with projecting pins or studs P' fixed to the other head, as set forth.



8. The combination, with the rotating disks or heads B E, provided with perforating and riveting or clinching devices, of the rod or shaft G, secured to head E, and passing through the head B, the lever G, connected to rod C for raising and lowering the same, and the spring H, surrounding the rod and acting to raise it when depressed, as described.

9. The combination, with the series of punches, of a gage-plate, M, adjustable with respect to the same and provided with studs or pins M², adapted to be passed through the clinched or riveted eyelets in the material, and to so determine the points at which the next perforations are to be made, as set forth.



401,709. FECULENT-MATTER RECEIVER. OSCAR D. MCCLELLAN, Philadelphia, Pa., assignor, by mesne assignments, to the Sanitary and Fertilizer Company of the United States, same place. Filed Dec. 26, 1888. Serial No. 294,713. (No model.)

Claim.—1. A feculent-matter receiver having perforated deposit-chamber D⁴, in combination with a series of reversely-inclined filtering-chambers having perforations at the lower or terminal parts of their inclinations, substantially as set forth.

2. A feculent-matter receiver having deposit-chamber D⁴, hav-

401,709.

ing a perforated front side, E', a chamber, D³, in front of chamber D³, in combination with a series of filtering-chambers, substantially as set forth.

3. The receiver B, having perforated deposit-chamber D³, in combination with a series of reversely-inclined filtering-chambers, each having a perforated pocket at their exit or terminal end, and an outlet-chamber below the filtering-chambers, substantially as set forth.

4. A feculent-matter receiver having deposit-chamber D³, provided with a perforated side, E', and a chamber, D³, in front of side E', in combination with a series of filtering-chambers and an outlet-chamber below said filtering-chambers, substantially as set forth.

5. A feculent-matter receiver having deposit-chamber D³, in combination with a series of filtering-chambers and precipitant pockets or receptacles located in said filtering-chambers, substantially as set forth.

6. A feculent-matter receiver having separate deposit-chambers, located one in front of the other, a series of reversely-inclined filtering-chambers located below said deposit-chambers, and an outlet therefor, substantially as set forth.

7. In a feculent-matter receiver, the combination of separate chambers D³ D⁴, the pockets G G', filtering-chambers D² D', having pockets G² G², and an outlet for said filtering-chambers, substantially as set forth.

8. The combination of chambers D³ D⁴, intervening partition, E, inclined partitions C, C', and C², having pockets G G' G² G², and outlet for the chambers bounded by said partitions C C' C², substantially as set forth.

9. The combination of chambers D³ D⁴ D⁴, reversely-inclined partitions C C' C², having pockets G G' G² G², and chamber D, substantially as set forth.

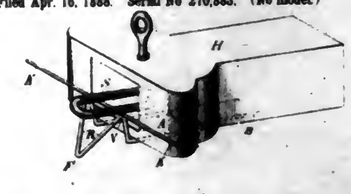
10. In a feculent-matter receiver, the perforated pockets G G', containing alum, and chambers D² D', located one above the other, containing a charge of pulverized coke or equivalent material, and having perforated pockets G¹ G², substantially as set forth.

11. In combination with perforated chamber D³, the chambers D² D', containing a filtering compound, perforated pockets G² G² in said chambers D² D', a supply of alum in said pockets G² G², and an outlet-chamber, D, substantially as set forth.

12. In combination with perforated chamber D³, the chambers D² D', containing a filtering compound, perforated pockets G². G² in said chambers D² D', an outlet-chamber, D, a supply of alum in said pockets G² G², and chamber D, substantially as set forth.

13. In combination with perforated chamber D³, the reversely-inclined partitions C C' C², having perforated pockets G' G² G², and side flanges, c, substantially as set forth.

14. In combination with receiver-casing A, having seat-opening a', lid a^3, and passage-way a^2 back of said seat-opening, of receptacle H, having incline h', extending through the passage-way a^2, valve I, pivoted within receptacle H near the bottom of incline h', and having two oppositely-located seating-edges facing and having alternate contact with incline h', and mechanism interposed between seat-lid a^3 and valve I for effecting the alternate contact of the valve-seating edges with said incline as the seat is raised and lowered, substantially as set forth.

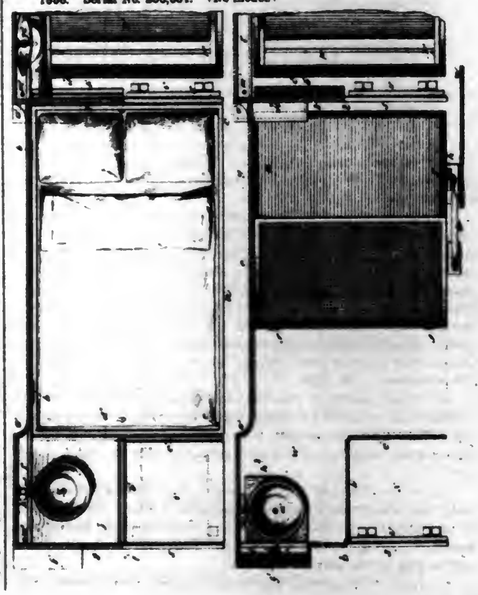


15. In combination with receiver-casing A, having seat-opening a', lid a^3, and passage-way a^2 back of said seat-opening, of receptacle H, having incline h', extending through passage-way a^2 and divided into communicating chambers h^3 h^4, valve I, pivoted within chamber h^4 near the bottom of incline h', and having two oppositely-located seating-edges for alternate contact with incline h', and a recess, i^4, having ends i^5 and i^6, and bracket a^6 on seat-lid a^3, having pin a^7 for alternate contact with ends i^5 i^6 as the seat is raised and lowered, substantially as set forth.

16. In combination with the receiver A, of a perforated deposit-chamber, D³, a separate chamber, D⁴, back of chamber D³ and having perforated pocket G', a receptacle, H, located above chamber D⁴, separate receptacles K K', secured to receptacle H and having outlet-pipes leading into chamber D⁴, and a series of filtering-chambers located below chambers D³ D⁴, substantially as set forth.

17. In combination with a receiver, A, having seat-lid a^3, a perforated deposit-chamber, D³, a chamber, D⁴, back of chamber D³ and having perforated outlet-pocket G', one or more separate receptacles, K K', communicating with chamber D³, and a series of filtering-chambers below chambers D³ D⁴, substantially as and for the purpose set forth.

18. In a receiver, A, having a seat-lid, a^3, the combination of a deposit-chamber, a series of filtering-chambers, a separate chamber back of said deposit-chamber, a supply-receptacle, H, containing an absorbing compound and having charging devices actuated by said seat-lid to eject a charge of said compound into said deposit-chamber, substantially as set forth.



401,710. CAR-COUPLING. ALLEN W. MCKENZIE, Helena, Wis. Filed Apr. 16, 1888. Serial No. 270,883. (No model.)

Claim.—1. The combination, in a car-coupling device, of a hinged swinging device or coupler, A, having a deflecting point or outward end, R, horizontal link-rest and handles K K, and attaching-strip B, substantially as shown and described, and for the use and purpose specified.

2. The combination, in a car-coupling device, of a hinged swinging device or coupler A, having a deflecting point or outward end, R, horizontal link-rest, and handles K K, and the attaching yoke or swing C, substantially as shown and described, and for the use and purpose specified.

401,711. SLEEPING-CAR. THOMAS W. MOORE, Plainfield, N. J., assignor to Thomas W. Moore, Jr., Los Angeles, Cal. Filed Oct. 22, 1888. Serial No. 288,851. (No model.)

Claim.—1. In a berth-section of a sleeping car having upper and lower berths, a private closet for each berth thereof, located between one end of the berths and the stationary partition at the end of the section and separated from each other by the folding partition b', located between them and connected to said stationary partition, with the entrance to the rear closet from the end and rear part of the lower berth, substantially as described.

2. In a berth-section of a sleeping-car having upper and lower berths, a private closet for each berth thereof, located between one end of the berths and the stationary partition at the end of the section and separated from each other by the folding partition b', located between them and connected to said stationary partition, with the entrance to the rear closet from the end and rear part of the lower berth, in combination with the jointed lower berth folding backward from said entrance, substantially as described.

3. In a berth-section of a sleeping-car having upper and lower berths, a private closet for each berth thereof, located between one end of the berths and the stationary partition at the end of the section and separated from each other, and the front closet separated from the lower berth by the folding partition b' d, jointed together and connected to said stationary partition, substantially as described.

4. In a berth-section of a sleeping-car having upper and lower berths, a private closet for each berth thereof, located between one end of the berths and the stationary partition at the end of the section and separated from each other, and the front closet separated from the lower berth by the folding partition b' d, jointed together and connected to said stationary partition, in combination with the folding basin-stand for the front closet, located over the rear closet and the folding stand in said front closet, substantially as described.

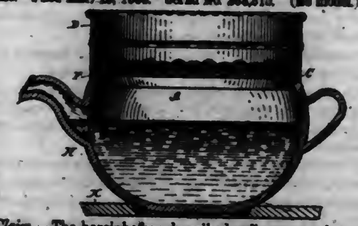
5. In a berth-section of a sleeping-car having upper and lower berths, a private closet for each berth thereof, located between one end of the berths and the stationary partition at the end of the section and separated from each other, the front closet separated from the lower berth, and the rear closet separated from the upper berth up to the basin-stand of the front closet by the folding partition b', d and d', jointed together and connected to said stationary partition, substantially as described.

6. In a berth-section of a sleeping-car having upper and lower berths, a private closet for each berth thereof, located between one end of the berths and the stationary partition at the end of the section and separated from each other, and the front closet separated from the lower berth by the folding partition b' d, jointed together and connected to the stationary partition, in combination with the basin-shelf in the rear closet folding into the recess of the stationary partition clear of the folding partition when folded, substantially as described.

7. In a berth-section of a sleeping-car having upper and lower berths, a private closet for each berth thereof, located between one end of the berths and the stationary partition at the end of the section and separated from each other, and the front closet separated from the lower berth by the folding partition b' d, jointed together and connected to the stationary partition, in combination with the basin-shelf of the front closet, located over the rear closet, substantially as described.

8. In a berth-section of a sleeping-car having upper and lower berths, a private closet for each berth thereof, located between one end of the berths and the stationary partition at the end of the section and separated from each other, and the front closet separated from the lower berth by the folding partition b' d, jointed together and connected to the stationary partition, in combination with the basin-shelf in the rear closet folding into the recess of the stationary partition clear of the folding partition, and the basin-shelf of the front closet located over the rear closet, substantially as described.

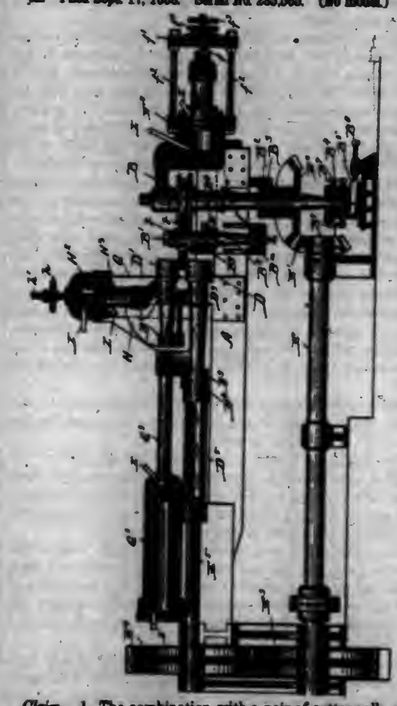
9. In a berth-section of a sleeping-car having upper and lower berths, a private closet for each berth thereof, located between one end of the berths and the stationary partition at the end of the section and separated from each other, and the front closet separated from the lower berth by the folding partition b' d, jointed together and connected to said stationary partition, in combination with the lower berth having the folding sections d e and being supported on the pivot-joint g to fold up and form a seat-back at the opposite end of the berth-section, substantially as described.



10. In a berth-section of a sleeping-car, the lower berth having the folding sections d e and being supported on the pivots g to fold up against the stationary partition s and form a seat-back, substantially as described.

11. In a berth-section of a sleeping-car having upper and lower berths, the lower berth having the folding sections d e, and the seat i, jointed to the lower side of section d and having jointed legs and arms, and said section supported on pivots g to fold up against partition s and form a back to the seat i, substantially as described.

12. The combination of the clothes-holding web p with the folding bed consisting of section d, supported on pivots g to fold upright thereon and having section e jointed to one end to fold over on it, said web being attached to the downwardly-folding end of section d and to the lower end of section e to form a clothes-sack, substantially as described.



13. In a berth-section of a sleeping-car, the combination of the clothes-holding web p with the lower berth having the folding sections d e and supported on pivots g, and with the stationary partition s, said berth being arranged to fold up against said partition for a seat-back, substantially as described.

401,712. COLANDER-STEAMER. GEORGE L. MOTTER, Rich Hill, Mo. Filed Mar. 10, 1888. Serial No. 266,815. (No model.)

Claim.—The hereinbefore-described culinary vessel, consisting of the cylindrical vessel having the narrow flange projecting laterally and inwardly from its lower edge, the tapering or beveled flange projecting downwardly and inwardly from said narrow flange, and the removable perforated bottom turned or struck up round its edge, whereby it may rest on said flanges when used as a colander, or be inverted and rest on the lateral flange only when used as a steamer, substantially as described.

401,718. TIRE-ROLLING MACHINE. JAMES MURTON, Maywood, Ill. Filed Sept. 17, 1888. Serial No. 285,566. (No model.)

Claim.—1. The combination, with a pair of cutter-rolls, of a pair of edging-rolls, substantially as specified.

2. The combination, with a pair of horizontal or edging rolls, D D', said roll D' being journaled in a vertically-movable slide, of a hydraulic cylinder and piston for operating said vertically-movable slide, an exterior vertical roll, and an inside movable pressure-roll mounted on a separate slide from said edging-rolls, substantially as specified.

3. The combination, with stationary exterior cutter-roll, B, of inside movable pressure cutter-roll, B', a slide upon which it is mounted, and a fixed stop on the frame of the machine limiting the movement of said slide, substantially as specified.

4. The combination, with cutter-rolls B B', of slide F, hydraulic

cylinder F^4, piston F^5, connected to said slide, and adjustable stop *f* on the frame of the machine, limiting the movement of said slide to prevent the cutter-flanges of said rolls from meeting, substantially as specified.

5. The combination, with an exterior stationary roll and its shaft, of inner movable roll and its shaft, a slide upon which said pressure-roll is mounted, a hydraulic cylinder and piston, and a connection between said slide and piston passing astride of said stationary roll or its shaft, substantially as specified.

6. The combination, with exterior vertical fixed roll, B, of inside pressure-roll, a movable slide on which said pressure-roll is mounted, two edging-rolls and two exterior vertical pressure-rolls, C C, and a main slide, as G, upon which said edging-rolls and said exterior pressure-rolls are all mounted, substantially as specified.

7. The combination, with edging-rolls D D′, of a movable main slide, G, carrying both said rolls, substantially as specified.

8. The combination, with edging-rolls D D′, of a movable main slide, G, carrying both said rolls, and a supplemental vertical slide mounted upon said main slide and in which one of said edging-rolls is journaled, substantially as specified.

9. The combination, with edging-rolls D D′ and a movable main slide, G, carrying both said rolls, and a supplemental vertical slide mounted upon said main slide and in which one of said edging-rolls is journaled, of a hydraulic cylinder and piston mounted on said main slide for operating said supplemental slide, substantially as specified.

10. The combination, with edging-rolls D D′, of a movable main slide, G, carrying both said rolls, and exterior vertical rolls, C C, mounted on said main slide G, substantially as specified.

11. The combination, with main slide G, of supplemental vertical slide H, mounted on said main slide, edging-roll D, journaled on said main slide, edging-roll D′, journaled on said supplemental slide, a hydraulic cylinder and piston carried by said main slide for operating said supplemental slide, exterior vertical rolls, C C, mounted on said main slide, and a fixed exterior roll opposing said rolls C C, substantially as specified.

12. The combination, with main slide G, of supplemental vertical slide H, mounted on said main slide, edging-roll D, journaled on said main slide, edging-roll D′, journaled on said supplemental slide, a hydraulic cylinder, H^3, and piston H^5, carried by said main slide, for operating said supplemental slide, exterior vertical rolls, C C, mounted on said main slide, a fixed exterior roll opposing said rolls C C, and a hydraulic cylinder, G^3, and piston G^5, mounted on the frame of the machine, for operating said main slide G, substantially as specified.

13. The combination, with main slide G, of supplemental vertical slide H, mounted on said main slide, edging-roll D, journaled on said main slide, edging-roll D′, journaled on said supplemental slide, a hydraulic cylinder, H^3, and piston H^5, carried by said main slide, for operating said supplemental slide, exterior vertical rolls, C C, mounted on said main slide, a fixed exterior roll opposing said rolls C C, a hydraulic cylinder, G^3, and piston G^5, mounted on the frame of the machine, for operating said main slide G, an inside vertical pressure-roll, a separate horizontal slide upon which it is mounted, and a hydraulic cylinder, F^3, and piston F^5 at the opposite end of the machine from said hydraulic cylinder and piston G^3 G^5, substantially as specified.

14. The combination, with main slide G, of edging-rolls D D′, carried thereby, shaft D^4, shaft E^3, and sliding sleeve D^5, connecting said shafts D^4 and E^3, substantially as specified.

15. The combination, with a stationary vertically-driven roll-shaft, B^3, of a horizontal slide carrying an inside pressure-roll shaft, a horizontal slide carrying exterior pressure-rolls, and hydraulic cylinders and pistons mounted on opposite sides of said stationary roll-shaft for operating said slides, substantially as specified.

16. The combination, with a stationary vertically-driven roll-shaft, B^3, of a horizontal slide carrying an inside pressure-roll shaft, a horizontal slide carrying exterior pressure-rolls, and hydraulic cylinders and pistons mounted on opposite sides of said stationary roll-shaft for operating said slides, and a pair of edging-rolls mounted upon said slide G, substantially as specified.

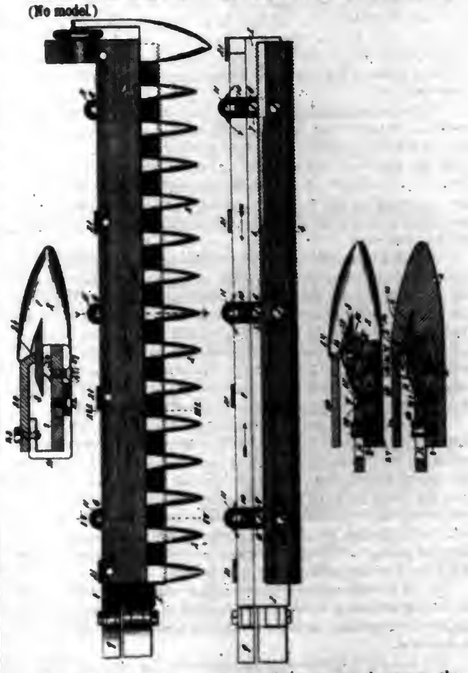
17. The combination, with edging-rolls D D′, of a movable main slide carrying both said edging-rolls, a stationary exterior roll, a movable or pressure inside roll opposing said stationary exterior roll, and an independent slide, upon which said inside pressure-roll is mounted, substantially as specified.

18. The combination, with a stationary exterior roll, of an inside pressure or movable roll, a horizontal slide, F, upon which it is mounted, a main slide, G, a supplemental slide, H, mounted on said main slide, edging-roll D, mounted on said main slide G, and edging-roll D′, mounted in said supplemental slide H, substantially as specified.

19. The combination, with a stationary exterior roll, of an inside pressure or movable roll, a horizontal slide, F, upon which it is mounted, a main slide, G, a supplemental slide, H, mounted on said main slide, edging-roll D, mounted on said main slide G, edging-roll D′, mounted in said supplemental slide H, and hydraulic cylinders and pistons at opposite ends of the machine, for operating said horizontal slides F and G, substantially as specified.

20. The combination, with a stationary exterior roll, of an inside pressure or movable roll, a horizontal slide, F, upon which it is mounted, a main slide, G, a supplemental slide, H, mounted on said main slide, edging-roll D, mounted on said main slide G, edging-roll D′, mounted in said supplemental slide H, and a hydraulic cylinder and piston mounted in said slide G, for operating said supplemental slide H, substantially as specified.

21. The combination, with a stationary exterior roll, of an inside pressure or movable roll, a horizontal slide, F, upon which it is mounted, a main slide, G, a supplemental slide, H, mounted on said main slide, edging-roll D, mounted on said main slide G, edging-roll D′, mounted on said supplemental slide H, a hydraulic cylinder, H^3, and piston H^5 on said main slide G, for operating said supplemental slide H, and hydraulic cylinders F^4 G^3 and pistons F^5 G^5 at opposite ends of the machine, for operating said horizontal slides F and G, substantially as specified.



22. In a tire-rolling mill, the combination of horizontal edging-roll D, vertically-movable or pressure edging-roll D′, and a stop to limit the downward movement of said edging-roll D′, substantially as specified.

23. In a tire-rolling mill, the combination, with a horizontal edging-roll, D, of vertically-movable edging-roll D′, a vertically-movable slide upon which it is journaled, a hydraulic cylinder and piston for operating said slide, and a stop for limiting its movement, substantially as specified.

24. The combination, in a tire-rolling mill, of an exterior vertical stationary roll, an inside movable pressure-roll, a hydraulic cylinder and piston for operating it, and a stop for limiting its movement, substantially as specified.

25. The combination, in a tire-rolling mill, of an exterior vertical stationary roll, an inside movable pressure-roll, a hydraulic cylinder and piston for operating it, and a stop for limiting its movement, a horizontal edging-roll, D, a movable edging-roll, D′, a hydraulic cylinder and piston for operating it, and a stop for limiting its movement, substantially as specified.

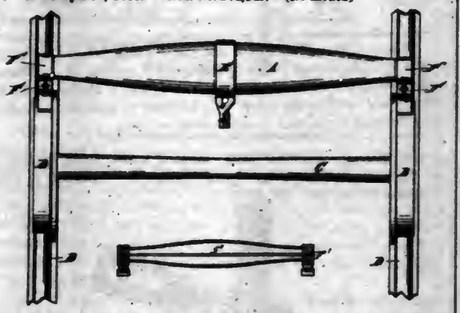
401,714. CUTTER-BAR FOR REAPERS AND MOWERS. JOHN I. MURRAY, St. Louis, Mo. Filed June 2, 1888. Serial No. 275,846. (No model.)

Claim.—1. In a cutting apparatus for reapers and mowers, the combination of the finger-bar, guard-fingers secured to the bar, arms pivoted to the bar, a knife pivoted to the forward ends of the arms, and a reciprocating bar pivoted to the rear ends of the arms, and by which the knife is operated, substantially as and for the purpose set forth.

2. In a cutting apparatus for reapers and mowers, the combination of the finger-bar, guard-fingers secured to the bar, a single reciprocating knife extending lengthwise of the cutting apparatus, and operating-bar parallel with and connected with said knife, and mechanism for imparting the necessary motions to said knife from said operating-bar, substantially as set forth.

3. In a cutting apparatus for reapers and mowers, the combination of the finger-bar, guard-fingers secured to the bar, arms pivoted to the bar, a knife pivoted to the arms, and a reciprocating bar pivoted to the arms for operating the arms, the connection between the knife and arms being made by means of studs 13 and screws 5, having enlarged heads 14, substantially as and for the purpose set forth.

4. In a cutting apparatus for reapers and mowers, the combination of the finger-bar, guard-fingers secured to the bar, arms pivoted to the bar, a knife pivoted to the forward ends of the arms, and a bar pivoted to the rear ends of the arms to operate the knife, the arms being connected with the finger-bar by means of screws 7, having enlarged heads 16 and shoulders 17, substantially as and for the purpose set forth.



5. In a cutting apparatus for reapers and mowers, the combination of the finger-bar, guard-fingers secured to the bar, a knife, means for operating the knife, and a cap-plate, 20, having flanges 24 fitting between the guard-fingers and the tongue-and-groove connection with the upper rear extensions of the guard-fingers, substantially as and for the purpose set forth.

6. In a cutting apparatus for reapers and mowers, the combination of the finger-bar, guard-fingers secured to the bar, a knife, means for operating the knife, the main plate 20, U-shaped straps 21, connecting plate 20 and the finger-bar at the rear, screws 22, passing through the finger-bar and straps, and bolts 23, passing through the upper ends of straps 21 and the rear end of the plate 20, substantially as and for the purpose set forth.

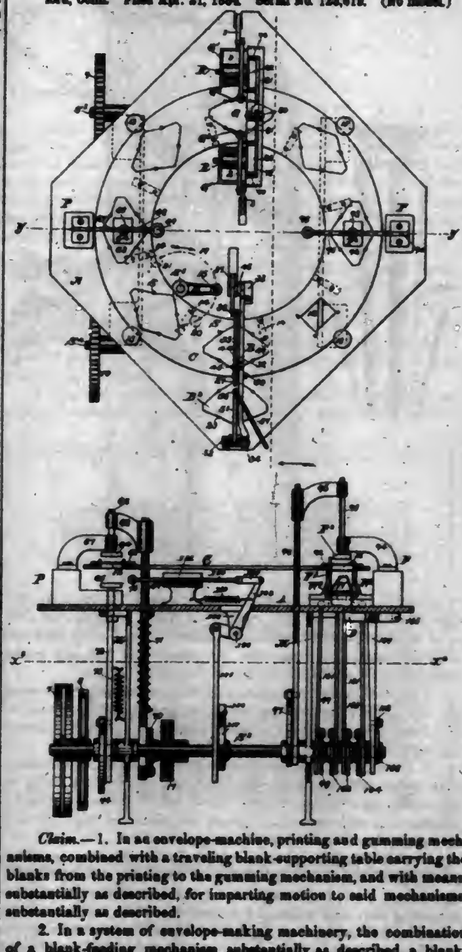
401,715. TANNING PROCESS. ERIK OLLESTAD, St. Paul, Minn., assignor of one-half to Andrew Jenson, same place. Filed Mar. 2, 1888. Serial No. 265,955. (No specimens.)

Claim.—As an improvement in the art of tanning, the process described, which consists in treating the hides with a solution composed, essentially, of water-tanning extracts, blue vitriol, alum, bichromate of potash, and sulphuric acid, as set forth.

401,716. BRAKE-BEAM. WILLIAM A. PRIOR, Detroit, Mich. Filed Apr. 19, 1888. Serial No. 271,149. (No model.)

Claim.—1. A brake-beam made of metal in two parts, A' A^3, said parts united by embracing-straps and having upon the interior re-enforcing blocks, said beam being in the form of a flattened tube of greater sectional dimensions along its middle portion than at its extremities, substantially as and for the purposes described.

2. The combination, with a hollow brake-beam, of a brake-head cast with a socket and an interior fillet, into which the end of the brake-beam projects, and which serves the purpose of a support for the end of the brake-beam, substantially as described.



3. The combination, with a hollow brake-beam, of brake-heads cast with sockets to receive the ends of the brake-beam, and with a single longitudinal bolt, *f*′, extending from end to end of the beam, whereby said heads and beam are fastened together, substantially as described.

4. The combination of interior re-enforcing blocks with a hollow brake-beam made in two parts united along the front and rear of the beam, the meeting edges of said parts being provided with flanges a' a^3, substantially as described.

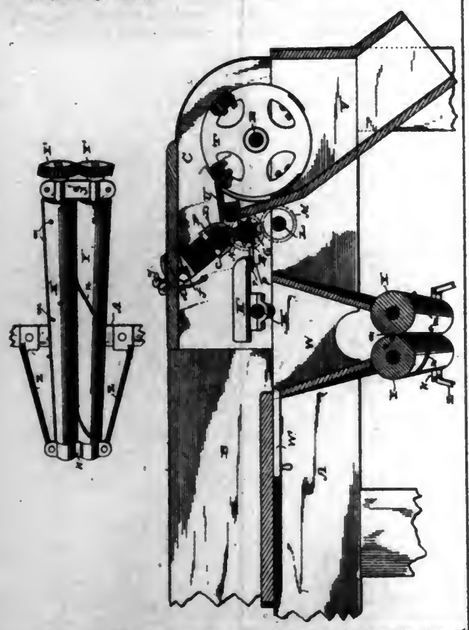
401,717. FLANNEL SHIRT. FRANK D. REMSHAW, Long Pine Nebr. Filed Jan. 5, 1889. Serial No. 295,881. (No model.)

Claim.—A shirt provided with a neck-band, composed of an outer layer of worsted, an inner layer of muslin, and buckram or the like between said layers, and a collar attached to said neck-band and composed of two layers of worsted, and layers of buckram or the like between the worsted layers, substantially as set forth.

401,718. ENVELOPE-MACHINE. FRANCIS H. RICHARDS, Springfield, Mass., assignor of one-half to The Pratt & Whitney Company, Hartford, Conn. Filed Apr. 21, 1884. Serial No. 128,619. (No model.)

Claim.—1. In an envelope-machine, printing and gumming mechanisms, combined with a traveling blank-supporting table carrying the blanks from the printing to the gumming mechanism, and with means, substantially as described, for imparting motion to said mechanisms, substantially as described.

2. In a system of envelope-making machinery, the combination of a blank-feeding mechanism, substantially as described, a blank-printing mechanism, substantially as described, a blank-gumming mechanism, substantially as described, and a blank-folding mechan-



lem, substantially as described, all located in a circuit in the order described, and a blank-carrier operating to receive blanks from the blank-feeding mechanism and convey them first to the blank-printing mechanism, then to the blank-gumming mechanism, and finally to the blank-folding mechanism, substantially as set forth.

3. In a system of envelope-making machinery, the combination of a blank-feeding mechanism, substantially as described, a blank-printing mechanism, substantially as described, a blank-gumming mechanism, substantially as described, and a blank-folding mechanism, substantially as described, all located, in the order described, in a circular circuit, and a circular blank-carrier operating to receive blanks from the blank-feeding mechanism and convey them first to the blank-printing mechanism or mechanisms, then to the blank-gumming mechanism, and then to the blank-folding mechanism, substantially as set forth.

4. In an envelope-machine, the traveling blank-carrier and gumming apparatuses situated on opposite sides of said carrier and arranged to operate on the blanks on said carrier, all substantially as described.

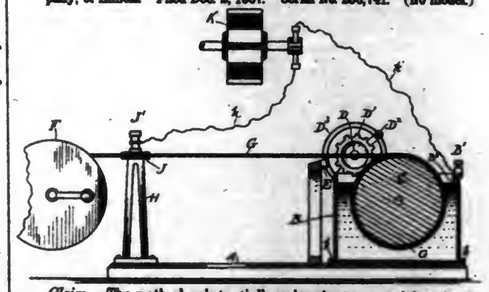
5. In an envelope-machine, the traveling blank-carrier and gumming apparatuses situated on opposite sides of said carrier and arranged to operate simultaneously on the same envelope-blank on said carrier, all substantially as described.

401,719. COMBINED FEED-CUTTER AND CORN-HUSKER. AUGUST ROSENTHAL, Milwaukee, Wis. Filed Oct. 29, 1888. Serial No. 289,399. (No model.)

Claim.—1. In a stalk-cutter and corn-husker, the combination of the cutter-box provided with longitudinal guides, a crank-shaft journaled to said cutter-box, and a plate loosely clipped to the shaft and provided with lateral projections for engagement with said guides, substantially as set forth.

2. In a stalk-cutter and corn-husker, the combination of a cutter box having its sides provided with slots, a crank-shaft journaled to said cutter-box, and a plate loosely clipped to the shaft and having projections that engage said slots, substantially as set forth.

3. A stalk-cutter and corn-husker comprising a cutter-box, shear-plate, cutter-head, and feed-rollers, in combination with a tilting reciprocating plate arranged in the rear of said feed-rollers, a chute depending from said cutter-box beneath the plate, and husking-rollers arranged below the chute, substantially as set forth.



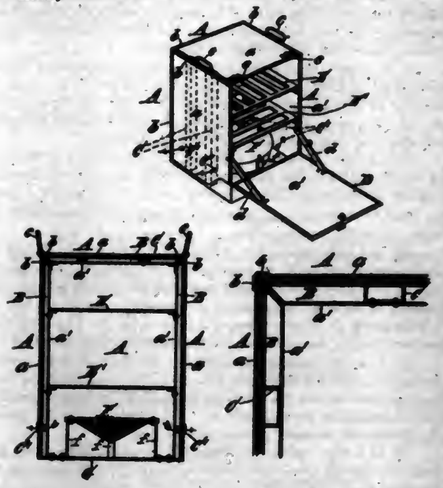
4. A stalk-cutter and corn-husker comprising a cutter-box, shear-plate, cutter-head, and feed-rollers, in combination with a tilting reciprocating plate arranged in the rear of said feed-rollers, a chute depending from said cutter-box beneath the plate, and inclined and tapered rollers arranged parallel to each other below the chute, one of these rollers being provided with a series of pins spirally arranged thereon and the other with a spiral groove to engage said pins, substantially as set forth.

401,720. CARRIAGE-CURTAIN FASTENER. SAMUEL P. SCOTT, Hillsborough, Ohio, assignor to the Star Manufacturing Company, same place. Filed Jan. 10, 1889. Serial No. 295,940. (No model.)

Claim.—As an improved article of manufacture, the herein-described four-part carriage-curtain fastening, consisting of a base-piece having a central bore enlarged at its outer end and a projecting flange around said bore, a head-piece having a central bore enlarged at its inner end to receive the flange of the base-piece, and having pairs of diametrically-opposite notches in its outer face at the end of the bore, with a coiled spring inclosed between the head and base in the enlargements of the bores thereof, and a pin passing through said head, spring, and base and rigidly secured to the base only, and having a pair of diametrically-opposite ears on its outer end adapted to engage the notches of the head and lie flush with the surface thereof when locked, all substantially as and for the purpose specified.

401,721. METHOD OF TEMPERING SPIRAL SPRINGS. FREDERICK SEDGWICK, Chicago, Ill., assignor to the American Spring Company, of Illinois. Filed Dec. 2, 1887. Serial No. 256,741. (No model.)

Claim.—The method, substantially as herein shown and described, in the manufacture of coiled springs, which consists in simultaneously heating the steel wire or strip to redness or a ductile condition, winding and chilling the same upon a former or mandrel, and afterward drawing the temper in any well-known way.



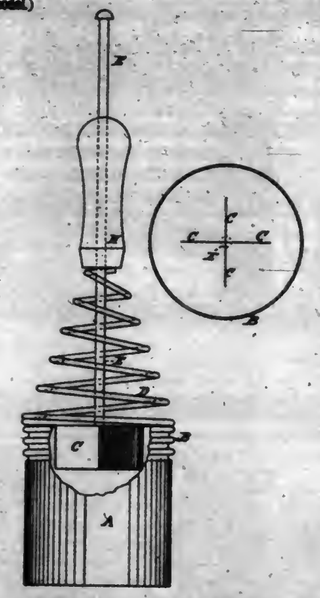
401,722. LIFTING-JACK. AXEL A. STROM, Austin, assignor to the Strom Manufacturing Company, Chicago, Ill. Filed Dec. 20, 1888. Serial No. 294,188. (No model.)

Claim.—1. In a lifting-jack, the combination, with the standard lifting-bar, and operating-lever, of a clutch for raising the lifting-bar or holding it in raised position, and comprising a collar on the bar provided with one or more reduced bearings near the center of its inner side, and a bearing-plate for each reduced bearing having a recess formed in its back transversely of the plate and fitting upon the reduced bearing, whereby the bearing-plate is pivotally supported between the collar and lifting-bar, substantially as and for the purpose set forth.

2. In a lifting-jack, the combination, with the standard, lifting-bar, and operating-lever, of a clutch for raising the lifting-bar or holding it in raised position, and comprising a collar supported on the bar and provided near the center of its inner side with one or more reduced grooved bearings, each having a rounded bar in the groove, and a bearing-plate for each reduced bearing having a recess formed in its back transversely of the plate and fitting over the rounded bar, whereby the bearing-plate is pivotally supported between the collar and lifting-bar, substantially as and for the purpose set forth.

401,728. OVEN FOR VAPOR OR GAS STOVES. JOSEPH STUBERS, Cincinnati, Ohio. Filed Nov. 4, 1887. Serial No. 254,274. (No model.)

Claim.—1. In a bake-oven for vapor or gas stoves, the walls A, each composed of two sheets, one of asbestus or other suitable non-conducting material on the outside, and the other of metal on the inside, the latter being turned or flared outwardly at its ends and sides to form a frame for receiving the said sheet of asbestus, and then a part of said flared ends and sides lapped over the edges of said asbestus sheeting to hold it in position and at the same time furnish a protecting seam or binding on the corners of the oven, substantially as herein set forth.



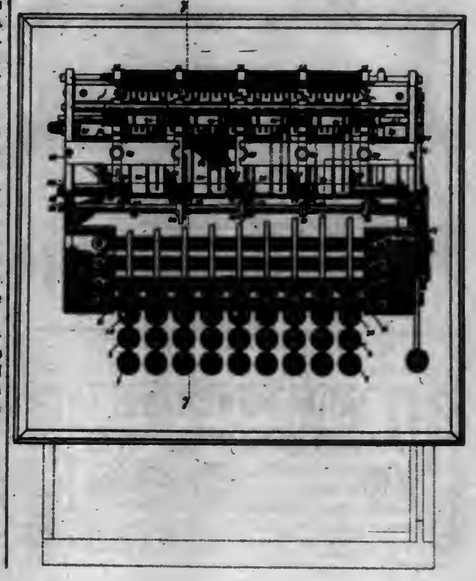
2. In a bake-oven for vapor or gas stoves, the walls A, each composed of two sheets, one of asbestus or other suitable non-conducting material on the outside, and the other of metal on the inside, the latter being turned or flared outwardly on the ends of the sides next the door, and the ends of the door being likewise turned or flared outwardly, the flared ends being lapped over the edge of the adjacent asbestus sheeting, substantially as and for the purposes specified.

3. In a bake-oven, an exterior wall of asbestus or other non-conducting substance and an inner wall of sheet metal, these two walls inclosing an air-space between them, the edges of the inner metal wall crossing the air space and lapping around the outer edges of the outer wall, substantially as and for the purposes specified.

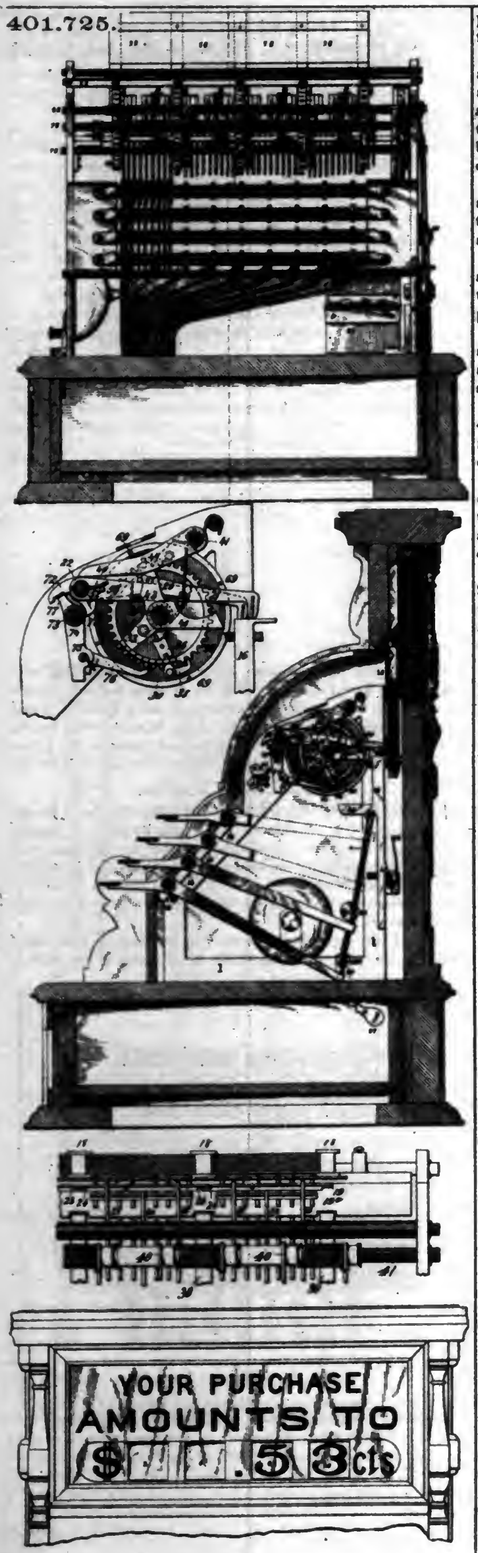
4. In a bake-oven, an exterior wall of asbestus or other non-conducting substance and an inner wall of sheet metal, these two walls inclosing an air-space between them, the edges of the inner metal wall crossing the air-space and lapping around the outer edges of the outer wall, and braces or stops for holding apart the central portions of the said outer and inner walls, substantially as and for the purposes specified.

5. In a bake-oven, the door composed of two sheets, one of asbestus or other suitable non-conducting material on the outside, and the other of metal on the inside, an air-space being present between the outside and inside sheets, the ends of said metal sheet lapping over the edges of the adjacent asbestus sheet, substantially as and for the purposes specified.

401,724. DEVICE FOR AGITATING LIQUIDS. ROBERT S. WILLIAMS, Merchantville, N. J. Filed Jan. 15, 1889. Serial No. 296,432. (No model.)



Claim.—The liquid-agitating device described, consisting of a receptacle, A, having a tightly-fitting cap or cover, said cap or cover carrying upon its upper surface a spring, D, and a standard, E, and on its lower surface blades or breakers, in combination with a handle, H, secured to the upper end of the spring and provided with a bore for reciprocating upon said standard, substantially as shown and described.



401,725. CASH INDICATOR AND REGISTER. WILLIAM W. WYTHE, Chautauqua, N. Y. Filed July 3, 1888. Serial No. 278,912. (Model.)

Claim.—1. In a cash register and indicator, the combination of the coiled springs 39 with the money-drawer D by means of the bent lever 60 63, connecting-rod 65, arm 66, sleeves 52, and pins 92, by means of which the closing of the drawer winds up the springs, substantially as described.

2. In a cash register and indicator, the combination of the coiled springs 39 with the registering-wheels 32 by means of the notched

401,725.

plates 36 and locking-pawls 38, whereby the wheels 32 are carried forward when the springs are released, substantially as described.

3. In a cash register and indicator, a curved arm, 34, constructed as the segment of a hollow cylinder or tube cut obliquely to its axis and bearing upon one edge nine notches or steps supported by radial arms 33 35, proceeding from a sleeve, 32ᵃ, which turns loosely upon the shaft 31, in combination with a registering-wheel, 32, and arms 49, by means of which the registering-wheel may be stopped at varying distances.

4. In a cash register and indicator, the combination of the curved arm 34 and spring 39 with an arm, 49, connected with a key-lever, so that when the key is depressed the arm 49 acts as a stop on the curved arm 34, substantially as described.

5. In a cash register and indicator, the combination of the curved arm 34 with the wheels 32 by means of the pawl 38 and plate 36, so that upon the release of the springs the wheel and pawl act as one piece, substantially as described.

6. In a cash register and indicator, the combination of the notched arms 43 with the pins 44 and arms 40, by means of which the curved arms 34 are held in position and the springs retained in tension, substantially as described.

7. In a cash register and indicator, the combination of the arms 46 with the pins 44 and arms 40, by means of which the arms 43 are released by the backward movement of the shaft 31 consequent upon opening the drawer, substantially as described.

8. In a cash register and indicator, the combination of two or more series of keys with the arms 43 and quadrants 34 by means of the rods 16, bars 19ᵃ, arms 20, and pins 48, so that the depression of any key of a series disengages the arm 43 and releases the spring 39 corresponding to that series, substantially as specified.

9. In a cash register and indicator, the combination of the pins 92 and shaft 31 with the locking-pawls 38 by means of the notched plate 36, so that by the rotation of the said shaft backward the pawls are lifted from the teeth of the wheels 32 and move independently of them, substantially as described.

10. In a cash register and indicator, the sleeve 74, with lugs 77 and jointed pawls 75 76, in combination with the notched arms 72, lugs 70, and pins 69, so arranged that when the pins 69 engage with the lugs 70 the arms 72 are raised sufficiently to release the lugs 77 and the pawls 75 76 are retracted one tooth on the wheels 32, preparatory to their action on the wheels, substantially as described.

11. In a cash register and indicator, the shaft 79, with a series of lugs, 80, arranged upon it, so that upon the rotation of the shaft the lugs press against the retracted pawls 75 76 and push them forward in succession the space of one tooth on the wheels 32, moving the wheels that distance, substantially as described.

12. In a cash register and indicator, the combination of the bellows 81, rack 89, pinion 90, shaft 79, pawls 76, and wheels 32, by means of which the speed of the carrying mechanism is controlled, substantially as described.

13. In a cash register and indicator, the combination of the shaft 79, lugs 80, and pawls 75 76 with the bellows 81 in such a way that the motion of the wheels 32 by the jointed pawls 76 can only take place when the other mechanism is at rest, substantially as described.

14. In a cash register and indicator, the combination of the retaining-pawls 26 with the bellows 81 by means of the arm 91, so that the rods 16 are kept up until all other motions of the mechanism have ceased, substantially as described.

15. In a cash register and indicator, the combination of the sleeves 32ᵃ, arms 35 43, pins 44, arm 20, and pin 48, by means of which the mechanism is locked until a key is depressed and the shaft 31 is rotated, substantially as described.

16. In a cash register and indicator, the locking-pawl 38, so arranged, in combination with the plate 36, pin 92, shaft 31, arm 66, connecting-rod 65, bent lever 60 63, and drawer D, that the pawl engages with the registering-wheel at the moment the drawer is opened, and remains engaged until the movement of the wheel is completed and the drawer is closed.

17. In a cash register and indicator, the combination of the curved arm 34, the sleeve 32ᵃ, the arms 33 and 35, the plate 36, the pawl 38, engaging with the toothed wheel 32, and the coiled spring 39, substantially as and for the purpose described.

18. The combination of two or more series of vertical sliding rods, 16, carrying the figured indicating-slides, the stops 49, engaging with the notches on the curved arms 34, connecting-rod *a*, and the key-levers 8 9 10 11, substantially as and for the purpose described.

19. In a cash register and indicator, the combination of the retaining-pawls 26 on the shaft 27, engaging with the tooth 25 on the sliding rods 16, and the arm 91, substantially as and for the purpose specified.

20. In a cash register and indicator, a series of figured plates provided with the arms *b* at different positions on the plate, and the guiding-arms *c d*, substantially as and for the purpose described.

21. In a cash register and indicator, the combination of the bar 19, carrying the zero-plate, the arms 20 21, journaled on the shaft 22, and the lugs 23 and 24, substantially as and for the purpose described.

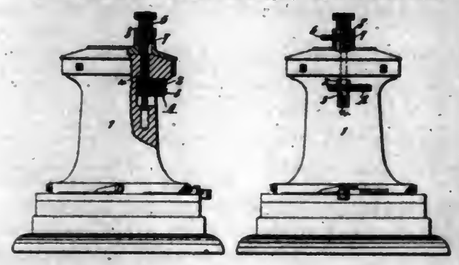
22. In a cash register and indicator, the combination of the arm 35, the locking-pins 44 on the arm 40, the pins 48 on the arm 20, the bar 19ᵃ, and the sliding rods 16, substantially as and for the purpose described.

23. In a cash register and indicator, the combination of the pins 52 on the shaft 22, the pins 53 on the arm 21, the arms 54 and 55, pivoted on the frame, the rod 56, and hook 57, engaging with the notch 58, substantially as and for the purpose described.

24. In a cash register and indicator, the combination of the spring 59, the arm 60, and the roller 61, the connecting-rod 65, the arm 66, the shaft 31, and the arm 41, by means of which the drawer is thrown open and the shaft 31 revolved, substantially as and for the purpose specified.

25. In a cash register and indicator, the combination of the pins 69 on the wheel 30, the lug 70, the notched arm 72, the lug 77, the arm 75, sleeve 74, and pawl 76, substantially as and for the purpose specified.

26. In a cash register and indicator, the combination of the lugs 80 on the shaft 79, the pinion 90, the rack 89, the bellows 81, arm 82, pin 83, slot 84, lug 85, and hook 86, substantially as and for the purpose specified.



27. In a cash register and indicator, the combination of the pin 92, inserted on the shaft 31, the lug 93, pawl 38, sleeve 32ᵃ, and spring 39, substantially as and for the purpose specified.

28. In a cash register and indicator, the key-levers 8 9 10 11, in combination with the connecting-rods A and rod 16, with its lug 49, by means of which the indicating-slides are raised, and at the same time the registering-wheels are stopped in the proper position, substantially as described.

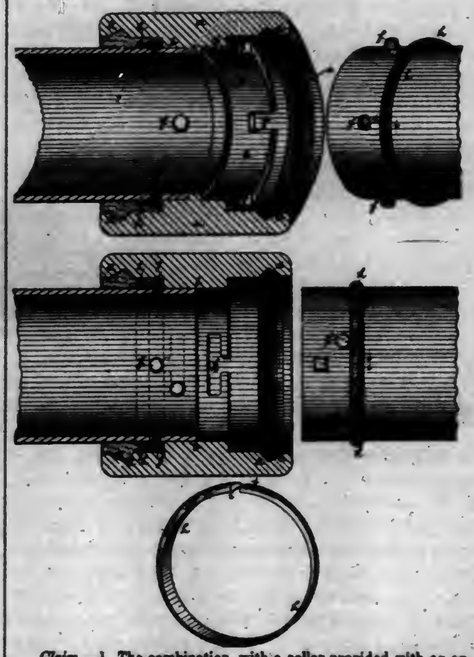
401,726. **CAR-COUPLING.** JOHN C. BRYANT, Charity, Tenn., assignor of two-thirds to James N. Bryant, same place, and John M. Sullivan, Flat Creek, Tenn. Filed Dec. 27, 1887. Serial No. 259,161. (No model.)

Claim.—In a car-coupling, the combination of the draw-head *b*, having the recess *l*, the flaring opening *n*, provided with a removable plate, *m*, with the clutches *k*, the cranks *e*, having crank-shafts *i*, the springs *k*, the chains *f* and *o*, the rods *c* and *d*, and pin *g*, having a conical-shaped head at each end, all constructed, arranged, and operating substantially as shown and described, and for the purpose set forth.

401,727. **COMBINED DRUM AND GRIPPER.** HORATIO FLETCHER, Newcastle-upon-Tyne, County of Northumberland, England. Filed Apr. 30, 1888. Serial No. 273,262. (No model.) Patented in England June 23, 1887, No. 8,948, and Nov. 18, 1887, No. 15,570; in France Mar. 27, 1888, No. 189,621; in Belgium Mar. 27, 1888, No. 81,196; in Italy Mar. 31, 1888, XLVI, 47, and in Austria-Hungary July 5, 1888, No. 13,186.

Claim.—1. In winding machinery, the combination of a winding-barrel, a gripping device comprising a fixed and a movable jaw, both applied to and extending outwardly from the circumference of said barrel, and a rod located within and extending to one end of said barrel for actuating said movable jaw, substantially as herein described, for the purpose set forth.

2. In winding machinery, the combination of a winding-barrel having a slot or guide, a hole extending lengthwise therein, and a bearing for a rod, a gripping device comprising a jaw fixed to said barrel, and a movable jaw arranged to work in said slot or guide, and a rod or bolt located in said hole and adapted to cause said movable jaw to approach or recede from said fixed jaw, said rod being arranged to act against said bearing, substantially as herein described, for the purpose set forth.



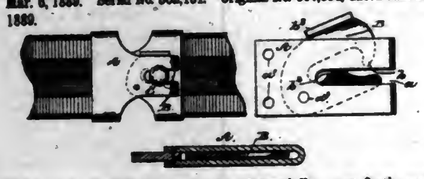
3. In winding machinery, the combination of a winding-barrel, a gripping device comprising a fixed and a movable jaw applied to and extending outward from the circumference of said barrel, and a screw-threaded rod adapted to engage with and actuate said movable jaw, said rod being located within and extending outward from one end of said barrel, against which it has a bearing, substantially as herein described, for the purpose set forth.

4. In winding machinery, the combination of a winding-barrel formed with a slot or guide, a gripping device comprising a jaw, 2, fixed to said barrel, a jaw, 3, movable within said slot or guide, a screw-threaded bolt, 4, arranged within and extending outward from one end of said barrel and adapted to operate said jaw 3, and a bearing at one end of said barrel and against which said rod acts, substantially as hereinbefore described, for the purpose specified.

5. The combination, with a winding-barrel, of a gripper comprising a fixed jaw, 2, a movable jaw, 3, a screw-threaded bolt, 4, adapted to move said jaw 3 nearer to or farther from the fixed jaw 2, a tubular extension, 8, with slot or cam-groove 7, a sleeve, 5, encircling said screw-threaded bolt, and a pin or projection, 6, secured to said sleeve and adapted to work in said slot or cam-groove 7, substantially as hereinabove described, for the purpose specified.

REISSUES.

10,994. **TUBE-COUPLING.** GEORGE N. RILEY, Braddock, Pa. Filed Mar. 21, 1888. Serial No. 304,069. Original No. 374,557, dated Dec. 6, 1887.



Claim.—1. The combination, with a collar provided with an annular inwardly-flaring calking-recess at the end thereof, of a section of tubing having lugs thereon and a loose ring fitting against said lugs and within the calking-recess, substantially as and for the purposes set forth.

2. In tube-couplings, the combination, with a collar provided with annular inwardly-flaring calking-recesses at the ends, of the tubing having lugs thereon and a loose ring fitting against said lugs and within the calking-recesses, substantially as and for the purposes set forth.

3. In tube-couplings, the combination, with a coupling-collar having annular inwardly-flaring calking-recesses at the ends, of the tubing having lugs thereon and a loose ring fitting against the lugs and within the calking-recesses, said loose ring having a curved or beveled face corresponding in shape to the inwardly-flaring calking-recesses, substantially as and for the purposes set forth.

4. In tube-couplings, the combination, with a coupling-collar having annular inwardly-flaring calking-recesses at the ends and tube-sections adapted to engage therewith by suitable locking devices, of lugs on the tubing and loose rings fitting against said lugs within the calking-recesses, substantially as and for the purposes set forth.

10,995. CLASP. FREDERICK R. SPOONER, Brooklyn, N. Y. Filed Mar. 6, 1889. Serial No. 302,181. Original No. 307,094, dated Jan. 29, 1889.

Claim.—1. A clasp for garments, substantially as set forth, comprising two parts consisting of a slotted plate and a cam-slotted latch pivoted to said plate and adapted to be operated by the stud eye or shank which it secures.

2. A clasp adapted to be operated by a stud, substantially as set forth, comprising a stationary slotted plate with an unattached bent-over end and a cam-slotted latch pivoted thereto, and whose bent-over end incloses the front part of said latch.

3. A clasp adapted to be operated by and secure a stud eye or shank, substantially as set forth, consisting of a plate constructed of a piece of doubled sheet metal having a slot therein for the reception of the stud eye or shank, and a cam-slotted latch pivoted to said plate and inclosed thereby.

4. A clasp adapted to be operated by and secure a stud eye or shank, comprising a doubled sheet-metal plate having a slot therein and a latch pivoted thereto having an operating-guard, a hooked end, and a slot with a cam projection.

5. A clasp substantially as described, comprising a slotted plate and a latch pivoted thereto having an open slot with a cam projection, in combination with an adjacently-situated stud for operating and engaging said latch.

6. A clasp adapted to be operated by a stud, substantially as set forth, comprising a slotted plate with a bent-over unattached end, and a cam-slotted latch pivoted thereto having an overhanging hooked end provided with a front-curved edge.

7. A clasp comprising a slotted plate, a latch having an open slot, with a cam projection pivoted to said plate below the slot thereof, and an adjacently-situated stud or its equivalent adapted to engage the slots in said plate and latch and close said latch independent of spring action, substantially as described.

8. A corset-fastening having studs or equivalents on one steel thereof and slotted plates secured to the opposite steel in alignment with the said studs, each plate having a cam-slotted latch pivoted thereto and operating through said slotted plate, adapted to be actuated by and secure said studs, substantially as described.

9. A clasp comprising a doubled sheet-metal plate provided with a slot in its doubled portion for the entrance of a stud or analogous device, and a locking-latch mounted in said plate and inclosed thereby, substantially as described.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

OPINION OF THE ATTORNEY-GENERAL OF THE UNITED STATES

Upon the construction of the articles of the International Convention for the Protection of Industrial Property in relation to Caveats.

LEGISLATION FOR THE ENFORCEMENT OF THE TREATY NECESSARY.

This treaty is a reciprocal one. Each party to it covenants to grant in the future to the subjects and citizens of the other parties certain special rights in consideration of the granting of like special rights to its subjects and citizens. It is a contract operative in the future infraterritorially. It is therefore not self-executing, but requires legislation to render it effective for the modification of existing laws.

DEPARTMENT OF JUSTICE,
Washington, D. C., April 5, 1889.

SIR: Your predecessor, by his letter of the 15th of January, 1889, requested the opinion of the Attorney-General on the following state of facts:

Section 4902 of the Revised Statutes grants the right to file caveats preliminary to applications for patents for inventions and establishes the legal effect that shall be given to them. It also provides—

Any *citizen of the United States* who makes any new invention or discovery, and desires further time to mature the same, may * * * file in the Patent Office a caveat.

It further provides—

An alien shall have the privilege herein granted if he has resided in the United States one year next preceding the filing of his caveat and has made oath of his intention to become a citizen.

By the first of these clauses the grant of the right is limited to citizens. By the second it is enlarged to include one class of aliens. The grant as a whole entitles only citizens and aliens who have been residents 1 year and have legally declared their intention to become citizens to file caveats.

It is claimed by Ferdinand Bourquin, a Swiss citizen, that the second article of a Convention entered into between the United States and certain other nations, of which the Swiss Confederation was one, proclaimed on the 7th day of June, 1887, (U. S. Statutes of 1887 and 1888, treaties, 37,) extends the grant of section 4902 Revised Statutes to all subjects and citizens of the parties to the Convention. That article provides:

The subjects or citizens of each of the contracting States shall enjoy, in all the other States of the Union, so far as concerns patents for inventions, trade or commercial marks, and the commercial name, the advantages that the respective laws thereof at present accord, or shall afterward accord to subjects or citizens. In consequence they shall have the same protection as these latter, and the same legal recourse against all infringements of their rights, under reserve of complying with the formalities and conditions imposed upon subjects or citizens by the domestic legislation of each State.

Congress has passed no law for the execution of this article, nor did the House of Representatives in any way consider or assent to the treaty.

Section 4902 is a part of the system of laws of the United States *concerning* patents for inventions. If, therefore, the article above quoted has become and is self-executing as an infraterritorial law, by virtue of the making and proclamation of the treaty by the President, by and with the advice and consent of the Senate, the claim made by Ferdinand Bourquin is valid. By the second clause of the second section of the second article of the Constitution the power to make treaties, by and with the advice and consent of the Senate, is vested in the President. By the second clause of the sixth article of the Constitution "all treaties made, or which shall be made, under the authority of the United States shall be the supreme law of the land." By the eighth clause of the eighth section of the first article the whole legislative power over the subject of patents is committed to Congress. It is found among the powers to borrow money: to coin money; to declare war; to raise and support armies; to constitute judicial tribunals; to regulate commerce, &c. It is due to the credit of the United States that the provisions concerning the treaty-making power of the President and the legislative power of Congress shall, if possible, be so construed and executed as to give full and proper effect to each and insure harmony in their exercise.

In the case of *Foster* v. *Neilson* (2 Peters, 314) Chief Justice Marshall, delivering the opinion of the Court, in discussing the effect of the Constitution on treaties as laws, declared:

A treaty is, in its nature, a contract between two nations, not a legislative act. It does not generally effect of itself the object to be accomplished, especially so far as its operation is infraterritorial, but is carried into execution by the sovereign power of the respective parties to the instrument.

In the United States a different principle is established. Our Constitution declares a treaty to be the law of the land. It is consequently to be regarded in courts of justice as equivalent to an act of the legislature whenever it operates of itself without the aid of any legislative provision. *But when the terms of the stipulation import a contract, when either of the parties engaged to perform a particular act, the treaty addresses itself to the political, not the judicial department; and the legislature must execute the contract before it can become a rule for the court.*

The principle thus stated has been generally accepted as a true interpretation of the constitutional provisions relating to the subject of treaties. It establishes that there is a class of treaties which, without legislation, do not become self-executing as a rule of municipal law. A statement is given of such provisions of treaties as come within this class; as "when the terms of the stipulation import a contract, when either of the parties engages to perform a particular act." But the decision does not enumerate or define the limitations of the whole class. In the treaty-making power conferred on the President the implication exists that the power is to be exercised by him

subject to the limitation of the Constitution. If, in time of peace, he should provide by the stipulations of a treaty for the quartering of soldiers in any house without the consent of the owner, such a stipulation would be simply void, because forbidden by the Constitution to every department of the Government. But where the Government of the United States has power under the Constitution over a subject, although that power may be vested by the Constitution exclusively in Congress, it has been claimed that in the making of treaties, such power may be exercised by the President, by and with the advice and consent of the Senate, without the co-operation of the House of Representatives or act of Congress. Issue was joined on this proposition in 1796 between the President and Senate in the affirmative, and the House of Representatives in the negative, concerning certain provisions of the Jay treaty with Great Britain. The treaty, at the end of the disagreement, remained intact, but the House of Representatives—

passed resolutions disclaiming the power to interfere in making treaties, but asserting their right, whenever stipulations were made on subjects committed to Congress by the Constitution, to deliberate on the expediency of carrying them into effect; and in legislating on several treaties then before them they struck out the words, "that provision ought to be made by law," and substituted words which declared merely the expediency of passing the necessary laws. (Sargeant's Constitutional Law, 411; Story on the Constitution, section 1841.)

In the session of 1815 and 1816 a like disagreement arose concerning a commercial treaty made in the July preceding "between the United States and Great Britain, by which it was agreed to abolish the discriminating duties on British vessels and cargoes." This disagreement was terminated with no decisive results.

The treaty between the United States and the King of the Hawaiian Islands, signed January 30, 1875, which provided for commercial reciprocity between the nations, and involved the exercise of one of the powers submitted to Congress by the Constitution, provided in its fifth article that it should not be ratified "until a law to carry it into operation should be passed by the Congress of the United States of America." (19 U. S. Stats., 627.) In execution of this treaty Congress, on the 15th of August, 1876 (19 U. S. Stats., 200) passed an act in accordance with the provisions of the treaty. The treaty by its terms, however, was clearly a contract by which, in consideration of certain special commercial privileges granted on the one part, certain other like privileges were granted on the other. Such special privileges granted in consideration of others received, the Supreme Court of the United States in the case of *Bartram* v. *Robertson* (122 U. S., 120) ruled, constitute a contract, FIELD, J., delivering the opinion (speaking of the treaty with Denmark as compared with that of the Hawaiian Islands) declaring:

Those stipulations, even if conceded to be self-executing, by the way of a proviso or exception to the general law imposing the duties, do not cover concessions like those made to the Hawaiian Islands for a valuable consideration. They were pledges of two contracting parties, the United States and the King of Denmark, to each other; that, in the imposition of duties on goods imported into one of the countries which were the product or manufacture of the other, there should be no discrimination against them in favor of goods of like character imported from any other country. They imposed an obligation on both countries to avoid hostile legislation in that respect. But they were not intended to interfere with *special arrangements with other countries founded upon a concession of special privileges.* (See, also, *Whitney* v. *Robertson*, 124 U. S., 192.)

If the treaty-making power, in all treaties whose execution required the exercise of powers committed to Congress, should uniformly provide in the treaties for their proper submission to Congress before they should be effective, consequences might be avoided which may jeopardize the credit of the nation. Under the British constitution, with reference to this subject the jurisdiction of Parliament is thus stated in 1 Todds Parliamentary Government in England, page 610:

The constitutional power appertaining to Parliament in respect to treaties is limited. It does not require their formal sanction or ratification by Parliament as a condition to their validity. The proper jurisdiction of Parliament in such matters may be thus defined: First, it is right to give or withhold its sanction to those parts of a treaty that require a legislative enactment to give it force and effect, as, for example, when it provides for an alteration in the criminal or municipal law, or proposes to change existing tariffs or commercial regulations. * * * If a treaty requires legislative action in order to carry it out, it should be subjected to the fullest discussion in Parliament, and especially in the House of Commons, with a view to enable the Government to promote effectually the important interests at stake in their proposed alterations in the foreign policy of the nation.

It is not necessary to the decision of the question submitted to me in the matter under consideration to determine whether all the provisions of treaties, whose execution requires the exercise of powers submitted to Congress, must be so submitted before they become law to the courts and executive departments, for the treaty under consideration is a reciprocal one—each party to it covenants to grant in the future to the subjects and citizens of the other parties certain special rights in consideration of the granting of like special rights to its subjects or citizens. It is a contract operative in the future infraterritorially. It is therefore not self-executing, but requires legislation to render it effective for the modification of existing laws.

Very respectfully,

W. H. H. MILLER,
Attorney-General.

The Secretary of the Interior.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

BROWN *v.* THE DISTRICT OF COLUMBIA.

Decided March 11, 1889.

1. BALLARD AND WADDELL—STREET-PAVEMENTS.

Letters Patent No. 94,062, granted August 24, 1869, to Ballard and Waddell, for an improvement in street-pavements, and Letters Patent No. 94,063, granted same date to the same parties, for an improved mode of cutting blocks for street-pavement, *Held* void for want of patentable novelty.

2. COWING—STREET-PAVEMENTS.

Letters Patent No. 101,590, granted to Turner Cowing April 5, 1870, for a new mode of constructing wood pavement for streets, cannot be regarded as possessing patentable novelty.

APPEAL from the Supreme Court of the District of Columbia.

STATEMENT OF THE CASE.

Tallmadge E. Brown filed his bill in the Supreme Court of the District of Columbia on the 14th day of April, 1880, counting upon three patents alleged to have been infringed by the respondent, namely: Patent No. 101,590, issued to Turner Cowing April 5, 1870, for "a new mode of constructing wood pavements for streets."

The specification and claim are as follows:

The nature of my invention consists in providing and arranging blocks of a peculiar shape, in manner to form wedge-shaped crevices for the reception of earth or gravel, and wherein such earth and gravel will be returned to act as a key to bind and confine the blocks in their place.

Figure 1 represents a section of road paved with the blocks, complete. Fig. 2 represents the straight side of a block, with the inclined side at E. Fig. 3 represents the top of a block, and also the section of the base D. Fig. 4 represents the straight side of a block, which is set next to the inclined side of the adjoining block.

In Fig. 1 letters A represent the top of the block; B, the side; and E the crevice and gravel. The blocks should, of course, be placed so that the gravel spaces may extend lengthwise across the direction of the street or road, so that, besides wedging and holding the blocks securely, they may furnish a better foothold for animals drawing heavy loads.

In the drawing, the front edge of the pavement, as shown, represents the side next the curb, or a section parallel to the curb.

It is obvious that the wedge-shaped crevices may also be formed by setting the above-described blocks so that two vertical sides and two inclined sides come together alternately, as shown in Fig. 5; and it is equally obvious that two blocks having their vertical sides together may be replaced by a single block, having two inclined faces, as shown in Fig. 6, without any material change of plan, and with a considerable saving of labor and expense in the construction.

To construct my pavement, prepare the roadway by grading it to the proper form, and ramming solid; then set the blocks as shown in Fig. 1, confining them permanently between the curbs of walks; then fill and ram the crevices with earth and gravel.

I do not claim a wood pavement composed of wedge-shaped blocks when the blocks are laid alternately on the larger and smaller ends so as to form a continuous surface of wood; but—

What I do claim, and desire to secure by Letters Patent of the United States, is—

A wood pavement composed of blocks, each side having a single plane surface, and one or more of the sides being inclined, and the blocks being so laid on their larger ends as to form wedge-shaped grooves or spaces to receive concrete or other suitable filling, substantially as set forth.

Patent No. 94,062, issued to William W. Ballard and Buren B. Waddell August 24, 1869, for "improvements in street-pavements," of which the following are the specification and claims:

Figure 1 is a perspective view of a section of pavement embracing our improvement. Fig. 2 is a perspective view of a piece of timber from which the block is cut, and showing the cuts made by the saw; and Fig. 3 is a perspective view of two of the blocks laid alongside of each other.

To more clearly illustrate our invention, we will proceed to describe the construction, &c., referring by letters to the drawings.

A represents the bed of the street, which is made slightly arched, the ends of the arch resting against the curbs B B. Strips C are laid upon said arch at right angles to the curb, and at convenient distances apart. Upon said strip is laid a flooring, composed of boards of any desired dimensions, and the blocks are then laid on this flooring in rows, and so as to break joints. These blocks are of a wedge shape, and are so laid as that their bases shall touch, forming a continuous arch across the street, and leaving V-shaped spaces between the rows. These spaces are filled with concrete, or its equivalent, and the whole surface tarred over, if thought necessary. The gutters are formed by inclining the bed slightly upward at the curb, and splitting the ends of the blocks off, to fit against the curb and the last one of the street-blocks.

The peculiarity of the blocks used in this pavement is that they are wedge-shaped, and having both sides at acute angles with the base, and the grain running parallel with one and oblique to the other of these sides.

A more perfect description of these blocks and the manner of producing them is given in another pending application, now on file in the United States Patent Office, entitled "A method of cutting blocks for street-pavements," prepared and executed by us on the 29th day of September, 1869.

The advantages of blocks having both sides beveled, with the grain running, as described, over the ordinary wedge-shaped block, are, first and most important, that only one corner of the base is at all likely to become broken off by transportation and rough handling, whereas in the ordinary block both corners are liable to such accidents. Another advantage of the relation of grain to the sides of the block is, that the V-shaped spaces have one perfectly smooth side, and consequently less opportunity is afforded to the gravel in the filling to jam, and leave the lower portion of the space loosely or entirely unfilled. This is believed to be a difficulty in pavements constructed of wedge-shaped blocks having the grain running vertically, and thereby exposing the end of the fiber on both the beveled sides of the blocks.

A pavement constructed of our improved blocks can be laid at a less cost than any other wedge-shaped pavement, owing to the cheapness of the blocks.

It has always been desirable to build pavements of wedge-shaped blocks, as they make a stronger and more durable pavement, and are more easily laid; but so far it has been impracticable, owing to the expense of producing the blocks caused by the waste in material and extra sawing.

Having described the construction and advantages of our improved pavement, what we claim as new, and desire to secure by Letters Patent, is—

1. As an article of manufacture, wedge-shaped blocks having the grain running parallel to one and oblique to the other of their beveled sides, and produced substantially in the manner referred to.

2. A wooden street-pavement constructed, substantially as hereinbefore described, of wedge-shaped blocks, with the grain running and produced in the manner and for the purpose set forth.

Patent No. 94,063, issued to said Ballard and Waddell, August 24, 1869, for "an improved mode of cutting blocks for street-pavement," of which the specification and claim are as follows:

Figure 1 represents the lumber, as the blocks are being cut off, in order to give the ends of the blocks the proper angle or bevel. Fig. 2 represents the blocks after being cut off, as above described, before splitting. Fig. 3 represents the blocks in the act of being split on a saw-table, showing the rest or guide necessary to cut them in the proper direction. Fig. 4 represents the blocks finished and placed in the pavement.

Our invention consists in a novel method of cutting and splitting blocks for wood pavement, in such a manner that two cuts, or rather one cut and one splitting, will produce two finished blocks with level top and bottom, and two sides beveled, one being with the grain and the other slightly oblique to the grain, without more waste of timber than is occasioned by the saws.

We take a piece of lumber four and a half feet long, twelve inches wide, and seven inches thick. This is placed under the saws, as shown in Fig. 1, in an inclined position, so that the first cut will produce blocks with two sides inclined, the top and bottom level, or in parallel planes. The first cut produces nine blocks, such as shown in Fig. 2, out of a piece of lumber as described above; each such block will then be twelve inches long, six inches high with the fiber, and seven inches wide across the fiber. These blocks are then split, as indicated in dotted lines, Fig. 2, slightly oblique to the fiber, as seen also in Fig. 3, being brought toward the splitting-saw in an inclined position, inclined in contradistinction to a position level at top and bottom, in such a manner that the line of the cut will form the other two beveled sides of two blocks, each of which has the top and bottom level, or in parallel planes, and the sides beveled, as shown in Fig. 4, and, moreover, has the grain running in the direction of one of the beveled sides, as clearly shown in Figs. 2 and 3. These blocks will then be twelve inches long, six inches high, three inches wide at the top, and four inches wide at the base.

The figures of feet and inches we have, of course, used only as an illustration, as different dimensions of lumber may be used; but those given will do for an ordinary street-block.

The two great advantages of this method are economy of lumber and of labor and time, the only loss of lumber being the small pieces cut off at each end to start the bevel; each two cuts, or rather one cut and one splitting, produces two complete blocks ready for use.

Having thus described our invention, what we desire to secure by Letters Patent is—

The herein-described method of cutting blocks for wooden pavement, so as to form by two cuts, or one cut and one splitting, two finished blocks with the top and bottom level, or in parallel planes, and the sides beveled, one side being inclined with the fiber, and without waste of material, substantially as set forth.

The defendant pleaded the statute of limitations, whereupon the complainant amended, and the defendant subsequently demurred, and, the demurrer being overruled, the defendant, after interposing another plea of want of notice, answered, denying that it had, in any way, violated the rights of the complainant, and, among other things, averring that all the substantial claims of complainant's alleged patents were covered by previous patents granted to Nicholson, De Golyer, Miller and Mason, Stone, Cranford, and others; and that wooden pavements, in all substantial particulars identical with those claimed by complainant, had been laid and used for more than two years before the patents were applied for, in Chicago, New York, Boston, &c., and that the alleged patents are null and void because the alleged invention is neither new nor useful.

Replication was filed and proofs taken. It appeared that Patent No. 101,590 was originally granted to Cowing, whose first application was made in November, 1865, and rejected December 27 of that year, whereupon it was amended and renewed in 1869, but the decision was that the application had been abandoned. It was afterward entertained, and was twice amended in 1870, and the patent was finally issued April 5, 1870. In the original application Cowing said as in the patent as issued:

The nature of my invention consists in providing and arranging blocks of a peculiar shape in manner to form wedge-shaped crevices for the reception of earth or gravel, and wherein such earth or gravel will be retained to act as a key to bind and confine the blocks in their place.

The amended claim of May, 1869, was:

The above-described wood pavement, constructed of rectangular blocks, having each a wedge-shaped piece cut from one of its four vertical sides to form a corresponding space for filling, and placed and filled in, substantially as set forth.

The amended claims of February 22, 1870, were:

1. A wood pavement consisting of blocks having one or more inclined sides, forming between them wedge-shaped spaces or crevices, which are filled with earth, gravel, or other suitable material, substantially as herein described.

2. In wood pavement, wedge-shaped spaces or crevices for the reception of earth, gravel, or other filling to act as a key to bind and confine the blocks in their places, substantially as described.

3. A wood-pavement block having one or more oblique or inclined sides, so as to form, when set, wedge-shaped spaces or crevices to receive earth, gravel, or other filling, substantially as set forth.

4. In wood pavement, in combination with wedge-shaped crevices above, formed by the peculiar shape of the blocks, for receiving gravel or other filling, a continuous base beneath, formed by the complete fitting together of the same blocks at the bottom, substantially as specified.

On the 31st of March, 1868, a patent was issued to Miller and Mason, of Chicago, Illinois, for "certain new and useful improvements in wood pavements," in which the claim is—

A pavement constructed of wedge-shaped blocks A, when laid so as to break joints with those of the opposite rows, in combination with a concrete filling, and in further combination with a continuous wood foundation, and so laid as to form continuous rows across the street.

It is said in the specification of that patent:

The blocks A are to be cut from plank, and are of the usual size, having the fiber vertical. The blocks of our pavement, however, differ from all other blocks in use for pavements, in having both sides beveled from top to bottom, as shown by the end view of the blocks in the drawings. The blocks thus prepared are placed in the board or plank foundation B in transverse rows. Each block may be secured to the foundation by a nail or spike, as shown at *a*. It will be observed that in consequence of the peculiar shape of the blocks those in the several rows touch each other at the bottom, but are some distance apart at the top, forming between the rows wedge-shaped channels. These channels are to be filled with concrete, or gravel and coal-tar, or other suitable substance, furnishing the necessary foothold for horses.

* * * * * * *

The blocks can be cut with less waste of material by cutting them from timber, and splitting the timber blocks with the proper bevel. This makes a strong pavement, and as the blocks have a broad base they will not cut or break the foundation when very heavily-loaded teams are driven over it.

August 20, 1867, Letters Patent were reissued to Samuel Nicholson, of Boston, for "a new and useful improved wooden pavement," the original letters having been issued August 8, 1854, and new letters issued dated December 1, 1863. The claims of the second reissue are:

1. Placing a continuous foundation or support, as above described, directly upon the roadway, then arranging thereon a series of blocks having parallel sides endwise in rows, so as to leave a continuous narrow groove or channel-way between each row, and then filling said grooves or channel-ways with broken stone, gravel and tar, or other light materials.

2. The formation of a pavement by laying a foundation directly upon the roadway, substantially as described, and then employing two sets of blocks; one, a principal set of blocks that shall form the wooden surface of the pavement when completed, and an auxiliary set of blocks or strips of board which shall form no part of the surface of the pavement, but determine the width of the groove between the principal blocks, and also the filling of said groove, when so formed, between the principal blocks, with broken stone, gravel and tar, or other light material.

3. Placing a continuous foundation or support, as above described, directly upon the roadway, and then arranging thereon a series of blocks having parallel sides endwise in a checkered manner, so as to leave a series of checkered spaces or cavities between said blocks, and then filling said checkered cavities with broken stone, gravel and tar, or other light material.

4. The formation of a pavement by laying a foundation directly upon the roadway, substantially as above described, and then employing two sets of blocks, viz., one a principal set of blocks that shall form the wooden surface of the pavement, and an auxiliary set of blocks that shall form no part of the wooden surface of the pavement, but determine the dimensions of the tessellated cavities between the principal blocks, and then filling said tessellated cavities with broken stone, gravel and tar, or other light material.

February 28, 1824, English Letters Patent were granted to A. H. Chambers for "improvements in preparing and paving horse and carriage ways," in which the nature of the invention is said to—

consist in an arrangement of conical-formed stones, or other hard mineral or silicious substances of the said form, placed on their natural bases, cemented together at their lower extremities, and having their remaining interstices filled with loose materials insoluble in water.

He describes pyramidal stones, "cut in the form represented in the drawing, and placed with their large end or natural base downward," to be grouted at their bases by a good strong cement; the upper part of the interstices that will then be left vacant to be filled "with finely-broken flints, patent English pozzolana powdered, or any other similar substance, not soluble in water."

Fig. 3 represents the stones in that form which I consider the best calculated to effect the required resistance to downward pressure, the size of which should be eight inches square at the apex, twelve inches square at the base, and ten inches high.

He explains that while stones of the shape described are the best adapted for the purpose of the pavement or carriage-way, yet to save expense use may be made for all ordinary pavements of stones as usually prepared for pavers, but taking care "always to lay their natural bases or largest end downwards, which is the exact reverse of the mode adopted by paviours;" "the upper part of the intermediate spaces or interstices aforesaid filled with powdered or finely-broken matter, not soluble in water, as aforesaid."

June 14, 1825, English Letters Patent were granted to John Lindsay for—

certain improvements in the construction or formation of the horse and carriage ways of streets, turnpike, and other roads, and an improvement or addition to wheels to be used thereon.

He says, referring to a pavement "with the common or usual sized paving-stones," that—

The method of arranging or laying them is as follows: Instead of laying them with their broadest ends upward, I lay them with the broadest ends downward, and, as each stone is made of a wedge form, this leaves a considerable space open between the stones. These I close with smaller stones of a wedge form, which, being carefully placed and well rammed down, after a sufficient quantity of fine gravel or grout has been worked between them, will make a pavement nearly as substantial as a solid sheet of granite.

In 1839, English Letters Patent were issued to Richard Hodgson for "improvements in the forms or shapes of materials and substances used for building and paving and in their combinations for such purposes," in which he describes an invention consisting in forming and shaping materials and substances according to a new section of the cube obtained by dividing the cube into eight equal prisms or parts, &c., the shapes and forms described, with their combinations, being "applicable generally to materials and substances employed in building and paving, whether of stone, iron, bricks, or wood." The shapes in the case of stone, marble, &c., are "to be formed by sawing or cutting the same out of the full size of the cube and leaving them entire in their relative dimensions, so as to be ready to be placed together either horizontally, vertically, or obliquely, as the case may require," while for "wood paving a peculiar disposition of the materials or blocks thus shaped, and, if necessary, pegged or doweled, will be required," &c. The blocks may be packed up together in the workshop in masses, so as to be laid down more speedily on the ground, where they must be fastened together with pegs or with any bituminous compound usually employed for similar purposes. They must be placed nearly vertically, as the tree grows, and according to the traffic the depth or substance of the wood pavement must be increased or diminished. They may in most cases be laid across the street from side to side, but, when necessary, in a diagonal line.

Defendant introduced various Letters Patent, to wit: For improvement in "the machine for resawing boards and other timber," (issued to Crosby, 1841;) for "improvements in saw-mills, for curved and bevel sawing, but which may also be used for rectilinear sawing," (issued to Normand, 1854;) for "a new and improved mode of sawing stone or marble into tapering and other forms," (issued to McBird, 1856;) for "an adjustable table for reciprocating saws," "whereby the proper bevel may be imparted to the ribs of vessels and other objects with accuracy and facility," (issued to Hinchman, 1863;) for "improvement in the manufacture of siding," (issued to Millengar, 1864;) for "an improved saw-mill," "so as to cut ship-timbers and other irregular forms," (issued to Wright and Molyneux, 1865;) and also extracts from a volume entitled "Turning and Mechanical Manipulation," by Charles Holtzapffel, London, 1847.

These extracts treat of cutting, by means of guides, rectangular pieces from the end of a long bar, and rhomboidal pieces of any angle and magnitude; the sawing of small pieces into regular and irregular polygons of any particular angles and numbers of sides; the cutting of miters, &c.; the sawing beveled edges and oblique prisms or those in which the angular variations are in the vertical plane, rhomboids, or squares.

When the pieces are parallel in one direction and beveled in the other, they may be cut out without any waste beyond that arising from the passage of the saw.

Figure 743 shows a method of cutting blocks at one cut for each piece, into rhombuses, which are shown separately at *a*, which blocks can be afterward divided into two, so as to make triangular-shaped blocks such as are shown at *c*.

At the hearing in special term the bill was dismissed, and the decree being affirmed in general term, the complainant has prosecuted his appeal to this court.

The opinion of Judge Cox at special term was adopted by the court in general term, (Cartter, C. J., Hagner and James, JJ.,) and from it it appears that it was held that no case of actionable infringement was made out as to No. 94,063, and that Nos. 94,062 and 101,590 were void for want of patentable novelty. (*Brown* v. *District of Columbia*, 3 Mackey, 502.)

Mr. C. C. Cole, *Mr. A. S. Worthington*, and *Mr. William E. Mason* for the appellants.

Mr. H. E. Davis for the appellee.

Mr. Chief Justice FULLER delivered the opinion of the Court:

Was a wood pavement "composed of blocks, each side having a single plain surface and one or more of the sides being inclined, and the blocks being so laid on their larger ends as to form wedge-shaped grooves or spaces to receive concrete or other suitable filling," patentable April 5, 1870, in view of the state of the art?

Chambers had, in 1824, described a pavement of pyramidal stones, twelve inches square at the base, eight inches square at the apex, and ten inches high, placed with their larger end downward, and the interstices filled with loose materials insoluble in water.

Lindsay's invention, in 1825, comprised stones made of a wedge-shaped form, laid with their broadest ends downward, leaving a considerable space between them to be closed with smaller wedge-formed stones, with fine gravel or grout worked between them.

Nicholson's pavement was composed of blocks of wood laid in rows across the street, with spaces obtained by interposing narrow wooden strips between the blocks, to be filled with concrete or other suitable filling.

Cowing disclaimed "a wood pavement composed of wedge-shaped blocks when the blocks are laid alternately on larger and smaller ends, so as to form a continuous surface of wood," but claimed the arrangement of the blocks so as to leave wedge-shaped spaces to receive filling to act as a key to bind the blocks together. But reference to these prior patents clearly shows that the formation of wedge-shaped spaces to receive concrete or other filling by laying blocks with one or more inclined sides with their larger ends downward, the filling acting as a key, and the use of wooden blocks in that way, were well known at the time of the alleged invention under consideration.

The blocks of the Lindsay patent are of the same shape as those of Cowing, but are of stone, while the latter are of wood, but this was nothing more than the substitution of one material for another without involving a new mode of construction, or developing anything substantially new in the resulting pavement. (*Hotchkiss* v. *Greenwood*, 11 How., 248; *Hicks* v. *Kelsey*, 18 Wall., 670; *Smith* v. *Goodyear Dental Vulcanite Co.*, 93 U. S., 486; *Phillips* v. *Detroit*, 111 U. S., 604.)

The filling under Lindsay's patent was with small stones, fine gravel, or grout, while Cowing names a filling of earth, gravel, or some other similar substance, but Nicholson used broken stone, gravel and tar, or other light material, being the same filling for the same purpose and with substantially the same result, while the material of the Nicholson block was the same as that of Cowing.

It is argued that gravel and similar substances cannot be forced into the stone blocks of the Chambers and Lindsay patents, and that in ramming gravel between wooden blocks it of necessity indents the blocks, and the filling must adhere much more firmly than would be the case if they were stone. There is nothing said about this by Cowing in his specification, but he is entitled, if this is an advantage directly following from the alleged invention as described, to the benefit of it, whether he perceived it or not. (*Stow* v. *Chicago*, 104 U. S., 547, 550.) The same effect, however, would be obtained in ramming filling between the blocks of any wooden pavement, and the same liability of the filling "to extend laterally into the fiber of the wood and seat itself therein" is found in the Nicholson pavement.

In the Chambers patent the blocks had four inclined sides, which would make the filled space run lengthwise as well as crosswise. In the Cowing patent the crevices run lengthwise "across the direction of the street or road."

As Cowing's combination simply embraces blocks of the same shape and material, and similar filling, applied in substantially the same way and producing substantially the same results as in the prior patents referred to, it cannot be regarded as possessing patentable novelty.

The first claim of Patent No. 94,062 covers, as an article of manufacture—

wedge-shaped blocks having the grain running parallel to one and oblique to the other of their beveled sides, and produced substantially in the manner referred to.

The second is—

a wooden street-pavement constructed, substantially as hereinbefore described, of wedge-shaped blocks with the grain running and produced in the manner and for the purposes set forth.

The original application of Ballard was filed June 15, 1869, and rejected by Examiner Spear upon the ground that the claim was essentially the same as that in No. 94,063, which was for a mode of cutting blocks. It was then amended and again rejected, the examiner saying:

It is admitted that there is no difference between the blocks of applicant and those of Miller and Mason in configuration, nor is any difference claimed of functions. These blocks and those of the patent referred to, once laid, would be indistinguishable, serving, under the same conditions, precisely the same purposes and wearing equally as long. The difference lies in the mode of cutting, by which not a different block is produced, but the same block is cut with a minimum of waste of material.

From this decision an appeal was taken to the Examiners-in-Chief, who affirmed the ruling, holding that—

the trouble with the present application appears to be that the specification and claim merely set forth and embrace a paving-block and the use thereof, having a certain form and being so cut that the grain will run in certain angles with the sides, or parallel thereto, and without any reference to the mode and manner of manufacturing. Blocks having all the peculiarities set forth may be manufactured without resorting to the method by which it seems the ones described in the application were made; and it does not follow, therefore, that the block described and claimed is the new article of manufacture produced by the

new invention, nor is it at all material whether the grain runs as set forth or the blocks have the precise form described. Therefore these peculiarities are not the patentable features of the invention; they merely result from the invention.

The application was then renewed by Ballard and Waddell with the result before us, but it is plain that the patent was granted for novelty in the method of making the block and not in the block itself, nor in a wooden street-pavement so constructed. It is not denied that the Ballard block is identical in shape with those set forth in the Cowing, Chambers, Lindsay, and Miller and Mason patents, but it is claimed that a difference exists between it and that of Miller and Mason in the arrangement of the grain, namely, running parallel with one and oblique to the other of its beveled sides.

We can discover nothing materially different in the practical result of having the grain run in this way, and no material difference is disclosed by the evidence.

The specification asserts that the gravel in the filling is not so liable to jam and leave the lower portion of the space loosely or entirely unfilled, where the blocks have one perfectly smooth side, and that "only one corner of the base is at all likely to become broken off by transportation and rough handling, whereas in the ordinary block both corners are liable to such accidents;" but, as appears from the evidence, "if the blocks are cut with the grain in the manner described in said patent, although one side is not so likely to break off as the other, yet the side that has the grain oblique to it is twice as likely to be broken off as the blocks made in the ordinary way, that is, with the grain vertical," and "the effect of the smooth side of one block, if there were such an alleged advantage in said side, would be fully recompensed by the additional roughness of the other side;" and it would seem that the durability of the block is less where the grain is inclined than where it is vertical. It is fully shown in an elaborate report upon wood paving, quoted from in the evidence, and which, it is testified, agrees with general experience, that vertical-fiber blocks have far greater power of resistance than blocks with fibers horizontal, and with fibers at various degrees of inclination.

The manner of laying the blocks is substantially the same as in prior pavements.

The process of making the block is given in Patent No. 94,063, the claim of which is—

The herein-described method of cutting blocks for wooden pavement, so as to form by two cuts, or one cut and one splitting, two finished blocks with top and bottom level, or in parallel planes, and the sides beveled, one side being inclined with the fiber, and without waste of material, substantially as set forth.

From what we have said it will be perceived that this claim and the first claim of Patent No. 94,062 must be considered together. The manner of producing these blocks is described as cutting them from lumber by means of guides so as to cut the blocks of certain bevels, by which a block is produced having two of its sides inclined and with the grain running parallel to one and oblique to the other of the beveled sides; but the essential features of the apparatus described in this patent appear in many of the defendant's exhibits. Instead of having a table parallel with the shaft of the saw or at right angles with the saw itself, the patent in question uses a rest or guide in presenting the material to the saws, but the use of such guides is shown in Holtzapffel's "Turning and Mechanical Manipulation," and Crosby's patent and others.

The prior existence of the method of cutting blocks without waste by severing a large block by a cross cut from a long stick and then dividing that block into two similar blocks by a splitting cut is satisfactorily established, as also the same result reached in the same way in the treatment of stone. In the case of the Ballard block, the splitting cut is made in a direction parallel with the grain; but that is because the object of having the grain run in a particular way controls the action of the mechanic, who makes the cut as he desires the fiber to run.

Complainant's expert admits that the patentee in the McBird patent, by the first cut he makes, produces a block of rhomboidal form, and, by a second oblique cut, divides his block into two equal wedge-shaped blocks, produced without waste of material; and the difference he points out between that and the Ballard and Waddell patent is, so far as the cutting operation is concerned, that in the former the cut which divides the rhomboid into two wedge-shaped blocks is made across the grain, while in the latter it is made in the general direction of the grain.

To cut the block so as to get the grain in a particular way, and so as to avoid waste, requires simple mechanical skill, without involving invention. The result is that none of these claims can be sustained, and the decree of the court below is affirmed.

Supreme Court of the United States.

BÉNÉ *et al.* *v.* JEANTET.

Decided March 5, 1889.

1. BÉNÉ—PROCESS OF REFINING AND BLEACHING HAIR.
   Reissued Letters Patent No. 8,637, granted March 25, 1879, to John Béné, for an improvement in the process of refining and bleaching hair, *Held*, except as to the second claim, not full and clear enough to give one skilled in chemistry such an idea of the particular kinds and character of the chemicals or combination of chemicals, with the relative proportions of each, as would enable him to use the invention without having to resort to experiments of his own to discover the ingredients.
2. CONSTRUCTION AND LIMITATION OF PATENT.
   The patent limited to the second claim is to be construed as one for a process of refining hair by treating it in a bath composed of a solution of chlorine salt dissolved in an excess of muriatic acid, and the claims are to be limited accordingly.
3. INFRINGEMENT.
   Thus limited and construed the patent is not infringed, and the allegation that the product cannot be produced except by treating the hair in a bath composed of chlorine salt dissolved in an excess of muriatic acid, or a solution of their (chemical) equivalents, is not established.

APPEAL from the Circuit Court of the United States for the Southern District of New York.

Mr. Samuel George Smith for the appellant.
Mr. William P. S. Melvin for the appellee.

Mr. Justice LAMAR delivered the opinion of the Court.

This is a suit in equity, brought in the Circuit Court of the United States for the Southern District of New York, by John Béné and Adolph Grünberg against Emile Jeantet, praying an injunction, accounting, and damages for an alleged infringement of Reissued Letters Patent No. 8,637, granted to Béné March 25, 1879, on an application filed March 4, 1879, for an improvement in the process of refining and bleaching hair.

Counsel for complainant stated in the record that no claim is made in this suit for the bleaching of hair except so far as the bleaching may result incidentally from the process of refining; and the only issue presented by the pleadings, therefore, relates to the question of infringement so far as the process of refining hair is concerned, there being no issue raised as to the validity of the patent in any respect.

The nature and object of the invention are set forth in the specification as follows:

This invention relates to the treatment of all kinds of coarse hair, which, in its natural state, has little commercial value, and is entirely unfit for toilet uses and purposes.
The said treatment serves, mainly, to refine the hair or reduce the diameter of the hairs, and to render them more pliable and glossy; but it also serves to partially bleach the hair or lighten its color or tint, and fit it to pass through any of the ordinary dyeing processes, whereby it may be given any shade or color desired or possible.
In carrying out my invention, for the purpose of producing from the coarse, harsh hair above mentioned a soft, pliable hair of fine texture, I treat the said coarse hair to a bath composed of such chemicals or chemical substances as will dissolve away a portion of the surface of each hair, and thus reduce its diameter.
I find that a solution of a chlorine salt dissolved in an excess of muriatic acid serves my purpose as a bath for this refining treatment. * * *
I claim as my invention—
1. The method of refining all grades of coarse hair, which consists in subjecting it to the action of chemicals, whereby the surface of each hair is corroded or dissolved away and its diameter reduced, substantially as set forth.
2. The method of refining coarse hair, which consists in subjecting it to the action of a bath composed of muriatic acid, in which is dissolved a chlorine salt, substantially as set forth.
3. The method of refining and bleaching all kinds and grades of coarse hair, which consists, first, in bathing and manipulating the same in a chemical bath composed of acid and a chlorine salt, and then in a bleaching-bath composed of acids and bichromate of potash, substantially as and for the purposes set forth.
4. The method of refining and bleaching all kinds and grades of coarse hair, which consists, first, in bathing and manipulating the same in a bath composed of acid and a chlorine salt, which refines the hair; second, subjecting the refined hair to a bath composed of acids and bichromate of potash; and, third, subjecting the hair thus refined and bleached to the proper shade to a fixing-bath composed of warm water, solution of muriate of tin, bisulphite of soda, and muriatic acid, which sets the color, substantially as set forth.
5. The method of refining and treating hair, which consists in first passing it through a refining-bath composed of an acid and a chlorine salt; then, if desired or necessary, through bleaching and fixing baths, as above described, and finally treating the hair so refined to a bath composed of water and ammonia, to remove all of its impurities, substantially as specified.
6. As a new article of commerce and manufacture, hair of fine texture produced from any grade of coarse hair, either animal or human, by the method of refining, substantially as herein described.

The court below held that were it not for the latter part of this description the specification would fail to comply with the statute, and would be void for uncertainty. It therefore limited the patentee to his second claim, and accordingly ruled that under this specification—

the patent is to be construed as one for a process of refining hair by treating it in a bath composed of a solution of chlorine salt dissolved in an excess of muriatic acid, and the claims are to be limited accordingly.

The court further found from the evidence produced in the case that the alleged infringement, the sole issue presented by the pleadings, had not been proven, and, therefore, dismissed the bill without prejudice to the right of the complainants to bring an action at law if they were so advised. An appeal from this decree brings the case here.

Under section 4888 Rev. Stat. the specification must describe the invention and the manner and process of—

making, constructing, compounding, and using it in such full, clear, concise, and exact terms as to enable any person skilled in the art or science to which it appertains * * * to make, construct, compound, and use the same.

Tested by this requirement, the patent in suit cannot receive the broad construction for which complainants contend. Except as applicable to the second claim, the specification is not full and clear enough to give one skilled in chemistry such an idea of the particular kinds and character of the chemicals, or combination of chemicals, with the relative proportions of each, as would enable him to use the invention without having to resort to experiments of his own to discover those ingredients. The broad construction claimed for this patent as a pioneer and foundation invention in the art of refining hair cannot extend the rights of the patentee beyond the compositions of matter and processes which, as stated in the patent, embody his real invention. It is true, as appears upon the pleadings, that the appellant Béné was the first discoverer of a process of refining hair, and his patent, therefore, is entitled, within the limits just indicated, to a liberal construction. If, therefore, it was proved that the hair dealt in by the defendant was refined by substantially the same chemical action as that set forth in the second claim, the fact of infringement was established, and the complainants were entitled to the decree prayed for.

Upon the trial no direct testimony was offered by plaintiffs to show that the articles dealt in by the defendant were treated or refined by the patented process. The only fact upon which the plaintiffs relied was the correspondence of the articles proved to have been sold by defendant, in respect of smoothness, luster, and pliability, with the hair produced according to the patented process; which correspondence, it was contended, showed that both products resulted from the same method or equivalent method of preparation; and it was further insisted that the court was bound from that fact to conclude that refined hair, like that in question, could not be produced except by treating it in a bath composed of a solution of chlorine salt dissolved in an excess of muriatic acid, or a solution of their (chemical) equivalents. To support this contention the plaintiff introduced an expert, Nathaniel S. Keith, who states that, while he had never attended any lectures on the subject of chemistry, he had pursued his studies in the chemical laboratory of his father, a practicing physician and a manufacturing chemist. He had given hair special consideration during three or four years past, and had made experiments upon the processes of refining and bleaching hair with reference to this suit and another legal controversy. In his testimony he asserts, substantially, that the defendant's article cannot be produced, except by a treatment in a solution of chlorine salt and muriatic acid, or their (chemical) equivalents. In response to the question—

What other substance is there, if any, except chlorine and its compounds, which will corrode or dissolve away the surface of the hair so as to reduce the size or diameter without essentially destroying the hair?

He answers—

I have no knowledge of any other.

Again—

My opinion is, that any method under which, by the action of chemicals, the surface of hair is dissolved or corroded away so as to reduce its diameter, comes within the province, or falls within one or more of the claims, of the said patent.

To repel this contention the defendant called as an expert witness one Charles Marchand, who stated that he had been engaged in chemical studies for twenty-four years, having graduated at a school of arts and manufactures in Paris in 1871, from which time his business had been that of a manufacturing chemist, to which, after he came to this country in 1878, he added the occupation of analytical chemist. He testifies that in his studies and business he has had much to do with bleaching and refining human hair, and other hair; has known for many years oxidizing agencies for bleaching or refining hair; first saw hair reduced in diameter by the use of chemicals twelve years ago in Paris by a chemist; and that he had made a number of experiments in the treatment of hair by subjecting it to a refining process entirely different from that described in the patent; and in corroboration of his testimony he produced several samples of refined hair, which he stated he had refined by the use of different chemicals from those mentioned in the patent. The first was treated by a chlorine gas solution in pure water, and then by a solution of peroxide of hydrogen. The second was a solution of permanganate of potash in water with sulphuric acid and muriatic acid in proper proportions. The third was a solution of sulphurous acid in water, and also a solution of permanganate of potash. The fourth was treated by one of the same methods. Another specimen was treated by a concentration of peroxide of hydrogen.

To break the force of this testimony, Keith was recalled, and, upon many points, contradicted Marchand's statements. He testified that he had made experiments according to the methods described by Marchand, and found them failures, and the hair subjected to them worthless and unrefined. The testimony of these two witnesses is conflicting. But the testimony of Marchand relates to facts declared to be within his knowledge and experience; while that of Keith is largely the assertion of a theory and a presentation of arguments to show that the facts testified to by Marchand cannot exist. The experiments which Keith said he had made according to Marchand's formula, and which failed to produce refined hair, were, as he admitted, his first experiments for that purpose; while those made by Marchand were the results of twelve years of practice, and attested themselves by the specimens produced.

We think the complainants did not make out a case of infringement. There is not a preponderance of evidence in their favor. The decree of the circuit court is therefore affirmed.

U. S. Circuit Court—Northern District of New York.

SARGENT *et al. v.* JENKINS *et al.*

Decided March 21, 1889.

INJUNCTION.

Motion for injunction to enjoin defendants from manufacturing wash-boards which infringe the patent to Gorham (No. 228,338, dated January 8, 1880) granted. (Sargent *et al. v.* Burgess, 46 O. G., 693, referred to.)

WALLACE, *J.*:

The wash-boards which the defendants are manufacturing embody the invention specified in the first and second claims of the patent to Gorham, and the motion for a preliminary injunction should be granted unless there is a serious question of the novelty of the subject-matter of those claims.

The essential feature of the wash-board of those claims is a protector, (to shield the operator from getting wet,) which yields to pressure and returns to its normal position automatically when the pressure is removed. In the second claim the spring is the device which gives the elastic or resilient quality to the protector; but the patentee states that he is not to be confined to any specific form of device, and consequently the first claim should be interpreted broadly to include any wash-board having a protector, whether with or without a spring, which is so constructed as to bend or yield to pressure and return when the pressure is removed.

If the patent to Frike describes a wash-board having a protector that possesses this function and yields to pressure and returns automatically on its pivot by gravity, the first claim is anticipated, and, as the substitution of the spring for the weight would not involve invention, the second claim would also be invalid. The protector of the Frike patent, however, is not of that character. There is no suggestion in the specification that it is to return to its position by gravity, or by any instrumentality except by the hand of the operator. It is designed exclusively for a wash-board having a double face, and is constructed so as to afford a broad surface to support the operator (and protect him from getting wet) until he desires to use the other side of the wash-board, when by tilting it over he can transfer it for use upon that side. It belongs to the second class of protectors referred to in Gorham's patent as not embodying his invention.

The Frike patent was before the Supreme Court in the suit upon the complainants' patent against Burgess, and is referred to in the opinion. In the opinion the Court say that but for the yielding or resilient function of Gorham's protector it would be questionable whether his patent would be valid.

It is fairly to be assumed that the Supreme Court did not consider the Frike patent an anticipation of either of the claims of the Gorham patent, and that the Court were of the opinion that the patent to Gorham was a valid one.

The motion for an injunction is granted.

Changes in Classification.

(ORDER No. 543.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 16, 1889.

It is directed that in Division III the title of Class 148, "Metal Tempering, Annealing, and Cementation," be changed to *Annealing and Tempering.*

Under Class 148, the following sub-classes are hereby abolished:

9. Tempering and annealing—
11. Compositions,
3. Metals generally,
4. Sheet and plate metal,
5. Wheels and tires,
6. Wire and springs.

And the following sub-classes are hereby established:

Annealing apparatus—
Boxes and pots,
Clamps,
Muffles,
Ovens,
Ovens, rotary hearths,
Pits,
Wire and springs.
Annealing processes—
Drawing temper,
Gas,
Toughening.
Cementation and case-hardening compounds—
Gaseous,
Liquids.
Glass-annealing, flattening-tables—
Hearths,
Leers,
Leers, grids,
Muffles,
Processes.
Hardening apparatus—
Bands and wire,
Clamps.
Hardening processes—
Solutions,
Molten metal.

Under Class 75, the following sub-classes are abolished:

Metallurgy—
Leers,
Leers, grids.

And the following sub-classes are established:

Converters, fixed—
Furnace,
Runways,
Sectional,
Tuyeres and bottoms.
Spelter, processes—
Retorts,
Stacks.

The title of sub-class "Revolving Roasters" is changed to *Roasters, Revolving Cylinders.*

ROBERT J. FISHER,
Assistant Commissioner.

DESIGNS.

19,033.—ORNAMENTATION OF GLASSWARE.—*William C. Anderson*, Toledo, Ohio, assignor to *The W. L. Libbey & Son Company*, same place. Application filed January 21, 1889. Serial No. 297,100. Term of patent 7 years.

19,034.—WINDOW-GLASS.—*William Buttler*, Fostoria, Ohio, assignor to *The Buttler Art Glass Company*, same place. Application filed March 30, 1889. Serial No. 305,456. Term of patent 7 years.

19,055.—BUILDING-BRICK.—*William H. Fish*, Columbus, Ohio. Application filed November 28, 1888. Serial No. 292,183. Term of patent 14 years.

19,056.—AX.—*William C. Kelly*, Louisville, Ky. Application filed February 19, 1889. Serial No. 300,491. Term of patent 14 years.

19,057 and 19,058.—KNITTED FABRIC.—*George D. Kinsey*, Brooklyn, N. Y., assignor to *The Australian Knitting Company*, Paterson, N. J. Applications filed March 7, 1889. Serial Nos. 302,338 and 302,337. Term of patents 7 years.

19,059.—BRETZEL OR CRACKER.—*Eugene H. Sandt*, Allentown, Pa. Application filed March 30, 1889. Serial No. 305,467. Term of patent 7 years.

19,060.—STRENGTH-TESTER CASING.—*Gustav Soeding*, Philadelphia, Pa. Application filed March 18, 1889. Serial No. 303,782. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,503.—MEDICINAL LOTION.—*Theodore Angelo*, New York, N. Y. Application filed March 13, 1889. Used since January 7, 1889.
"The word 'BENZOINOL.'"

16,504.—WHISKY.—*Belmont Distillery Company*, Louisville, Ky. Application filed October 29, 1888. Used since November, 1880.
"The representation of a bell having a scroll containing the word 'BELMONT' arranged across the top thereof."

16,505.—KNITTED SHIRTS, DRAWERS, OVERSHIRTS, BLOUSES, AND JACKETS.—*Suits Condé*, Oswego, N. Y. Application filed February 18, 1889. Used since January 1, 1881.
"The letters 'S. C.'"

16,506.—TIMOTHY-SEEDS.—*Conklin & Mersereau*, Binghamton, N. Y. Application filed February 27, 1889. Used since March 1, 1884.
"The representation of a star arranged within a shield."

16,507.—WHISKY.—*Joseph Cornibé*, New Orleans, La. Application filed January 23, 1889. Used since November, 1884.
"The figure of Justice."

16,508.—WHIPS.—*Henry S. Cushman*, Milford, Mass. Application filed March 13, 1889. Used since August 1, 1888.
"The word 'PARADOX.'"

16,509.—SIRUPS AND ROCK-CANDY.—*Dryden & Palmer*, Baltimore, Md. Application filed March 13, 1889. Used since March 1, 1880.
"The word 'CHESAPEAKE.'"

16,510.—HAIR-RESTORATIVE.—*Julius Falke*, St. Louis, Mo. Application filed March 27, 1889. Used since December, 1886.
"The figures, words, and letters '3 K-K-K 3 HAIR RESTORATIVE' and the picture of a bird inscribed 'THE FALKE LEADS THEM ALL.'"

16,511.—HAY ELEVATORS OR CARRIERS.—*Manlas G. Grosscup*, Milwaukee, Wis. Application filed February 19, 1889. Used since July 1, 1886.
"The word 'JUMBO.'"

16,512.—[Withdrawn.]

16,513.—CIGARS, CIGARETTES, AND CHEROOTS.—*L. Kahner & Co.*, New York, N. Y. Application filed March 5, 1889. Used since December 1, 1868.
"The word 'METROPOLIS' and the representation of a bird's-eye view of Manhattan Island."

16,514.—ANTI-SUDORIFIC POWDER.—*Naum Khasan*, New York, N. Y. Application filed February 26, 1889. Used since January 1, 1889.
"The figure of a woman downward to the waist, with the hands upon the top of the head, and the word-symbols 'KHASAN'S SANTIN.'"

16,515.—CORSETS.—*H. C. F. Koch & Co.*, New York, N. Y. Application filed March 13, 1889. Used since February 9, 1889.
"The word 'ELAINE.'"

16,516.—PERFUMERY.—*Ladd & Coffin*, New York, N. Y. Application filed March 16, 1889. Used since October 1, 1887.
"A combination of the letters and character 'L & C.'"

16,517.—SHIRTINGS, SHEETINGS, GINGHAMS, TICKINGS, CHEVIOTS, AND PRINTS.—*Lewis Bros. & Co.*, New York, N. Y. Application filed March 2, 1889. Used since February 12, 1889.
"The word 'NANTUCK.'"

16,518.—ANTISEPTIC POWDER.—*Nelson A. Lloyd* and *Curtis G. Lloyd*, Cincinnati, Ohio. Application filed May 19, 1888. Used since November, 1887.
"The word 'ASEPSIN.'"

16,519.—BLEACHED, COLORED, AND PRINTED COTTON FABRICS.—*Miller, Kaster & Co.*, New York, N. Y. Application filed March 13, 1889. Used since July 15, 1888.
"The words 'SANS PAREIL.'"

16,520.—BONE FERTILIZERS.—*H. S. Miller & Co.*, Newark, N. J., and Baltimore, Md. Application filed August 4, 1888. Used since December 15, 1887.
"A circular band or figure inclosing a white ground, on which latter appear words printed in letters contrasting with said ground and circular figure or band, the said band and words being printed in red and blue and contrasting with one another."

16,521.—RUBBER-STONES FOR CLEANING AND POLISHING.—*Joseph J. Murphy* and *John W. Mosier*, Louisville, Ky., and Chicago, Ill. Application filed March 14, 1889. Used since June 2, 1887.
"The word 'EUREKA.'"

16,522.—PIPES, CIGAR AND CIGARETTE HOLDERS, AND CIGARETTE-PAPER.—*Quentin & Co.*, Paris, France. Application filed August 20, 1888. Used since January, 1888.
"A representation of the sun together with the letters 'J' and 'G.'"

16,523.—ALCOHOLIC LIQUORS.—*Harry Rab* and *Gustavus Rab*, Denver, Colo. Application filed December 8, 1888. Used since November 1, 1885.
"The representation of a windmill."

16,524.—IMPREGNATED CANVAS, LINEN, AND CLOTH FOR ROOFING.—*F. Reddaway & Co.*, Hamburg, Germany. Application filed March 11, 1889. Used since January 1, 1869.
"The word 'ANTI-ELEMENTUM' and a scroll having the picture of a house upon it."

16,525.—ORANGES, LEMONS, AND PRODUCTS OF THE CITRUS FAMILY.—*Henry S. Sanford*, Sanford, Fla. Application filed March 9, 1889. Used since 1880.
"The word 'BELAIR.'"

16,526.—AERATED TONIC BEVERAGE.—*Clara H. Schmidt* and *Walter B. Starbird*, Stockton, Cal. Application filed March 9, 1889. Used since October 1, 1888.
"The word 'ORANGINE' and the fac-simile signature 'SCHMIDT & Co.'"

16,527.—LAUNDRY AND TOILET SOAP.—*Schultz & Co.*, Zanesville, Ohio. Application filed March 11, 1889. Used since January 30, 1889.
"The word 'DUCK.'"

16,528.—OUTER GARMENTS.—*Forrest F. Tebbetts*, Providence, R. I. Application filed March 18, 1889. Used since September 15, 1888.
"The representation of a bear."

16,529.—PETROLEUM LUBRICATING-OIL.—*Vacuum Oil Company*, Rochester, N. Y. Application filed March 11, 1889. Used since December 1, 1888.
"The word 'ZETA.'"

16,530.—HARNESS AND HORSE-BLANKETS.—*J. Newton Van Ness & Co.*, New York, N. Y. Application filed February 19, 1889. Used since February 1, 1889.
"The representation of a horseshoe and an equestrian scene within the same."

16,531.—PERFUMES, PERFUMED WATERS, AND BAY-RUM, ALSO SOAPS, POWDERS, AND COSMETICS.—*John Wanamaker*, Philadelphia, Pa. Application filed June 25, 1888. Used since January 1, 1881.
"The words 'THE QUEEN MARY.'"

LABELS.

5,876.—Title: "ANGIER'S PETROLEUM PASTILLES" (FOR A MEDICINE.) *Angier Chemical Company*, Newton and Boston, Mass. Application filed April 1, 1889.

5,877.—Title: "GERMAN FRESH ROASTED COFFEE."—*The Consolidated Coffee Company*, Omaha, Nebr. Application filed March 30, 1889.

5,878.—Title: "THE COTTON OIL PRODUCT CO'S COTTON SEED LARD—A VEGETABLE LARD."—*The Cotton Oil Product Company*, New York, N. Y. Application filed March 26, 1889.

5,879.—Title: "VIBRATING" (FOR WIND MUSICAL INSTRUMENTS.)—*Henry J. Distin*, Philadelphia, Pa. Application filed April 1, 1889.

5,880.—Title: "HOG CHOLERA CURE AND PREVENTIVE AND INSECT DESTROYER."—*J. M. Ellerd*, Lindale, Tex. Application filed February 27, 1889.

5,881.—Title: "ACACINE THE PERFECT EMULSIFIER" (FOR MEDICINES.)—*James G. Flint*, Fort Scott, Kans. Application filed March 8, 1889.

5,882.—Title: "HEILNER'S SURE CURE FOR MALARIA."—*Abraham M. Heilner*, New York, N. Y. Application filed March 28, 1889.

5,883.—Title: "KIRTLEY'S FIRE BALL" (FOR A FIRE EXTINGUISHER.) *William F. Kirtley*, Quincy, Ill. Application filed March 18, 1889.

5,884.—Title: "COCOANUT TAFFY" (FOR BISCUITS.)—*Justin J. Langlés*, New Orleans, La. Application filed March 14, 1889.

5,885.—Title: "PEOPLES MIXED" (FOR BISCUIT.)—*Justin J. Langlés*, New Orleans, La. Application filed March 28, 1889.

5,886.—Title: "RICH LUNCH" (FOR BISCUITS.)—*Justin J. Langlés*, New Orleans, La. Application filed March 28, 1889.

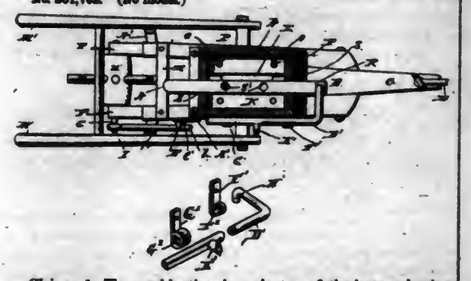
5,887.—Title: "DESSERT MIXED" (FOR BISCUITS.)—*Justin J. Langlés*, New Orleans, La. Application filed March 28, 1889.

5,888.—Title: "CONSOLS" (FOR CIGARS AND CIGARETTES.)—*The Consolidated Cigarette Company*, New York, N. Y. Application filed March 26, 1889. (Trade-Mark Registered.)

5,889.—Title: "WHITE WAINSCOTING" (FOR A VARNISH.)—*Theodore T. Lines*, Philadelphia, Pa. Application filed March 27, 1889.

5,890.—Title: "OWEN'S PINK MIXTURE" (FOR MEDICAL COMPOUND.) *J. H. Owen* and *R. H. Wilhoyte*, Sheffield, Ala. Application filed January 22, 1889.

5,891.—Title: "PAIN EXTERMINATOR" (FOR A LINIMENT.)—*William L. Robinson*, East Somerville, Mass. Application filed March 28, 1889.

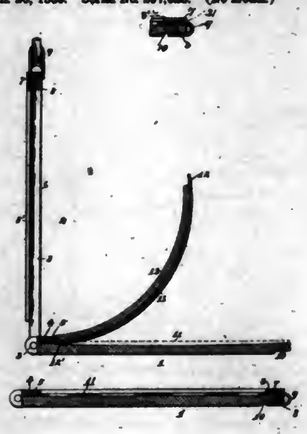


5,892.—Title: "ALL HEALING SALVE."—*William L. Robinson*, East Somerville, Mass. Application filed March 28, 1889.

5,893.—Title: "WHITTAKER'S COUGH SYRUP."—*James Whittaker*, Silver City, Utah Ter. Application filed March 1, 1889.

PATENTS

GRANTED APRIL 23, 1889.

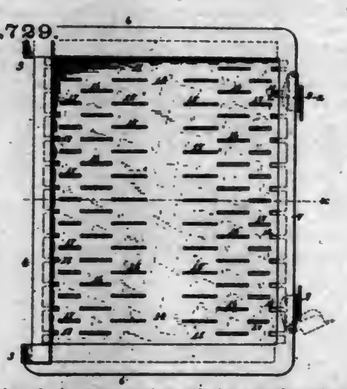


401,728. CORN AND COTTON PLANTER. JOHN J. ARMSTRONG and ANDREW S. LOWREY, Weimar, Tex. Filed Aug. 2, 1888. Serial No. 281,782. (No model.)

Claims.—1. The combination, in a planter, of the hopper having the plates F G on one side at its front and rear ends, respectively, said plates being provided, respectively, with cylindrical and rectangular guides or bearings F^2 G^2, the seed-slide arranged in the hopper and extending longitudinally through openings in the front and rear sides thereof, the reciprocating yoke having its front portion circular in cross-section and its rear portion rectangular in cross-section, said front and rear portions being arranged, respectively, in the cylindrical and rectangular guides or bearings, and said yoke being further provided at its front ends with the arm to engage the seed-slide and provided at its center with the stud E, the driving-shaft having the crank, and the rod Z, connected to the crank and detachably connected to the stud E, substantially as described.

2. In a planter, the combination, with the hopper and the seed-slide therein having one end projecting from one end of the hopper, of the reciprocating yoke D, having its rear portion angular in cross-section and its front portion cylindrical in cross-section and having an arm at one end to engage the opening in the projecting end of the seed-slide, the angular and cylindrical bearings G F, for the respective parts of the yoke, whereby the latter may be unshipped from or attached to the seed-slide, and the mechanism to reciprocate the yoke, substantially as described.

401,729. MATRIX-PLATE FOR CURVED ELECTROTYPES. GILBERT H. BENEDICT, Ellsworth, and PATRICK M. PURDOM, Albany, N. Y. Filed Jan. 26, 1889. Serial No. 297,635. (No model.)



Claim.—1. The combination, with a curved matrix-plate, of a clamping-frame having guards for the retention of the matrix-plate, substantially as described.

2. The combination, with a curved matrix-plate, of a clamping-frame having guards for the retention of the matrix-plate, and a clamping-screw for tightening the matrix-plate, substantially as described.

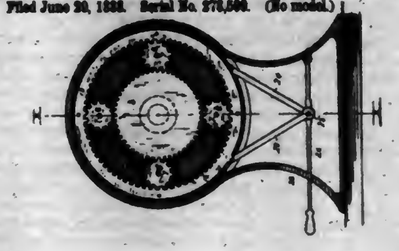
3. The combination, with a curved matrix-plate, of a clamping-frame having guards for the retention of the matrix-plate, and a clamping-screw for tightening the matrix-plate, and a gage for the proper adjustment of the matrix-plate, substantially as described.

4. The combination, with a curved matrix-plate, of a clamping-frame having guards for the retention of the matrix-plate, and a clamping-screw for tightening the matrix-plate, and a gage for the proper adjustment of the matrix-plate, and a stop for the proper adjustment of the clamping-frame, substantially as described.

401,729.

Claim.—1. An apparatus for producing curved matrices for electrotype-plates, consisting, essentially, of a curved elastic matrix-plate having its mass reduced from the middle toward the edges in the direction of the curvature, and a clamping-frame for flattening the matrix-plate, provided with guards for the retention of the matrix material, substantially as described.

2. An elastic matrix-plate for the production of electrotype-plates for cylinder-presses, having a set curvature corresponding to the curvature of the printing-cylinder of the press, and having its mass reduced from the middle line to the edges in the direction of the curvature, substantially as described.

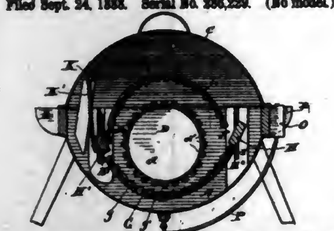


3. A matrix-support for the production of electrotype-plates for cylinder-presses, consisting of a plate of spring metal bent to a definite set curvature, and having its mass gradually reduced from the middle toward the edges in the direction of the curvature, whereby the matrix-plate may be flattened out without buckling to receive the matrix material and to recurve to its original shape when released, substantially as described.

4. A matrix-support for the production of curved electrotype-plates for cylinder-presses, consisting of a plate of spring metal bent to a definite set curvature and having its mass reduced step by step from the middle toward the edges in the direction of the curvature, substantially as described.

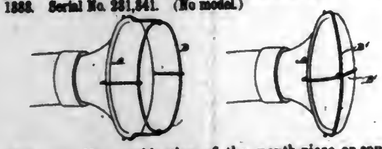
5. A matrix-support for the production of curved electrotype-plates for cylinder-presses, consisting of a plate of spring metal having parallel series of slots from near the middle to the edges in the direction of the curvature, substantially as described.

6. A matrix-support for the production of curved electrotype-plates, consisting of a plate of spring metal having its mass reduced from the middle toward the edges in the direction of curvature by a series of perforations, substantially as described.



401,730. VALVE-GEAR. ELIJAH B. BENHAM, Providence, R. I. Filed June 20, 1888. Serial No. 278,069. (No model.)

Claim.—1. A shaft and a sleeve thereon, each provided with a gear, the rotatable walls 8 and 9, one or more pinions, 6, and one or more pinions, 10, supported and capable of an independent rotation on pintles 7, which are extended between and supported in said walls 8 and 9, the said pinions respectively meshing with said shaft and sleeve-gears, combined with the internal gears, 12 and 15, normally immovable, having their teeth in engagement with said pinions, and means, substantially as described, for securing a partial rotation of said internal gears in reverse directions, substantially as described.



2. The crank-shaft E and sleeve-valve F, each provided with a gear, 3 and 5, the standard 11, having the circular rim 19 and the ratcheted edge 28, the walls 8 and 9, rotatable on said rim 19, two series of pinions, 6 and 10, supported and capable of an independent rotation on pintles 7, which are extended between and supported on said walls 8 and 9, the said pinions meshing with said gears 3 and 5, combined with the internal gears, 12 and 15, normally immovable, having their teeth in engagement with said pinions, the handle-lever 26 by its inner end pivoted to said standard and capable of engagement by its handle end with said ratcheted face 28, and the link-levers 18 and 20, each pivoted by one end to the said handle-lever and by their other ends pivoted to the said internal gears, 12 and 15, respectively, all substantially as and for the purpose described.

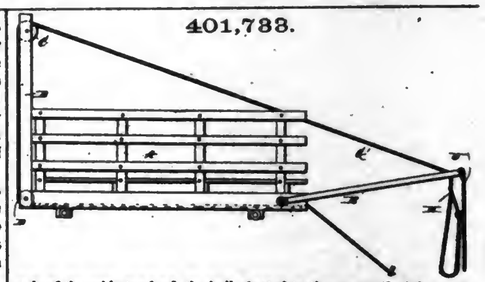
401,731. WASHING-MACHINE. HENRY BROADWELL, Blue Mound, Kans. Filed Sept. 24, 1888. Serial No. 286,229. (No model.)

Claim.—The combination, with the semi-cylindrical casing or tub A, the top C, the rotary cylindrical rubber D, mounted in the casing, the vertical guides H^3, springs I, secured in said guides, and the vertical guides H^2, of the lower concave wash-board, G, having an end cross-bar, H, provided with projecting pins *h*, mounted in the guides H^2 and engaging with the springs I, and the end cross-bar H′, provided with projecting pins *h′*, mounted in the guides H^2, the spring K′, secured to the casing and connected with the cross-bar H′, and the upper concave wash-board, L, the springs M, connecting one end of the said concave L with the concave G, and the springs *m*, secured to the casing and attached to the other end of the concave L, all constructed, arranged, and operated substantially as shown and described.

401,732. MOUTH-PIECE GUARD FOR PHONOGRAPHS OR TELEPHONES. WILLARD L. CANDEE, Brooklyn, N. Y. Filed Aug. 3, 1888. Serial No. 281,841. (No model.)

Claim.—1. The combination of the mouth-piece or sound-conveying tube or chamber of a phonograph, telephone, or the like, and an open-work or skeleton guard arranged in front thereof, substantially as and for the purpose set forth.

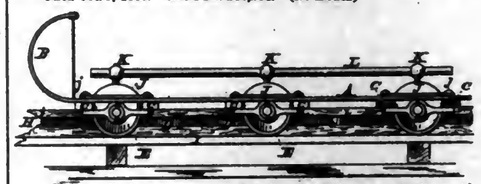
2. The combination of the mouth-piece or sound-conveying tube or chamber of a telephone, phonograph, or the like, and a skeleton wire frame or guard arranged in front thereof, substantially as and for the purpose set forth.



401,733. HAY AND GRAIN RACK. GEORGE CARR, Charles City, Iowa. Filed Jan. 26, 1889. Serial No. 297,639. (No model.)

Claim.—1. The combination, with the rack, of the lifting-bail pivoted to the rear end of the same, and the operating-rope passing forward over the rack and across the front end of the same and then rearwardly beneath the rack, whereby, as the rack is drawn forward, the bail will be raised, as set forth.

2. The combination, with the rack, of the standard erected at the front end of the same, the pulleys C D, journaled in the upper and lower ends of the standard, the lifting-bail pivoted to the rear ends of the rack, and the rope passing from the said bail over the pulley C and under the pulley D and thence rearward beneath the rack, as set forth.



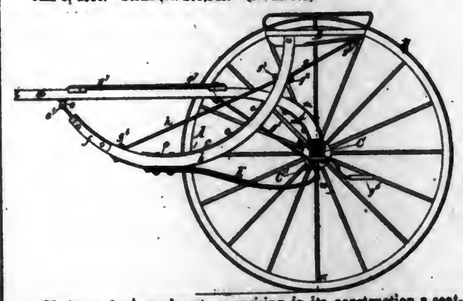
3. The combination, with the rack, of the standard erected at the front end of the same, the rollers C D, journaled in the upper and lower

401,733.

ends of the said standard, the bail pivoted to the rear end of the rack and having an eye at its center, the rope passing through said eye over the pulley C and under the pulley D and thence rearward beneath the rack, the hook secured to the end of said rope, and the rope J, secured to the bail, as specified.

401,734. TOBOGGAN. GEORGE H. CHADEAYNE, Buffalo, N. Y. Filed Oct. 5, 1888. Serial No. 287,361. (No model.)

Claim.—1. A toboggan consisting, essentially, of a platform, A, having the dash B, and a series of battens, C, each set of said battens being provided with outside bearings, D, having track-wheels E, and two spiders, F, having vertical spindles fitted with guard-wheels G, engaging a central rail having grooves on opposite sides, said outside bearings being provided with caps J, having eyes K fitted with the hand-rails L, the whole being constructed and combined in the manner as and for the object stated.



2. In toboggans, the combination, with the platform, of the battens having the bearings for the track-wheels, and the spiders with the bearings for the guide-wheels, as described, said bearings being provided with wheels, as stated, and the whole arranged to operate with suitable tracks, as and for the purpose set forth.

3. In toboggans, the track-wheel bearings having wheels, as shown, in combination with caps having eyes provided with hand-rails, as and for the purpose stated.

4. In toboggans, a bearing for the guard-wheels, consisting of an X-shaped frame having at the intersection of the radiating members a boss provided with a pendent stud fitted with a horizontally-revolving guard-wheel, G, in combination with the battens and the platform, as and for the object set forth.

5. In toboggans, the combination, with the platform and battens, of a combined wheel-bearing and cap, consisting of a frame, D, having the wheel E journaled upon a bolt, and a cap-piece, J, provided with upwardly-projecting member K, adapted to receive the hand-rail L, said cap-piece being secured upon the platform and the wheel-bearing below the same, in a manner as and for the purpose set forth.

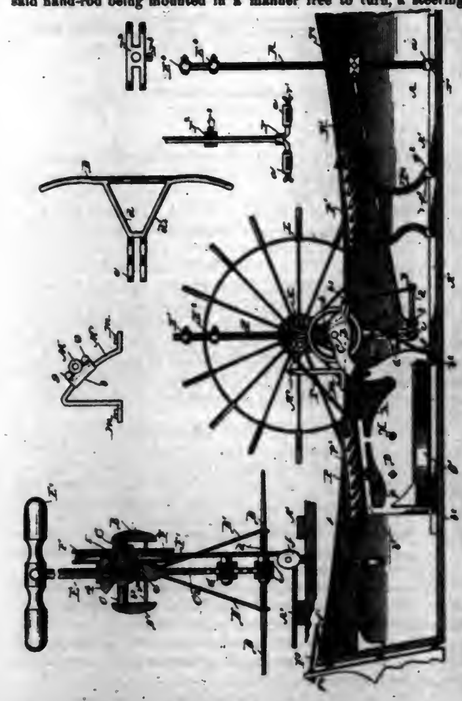
401,735. ROAD-CART. MORRIS L. CLEVELAND, Delhi, N. Y. Filed Jan. 5, 1889. Serial No. 296,545. (No model.)

Claim.—1. A road-cart comprising in its construction a seat-body, A, formed of segmental side bars united by flooring-boards and braced, as at *a*, and arranged forward of the axle and connected at its front end to the thills by joint-connections which do not slide and to the axle by longitudinal flat springs fastened directly to the body A forward of the center of the length of said body, and a driver's

seat on a vertical line, *x x*, with the axle, substantially as and for the purpose described.

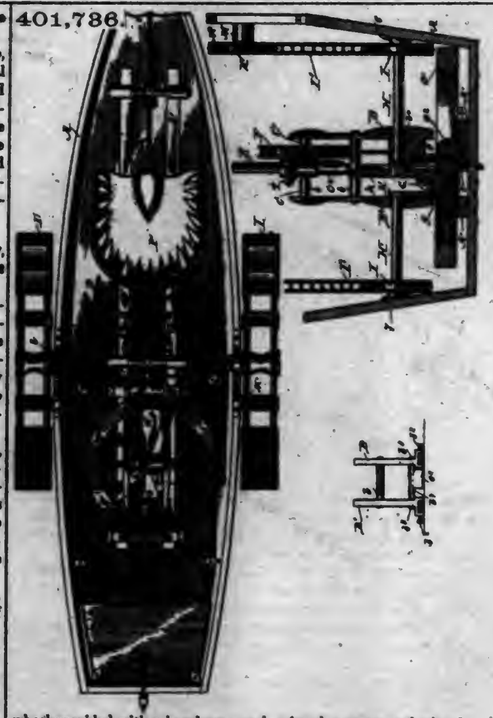
2. A road-cart comprising a body having segmental side bars, *b*, united by flooring-boards *c*, braced by rods *a*, and provided with metal thill-connection straps *f*, a seat, B, mounted on said side bars and braced by rods *g* in line with the brace-rods *a*, said seat being centrally over the axle, thills, *d d*, rigidly connected to the road-cart axle D and having hinging eye-connections *e*, to which straps *f* of the body-bows are hinged, as at *e′*, and longitudinal flat springs attached directly to the under side of the body at a point forward of the longitudinal center of the body, substantially as and for the purpose described.

401,736. MARINE VELOCIPEDE. SETH CURLIS, Union City, Tenn., assignor to the Seth Curlis Marine Velocipede Company, same place. Filed Apr. 9, 1888. Serial No. 270,023. (No model.)



Claim.—1. In a marine velocipede or similar apparatus, the combination, with suitable mechanism for imparting movement to the propeller or paddle wheels and suitable steering mechanism, of a single main hand-rod consisting of a single bar pivotally sustained with respect to the mechanism for propelling the boat and connected directly with the steering mechanism, whereby said single hand-rod serves to effect both the movement of the driving mechanism and of the steering mechanism, substantially as described.

2. In a marine velocipede or similar apparatus, the combination, with a driving-lever for imparting movement through suitable intermediate mechanism to the propeller or paddle wheels, said driving-lever having a socket in its upper end, of a main hand-rod having its lower end fitted within the socket of the driving-lever, and suitable steering mechanism connected with said hand-rod, whereby said hand-rod serves to effect both the movement of the driving-lever and of the steering mechanism, substantially as described.



3. In a marine velocipede or similar apparatus, the combination, with the driving-lever C^3, of a hand-rod, E, mounted upon the end of said driving-lever in a manner free to turn, a steering-wheel, F, gear-wheels 4 and 5, and suitable connections from said gear-wheel to the rudder, substantially as described.

4. In a marine velocipede or similar apparatus, the combination, with the driving-lever C^3, of a suitable hand-rod, E, mounted in a manner free to turn, a steering-wheel, F, journaled upon the trunnion or shaft of said driving-lever, suitable gear-wheels connecting said hand-rod with the steering-wheel, and suitable ropes leading from said steering-wheel to the rudder, substantially as described.

5. In a marine velocipede or similar apparatus, the combination, with the driving-lever C^3, of a hand-rod for moving said driving-lever, said hand-rod being mounted in a manner free to turn, a steering-

401,736.

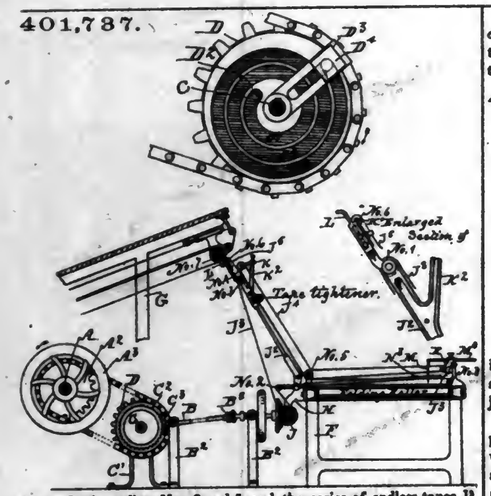
wheel provided with a bevel-gear, and a bevel-gear upon the hand-rod, and suitable connections leading from said steering-wheel to the rudder, substantially as described.

6. In a marine velocipede or similar apparatus, the combination, with the hull, of suitable stringers or supports, A′, attached thereto, the operating mechanism, and a main frame for sustaining said operating mechanism, said main frame being movably mounted upon said stringers and within said hull, and suitable means for adjusting said main frame in the direction of the length of the hull, substantially as described.

7. In a marine velocipede or similar apparatus, the combination, with the sides B and B′, of the main frame for supporting the driving-lever and operating mechanism, said main frame having rails b^4, extending lengthwise of the boat, of the operator's seat P, adjustably mounted upon said rails, whereby said seat can be moved in the direction of the length of the boat, substantially as described.

8. In a marine velocipede or similar apparatus, the combination, with the paddle-wheels, of the brackets M′, having the curved bearing portions, and the vertically-movable journal-blocks M for the shafts of said wheels, said journal-blocks being adjustably mounted upon the curved portions of said brackets, substantially as described.

9. In a marine velocipede or similar apparatus, the combination, with the main frame, of a driving-lever, C^3, sustained within said main frame, a suitable hand-rod and treadle connected with said driving-lever, a main shaft and shaft-wheel sustained within said main frame that supports the driving-lever, a pitman for imparting motion to said main shaft from the driving-lever, and suitable mechanism leading from said shaft-wheel to the paddle-wheels or propeller-wheel, substantially as described.



401,737. PAPER-FOLDING ATTACHMENT FOR PRINTING-PRESSES. TALBOT C. DEXTER, Des Moines, Iowa. Filed May 31, 1884. Serial No. 133,431. (No model.)

Claim.—1. A loose wheel, D, having a spiral or convolute groove in its side face, a shaft, C, a slotted arm, D^3, and a pin or stud, D^4, in combination with the driving-shafts A and C and sheet carrying and folding mechanism, to operate in the manner set forth, for the purposes specified.

2. The hinged frame J^3, the tape shaft or roller No. 1, the shaft J, carrying driver-pulleys, the adjustable roller No. 2, the rollers Nos. 3 and 5, and series of endless tapes J^2 and J^4, and operating mechanism arranged and combined to operate in the manner set forth in conveying sheets from the press to the folding mechanism.

3. The adjustable arms L, the adjustable arms K, carrying a roller, No. 4, and a series of endless tapes, in combination with the hinged

401,737.

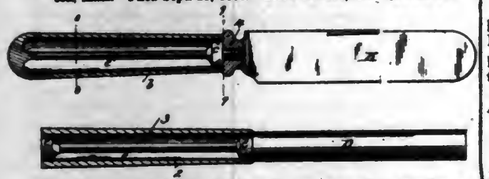
frame J^3, the rollers Nos. 3 and 5, and the series of endless tapes J^3, to aid in carrying a sheet from a printing-press to a folding-machine.

4. The adjustable shaft No. 6, carrying a series of short endless tapes, in combination with the hinged frame J^3, the roller No. 1, and the endless tapes J^3 and J^4, the shaft No. 7, and a series of sheet-delivering tapes, combined with said shaft No. 7, as illustrated in Fig. 1, to convey sheets to the folding-machine.

5. A frame consisting of two parallel arms or side pieces hinged to the frame of a paper-folding machine and connected at their outer ends by means of a roller journaled thereto, a series of sheet-carrying tapes stretched over said roller carried by said hinged side pieces, and also stretched over rollers journaled to the machine-frame, and an adjustable roller connected with the same machine-frame, arranged and combined relative to each other and the sheet-delivery mechanism of a printing-press to operate in the manner set forth, for the purposes stated.

6. In a paper-folding machine, an adjustable gage supporting rigid slats, in combination with sheet-carrying tapes for the purpose of lifting the advancing sheets relative to the tapes, in the manner set forth.

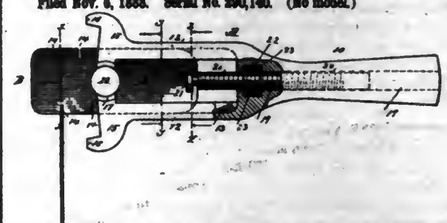
7. The gage M, having slots N and N^2, and supporting-slats N^3, the adjustable arms M^2, and the adjustable bar P, in combination with a series of endless tapes, J^3, substantially as shown and described, to operate in the manner set forth, for the purposes stated.



8. The gage M M^2, carrying slats N^3, the arms M^2, and the adjustable bar P, arranged and combined as and for the purposes stated.

401,738. MATRIX FOR STEREOTYPE-PLATES. GEORGE EASTWOOD, Kingston-upon-Hull, County of York, England. Filed Jan. 5, 1888. Serial No. 259,857. (No model.)

Claim.—A mold or matrix for stereotype-plates, having a facing and a backing, the facing being composed of sheets of tissue-paper or other like thin paper united together by means of a mixture of glycerine, a starchy material, and gum, the said facing containing at the time of use only sufficient moisture to render the paper slightly soft, and the backing being composed of one or more dry sheets of soft paper capable of receiving and retaining an impression, all substantially as set forth.



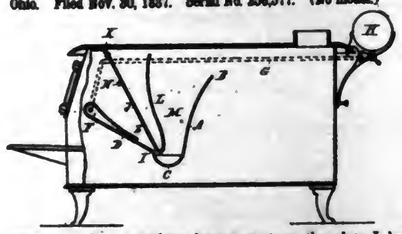
401,739. TABLE-CUTLERY. FREDRICK C. FISCHER, Northampton, Mass. Filed Sept. 26, 1888. Serial No. 286,311. (No model.)

Claim.—1. A hollow knife-handle consisting of a metallic tube and two metal plugs united by a bar, *c*, which said tube incloses and to which it is solidly united, one of said plugs having an extension beyond the end of said tube, from which to form a blade, substantially as set forth.

2. A hollow metallic handle consisting of a tube and the plugs *c c*, one thereof having a tang, 4, thereon, inserted within and closing the ends of said tube, said plugs being united by a bar, *c*, integral therewith, substantially as set forth.

401,740. SAW-SET. FREDERICK C. FISCHER, Northampton, Mass. Filed Nov. 6, 1888. Serial No. 290,140. (No model.)

Claim.—1. A saw-set consisting of a holder and slide-frame having a laterally-extended abutment-nose at one end, combined with a set-plate having one or more slots, 14, in its edge, longitudinally adjustable on said slide-frame, for the purpose described.



2. The combination, with the holder-frame comprising the legs 12, provided with the slideways 13, the abutment-noses 16, and the bridge-web, of the set-plate having one or more slots, 14, longitudinally movable in said ways, and the set-screw 18 through said bridge-web for a bearing against the set-plate, substantially as described.

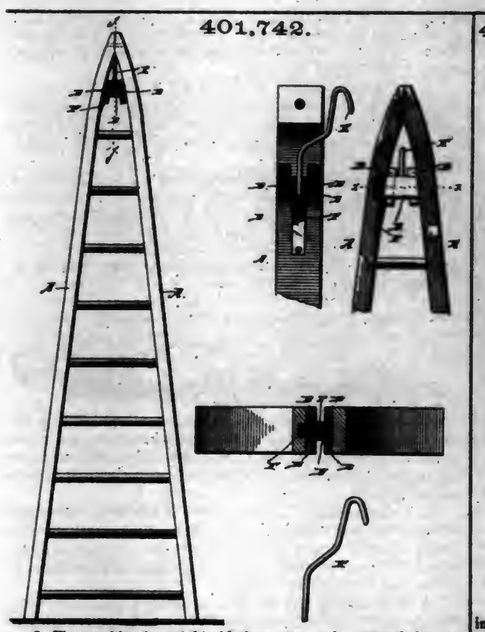
3. The combination, with the holder-frame having longitudinal slideways, of the edge-slotted set-plate B and a screw-rod, substantially as described, engaging said set-plate and having a screw engagement in the holder-frame, substantially as and for the purpose described.

4. The combination, with the holder-frame provided with the longitudinal bore 20, the aperture 22, and having longitudinal slideways, and a laterally-extended abutment-nose, 16, of the edge-slotted set-plate, the screw-rod playing endwise in said handle-bore and having a non-rotatable connection with said set-plate, and the nut 23 in said aperture engaging the said screw-rod, substantially as and for the purpose described.

5. The combination, with the holder-frame provided with the longitudinal bore 20, the aperture 22, and having longitudinal slideways and a laterally-extended abutment-nose, of the edge-slotted set-plate having the rectangular socket 25, the screw-rod playing endwise in said handle-bore and having the squared button 21 engaging said rectangular socket, and the nut 23 in said aperture engaging the said screw-rod, all substantially as described and shown, and for the purpose specified.

401,741. PETROLEUM-BURNER. CALEB V. FLEETWOOD, Cleves, Ohio. Filed Nov. 30, 1887. Serial No. 256,577. (No model.)

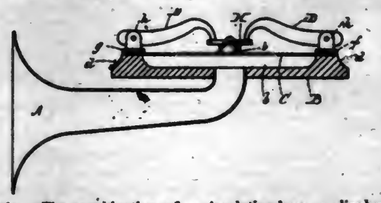
Claim.—1. In a petroleum burner or stove, the plate J, bent at L, and hinged at its upper end to the inside of the stove and forming the front of the combustion-chamber, in combination with the rod N, having an eccentric, *n*, upon it, and the plate D, bent to form the chamber F, having the opening E, and the oil-inlet pipe, whereby the oil-supply and the draft, which enter the combustion-chamber simultaneously and through the same aperture, can be regulated at will.



2. In a petroleum burner or stove, the combustion-chamber composed of the rear upwardly-curved back, the trough C, the angle-point I, and plate D, bent to form the chamber F, having opening E, and the plate J, having a shield or plate next to the combustion-chamber, and the oil-supply pipe, all combined, as and for the purposes set forth.

401,742. LADDER-HOOK. JAMES B. FOOTE, Delancy, N. Y., assignor of one-half to Gordon B. Maxwell, same place. Filed Jan. 28, 1889. Serial No. 297,966. (No model.)

Claim.—1. The combination, with the side bars of the ladder having their upper ends secured together in contact, of the hook removably fitted between the same, as set forth.



2. The combination, with the side bars, of the guides secured thereto and the sliding block engaging the guides and carrying the hook, as set forth.

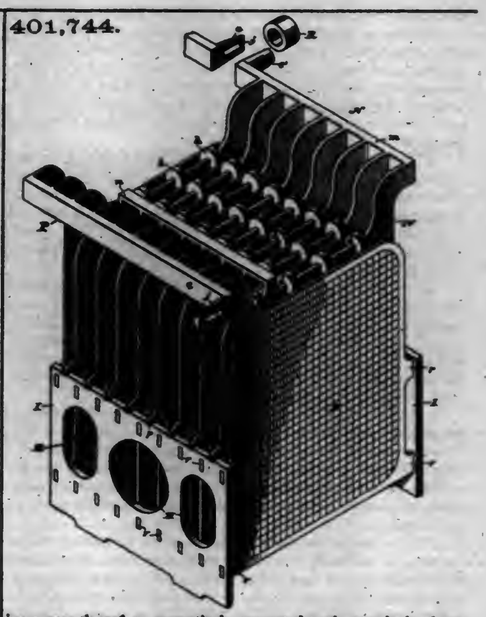
401,742.

3. The combination of the side bars, the guides secured thereto, the sliding block having its ends engaging the guides and carrying the hook, and the spring secured to one of the side bars and bearing against the under side of the sliding block, as set forth.

401,743. TELEPHONE-TRANSMITTER. WEBSTER GILBERT, St. John, New Brunswick, Canada, assignor to James Straton, same place. Filed Jan. 26, 1889. Serial No. 297,556. (No model.)

Claim.—The combination of an insulating-base, a diaphragm, separate arc-shaped metallic plates secured to said base, and provided with upright ears disposed in pairs, an insulating-cushion on the center of said diaphragm, a carbon disk on said cushion, carbon electrodes pivoted at their outer ends in said ears, in conductive contact therewith, and resting at their inner ends on said disk, and electric connections for said arc-shaped plates.

401,744. SECONDARY BATTERY. WILLIAM W. GIBSON, Haverford College, Pa., assignor to The Electrical Accumulator Company, of New York. Filed Feb. 1, 1889. Serial No. 298,236. (No model.)

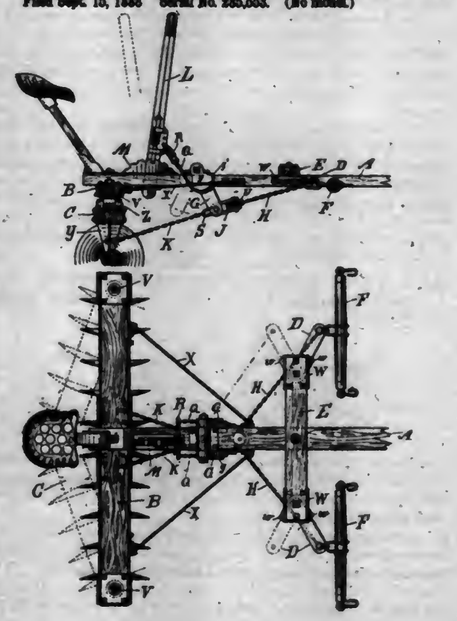


Claim.—1. In a secondary battery, the combination of two elements or electrodes, an inclosing-cell therefor, an electrolytic liquid, and means for supporting both electrodes, consisting of boards or strips of insulating material mechanically connecting and fixed to the plates of one element at points upon opposite edges, forming a support, substantially as described.

2. In a secondary battery, the combination of two elements or electrodes, an inclosing-cell therefor, an electrolytic liquid, boards or strips of insulating material to which the plates of one element are fastened, and a series of projections on the second element resting upon said strip, whereby both elements are supported free from contact with the cell-bottom, substantially as described.

3. In a secondary battery, the combination of two elements or electrodes, an inclosing-cell therefor, an electrolytic liquid, and boards or strips of insulating material to which the opposite edges of the plates of one element are respectively riveted, forming a support for the projections on the second element, whereby both elements are supported free from contact with the cell-bottom.

4. An electrical connector for batteries, consisting of two sections of conducting material, each forming part of a cone or cylinder having a smooth surface, respectively connected to the terminals of two battery-elements, and a clamp or ring for uniting the two sections mechanically.



401,744.

5. An electrical connector for batteries, consisting of two sections of conducting material, each forming part of a cone or cylinder having a smooth curved surface, said sections being respectively connected to two battery-elements, and a ring having an interior wall conforming to said curved surface for uniting the two sections mechanically and electrically, substantially as described.

6. An electrical connector for uniting two cells of battery, consisting of two complementary sections of conducting material connected, respectively, to two battery-elements and suited to form a cone or cylinder having a smooth surface, guides upon the meeting surfaces to produce accurate registry, and a suitable device for clamping or holding the sections together.

401,745. DISK HARROW. ROBERT W. HARDIE, Albany, N. Y. Filed Sept. 15, 1888. Serial No. 285,553. (No model.)

Claim.—1. In a disk harrow, the combination, with a main frame and cutter-gangs pivoted thereto, of whiffletrees movable forward and backward together independently of a doubletree, draft-equalizing mechanism movable bodily forward and backward in the line of draft, and draft-connections flexibly uniting said equalizing mechanism with the free ends of the cutter-gangs, substantially as shown and described.

2. In a disk harrow, the combination, with a main frame and cutter-gangs pivoted thereto, of whiffletrees movable forward and backward together independently of a doubletree, draft-equalizing mechanism movable bodily forward and backward in the line of draft by means of a swinging arm pivoted to the pole, and draft-connections flexibly uniting said swinging arm with the free ends of the cutter-gangs, substantially as shown and described.

3. In a disk harrow, the combination, with a main frame and cutter-gangs pivoted thereto, of whiffletrees movable forward and backward together independently of a doubletree, flexible connections uniting said whiffletrees and engaging with a pulley flexibly attached to a swinging arm pivoted to a pole, and draft-connections flexibly uniting said swinging arm with the free ends of the cutter-gangs, substantially as shown and described.

4. In a disk harrow, the combination, with a main frame and cutter-gangs pivoted thereto, of whiffletrees mounted upon pivoted arms movable together forward and backward on their pivots, draft-equalizing mechanism movable bodily forward and backward in the line of draft, and draft-connections flexibly uniting said equalizing mechanism with the free ends of the cutter-gangs, substantially as shown and described.

5. In a disk harrow, the combination, with a main frame and cutter-gangs pivoted thereto, of whiffletrees mounted upon pivoted arms movable together forward and backward on their pivots, draft-equalizing mechanism movable bodily forward and backward in the line of draft, draft-connections flexibly uniting said equalizing mechanism with the free ends of the cutter-gangs, a lever pivoted to a pole, and flexible connections uniting said lever and draft-equalizing mechanism, substantially as shown and described.

6. In a disk harrow, the combination, with a main frame and cutter-gangs pivoted thereto, of whiffletrees mounted upon pivoted arms movable together forward and backward on their pivots, draft-equalizing mechanism movable bodily forward and backward in the line of draft by means of a swinging arm attached to a pole, draft-connections flexibly uniting said swinging arm with the free ends of the cutter-gangs, a lever pivoted to a pole, and flexible connections uniting said lever and swinging arm, substantially as shown and described.

7. In a disk harrow, the combination, with a main frame and cutter-gangs pivoted thereto, of a swinging arm pivoted to a pole and provided with a sector, flexible draft-connections uniting said swinging arm with the free ends of the cutter-gangs, a lever pivoted to the pole, and flexible connections attached to said lever and engaging the edge of said sector, substantially as shown and described.

8. The combination, with a pole, of whiffletrees mounted upon pivoted arms, draft-equalizing mechanism movable bodily forward and backward in the line of draft, an adjusting-lever pivoted to the pole, a locking device connected therewith, and flexible connections uniting said lever and equalizing mechanism, substantially as shown and described.

9. The combination, with a pole, of whiffletrees mounted upon pivoted arms and movable together backward and forward in a horizontal plane, draft-equalizing mechanism consisting of flexible connections uniting said whiffletrees, engaging with a pulley flexibly attached to a swinging arm pivoted to a pole, an adjusting-lever attached to said pole and having a locking device connected therewith, and adjustable connections uniting said lever and swinging arm, substantially as shown and described.

401,746. COMBINED BUTTON-HOOK AND BRACELET. ALICE JOHNSTONE, Avondale, N. J. Filed Jan. 14, 1889. Serial No. 296,253. (No model.)

Claim.—1. A bracelet consisting of a body portion and a detachable buttoner portion, the body portion having bearings or connections for the attachment of the ends of the detachable portion, substantially as set forth.

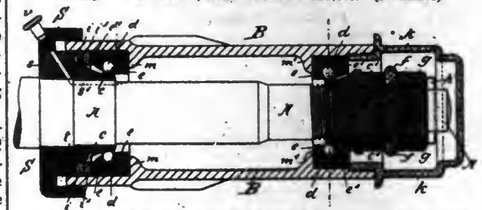
2. A bracelet formed of a body portion and a detachable hook portion, the latter forming an integral part of the bracelet and wholly removable from the body portion, substantially as described.

3. A combined bracelet and button-hook, the body portion of the bracelet terminating in enlargements which form part of the securing means, and the removable button-hook portion having ends adapted to engage with said enlargements to complete the securing means, substantially as described.

4. A bracelet consisting of a body and a buttoner portion, the body portion of the bracelet formed of springy material and terminating in connections, and the removable buttoner portion having ends adapted to detachably engage with said connections, substantially as described.

5. A bracelet consisting of a body portion and a detachable buttoner portion, the body portion having bearings for the attachment of the detachable portion, and a chain for connecting the buttoner and bracelet portion together, substantially as set forth.

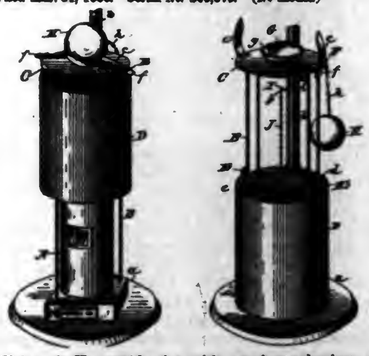
401,747. RIVET. ALBERT KIRK, Canton, Ohio. Filed Feb. 25, 1889. Serial No. 301,025. (No model.)



Claim.—1. A rivet having an outside portion of soft iron, embracing a portion of flat hardened steel extending from the central portion of the rivet to the outside, a portion of the said steel having been removed before hardening, substantially as described, and for the purpose set forth.

2. A rivet having an outside portion of soft iron, embracing a portion of flat steel extending from the central to the outside portion, having one head formed by upsetting the iron and steel, the other formed of the soft iron over the end of the steel, substantially as described, and for the purpose set forth.

3. A rivet, preferably of soft iron, having a groove extending from the central portion to the outside, and a hardened-steel plate driven in said groove, substantially as described, and for the purpose set forth.

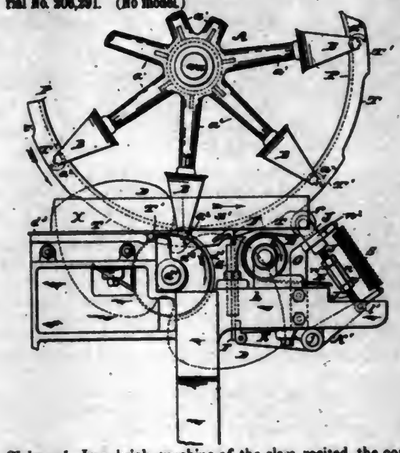


401,748. BALL-BEARING. HERMANN KUHATH, Dresden, Saxony, Germany. Filed Dec. 17, 1888. Serial No. 293,573. (No model.)

Claim.—1. In adjustable ball-bearings for carriage-axles, the combination of the rings *e e' e d'*, cones *c c'*, axle-spindle A, washer *f*, lock-nut *g*, and box B, with cap *k*, substantially and for the purpose as described.

2. In adjustable ball-bearings for carriage-axles, the combination of the spindle A, butting-ring 8, cones *c c'*, rings *e e' e d'*, leather washers *i i'*, soft-metal washer *f*, lock-nut *g*, balls *d*, axle-box B, and cap *k*, substantially and for the purpose as described.

401,749. RAILWAY-CAR HEATER. ROLAND M. LA RUE, Connersville, Ind., assignor of one-half to William Newkirk, same place. Filed Mar. 31, 1888. Serial No. 269,079. (No model.)



Claim.—1. The combination, with a car-heater having a movable hood with holds on its sides and perforations in its head for guide-rods, of a cap on top of the rods above the elevated hood having a slotted cap thereon, and hinged lever-arms at its edges registering with the holds on the hood and with the slots in the cup, and a weight within the cup holding the ends of the arms, as set forth.

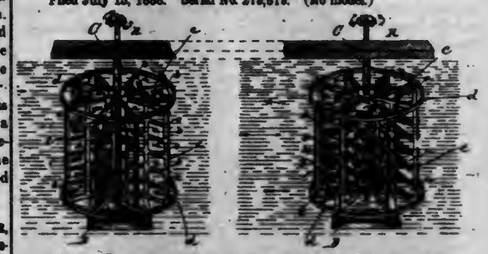
2. The combination, with a movable hood with holds on its sides and perforations in its head for a stove-pipe and guide-rods, of detents on the guide-rods passing through the perforations of the head, and a cap on top of the rods having hinged lever-arms at its edges and a cup in its center having slots in its sides, the outer ends of the arms taking into the holds on the hood and the inner ends resting in the slots of the cup, and a weight on the arms in the cup, as set forth.

3. The combination, with a car-heater having a drop-hood and stationary guide-rods securing the heater to the floor, a stove-pipe and said rods extending up through the head of the cover above the elevated hood, of a cap on top of the rods with curved hinged lever-arms on its sides, a cup in the center of the cap having slots in its upper side, holds on the sides of the upper end of the hood, and a damper in said pipe automatically opened and closed by the movement of the hood, said lever-arms registering with the holds on the hood and slots in the cup and their ends held in the cup by a weighted ball, as set forth.

401,750. WIRE CUT-OFF BRICK-MACHINE. ELIZABETH S. LESOR, Philadelphia, Pa., (administratrix of Sanford W. Lesor, deceased,) assignor to Cyrus Chambers, Jr., same place. Filed June 26, 1886. Serial No. 206,291. (No model.)

Claim.—1. In a brick-machine of the class recited, the combination, with the continuously-moving belt E and the rotating cut-off device arranged with relation thereto, substantially as shown and described, of the plate for supporting and retarding the advancing end of the bar of clay while a brick-length is being severed therefrom, said plate being located between the point of severance and delivery beyond said belt, substantially as described.

2. In a brick-machine of the class mentioned, the combination, with the rotating cut-off devices, of the supporting-plate located with relation to the point of severance of the clay bar, as shown and described, together with mechanism, such as shown and described, for bringing and retaining the plate in position to support the end of said bar and for moving the same away from such supporting position out of the path of the cut-off wires, substantially as and for the purpose set forth.



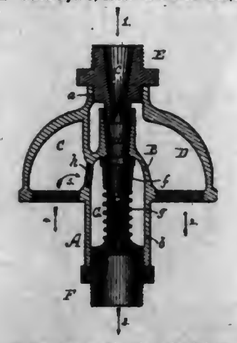
3. In a brick-machine of the class mentioned, the combination, with the rotating cut-off devices, of the vertically-sliding plate located relatively to the point of severance of the clay bar, as shown and described, the rock-lever, the rod, the bracket, the spring, and the disk having the elevations and depressions, all constructed and adapted to operate substantially as and for the purpose set forth.

4. In a brick-machine of the class mentioned, the combination, with the rotating cut-off devices, of the belt for carrying the clay bar, the off-bearing-belt with its surface below the said carrying-belt, the supporting-plate located with reference to the point of final severance of the clay bar, as shown, together with the mechanism for elevating, depressing, and retaining said plate, all constructed and adapted to operate substantially as and for the purpose set forth.

5. In a brick-machine of the class mentioned, the combination, with the rotating cut-off devices, of the vertically-sliding plate located relatively to the point of severance of the clay bar, as shown and described, the rock-lever, the rod, with means for adjusting its length, the bracket, the spring, and the disk having the elevations and depressions, all constructed and adapted to operate substantially as and for the purpose set forth.

6. In a brick-machine of the class mentioned, the combination, with the rotating cut-off devices, of the sliding plate located with relation to the point of complete severance of the clay bar, as shown, the rock-lever, the rod, the disk having the elevations and depressions, and means for holding the free end of said rod in contact with the disk by a yielding force, substantially as and for the purpose set forth.

401,751. WATER-WHEEL. FREDERICK LE BEAU, Buffalo, N. Y. Filed July 13, 1888. Serial No. 279,819. (No model.)



Claim.—In a water-wheel, A, the vertical shaft C, its upper end working through a suitable bearing and having a gear-wheel thereon, its lower end working in a bearing in the base-piece B, the frames *c c c*, radiating from the said shaft, divided by a vertical strip and longitudinal strips into a series of valve-openings covered by flap-valves *a a a*, attached to the top of valve-openings at *b*, the flaps on one side of the shaft opening on one side of the frame, and the flaps on the other side of shaft opening on opposite side of frame, the outer end of the frames being secured to circular rings or hoops *d d*, substantially as described.

401,752. PAVEMENT FOR STREETS OR ROADS. MORDICAI LEVI, Charleston, W. Va. Filed Nov. 19, 1888. Serial No. 291,284. (No model.)

Claim.—A pavement consisting of a first or bottom layer of comminuted stone, of a second layer composed of asphalt and any suitable comminuted material, of a third layer of sand, and of a fourth or surface layer of any suitable material, substantially as described.

401,753. INJECTOR. LEVI W. LOMBARD and WILLIAM CONNOR, Boston, Mass. Filed Apr. 2, 1888. Serial No. 269,356. (Model.)

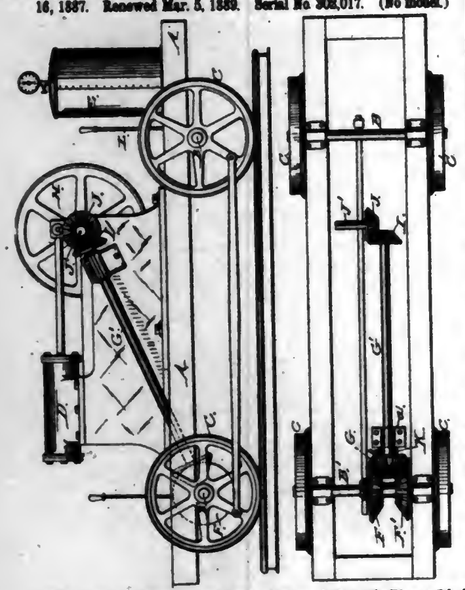
Claim.—1. In general combination, the injector composed of the tubular body A, the partition B, with the combining-cone *d*, the supply and overflow chambers D C, the aperture *h*, the relief-chamber G, the discharge-cone *e*, located therein, and the relief-valve *f*, with its spring *g*, as and for purposes set forth.

2. In an injector provided with a relief-chamber constantly open to the external air, a discharge-cone, *e*, located therein, the relief-valve *f*, movable upon said cone and adapted to engage with the outlet-mouth of the combining-cone, in combination with a discharge-cone, *c*, and the steam-cone *c*, aligned therewith, projecting within and partially inclosed by said combining-cone, for purposes stated.

401,754. RAILWAY-GATE. ALEXANDER J. MCDONALD, Chicago, Ill. Filed May 14, 1888. Serial No. 273,781. (No model.)

Claim.—A railway-gate arm consisting of a tubular metallic body provided with one or more longitudinal strengthening-ribs projected radially from the body, and angle-irons whose flanges are secured, respectively, to the body and the rib, substantially as described.

401,755. RAIL-BRAKE. MOSES A. MICHAELS, Allegheny, assignor of one-half to John T. Moore, Pittsburg, Pa. Original application filed May 15, 1888, Serial No. 273,951. Divided and this application filed July 10, 1888. Serial No. 279,514. (No model.)

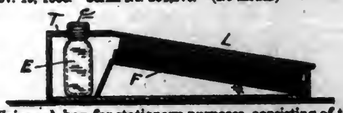


Claim.—1. In a rail-brake, the combination, with the truck-sill, of two parallel journaled brake-shafts having crank-arms arranged between the wheels of the truck in line therewith and adapted to grip the track-rail, substantially as and for the purposes specified.

2. The combination, in a rail-brake, of two parallel journaled brake-shafts provided with pinions, and a bevel skew-gearing, substantially as and for the purposes specified.

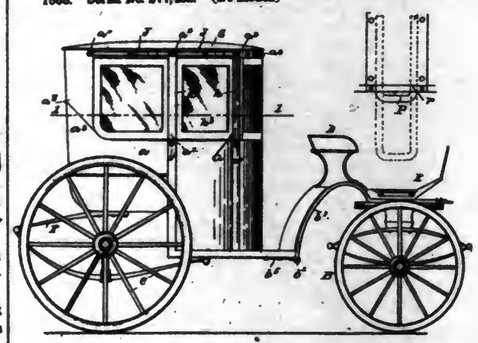
3. The combination, with a truck one of whose sills has an offset or bracket arranged between the wheels, of two parallel brake-shafts journaled on said bracket of the side sill, and mechanism for rotating the parallel journaled brake-shafts, substantially as and for the purposes specified.

401,756. MOTOR. WILLIAM H. PATTON, Pueblo, Colo. Filed Nov. 16, 1887. Renewed Mar. 5, 1889. Serial No. 302,017. (No model.)



Claim.—1. The frame A of a car-truck, and the axle B', provided with the sliding bevel-gears F F', in combination with the bevel-gears G and I, mounted on a flexible shaft, G', the bevel-gear J, mounted on the shaft J', and a motive power for operating the same, substantially as and for the purpose herein described.

2. The axle B', provided with the sliding bevel-gears F F', in combination with the bevel-gears G and I, mounted on a flexible shaft supported in proper bearings, and provided with a close collar held in place by means of a thumb screw and adapted to hold the bevel-gear G up to its work, substantially as herein set forth.



3. The flexible shaft G', supported in proper bearings, provided with the bevel-gears G and I, in combination with the collar K, secured to the said shaft between the bearing and gear G, substantially as and for the purpose set forth.

401,757. DESK-BOX. ALLEN W. PHILLIPS, Providence, R. I. Filed Nov. 19, 1888. Serial No. 291,276. (No model.)

Claim.—A box for stationery purposes, consisting of the inclined lid L, the flat portion T, and the inclined false bottom F, combined with the ink-receptacle E, substantially as described, for the purpose specified.

401,758. CAR. CHARLES A. READE, Chicago, Ill. Filed June 18, 1888. Serial No. 277,402. (No model.)

Claim.—1. In a covered vehicle, the fixed front panel which extends from the level of the floor of the vehicle to a point about midway in its height, in combination with a sash arranged to telescope into the panel, substantially as described.

2. In combination, in the body of a covered vehicle, doors, the position of which is substantially upon the sides of the vehicle, a floor-platform extending to the front of the vehicle, a bayed front wall extending from the floor-platform to the roof to form a recessed interior to the vehicle forward of the doors of the full height of the vehicle, and seats therein adapted to be removed or folded out of the way to permit of said recess being used when the seats are unoccupied, as specified.

3. In a cab-body, the combination of window-sashes in the sides of the vehicle, socket-receptacles into which they telescope, sectional doors, a roof to the vehicle of flexible material, and sectional standards to support the roof, the upper portions of the standards adapted to be loosened from the lower portions and carried to the rear with the roof-covering, as specified.

4. In a cab-body, the combination of window-sashes in the sides of the vehicle, socket-receptacles into which they telescope, a roof to the vehicle of flexible material, and sectional standards to support the roof, the upper portions of the standards being provided with socket ends and adapted to be loosened from the lower portions and carried to the rear with the roof-covering, as specified.

5. In combination with a vehicle, a vehicle-door which opens and closes with a sliding swinging motion determined by suitable guides upon the one side thereof and upon the other side by a hinge or hinges which swing the door outwardly and then inwardly, substantially as shown.

6. A vehicle and a guide-casting, K, in combination with a vehicle-door, a guiding-arm, H', and a hinge, H², all operating together, substantially as and for the purpose specified.

7. In combination with a vehicle-seat, parallel rack-standards O², casting o, arranged to slide upon the standards, hinges which unite the seat to the castings, and a bolt, o', projecting from the seat and adapted when the seat is lowered to enter the apertures in the standards O² to sustain the seat in position, substantially as specified.

8. In a vehicle, a standard provided with apertures to form a rack, in combination with a seat adjustable in height, an arm pivoted to the seat, and a casting movably secured to the rack through which the lower end of the arm operates and engages in the apertures of a rack, the said arm being retained in the casting in such manner as to be limited in its motion, as specified.

9. A convertible four-wheeled cab having that portion of the frame-work of its front running-gear which attaches directly to the body of the vehicle of identical or equivalent shape with the similar portion of a shaft used by two-wheeled cabs, the said running-gear and the said shafts being readily interchangeable and the vehicle thus made convertible, as specified.

10. In a cab interchangeably convertible from a two into a four wheeled vehicle, a rear elevated driving-seat, the stand of which is detachably connected to the body of the cab, for the purpose specified.

11. In a package-support for vehicles, the combination of a U-shaped continuous bar of angle-iron with guides secured to the vehicle in which the legs of the angle-bar may slide and the bar be supported when extended beyond the edge of the vehicle, as specified.

12. An elevated rear driving-seat to a cab, the base of which is inclined upwardly and to the rear and a latch-rod attached in bearings thereto, in combination with a seat-support similarly inclined, and with a rack-bar, N⁹, adapted to co-operate with it and secure the seat in any adjusted position, as and for the purpose specified.

401,759. WATCH-MAKER'S STAKING-TOOL. JOHN C. ROGERS-LEAN, Worcester, Mass. Filed Oct. 31, 1887. Serial No. 253,234. (No model.)

Claim.—1. In a tool for watchmakers' use, the supporting-stand adapted to be held in a vise and having the end to be embraced by the jaws of the vise provided with a slot forming two elastic portions at each side of the slot, substantially as described, and for the purpose specified.

2. In a tool for watchmakers' use, a supporting-stand for maintaining a rest for the work, a rest for the work, a barrel for a vertically-moving plunger, said barrel having an external screw-thread, a sleeve provided with an internal screw-thread, and a screw-threaded plug entering said sleeve and arranged to force the plunger downward in said barrel, substantially as described.

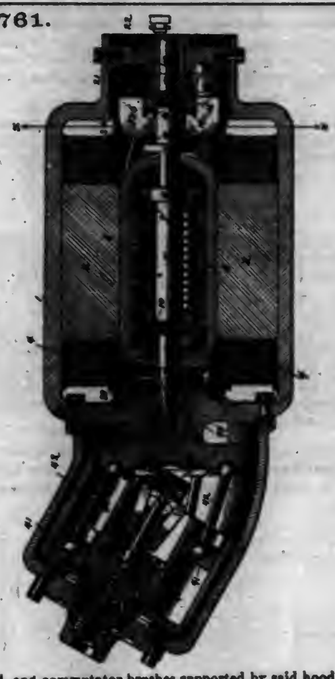
3. In a tool for watchmakers' use, having a supporting-stand and a vertically-moving plunger, the stamp D, said stamp being provided with a series of openings substantially semicircular in form, as and for the purpose set forth.

4. In a tool for watchmakers' use, the stand A, provided with a slot, *d*, and holes *b* and *c*, and a tubular barrel to receive a sliding plunger, substantially as described.

5. The combination of stand A, barrel *d'*, screw-threaded sleeve F, and plug G, having a socket, *m*, substantially as described.

6. The combination of the supporting-stand A, provided with rests for the work and a barrel, *d'*, screw-threaded sleeve F, and plug G, provided with a central socket, *m*, to receive a plunger or tool, H, said tool being flattened on its side, together with means by which the rotation of the tool is prevented, substantially as described.

401,760. STOPPER-RECEIVER FOR BOTTLES. AXEL T. SOHER, Salem, Mass. Filed Mar. 7, 1888. Serial No. 266,644. (No model.)



Claim.—The bottle a, having neck *a'* and projecting shoulder a^2 at the junction of the neck and body of the bottle, in combination with the spring-clasp *c* and its cup *c'*, supported on the said shoulder or projection a^2 of the bottle, substantially as set forth and described.

401,761. COMBINED MOTOR AND ELECTRIC GENERATOR. JAMES F. SHAWHAN, Dayton, Ohio, assignor of one-half to James W. Carpenter, same place. Filed Mar. 23, 1888. Serial No. 268,268. (No model.)

Claim.—1. In an electric generator, a frame supporting the field-magnets and provided with a contracted hood extending from one end thereof, and an armature-shaft, one end of which is supported in the frame and the other in the hood, a commutator arranged within

401,761.

the hood, and commutator-brushes supported by said hood, substantially as described.

2. In an electric generator, a supporting-frame carrying the field-magnets and provided with a hood extending from one end thereof, a cross-bar arranged in said hood, and an armature-shaft, one end of which is supported in said cross-bar and the other is supported in the frame, substantially as described.

3. In an electric generator, a frame supporting the field-magnets and having a hood extending from one end thereof inclosing the commutator and brushes, and a casing surrounding the exposed portions of the armature between the field-magnets and the frame, substantially as described.

4. In an electric generator, a frame supporting the field-magnets and having a hood projecting from one side thereof, a disk of insulating material closing the end of said hood, and casings extending between the field-magnets and the frame, whereby the armature and commutator and brushes are completely protected from exposure, substantially as described.

5. In an electric generator, an armature-shaft, a commutator supported thereon, and screw-nuts for holding said commutator in position, one of the nuts being provided with a recess for the reception of oil, substantially as set forth.

6. In an electric generator, a frame supporting the field-magnets, a hood projecting from said frame, and having a cross-bar supporting the armature-shaft, a commutator upon said armature-shaft, a disk of insulating material closing said hood, and commutator-brushes supported in said disk and arranged parallel to said shaft to make contact with the commutator-sections at right angles to the shaft, substantially as described.

7. In an electric generator, a frame supporting the field-magnets, a hood extending therefrom, a disk of insulating material secured in said hood, sleeves secured to said insulating material, and commutator-brushes in said sleeves and arranged parallel with the armature-shaft, substantially as described.

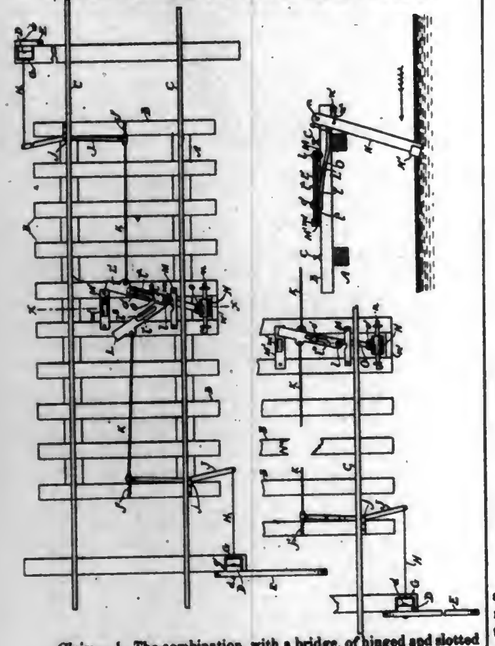
8. In a combined electric generator and motor therefor, a frame supporting the field-magnets, provided with a hood inclosing the commutator and brushes therefor, a casing between the field-magnets and frame inclosing the exposed portions of the armature, and a casing secured to the other end of the frame inclosing the motor connected to the armature-shaft, whereby all the operative parts of the generator and motor are protected from exposure, substantially as described.

9. In an electric generator, a frame supporting the field-magnets, casings arranged between the field-magnets and frame, and a hood inclosing the commutator and brushes, whereby the operative parts of the generator are protected from exposure while the field-magnets are exposed to the air, substantially as described.

10. In an electric generator, the combination, with an armature

shaft carrying a commutator, of a disk of insulating material, casings attached to said disk, commutator-brushes sliding in said casings, springs secured to the disk and bearing upon the end of said brushes, and adjusting-screws in the ends of the springs, substantially as described.

401,762. COPYING APPARATUS. GEORGE H. SMITH, London, County of Middlesex, England. Filed Aug. 13, 1888. Serial No. 282,637. (No model.) Patented in England May 14, 1888, No. 7,149.

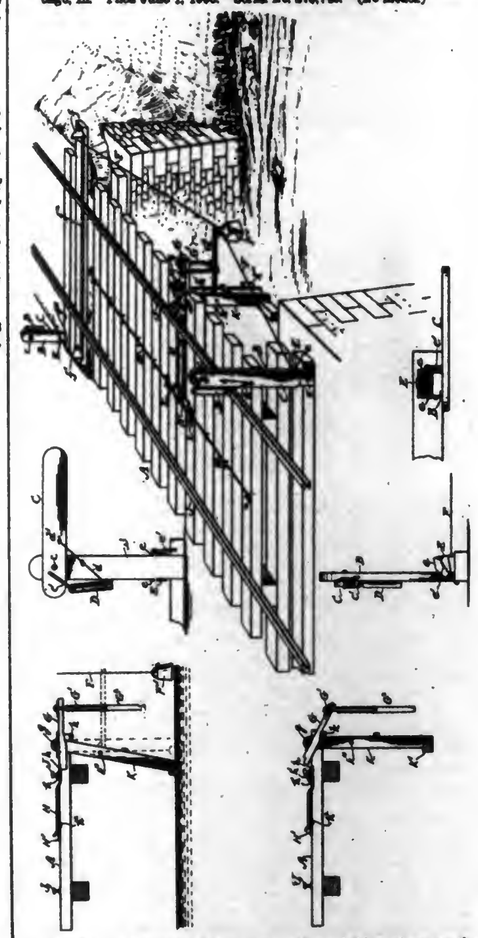


Claim.—1. The hereinbefore-described composition of matter to be used for a slab or pad for taking manifold copies of writing or other analogous matter, consisting of china-clay, starch, glycerine, and water.

2. The combination, with a back plate of absorbent material, of a composition consisting of china-clay, starch, glycerine, and water mounted on said plate, substantially as and for the purpose set forth.

3. The combination, with a retaining-tray, of a layer of absorbent material in the tray, and a composition consisting of china-clay, starch, glycerine, and water above the said absorbent material, substantially as and for the purpose set forth.

401,763. DANGER-SIGNAL FOR RAILWAY-BRIDGES. JAMES W. STEELE, Topeka, Kans., assignor of one-half to Andrew McNally, Chicago, Ill. Filed June 1, 1888. Serial No. 275,745. (No model.)



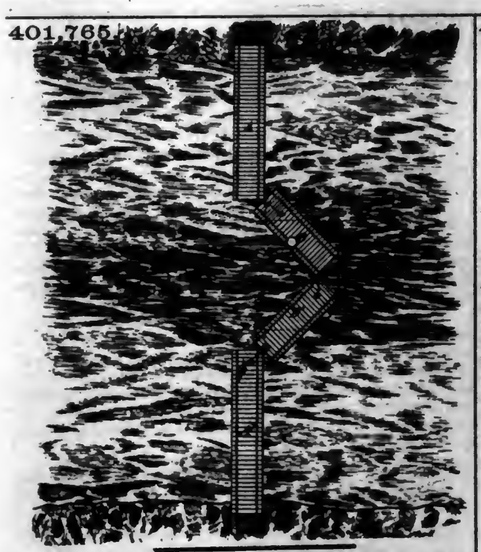
Claim.—1. The combination, with a bridge, of hinged and slotted jaws normally held together by a pin or stud in operative connection with a float-trigger, rods, cords, or strips K K, attached to said jaws, respectively, and to the ends of the bridge, springs for holding said cords under resilient tension, and signals at or near the ends of said bridge in operative connection with said springs, whereby the severing one or both of said cords will permit the springs to recoil and operate the signals, substantially as shown and described.

2. The combination, with a railway-bridge, of automatic semaphores or signals arranged, respectively, at or near the ends of the bridge, the slotted jaws L L', wires, rods, or strips for connecting the same with said automatic signals, and a float-trigger having a rod, O, and stud o', substantially as shown and described.

3. The combination, with a railway-bridge, of automatic semaphores or signals arranged, respectively, at or near the ends of the bridge, slotted jaws L L', a float-trigger for releasing said jaws, and rods or strips of a fusible or inflammable material for connecting said jaws with said automatic signals, substantially as shown and described.

4. In a danger-signal for railway-bridges, the hinged jaws L L' in operative connection with automatic signals at or near the ends of the bridge, a pin, o', for normally holding said jaws together, a suspended float-trigger in operative connection with said pin, and means—such as the cleat n' and spring n^3—for preventing the swinging of said frame by the action of the wind, substantially as shown and described.

401,764. DANGER-SIGNAL FOR RAILWAY-BRIDGES. JAMES W. STEELE, Topeka, Kans., assignor of one-half to Andrew McNally, Chicago, Ill. Filed June 1, 1888. Serial No. 275,746. (No model.)

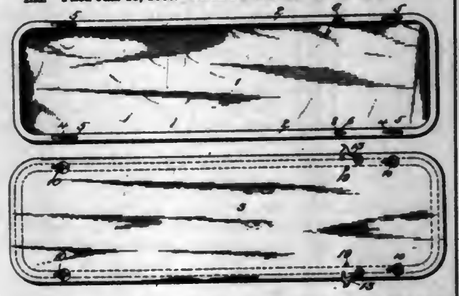


Claim.—1. The combination, with a railway-bridge, of automatic signals at or near the ends thereof, a wire or cable for connecting the releasing mechanism of said signals, a float-trigger, a weight attached to said cable at or near the middle of the bridge, w pivoted bar in operative connection with said trigger for normally sustaining said weight, a secondary pivoted bar for sustaining said weight-supporting bar, a tripping-plate for normally holding said secondary bar, springs attached to said tripping-plate, and rods, cords, or strips of fusible or inflammable material attached to the ends of the bridge for holding said springs under resilient tension, whereby a fire or dangerous rise of water may release said weight and actuate said signals, substantially as shown and described.

2. The combination, with a bridge, of the tripping-plate H, springs L L', rods, cords, or strips M M', for holding said springs under resilient tension, bars G G^2, the latter being suspended from the former, float-trigger K, weight F', and cable F, in operative connection with automatic signals at or near the ends of the bridge, substantially as shown and described.

401,765. PONTOON-BRIDGE. SYLVESTER H. STEWART, Philadelphia, Pa. Filed Jan. 19, 1889. Serial No. 296,926. (No model.)

Claim.—A bridge with a floating draw constructed of two floating leaves, one connected to each causeway in such manner as to swing freely, and of such length relatively to the open water-way as when closed to have the form of a V, substantially as and for the purpose described.



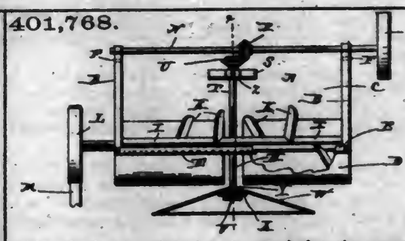
401,765.

401,766. DETERGENT. FRANCIS C. TAYLOR, New York, N. Y., assignor of two-thirds to Robert C. Campbell, Philadelphia, Pa., and William K. Peck, Grand Rapids, Mich. Filed Aug. 6, 1888. Serial No. 282,060. (No specimens.)

Claim.—The herein-described composition of matter adapted for softening hardened printing-inks and the skins thereof, consisting of balsam of copaiba, glycerine, crude petroleum, and oil of sandal-wood, combined together substantially in the proportions specified.

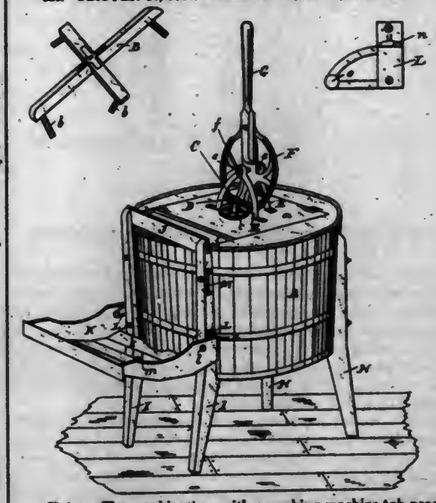
401,767. COFFIN-FASTENER. CHARLES R. TEMPLE, Terre Haute, Ind. Filed Jan. 15, 1889. Serial No. 296,422. (No model.)

Claim.—1. A coffin or casket provided near one end in each of its sides with a socket and at the opposite end with a transverse recess, one of the walls of which is undercut, in combination with a lid provided near one end with opposite lugs adapted to enter the sockets and at its opposite end with a pivoted hook adapted to take in the recesses and bind against one of the walls thereof, substantially as specified.



2. A coffin or casket provided near one end at each of its sides with inclined sockets and at the opposite end with a transverse recess, one of the walls of which is undercut for a portion of its length, in combination with a lid having horn-shaped lugs adapted to enter the sockets and having pivoted hooks adapted to enter the recesses, the hooks being formed on a taper and undercut at its inner edge, whereby a forcing and drawing action takes place when the hooks enter the recesses, substantially as specified.

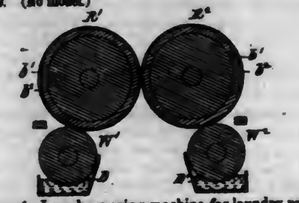
3. The casket 1, having the walls 2, formed with the sockets 4, having grooves 5, and the opposite recesses 6, provided with transverse bars 8 and undercut, as at 7, in combination with the lid 3, having the lugs 10, secured thereto by means of the perforated plates 11 and adapted to enter the sockets, and having the hooks 13, provided with the eye 14 and secured to the lid by the screw 15, and having the hook end 16, tapered and undercut as at 17, substantially as specified.



401,768. MANURE-DISTRIBUTER. JAMES A. TISHER, Gordon La. Filed Nov. 13, 1888. Serial No. 290,668. (No model.)

Claim.—The manure-distributing attachment for wagons, comprising the hopper adapted to be attached to the rear end of the wagon-body and having the semi-cylindrical bottom provided with the discharge-opening, the shaft I, journaled in the walls of the hopper above the bottom thereof, and having the stirring-arms K and the pulley L at one end, the shaft N, journaled in the upper side of the hopper and having the pulley O, the vertical shaft T, journaled in bearings S in the hopper and extending down through the discharge-opening thereof, the mitered gears P U, connecting the shafts N T, the distributing device detachably secured to the lower end of shaft T, and the endless belts to connect the pulleys O L to the hubs of the rear wagon-wheels, substantially as described.

401,768.

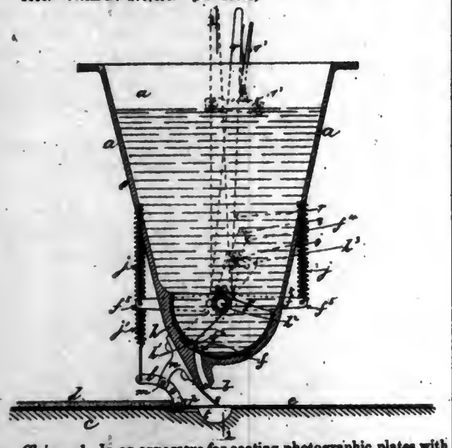


401,769. WASHING-MACHINE. THOMAS WALDRON, Sheldon, Mo. Filed June 17, 1887. Serial No. 241,642. (No model.)

Claim.—The combination, with a washing-machine tub provided with legs, of the projecting brackets L, secured to the legs of the tub and provided with the stops s on their inner ends, and with the pivots o, projecting horizontally from the projecting outer ends of the said brackets some distance from the said stops, and the clothes-rack having its sides pivoted on the said pivots, with the inner ends of its sides resting against the under sides of the stops, said clothes-rack being adapted to fold upwardly over the center of the said pivots and to rest against the side of the tub when not in use, substantially as set forth.

401,770. DAMPENING-MACHINE. MEMO R. WENDELL, Troy, and THOMAS S. WILDE, Albany, N. Y. Filed Nov. 17, 1883. Serial No. 112,079. (No model.)

Claim.—1. In a dampening-machine for laundry purposes, a pair of rollers each having a non-absorbent elastic body or periphery covered by a thin textile fabric and arranged to run in contact with each other, in combination with separated water-supply rollers, substantially as specified.



2. The combination of the rollers R' R^2, each having the rubber body or periphery b' and thin textile covering b^2, and arranged to run

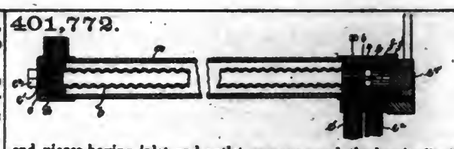
in contact with each other, the separated water-supply rollers W' W³, the troughs D', connecting-troughs D³, supply-pipe I, overflow-nipple n, and discharge-pipe o, substantially as specified.

3. The combination, with the rollers R' R³, arranged to run in contact with each other, having the non-absorbent elastic bodies or peripheries b' and thin textile covering b³, of the adjustable bearings J', the water-supply rollers W' W³, the adjustable bearings J³ J⁴, and the troughs D' D³, substantially as specified.

4. The combination, with the two dampening-rollers R' R³, each having a rubber body or periphery, b', and thin textile covering b³, running in contact with each other, of the supply-rollers W' W³, each running in contact with one of the rollers R' R³, and a suitable frame-work, substantially as specified.

401,771. APPARATUS FOR COATING PHOTOGRAPHIC PLATES WITH EMULSION. ROBERT R. M. BAIN, St. Louis, Mo. Filed Jan. 5, 1888. Serial No. 260,490. (No model.)

Claim.—1. In an apparatus for coating photographic plates with emulsion, the combination of a tank having an outlet-passage, a cylindrical-shaped valve pivoted axially and having arms connected by springs to said tank, a spring connecting one of said arms to a lever fixed on a shaft mounted in bearings and having an arm, whereby, when the plate to be coated is brought into contact with the lever, the valve is opened and the emulsion is permitted to flow, substantially as shown, and for the purpose described.



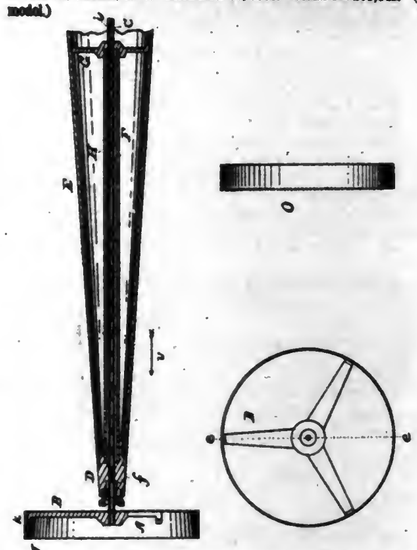
2. In an apparatus for coating photographic plates with emulsion, the combination of a tank having an outlet-passage, a cylindrical-shaped valve pivoted axially and having arms connected by springs to said tank, a spring connecting one of said arms to a lever fixed on a shaft mounted in bearings and having an arm, with a hand-lever having a ratchet or clicking device, whereby, when the plate to be coated is brought into contact with the lever, the valve is opened and the emulsion is permitted to flow, substantially as shown, and for the purpose described.

3. In an apparatus for coating photographic plates with emulsion, the combination of a tank having an outlet-passage, a cylindrical-shaped valve pivoted axially and concentrically, with an adjustable portion formed on its edge with notches, said valve having arms connected by springs to said tank, and an arm having a projecting stud or pin, a spring connecting one of said arms to a lever fixed on a shaft mounted in bearings and having an arm, a slotted arm fixed on the pivot of the adjustable portion of the valve and adjustably confined to the arm having the stud or pin, with a hand-lever having a ratchet or clicking device, whereby, when the plate to be coated is brought into contact with the lever, the valve is opened and the emulsion is permitted to flow, substantially as shown, and for the purpose described.

4. In an apparatus for automatically coating photographic plates with emulsion, the combination of a tank for holding the emulsion, an outlet-passage in the said tank for the escape of the emulsion, a flexible apron for directing the emulsion onto the plate to be coated, a valve for opening and closing said outlet-passage, and mechanism for operating said valve, substantially as described, whereby, when the plate to be coated is brought into contact with the lever, the valve is opened and the emulsion is permitted to flow, substantially as described.

401,772. STEAM-TRAP. CHARLES F. REISHAW, Boston, Mass. Filed July 20, 1888. Serial No. 280,630. (No model.)

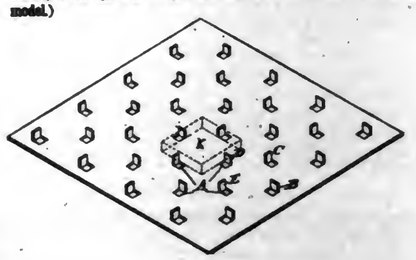
Claim.—1. In a steam-trap, the external elongated case, a, and



end pieces having inlet and outlet passages, and the longitudinally-expansible tube b, combined with a valve moved by said tube b, the rotatable plug f, and the valve-seat within it, substantially as described.

2. In a steam-trap, the external case, a, and longitudinally-expansible tube b, held adjustably within it, and the valve moved by said tube, combined with the end piece c, having the outlet-passages c' c², and the plug-valve f, contained in said end piece, it having the ports 2 3 and the valve-seat formed within it between said ports, substantially as described.

3. In a steam-trap, the external case, a, adapted to be placed beneath a car-seat and made substantially as long as the said seat to serve as a radiating and discharge pipe, and the end pieces connected with said case having inlet and outlet passages, the expansible tube held in said case, and the valve controlled by the longitudinal expansion of said tube, combined with the rotatable plug controlling the outlet-passages, and the valve-seat formed within said plug, substantially as described.



401,773. NET-CUTTING ATTACHMENT FOR TORPEDOES. SETH A. BROWN, Buffalo, N. Y. Filed Dec. 17, 1888. Serial No. 293,843. (No model.)

Claim.—1. In a torpedo, the combination therewith of an annular cutter secured in a supporting-frame mounted at the head of the torpedo upon a shaft set in bearings within the torpedo, and extending from the front toward the rear, and a suitable means for giving it a rotary motion, substantially as described.

2. In a torpedo, the combination therewith of a tube, F, passing longitudinally through the explosion-chamber H, and the shaft C, passing through the tube and having at its forward end an annular cutter, and at its rear end a means for giving it a cutting motion, substantially as described.

401,774. CARAMEL-HOLDER. GEORGE W. CRANE and ERNEST E. CRANE, St. Joseph, Mo. Filed July 13, 1888. Serial No. 279,885. (No model.)

Claim.—1. A caramel-holder consisting of a sheet having fingers B, C, D, and E stamped out therefrom, forming apartments for the articles to be packed, substantially as described.

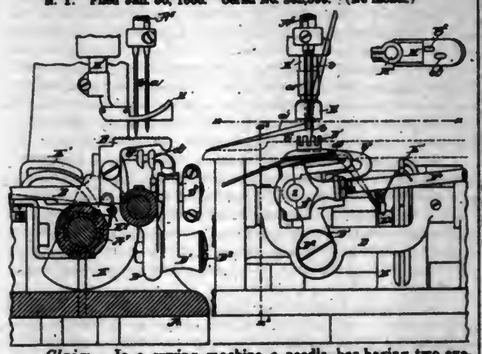
2. A caramel-holder consisting of a sheet having upright fingers B, C, D, and E stamped therefrom, forming apartments for the articles to be packed, substantially as described.

401,775. CAR-COUPLING. JOHN CONE, New Haven, Conn. Filed Aug. 14, 1888. Serial No. 282,711. (No model.)

Claim.—1. In a car-coupler of the Janney type, a draw-head pivotally secured to the draw-bar outside of the framing of the car, and a swinging hook secured to one of the lateral extensions of the head, in combination with a locking device, substantially as described.

2. In a car-coupler of the Janney type, a draw-bar having upper and lower projecting jaws at its front end, a draw-head having seats or recesses to receive said jaws, and a pin for securing said parts, in combination with a swinging hook secured to one of the lateral extensions of the head, and a locking device, substantially as described.

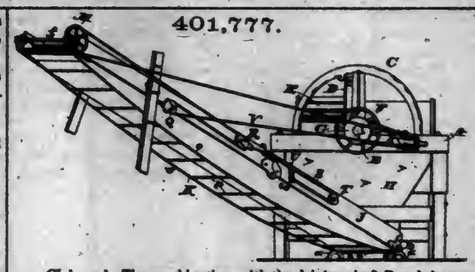
3. In a vertical-hook coupler, the combination of a draw-bar, a head made in two detached sections and pivotally secured to the bar, a hook having a shoulder on its rear arm, a latch having two arms, and a pin provided with a projection for tripping said latch, substantially as described.



4. In a car-coupler having a swinging hook, a snow or ice guard constructed to cover the joint of the hook, substantially as described.

5. In a car-coupler having a swinging hook, a swinging snow or ice guard supported by a pin in the draw-head and constructed to cover the joint of the hook when the hook is in locked position, substantially as described.

6. In a vertical-hook coupler, a draw-bar, a draw-head secured thereto by a bolt and forming a laterally-swinging joint, a rotary hook, and a latch for locking the hook, in combination with a snow-guard for the joint between the hook and the draw-head, substantially as described.



7. In a vertical-hook coupler, the combination of a draw-bar having upper and lower jaws or extensions on its front end, a draw-head made in two separate sections, each having a rounded extension on its rear end, the upper section having a vertical projection on said extension and the lower section having a recess corresponding therewith, a rotary hook, and a latch, substantially as described.

401,776. SEWING-MACHINE. JOHN W. DEWEES, Philadelphia, Pa., assignor to The Union Special Sewing Machine Company, New York, N. Y. Filed Jan. 30, 1888. Serial No. 262,309. (No model.)

Claim.—In a sewing-machine, a needle-bar having two eye-pointed needles set in different vertical planes, both in the direction of the width and length of the machine, combined with two loopers arranged one behind the other in the direction of the feed of the material, and with a looper-carrier, each looper co-operating with one of the said needles in the formation of parallel seams, substantially as described.

401,777. DRIVING MECHANISM FOR ENDLESS CARRIERS. JOSEPH DIEM, Canton, Ohio. Filed July 9, 1888. Serial No. 279,477. (No model.)

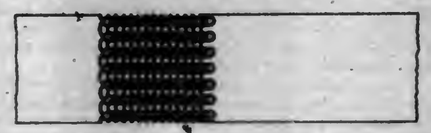
Claim.—1. The combination, with the driving-shaft B and sheave G, of sheaves N and sheave-holders O, terminating in shanks r, having extending bearing portions s, about which the sheaves may swing, substantially as set forth.

2. In combination, the sheave G, sheaves N, arranged at one side of the sheave G, sheave-holders O, having bearing portions s, and a clasp, P, having oppositely-projected fingers u, by which said holders and sheaves are spaced apart, one above the other and free to swing vertically, substantially as set forth.

3. The combination of the sheaves G and N, sheaves M and Q on the carrier-frame, endless rope V, movable sheave R, and a take-up device in connection with the movable sheave R, for adjusting the endless rope V to different positions of the carrier, substantially as set forth.

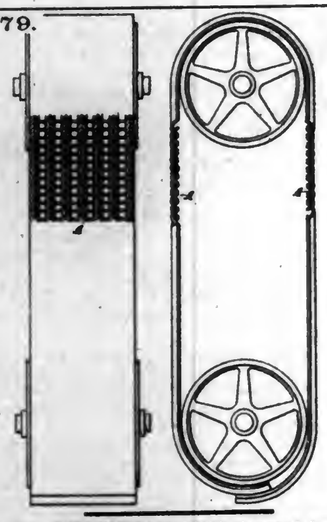
401,778. CULTIVATOR. JOSIAH DODDS, Appleton City, Mo. Filed Aug. 6, 1888. Serial No. 282,111. (No model.)

Claim.—1. In a cultivator, a main frame provided with ground-wheels and with a doubletree to permit the connection of two draft-animals thereto, two drag bars or beams connected to the frame by suspending devices and free to move longitudinally in relation to each other and to the frame, and two singletrees connected one with each beam, substantially as described.



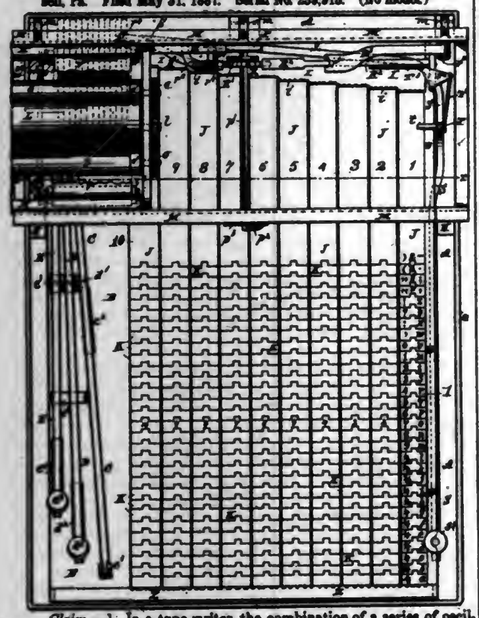
2. In a cultivator, the main or draft frame provided with supporting-wheels and with means for the connection of two draft-animals thereto, the pendent arms or links attached to said frame, the two independent drag bars or beams connected to the respective links by joints which admit of their rear ends swinging vertically and laterally, the singletrees connected to the forward ends of the respective beams, and adjustable devices, substantially as shown, connecting the beams with the frame and regulating the elevation of their rear ends.

3. In a cultivator, a wheeled frame provided with a draft device, a drag-bar connected to said frame by devices which permit free longitudinal motion in relation thereto, and a distinct and independent draft device connected with said beam, as described, whereby the power required for the propulsion of the beam may be applied to each independently of the other.



4. In combination with the wheeled frame, the drag-bar, the rock-shaft provided with the sector-plates, the suspending device connecting one of said plates with the beam, the chain extended rearward from the other of said plates, and a fastening device for the last-named chain, substantially as described.

401,779. BELTING FOR MACHINERY. WILLIAM C. EDGE, Newark, N. J. Filed Jan. 21, 1888. Serial No. 266,978. (Model.)



Claim.—As an improved article of manufacture, a driving-belt for machinery, the same consisting of a strip of knitted wire having a practically smooth or flush side for contact with the pulleys, and ribs on the reverse side, substantially as described.

401,779.

401,780. TYPE-WRITING MACHINE. LEBBEUS G. GARRETT, Biscoll, Pa. Filed May 31, 1887. Serial No. 239,913. (No model.)

Claim.—1. In a type-writer, the combination of a series of oscillating type-carriers, a series of keys connected, substantially as described, to and operating the said type-carriers to bring the type into line, and a rocking plate upon which the said type-carriers and keys are mounted and by which the type-carriers are elevated to make the impression, substantially as described.

2. In a type-writer, the combination of a series of oscillating type-carriers and a series of keys, each composed of a number of sections hinged together, connected, substantially as described, to and operating the said type-carriers to bring one or more of the type into line at once, substantially as described.

3. In a type-writer, the combination of a series of oscillating type-carriers, a series of keys, each composed of a number of sections hinged together, and connected, substantially as described, to and operating the said type-carriers to bring one or more type into line, and springs for returning the type-carriers and keys to their normal position, substantially as described.

4. In a type-writer, the combination of a series of oscillating type-carriers, a series of keys, each composed of sections hinged together, substantially as described, and connected, substantially as described, to and operating the said type-carriers to bring the type into line, a rocking plate upon which the said type carriers and keys are mounted and by which the type-carriers are elevated to make the impression, and springs for returning the type-carriers, keys, and rocking plate to their normal position, substantially as herein set forth.

5. In a type-writer, the combination, with a frame and a paper-carriage thereon, of a series of oscillating type-carriers, a series of keys connected, substantially as described, to and operating the type-carriers to bring the type into line and having their inner ends of varying lengths, a pivoted spacing-plate having a series of shoulders, and intermediate mechanism, substantially as described, between the spacing-plate and the paper-carriage for operating the same, substantially as herein shown and described.

6. In a type-writer, the combination, with a frame and a paper-carriage thereon, of a series of oscillating type-carriers, a series of keys, each composed of hinged sections connected to and operating the said type-carriers to bring the type into line and having their inner ends of varying lengths, a rocking plate upon which the said type-carriers and keys are mounted and by which the type-carriers are elevated to make the impression, springs for returning the type-carriers, keys, and rocking plate, a pivoted spacing-plate having a series of shoulders, a pawl on the spacing-plate, and mechanism, substantially as described, operated by the pawl to shift the paper-carriage, substantially as herein specified.

7. In a type-writer, the combination of a frame, a paper-carriage thereon a rocking plate, B, fulcrumed on the frame, a shaft, 1^a, held in bearings on the plate B, a series of keys, as 1 to 10, supported independently by a series of hollow shafts from said shaft 1^a, a series of type-carrying sectors, as 3^b to 12^b, connected to the key-shafts to be rocked by or from the keys to carry the type into line for print, springs retracting the rocking plate, the type-carrying sectors and the keys, and an impression roller or platen on the paper-carriage opposite the type on the adjusted sectors, substantially as shown and described.

8. In a type-writer, the combination of a suitable frame, a paper-carriage thereon, a rocking plate, B, fulcrumed on the frame, springs F and stops for said plate, a shaft, 1^a, on the plate B, a series of keys, as 1 to 10, supported independently from said shaft and having rear stems of varying lengths, a series of type-carrying sectors, as 3^b to 12^b, connected to the respective key-shafts to be rocked by or from the keys to bring the type into line for print, springs G, retracting the sectors and keys, an impression roller or platen on the carriage opposite the type on the adjusted sectors, a spacing-plate, I, having a series of shoulders, *i*, normally overlapping the keys, and said plate I fitted to the frame so as to yield to let the ends of the keys pass the shoulders, a stop, I', for the plate I, a pawl, R^3, connected to the plate I, a shaft, *p'*, a ratchet-wheel, R, thereon, actuated by the pawl R^3, and a pinion, P, engaging a rack on the paper-carriage, substantially as described, for the purposes set forth.

9. In a type-writer, the combination of a frame, a paper-carriage thereon, a rocking plate, B, fulcrumed to the frame, a shaft, 1^a, on the plate B, retracting-springs and stops for said plate, a series of keys, as 1 to 10, supported independently from the shaft 1^a and having rear stems of varying lengths, a series of type-carrying sectors, as 3^b to 12^b, connected to the respective key-shafts, an impression roller or platen on the carriage, a spacing-plate, I, having a series of shoulders, *i*, normally overlapping the keys, a pawl, R^3, connected to the plate I, a shaft, *p'*, a ratchet-wheel, R, thereon, actuated by the pawl, a pinion, P, engaging a rack on the carriage, a spring, E', connected to the frame and to the shaft *p'* and adapted to be put in tension as the carriage is shifted by the pawl, a retaining-pawl, R^4, having a hook-head, *r*, engaging the ratchet-wheel to lock the carriage when shifted by the pawl and pinion, the pin r^2, for engaging the head of the pawl to disengage it from the ratchet-wheel, and a lever for raising the said pawl, substantially as described, for the purposes set forth.

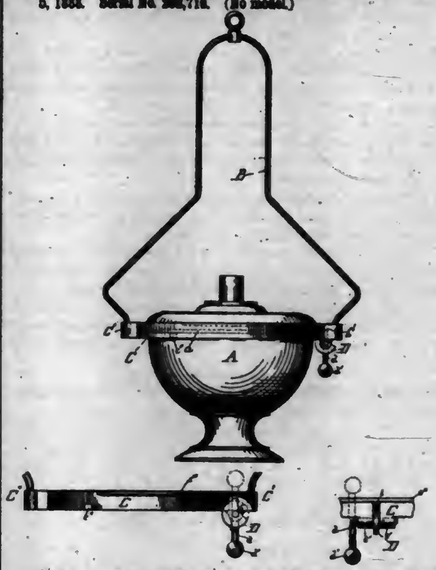
10. In a type-writer, the combination, with a frame, a paper-carriage thereon, a rack-and-pinion device adapted to shift the carriage, and a pawl, R^3, connected to a pivoted spacing-plate operated by the keys for actuating the pawl, substantially as specified, of a lever, S, fulcrumed to the key-board support and having an arm, T, the elbow-lever T^2, pivoted to the frame, the rod T', pivoted to the arm T and elbow lever T^2, and the rod T^3, pivoted to the elbow-lever and to the pawl R^3, substantially as herein set forth.

11. In a type-writer, the combination, with a frame, a paper-carriage thereon, a rack-and-pinion device adapted to operate the carriage, a pawl, R^3, connected to a pivoted spacing-plate operated by keys for actuating the pawl, a ratchet-wheel, R, a spring, R', on the ratchet-shaft, and a retaining-pawl, R^4, for the ratchet and carriage, of a lever, S, fulcrumed to the key-board support and having an arm, T, the elbow-lever T^2, pivoted to the frame, the rod T', pivoted to the arm T and to the elbow-lever, and the rod T^3, pivoted to the elbow-lever and to the pawl R^3, said lever S extended to the detent-pawl R^4, substantially as shown and described, whereby as the lever is depressed at s^4 both pawls R^3 R^4 will be disengaged from the ratchet-wheel R to allow the spring R' to automatically retract the carriage, as herein set forth.

12. In a type-writer, the combination, with a frame, a paper-carriage, N, sliding thereon, a paper-roller in the said carriage, a pinion on the end of the paper-roller, a lever, S, having an arm, T, carrying a pin, *t*, a ratchet-and-pinion device, *p'* R P, adapted to feed the carriage, a spring, R', adapted to retract the carriage, a feeding-pawl, R^3, connected to a pivoted spacing-plate operated from the type-keys, and a retaining-pawl, R^4, substantially as shown and described, whereby as the lever S is depressed at s^4 the pawls R^3 R^4 will be disengaged from the ratchet-wheel R to allow the spring to retract the carriage, and the pin *t* of the arm T will be set to engage a pinion on a paper-roller of the retracted carriage, and when the lever S is released the carriage-rollers will be actuated by the pin *t* to shift the paper for the next line of printing, as herein set forth.

13. In a type-writer, the combination, with the frame, a sliding carriage thereon, paper holding and feeding rollers mounted in the said carriage, and pinions on the ends of the rollers and meshing with each other, of the lever S, provided with the arm T, having an inwardly-projecting pin, *t*, and a spring for returning the lever to its normal position, substantially as described, whereby when the lever is depressed the arm will be swung forward with its pin between the teeth of the pinion of one of the feed-rollers, ready to move the said roller by the action of its spring when released, as set forth.

14. In a type-writer, the combination of a series of keys forming a key-board, a rocking plate pivoted to the frame and to which the keys may be depressed, said keys being connected independently to a series of oscillating type-carriers adjustable by depressing the keys to bring the type into line for print, and springs retracting the type-carriers and keys, and said keys having inner parts or stems varying in length, a pivoted spacing-plate having a series of shoulders normally overlapping the keys, a pawl connected to the spacing-plate, and mechanism, substantially as specified, operated by the pawl for shifting the paper-carriage, a stop, b^3, for the rocking plate, and a stop, I', fixed to said plate and adapted, when the plate is rocked by pressure on said bar, to operate the pawl for feeding the paper-carriage to space words apart and, without operating the type-carriers, to adjust the type into line for print, substantially as shown and described.



15. In a type-writer, the combination of a series of keys forming a key-board and connected to independent type-carriers, and adapted, when depressed, to operate the carriers to bring the type on them into line for print, and said keys having characters produced on them corresponding to those on the carriers, in combination with one or more special type-carriers bearing capitals and other special characters, and a lever and one or more special keys and pins arranged to couple the special carriers to the shaft of the first key and simultaneously uncouple said key from the type-carrier to which it is normally connected, and said first key bearing characters like those on the type-carriers connected to the key-board keys, and also bearing characters corresponding with or indicating those on the special type-carriers, which may be coupled to it, substantially as described, for the purposes set forth.

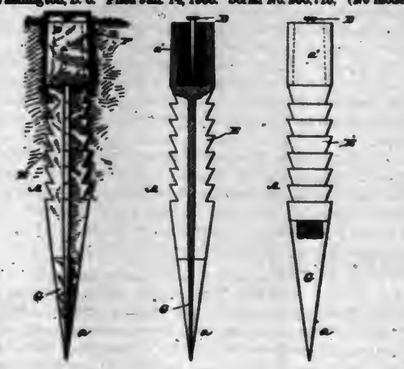
16. In a type-writer, the combination, with a frame, a rocking plate, B, fulcrumed thereon, a series of keys, as 2 to 10, supported independently from a shaft, 1^a, held to the plate B, a series of type-carriers, as 4^b to 12^b, inclusive, fixed to shafts on which the keys 2 to 10, respectively, are supported, and said type-carriers having a series of like characters corresponding with the characters of the keys to which they are normally connected, a key, 1, fixed to the shaft 1^b, type-carriers 3^b 2^b 1^b, mounted loosely on said shaft 1^a, and the carrier 3^b, having a series of characters corresponding with those of the carriers 4^b to 12^b, and adapted for connection with a key, 1, which is held to the common shaft 1^a, a spring-actuated lever, C, fulcrumed on the plate B, and having a pin, *c*, normally entering the carrier 3^b and coupling it to the key 1, and said lever C having a lug, C', and spring-actuated keys D E, fulcrumed on the plate B, and provided, respectively, with coupling-pins *d e*, entering type-carriers 2^b 1^b, and adapted, when the keys D E are depressed, to engage the pins *d e* with the shaft 1^a, to couple the carriers 2^b 1^b, respectively, to said shaft and to simultaneously uncouple the carrier 3^b from the shaft, substantially as shown and described, whereby either of the carriers 2^b 1^b, having capitals or other special characters, may be operated at will from the key 1 of the key-board, and said key 1 also bearing characters corresponding with or indicating those on the carriers 2^b 1^b, all operating as and for the purposes set forth.

17. In a type-writer, the combination, with a frame, a rocking plate fulcrumed thereto and supporting a key-board, and a series of reciprocating type-carriers adapted to be adjusted by operating the keys and to be lifted to make an impression by tilting the rocking plate, substantially as specified, of a pair of inking-ribbon rollers, V' V^2, journaled on the frame, a ribbon, V, on the rollers and next the type, ratchet-wheels w' w^2 on the shafts of the rollers V' V^2, and pawls W' W^2, engaging the ratchets and connected to a rod, W, held to the rocking plate, substantially as shown and described, whereby as the rocking plate is tilted the pawls W' W^2 will shift the inking-ribbon, as and for the purpose set forth.

18. In a type-writer, the combination, with the operating-rollers V' V^2, provided with ratchet-wheels w' w^2, pitched in the same direction, and the rocking plate B, of the elastic pawls W' W^2, having their teeth pitched in opposite directions and secured to the elastic arm W, which is secured to the rocking plate B, substantially as herein shown and described.

401,781. SUSPENSION DEVICE. WILLIAM C. HOMAN, Meriden, Conn., assignor to Edward Miller & Company, same place. Filed Dec. 5, 1888. Serial No. 292,716. (No model.)

Claim.—1. In a ring for the support of a lamp or similar article, the combination of an interiorly-projecting lug or lugs and a rotary cam-shaped disk also normally projecting into said ring, substantially as described.



2. In a ring for the support of a lamp or other article, the combination of an interiorly-projecting lug or lugs, a rotary cam-shaped disk also normally projecting into said ring, and an interiorly-projecting flange in a plane above that of said lugs and said disk, substantially as described.

3. In a ring for the support of a lamp or similar article, the combination of an interiorly-projecting lug or lugs and a cam-shaped disk also normally projecting into said ring and capable of rotation in a vertical plane, substantially as described.

4. In a ring for the support of a lamp or similar article, the combination of an interiorly-projecting lug or lugs, a rotary cam-shaped disk also normally projecting into said ring, and an axle on which said disk is secured, one end of which is bent to form a lever or thumb-piece, substantially as described.

5. In a ring for the support of a lamp or similar article, the combination of lugs *c'*, slotted ear C, bearing *c'*, disk D, lever *d*, and weight *d'*, substantially as described.

401,782. SURVEYOR'S CORNER-STAKE. JOHN H. HOWLETT, Washington, D. C. Filed Jan. 14, 1888. Serial No. 260,715. (No model.)

Claim.—1. A surveyor's stake consisting of a metallic body provided with a head filled with an imperishable substance adapted to receive and retain a nail at any point within its limits, substantially as set forth.

2. A surveyor's stake consisting of a metallic body provided with a head filled with soft metal exposed on its upper surface to receive and retain a nail, substantially as set forth.

3. A surveyor's stake consisting of a metallic body provided with exterior longitudinal grooves, and further provided with a head filled with soft metal exposed at its upper surface to receive and retain a nail, substantially as set forth.

4. A surveyor's stake consisting of a metallic body provided with peripheral grooves extending laterally thereto and having a head filled with an imperishable substance adapted to receive and retain a nail at any point within its limits, substantially as set forth.

5. A surveyor's stake consisting of a metallic body provided with exterior longitudinal grooves and provided with a laterally-extending grooves and having a head filled with soft metal to receive and retain a nail, substantially as set forth.

6. A surveyor's stake having a filled head, the filling in the head being larger at the base than at the top and exposed at the top to receive and retain a nail, substantially as set forth.

7. A surveyor's stake provided with a head filled with an imperishable substance to receive a nail, in combination with a cap to protect the filling and nail in the head, substantially as set forth.

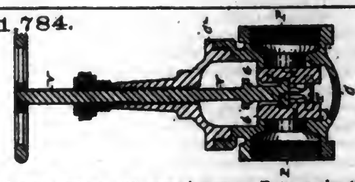
8. A surveyor's stake consisting of a metallic body provided with a steel point and having a head filled with soft metal, the soft-metal filling being exposed to receive and retain a nail, substantially as set forth.

401,788. BURNER FOR GAS-STOVES. LAZARD KAHN, Hamilton, Ohio. Filed May 31, 1888. Serial No. 275,594. (No model.)

Claim.—1. In a gas-burner, a closed receiver having an annular series of jet-holes at its top and a vertical air-tube leading downwardly from within said series of jet-holes, said air-tube being open to the atmosphere at its lower end, and having at its base a series of jet-holes, placing the interior of the tube in communication with the interior of the receiver, whereby flames are produced at said upper jet-holes and supplied by a column of air rising through said air-tube and heated by flames at said lower jet-holes, substantially as set forth.

2. In a gas-burner, the combination, substantially as set forth, of a receiver, a pipe in communication therewith for the supply of gas and air, and an air-tube vertically through said receiver within said series of jet-holes and enlarged from its base upward and provided with jet-holes at its base leading from within the receiver to within the air-tube.

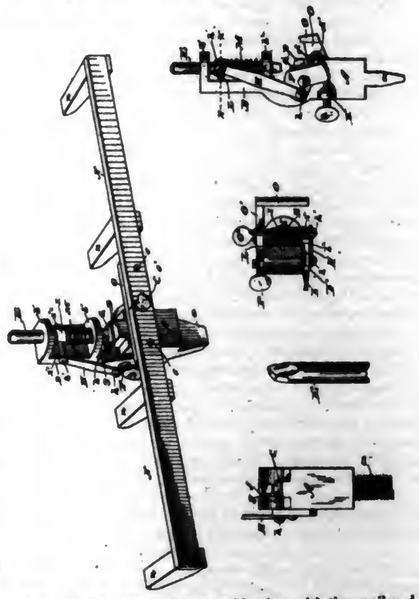
3. In a gas-burner, the combination, substantially as set forth, of a receiver, a pipe in communication therewith for the supply of gas and air, a continuous bead formed in the top of said receiver having a series of jet-holes leading vertically through the top of the bead, a series of jet-holes in said bead and having also outside said first series of jet-holes and leading upward and outwardly from the receiver, and prongs disposed within the receiver and joining the metal of said bead.



4. In a gas-burner, the combination, substantially as set forth, of a receiver, a pipe in communication therewith for the supply of gas and air, a bead formed at the top thereof and provided with a vertical series of jet-holes and with an outer series of jet-holes upwardly and outwardly inclined, and a second bead formed at the top of the receiver around said first-mentioned bead and provided with a series of jet-holes upwardly and inwardly inclined.

5. In a gas-burner, the combination, substantially as set forth, of a receiver having a series of jet-holes in its top, a pipe in communication therewith for the supply of gas and air, and a circle of prongs projecting downward from the top of the receiver to near the bottom thereof.

6. In a gas-burner, the combination, substantially as set forth, of a receiver having a series of jet-holes in its top, a pipe in communication therewith for the supply of gas and air, a tube reaching vertically through the receiver and disposed within said series of holes and having jet-holes in its base leading from the receiver to the tube, and a series of prongs disposed within the receiver between the outer wall thereof and said tube.



401,784. STRAIGHT-WAY VALVE. WARREN T. KELLOGG, Lansingburg, N. Y. Filed Jan. 7, 1888. Serial No. 260,068. (No model.)

Claim.—The combination, with the valve-casing C, formed with interior wedging-surfaces, W^2, and the reciprocating valve-stem V, formed with a boss, B, on its lower end, of the valve-gates G, having

beveled inner surfaces and central recesses, R, to receive the end of the valve-stem, and bearings *b* in their lower portions, and the wedges W', pivotally mounted in the bearings *b* between the gates with their free ends upward, substantially as and for the purpose specified.

401,785. SAW-SET. EVERETT H. KITCHEN, Jamestown, N. Y. Filed Aug. 15, 1888. Serial No. 282,780. (No model.)

Claim.—1. In a saw-set, the combination, with the anvil and the brackets in which the punch takes its bearings, of the pivoted gage and the arm pivotally connected to the punch between the brackets at one end and to the gage at the opposite end, whereby the gage is retracted as the punch descends, substantially as described.

2. In a saw-set, the combination, with the anvil and the reciprocatory punch, of the gage, connections, substantially as described, between the gage and punch, whereby the gage is withdrawn as the punch descends and is projected again as the punch ascends, and a spring for holding said gage in engagement with the anvil, as and for the purpose set forth.

3. In a saw-set, the combination, with the anvil, the reciprocatory punch, and the spring for returning it to normal position, of the segmental plate carrying the pivotal gage, a connection between said plate and punch whereby the gage is withdrawn as the punch descends, and the spring for holding the gage depressed, substantially as described.

4. In a saw-set, the combination, with the base carrying the anvil, the standard having the brackets for guiding the punch, and the straight surface on said standard, of the punch, and the straight surface on the same engaging the straight surface on the standard to hold the punch in alignment, substantially as described.

5. In a saw-set, the combination, with the base carrying the anvil and the standard having the two brackets and the straight surface intermediate said brackets, of the punch moving in bearings in the brackets, and the collar secured to the punch having the straight surface engaging the straight surface on the standard for holding the punch in alignment, substantially as described.

6. In a saw-set, the combination, with the base carrying the anvil, the standard having the two brackets with the intermediate straight surface and the pivoted gage, of the punch moving in bearings in the brackets, the collar connected to the punch having the straight surface engaging the straight surface on the standard, the arm extending from one side of said collar, and the rod connecting said arm and pivoted gage, substantially as and for the purpose specified.

7. In a saw-set, the combination, with the base carrying the anvil and the reciprocating punch co-operating with said anvil, of the table or saw-support pivoted to the side of the base, and the set-screw engaging said support to adjust the inclination of the same, substantially as described.

8. In a saw-set, the combination, with the base carrying the anvil, of a table or support for the saw formed of the two frames united to a central base by the pins, and the single set-screw engaging the end of both frames, substantially as described.

9. In a saw-set, the combination, with the base carrying the hardened anvil made integral therewith, of the standard extending up from one side of the base and supporting the reciprocatory plunger for co-operating with the anvil, substantially as described.

10. In a saw-set, the combination, with the base carrying the anvil, the segmental plate carrying the short shaft on which the movable gage is mounted, and the coil-spring surrounding the shaft and engaging the gage and segmental plate, respectively, of the punch, the collar surrounding the punch, having the straight surface projection and connected to the punch by the screw, the short arm on the collar, and the single link or rod connecting said arm and the segmental plate, substantially as described.

11. In a saw-set, the combination, with the reciprocating punch and segmental plate carrying the movable gage, of a collar surrounding the punch and connected to the segmental plate, said collar having a screw-threaded aperture through the same from side to side, and a screw passing through said aperture and a corresponding aperture in the punch to unite the two, substantially as described.

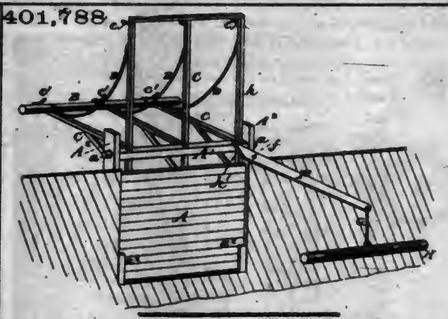
401,786. IRONING-TABLE. JASON A. KIMBALL, Grand Ledge, Mich. Filed Aug. 23, 1888. Serial No. 284,007. (No model.)

Claim.—1. The combination, with an ironing-board, a main inclined standard pivoted to one end of the board, and an upright standard, of a brace pivoted to the under side of the opposite end of the board to allow its free end a vertical movement, said brace being adapted to rest on the inclined standard and removably hold the free end of the board in position, and a cord or rope to limit the movement of the brace, substantially as described.

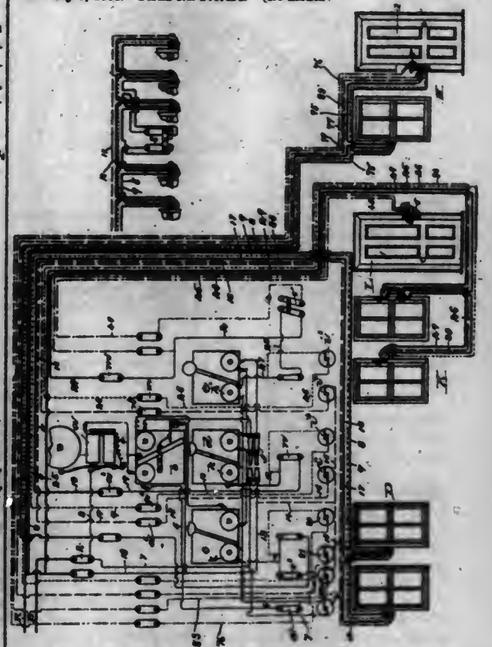
2. The combination of an ironing-board, a main inclined standard hinged to the board, an upright short standard hinged to the main standard, a brace to support the free end of the board provided with a string or cord to limit its downward movement, a cross-piece of the upright standard provided with a pin, and a horizontal brace hinged to a cross-piece of the main standard and provided at its free end with an aperture to receive said pin, substantially as described.

3. In an ironing-board, the combination of a main inclined standard pivoted to the board, an upright standard pivoted to the inclined standard, a brace hinged to the board and limited in its play by a cord attached to its free end, and a notch or depression in said inclined standard, within which the outer end of said brace rests, substantially as described.

401,787. SURGICAL APPLICATOR. ELMER LEE, St. Louis, Mo. Filed Sept. 28, 1888. Serial No. 286,655. (No model.)



Claim.—In a surgical applicator, the combination of a tube open at one end and a rod having a rounded end or knob working freely in said tube, with a funnel or receptacle carried by and opening into the tube, substantially as shown, and for the purpose described.



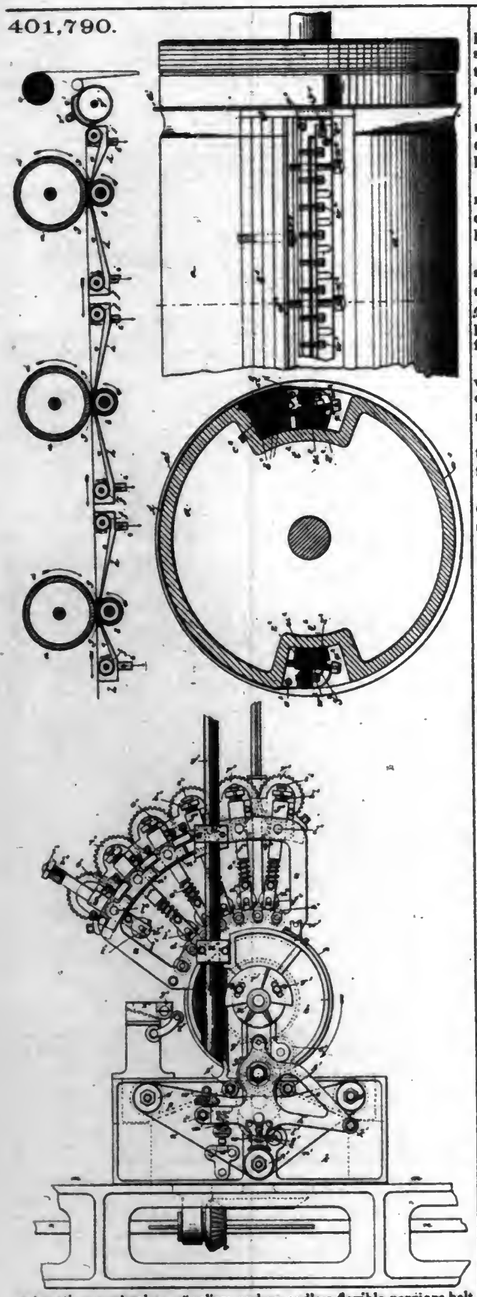
401,788. WATER-GATE. WILLIAM T. MCCLOSKEY, Westport, Pa. Filed June 18, 1888. Serial No. 277,443. (No model.)

Claim.—1. The combination, with a pivoted water-gate, of the frame C, carrying rolling or sliding weights, which change position to hold the gate open or closed, as described.

2. The combination, with a water-gate having the pivoted bar A', of the lever F, automatically operated by a float connected therewith by a rod, G, as and for the purpose set forth.

401,789. BURGLAR-ALARM AND TESTING SYSTEM. FRANK H. NUTTER, Malden, assignor to Herbert L. Slade, Chelsea, Mass. Filed July 9, 1888. Serial No. 279,431. (No model.)

Claim.—1. In a burglar-alarm system, the battery-wires and several pairs of independent loops leading therefrom, each pair of loops being normally open respectively at opposite sides of the battery, and provided with a testing press-button, combined with one member of a circuit-changing device included in each loop, whereby each independent pair of loops offers a closed path for the current when the members of the circuit-changing devices are brought in contact, and the indicating-signal included in one of the loops of each pair between its testing press-button and the battery, substantially as described.



2. In a burglar-alarm system, the battery-wires and several pairs of independent loops leading therefrom, each pair of loops being normally open respectively at opposite sides of the battery, and provided with a testing press-button and circuit-closing devices, one of the members of which is connected in each loop, combined with the independent loop or wire 76 83 and the circuit-changing device included therein, and the switch, as 82, included in said independent loop or wire, substantially as and for the purpose set forth.

3. In a burglar-alarm system, the battery-wires and several pairs of independent loops leading therefrom, each pair of loops being normally open respectively at opposite sides of the battery, and provided with a testing press-button, combined with one member of a circuit-closing device for each loop, substantially as described.

401,790. PRINTING-MACHINE. JOHN W. OSBORNE, Washington D. C., assignor to William H. Forbes, Boston, Mass. Filed May 1, 1882. Serial No. 60,065. (No model.)

Claim.—1. The combination, substantially as described, with a case having an open side for the feeding-belt and provided with air-

401,790.

exhausting mechanism, of rollers and an endless flexible pervious belt mounted on said rollers.

2. The combination, substantially as described, of the endless pervious belt and its rollers with the case provided at one end with the supporting-tongues and with air-exhausting mechanism.

3. The combination, substantially as described, of a pervious surface or support, means for moving said surface, and means for applying atmospheric pressure to the same, with the case having its projecting end provided with supporting-tongues.

4. The combination, substantially as described, with an intermittent feeder, of two or more pairs of form and impression cylinders having their several printing surfaces or forms located to print simultaneously, and means for continuously revolving said cylinders.

5. The combination, substantially as described, with two or more pairs of form and impression cylinders having their several printing surfaces or forms located to print simultaneously, and meaus for continuously revolving said cylinders, of intermittent feeders located, respectively, in front of the first pair and between the pairs of cylinders.

6. The combination, substantially as described, of the perforated revolving feed-roller, as q^3, provided with flange s^3 and stationary case, as t^6, partially inclosing said roller and provided with air-exhausting mechanism, with the inclined adjustable guide-roller, as c^4.

7. The combination, substantially as described, of the perforated revolving feed-roller, as q^3, provided with flange s^3, and stationary case, as t^6, partially inclosing said roller, and provided with air-exhausting mechanism, with the inclined guide-roller, as c^4.

8. In a printing-machine, the combination, substantially as described, of the driving-pulley g', connected by gearing with the form-cylinder shaft, the free pulley l' in the arm K', held against the pulley g' by the spring m', the belt n', passing between the two and over the pulleys o' on the exhaust-belt rollers, and the depressing-cam r' on the form-cylinder shaft, substantially as and for the purpose described.

9. In a printing-press, the wheels, as r^6, geared together and provided with cam-surfaces s^6, in combination with the vibrating shaft l^6, carrying the anti-friction rollers t^6, the forked bars j^6, and the form-roller riders, substantially as and for the purpose described.

10. In a printing-press, the vibrating shaft l^6, in combination with the pieces n^6, keyed thereon, the screws o^6, the forked bars j^6, and the form-roller riders, substantially as and for the purpose described.

11. In a printing-press, the roller-frame z, carrying the form-rollers, their riders, and devices for vibrating the same, and provided with sliding bearings u^6, in combination with the guide-posts v^6, substantially as and for the purpose described.

12. In a printing-press, the false bearer c', in combination with the form-cylinder and the form-roller trucks, substantially as and for the purpose described.

13. In a printing-press having one or more form-cylinders adapted for the reception of flexible forms, the straining-bars w^3, provided with nippers, in combination with the segments v^6 and the straining-screws x^3, substantially as and for the purpose described.

14. In a printing-machine having one or more cylinders adapted for the reception of flexible forms, the straining-bars w^6, provided with nippers, in combination with the segments v^3, the straining-screws x^3, the adjusting-screws y^6, and the releasing-screws z^6, substantially as and for the purpose described.

15. In a printing-press, the combination, substantially as described, of a form-cylinder adapted to carry flexible forms with the movable pieces b^3 and the interchangeable lip-piece d^3, as set forth.

16. In a printing-press, a form-cylinder adapted for flexible forms, in combination with a straining-bar provided with clamps and adjustable in all directions, and mechanism, substantially as described, for adjusting the straining-bar in all directions on the cylinder.

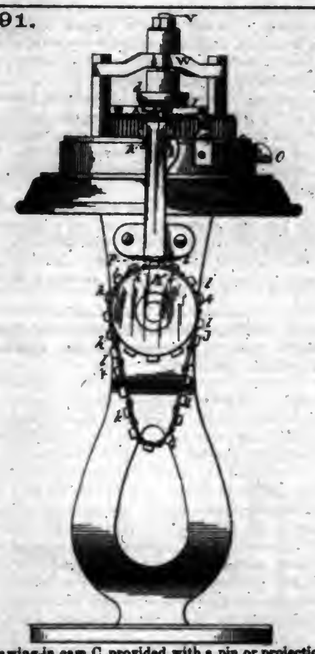
17. In a printing-press, a form-cylinder having gaps in its surface, as described, a straining-bar adjustable in all directions in each gap, a flexible form, and mechanism, substantially as described, by which the straining-bar may be adjusted in all directions in the gap, all combined substantially as described.

18. In a printing-press having a form-cylinder adapted for printing in the lithographic manner, the projecting rib d', in combination with the form and with apparatus for damping the same, substantially as and for the purpose set forth.

401,791. CIRCULAR-KNITTING MACHINE. WILLIAM H. PEPPER and ALBERT T. L. DAVIS, Lake Village, N. H. Filed June 5, 1885. Serial No. 167,763. (No model.)

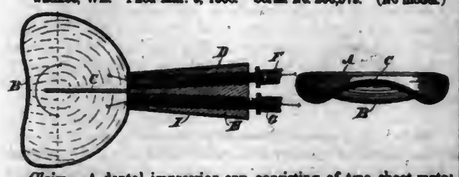
Claim.—1. The combination of the cap A, dial B, dial-needles w, thread-guide 1, drawing-in cam C, lever D, lever-arm E, slide G, pattern-chain J, and means, substantially as described, for actuating the said slide from the pattern-chain, substantially as and for the purpose herein specified.

2. The combination of the cap A, dial B, dial-needles w, two thread-guides, 1 2, movable drawing-in cam C, lever D, lever-arm E, slide G, pattern-chain J, means, substantially as described, for actuating the said slide from the pattern-chain, and stationary drawing-in cam C', substantially as and for the purpose herein specified.



3. The combination of the cap A, drawing-in cam C, pivoted to the said cap and provided with a pin or projection, o, and a cam-ring, T, substantially as and for the purpose herein specified.

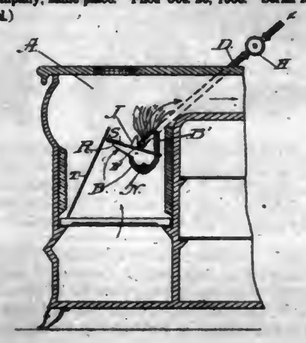
4. The combination of the cap A, dial B, dial-needles w, thread-guide 1, drawing-in cam C, provided with a pin or projection, o, and a cam-ring, T, substantially as and for the purpose herein specified.



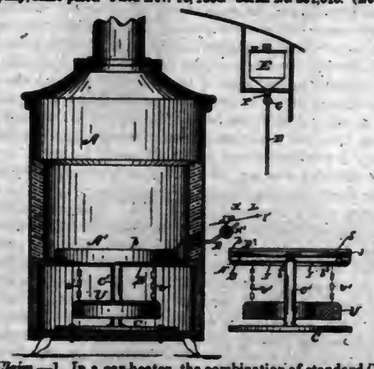
5. The combination of the cap A, drawing-in cam C, provided with a pin or projection, o, cam-ring T, slide G, a device connecting the cam and slide, pattern mechanism, and means, as described, intermediate between the slide and pattern mechanism, substantially as and for the purpose herein specified.

6. The combination of the cap A, dial B, dial-needles w, thread-guide 1, drawing-in cam C, provided with a pin or projection, o, camring T, slide G, a device connecting the cam and slide, pattern mechanism, and means, as described, intermediate between the slide and pattern mechanism, substantially as and for the purpose herein specified.

401,791.



401,792. DENTAL IMPRESSION-CUP. JULIUS SCHEFFLER, Milwaukee, Wis. Filed Mar. 8, 1888. Serial No. 266,579. (No model.)



Claim.—A dental impression-cup consisting of two sheet-metal water-holding chambers, the outer one being so formed as to encircle the jaw and teeth, and the inner one being so formed as to encircle the tongue within the jaw and teeth, the two chambers being connected at their inner ends by water-conveying pipes, and being otherwise unconnected and located so far from each other that the teeth of the upper and of the lower jaw may come together from above and below in the space between said chambers, the outer chamber having a water-receiving and a water-discharging duct leading into and from said outer chamber, one on each side of a vertical partition in said outer chamber, substantially as described.

401,793. OIL-BURNER FOR STOVES. HENRY SCHREINER, Philadelphia, Pa., assignor to the American Patent Safety Heater Manufacturing Company, same place. Filed Oct. 26, 1888. Serial No. 289,171. (No model.)

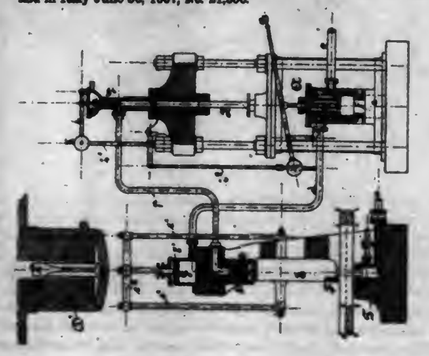
Claim.—In a stove of the kind described, the combination, with a burner-trough having an elevated back, B', partitions E, and bridges J, of the foraminous plate S and burner-pipe D', supported on the bridges above the foraminous plate, and an imperforate plate, T, resting upon the grate of the stove at the front edge thereof at its lower end and against plate S at the top.

401,794. CAR-HEATER. HENRY SCHREINER, Philadelphia, Pa., assignor to the American Patent Safety Heater Manufacturing Company, same place. Filed Nov. 16, 1888. Serial No. 291,015. (No model.)

Claim.—1. In a car-heater, the combination of standard C, a circular burner pivoted thereon, and a circular weight surrounding said standard and suspended from said burner, substantially as described.

2. A burner for burning oil, consisting of a suitable support, a trough pivoted upon said support and having a high outer side, b, and a lower inner side, b', a series of segmental foraminous plates, S, laid over the trough upon its lower side, and a burner-pipe, D', placed over the foraminous plates inside the higher outer wall of the burner, as set forth.

3. The combination of a circular trough having a layer of ashes or sand, bridges or partitions at suitable intervals, a pivot on which the trough is supported, and a circular burner-pipe supported on the bridges in the trough, as set forth.



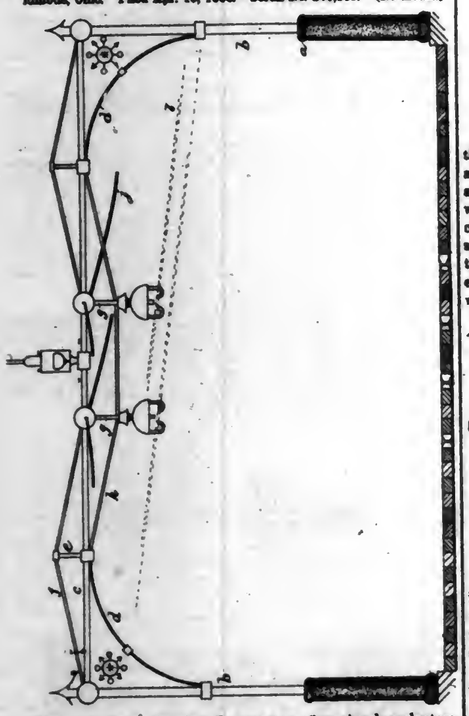
4. The combination of a circular burner having a trough, as described, a burner-pipe supported upon said trough, a supply-pipe connected to the burner-pipe, and a pivot or support on which the whole is pivoted, as set forth.

5. The combination, with a suitable support, of a circular burner pivoted thereupon and a circular weight suspended from the burner, as set forth.

6. The combination, with a heater and supply-pipe, of a needle-valve in said supply-pipe, a weighted wheel on the stem of the needle-valve, having ratchet-teeth on its rim, a gravity-dog engaging said teeth, and a wedge for automatically raising said dog, as set forth.

7. The combination, with the feed-pipe of an oil-heater, of a needle-valve, a weighted wheel on the stem of said valve, having ratchet-teeth over a portion of its circumference, a hinged gravity-dog having teeth for engagement with the ratchet-teeth, and a wedge mounted on rollers for operating the dog, as set forth.

401,795. PUNCHING, SHEARING, AND SUCH LIKE MACHINE. CASPAR SCHUMACHER, REINER DAELEN, and MORITZ ROTER, Kalk, Prussia, Germany. Filed May 19, 1888. Serial No. 274,412. (No model.) Patented in Germany May 21, 1886, No. 37,917, and May 25, 1886, No. 38,347; in Austria-Hungary June 23, 1887, No. 24,929 and No. 2,540, and in Italy June 30, 1887, No. 21,850.



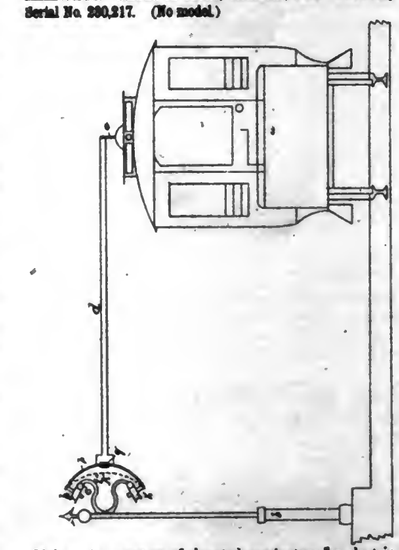
Claim.—1. In punching, shearing, and such like machines worked by steam and water power, the combination of a punching, shearing, or such like machine with a steam-cylinder, A, with a distributing-valve, *b*, hydraulic cylinder C, and piston-rod B, the piston-rod B being fastened to a piston in the steam-cylinder A, hand-lever *a*, hydraulic cylinder D, attached to the head of the punching-machine, the said hydraulic cylinder having an automatic throttle piston-valve, *l*, and pipe *p*, substantially and for the purpose as described.

2. In punching, shearing, and such like machines worked by steam and water power, the combination of a punching, shearing, or such like machine with a steam-cylinder, A, with a distributing-valve, *b*, hydraulic cylinder C, and piston-rod B, the piston-rod B being fastened to a piston in the steam-cylinder A, hand-lever *a*, hydraulic cylinder D, attached to the head of the punching-machine, the said hydraulic cylinder having an automatic throttle piston-valve, *l*, steam-cylinder G, rods *d' d'*, and cross-head d^3, fastened to the piston *g'*, filling-valve *g*, having its lever *i* attached to the hand-lever *a* by a rod, i^3, and pipes *p d*, substantially and for the purpose as described.

3. In punching, shearing, and such like machines worked by steam and water power, the combination of a punching, shearing, or such like machine with a steam-cylinder, A, with a distributing-valve, *b*, hydraulic cylinder C, and piston-rod B, the piston-rod B being fastened to a piston in the steam-cylinder A, hand-lever *a*, hydraulic cylinder D, attached to the head of the punching-machine, the said hydraulic cylinder having an automatic throttle piston-valve, *l*, and pipe *p*, with hydraulic buffer or buffers T, piston or pistons *m*, non-return valve *p'*, and pipes *n* and *o*, substantially and for the purpose as described.

4. In punching, shearing, and such like machines worked by steam and water power, the combination of a punching, shearing, or such like machine with a steam-cylinder, A, with a distributing-valve, *b*, hydraulic cylinder C, and piston-rod B, the piston-rod B being fastened to a piston in the steam-cylinder A, hand-lever *a*, hydraulic cylinder D, attached to the head of the punching-machine, the said hydraulic cylinder having an automatic throttle piston-valve, *l*, steam-cylinder G, rods *d' d'*, and cross-head d^3, fastened to the piston *g'*, filling-valve *g*, having its lever *i* attached to the hand-lever *a* by a rod, i^3, and pipes *p d*, with hydraulic buffer or buffers T, piston or pistons *m*, non-return valve *p'*, and pipes *n* and *o*, substantially and for the purpose as described.

401,796. **ELECTRIC-RAILWAY SYSTEM.** SIDNEY H. SHORT, Columbus, Ohio. Filed Apr. 10, 1888. Serial No. 270,185. (No model.)



Claim.—1. In an electric-railway system of overhead conductors, the combination of elevated supports located at intervals along the railway, insulated hangers suspended from the supports, cables connecting and secured to the said supports, a second set of hangers suspended from the cables, electrical conductors supported upon the said hangers, and a current-collector located upon the conductors and connected with the electric car of the system.

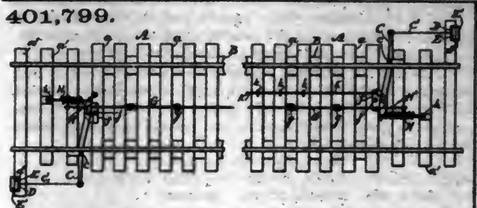
2. In an electric-railway system of overhead conductors, the combination of two posts, a chord connecting the upper portions of the posts, tie-rods connecting the chord and posts, insulated hangers supported upon the chord and ties, cables supported upon the chord, a second set of insulated hangers suspended from the cables, and conductors supported upon the hangers.

3. The combination of three fixed supports not located in the same straight line, but substantially in the same horizontal plane, cables connecting every two supports, tie-wires connecting one of the cables with the remaining two, and insulated electrical conductors suspended from that cable which is held by tie-wires to the remaining two cables.

401,797. **SYSTEM OF ELEVATED CONDUCTORS FOR ELECTRIC RAILWAYS.** SIDNEY H. SHORT, Columbus, Ohio. Filed July 17, 1888. Serial No. 280,217. (No model.)

Claim.—In a system of elevated conductors for electric railways the combination of one conductor above the other in a vertical plane and parallel to the railway, metallic wheels thereon and standing at an angle to the vertical, the planes of the wheels forming an angle which points toward the railway, a spring in two insulated portions connecting the said wheels, and two electrical conductors under tension and connected, respectively, to the said two portions of the spring, the other ends of the last-named conductors being connected to an electric car, and the direction of tension being such as to force the wheels against the conductors upon which the same are mounted.

401,798. **SEESAW.** FREDERICK SPENCER, Sterling, Ill. Filed July 27, 1888. Serial No. 281,234. (No model.)



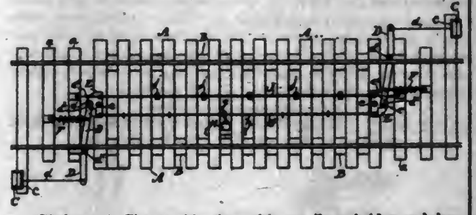
Claim.—The combination of the boards C, centrally gashed and interlocked, as shown, and provided with beveled crowns and upwardly-extending posts D D, the board E, provided with transverse ribs F and holes G G, and the bushing H, provided with opening J, substantially as shown, and for the purpose described.

401,799. **DANGER-SIGNAL FOR RAILWAY-BRIDGES.** JAMES W. STEELE, Topeka, Kans., assignor of one-half to Andrew McNally, Chicago, Ill. Filed Dec. 14, 1888. Serial No. 293,509. (No model.)

Claim.—1. The combination, with a railway-bridge and danger-signal, of a coiled, crimped, or bent wire, rod, or strip for holding said signal in a normal position, said wire, rod, or strip being composed of a material capable of being annealed by heat, substantially as shown and described.

401,799.

2. The combination, with a railway-bridge and the tripping mechanism of a danger-signal, of a tempered metallic wire, rod, or strip having a series of coils, bends, or crimps therein, whereby the heat caused by the burning of the bridge will permit said wire to stretch and release the signal, substantially as shown and described.



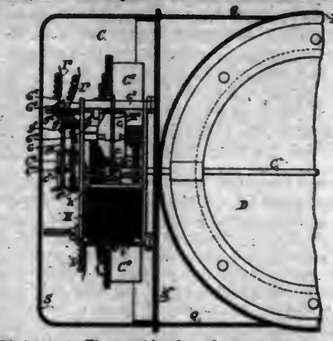
3. The combination, with a railway-bridge, of a semaphore, means—such as the spring H—in operative connection with said semaphore for unlocking and releasing it, and a tempered wire, rod, or strip having coils, crimps, or bends therein and attached to said bridge and spring, respectively, for normally holding the latter in an expanded position, substantially as shown and described.

4. The combination, with a railway-bridge, of a semaphore, means—such as a spring—in operative connection with said semaphore for unlocking it, a tripping mechanism for normally holding said spring in an expanded position, a tempered wire, rod, or strip having a series of bends, coils, or crimps therein, attached to said tripping mechanism and to the bridge, respectively, and a secondary spring attached to said tripper for actuating the same upon the annealing of the coils, crimps, or bends in said rod, substantially as shown and described.

5. The combination, with a railway-bridge, of a semaphore, a spring in operative connection with said semaphore for unlocking it, a pivoted tripping device—such as the plate J—for normally holding said spring in an expanded position, wires, rods, or strips K G, attached to said tripping device upon opposite sides of its pivotal point, the former being straight and the latter provided with coils, crimps, or bends *g*, substantially as shown and described.

6. The combination, with a railway-bridge, of a semaphore arranged at a distance therefrom, a tripper for locking it in a normal position, lever C and spring H, for operating said tripper, pivoted plate J, stud c^3, flange *j'*, and wires K G, the latter having a series of coils therein, whereby the burning or carrying away of the bridge may permit the plate J to rotate and thus actuate the signal, substantially as shown and described.

401,800. **DANGER-SIGNAL FOR RAILWAY-BRIDGES.** JAMES W. STEELE, Topeka, Kans., assignor of one-half to Andrew McNally, Chicago, Ill. Filed Dec. 14, 1888. Serial No. 293,600. (No model.)



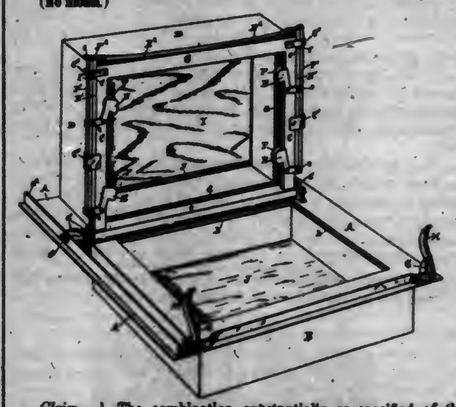
Claim.—1. The combination, with a railway-bridge and danger-signals, of the trippers E E, constructed and arranged as described, and in operative connection with the signals, connecting-wire G, springs c^3 c^3, held normally under tension by means of said connecting-wire, a swinging float suspended beneath the bridge and connected directly to the wire G, and independent springs for actuating the signals upon the movement of said trippers, substantially as shown and described.

2. The combination, with a railway-bridge and danger-signals, of the trippers for holding said signals in a normal position, wire G, having a swinging float connected therewith and suspended beneath the bridge, and a coiled, crimped, or bent wire, J, composed of a material capable of being annealed by heat, substantially as shown and described.

3. The combination, with a railway-bridge and danger-signals, of the trippers E E, for holding said signals in a normal position, wire G, having a swinging float connected therewith and suspended beneath the bridge, springs c^3 c^3, and wire J, having a series of coils, crimps, or bends therein, substantially as described.

401,801. **COMMUTATING DEVICE.** DAVID W. THOMPSON, Englewood, Ill. Filed May 29, 1888. Serial No. 275,496. (No model.)

Claim.—1. The combination of a commutator consisting of a cylindric metal body having insulating-sections extending radially outward beyond the cylindric surface of the body, and brushes bearing upon said commutator, substantially as described.



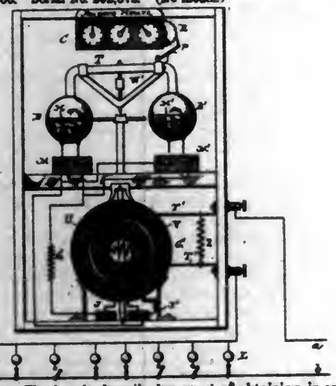
2. The combination of a commutator consisting of a cylindric metal body having insulating-sections extending radially outward beyond the cylindric surface of the body, and brushes resting at their free ends against the commutator, said brushes consisting of wires provided with spiral coils, whereby the brushes may bend or yield to allow the passage of their free ends over said projecting insulating-sections, substantially as described.

3. The combination of a cylindric commutator provided with insulating sections in its cylindric surface, and brushes bearing thereon provided with transverse parts or bends between their points of support and their ends which are in contact with the commutator, whereby the parts of the brushes which bear upon the commutator may be adjusted relatively to the insulating-sections, substantially as described.

4. The combination of a commutator consisting of a cylindric metal body provided with projecting insulating-sections and having circumferential grooves, and wire brushes, the free ends of which engage said grooves, substantially as described.

5. The combination, with the frame, of the motor and the revolving cylindric distributer provided with insulating-sections extending radially outward beyond the surface thereof, brushes resting at their free ends against the distributer, and parts supporting the brushes having rotative connection with the frame of the motor, whereby the brushes may be adjusted to give greater or less pressure upon the commutator, substantially as described.

401,802. **ATTACHMENT FOR PHOTOGRAPHIC CAMERAS.** OTTO D. TROUTROT, Lockland, Ohio. Filed June 11, 1888. Serial No. 276,742. (No model.)



Claim.—1. The combination, substantially as specified, of the two frames hinged together, the two receptacles, one secured to each frame, two sets of spring-pressed catches on the upper frame to retain the plates in the upper receptacle, and cam projections upon the lower frame to alternately actuate each set of catches as the upper frame is opened or closed down upon the lower one, whereby the plates are successively released and permitted to drop into the lower receptacle, when the frames are closed and the following plates successively placed in position to receive an impression when the frame is raised.

2. The combination, substantially as specified, of the frame A, the box B, secured underneath said frame, the frame $C c^3$, the box D, secured above said frame, the hinge for uniting the two frames, the pivoted latches E and F upon opposite sides of said frame, the rods E' F', coupled to the latches, the springs F^2 and F^3, exerting an outward pressure upon said rods, the guides C', for the rods, the cam projections G in the path of said rods E', and the cam projections H in the path of the rods F', for the purpose of automatically releasing the impressed plates as the upper frame is closed and automatically placing a fresh plate in position to be acted upon as the frame is raised.

3. In a camera attachment, the combination of an upper receptacle for the fresh plates and a lower receptacle for the image-impressed plates, the hinge uniting the two receptacles, the hinge-shaft extending out and formed to receive a key, whereby the upper receptacle may be changed from a horizontal to a vertical position without opening the camera or dark box inclosing the receptacles, plate-holders J, to fit the receptacles to protect and shield the plates and hold them separated for the reception of one set of the holder and plate retaining latches, two sets of spring-actuated latches, and cam projections for each set, combined and operating substantially as hereinbefore set forth.

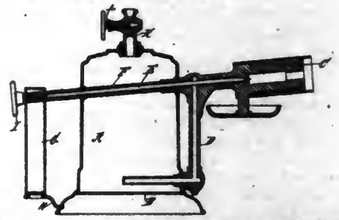
4. The combination of the hinged frames A C, having hinged flanges $a c^3$, provided with pins $a^3 c^3$, and spring-latches $b^3 b^3$ $d^3 d^3$, with the receptacles B D, provided with perforated plates $b' b'$ and $d' d'$, whereby the receptacles are detachably connected to their respective frames, substantially as shown and described.

401,808. ELECTRIC METER. ELIHU THOMSON, Lynn, Mass. Filed Dec. 7, 1888. Serial No. 292,872. (No model.)

Claim.—1. The herein-described method of obtaining, in an electric translating device, actions or effects in direct proportion to the current flowing in another circuit or portion of the circuit, consisting in admitting current to said translating device in proportion to the square root of the current in such circuit.

2. The herein-described method of obtaining, in an electric meter operated by heating effects of an electric current, indications in direct proportion to the currents to be measured, consisting in admitting current to the meter in proportion to the square roots of such currents.

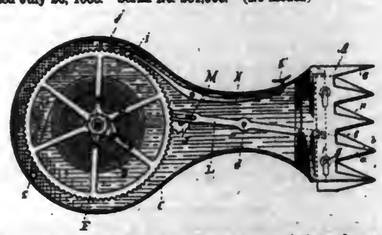
3. In an electric translating device in which actions or effects are the direct result of the flow of electric current, the herein-described method of obtaining an action or effect in direct proportion to the flow of current on another circuit or portion of the circuit, consisting in admitting current to the translating device in proportion to the square root of the current on such other circuit or portion of circuit.



401,804. METALLIC MOLD. NATHAN WASHBURN, Boston, Mass. Filed Dec. 21, 1888. Serial No. 294,248. (No model.)

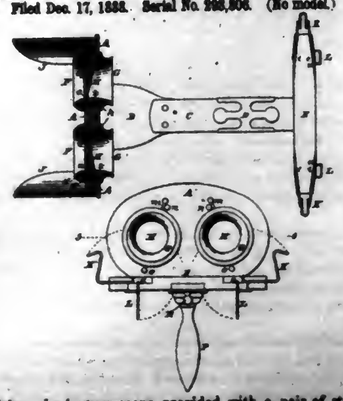
Claim.—1. A metallic mold for the production of steel car-wheels, consisting of a metallic top plate, a metallic bottom plate, and a metallic rim detachably connected together, the said top and bottom plates being provided near their circumference with annular layers b b' of non-metallic refractory material, whereby the molten steel poured into the mold retains its heat and is prevented from setting, substantially as described.

2. The combination, with a metallic mold for the production of steel car-wheels, consisting of a metallic top plate and a metallic bottom plate, each provided with an annular groove at its outer edge or circumference and a metallic rim, of a layer of non-heat-conducting material in said groove, a second layer, b^3, of non-metallic material near the center of the mold, and a sand or non-metallic core, the top and bottom plates being detachable from the rim, substantially as and for the purpose specified.



401,805. TORCH. HENRY WELLINGTON, Brooklyn, N. Y. Filed May 1, 1888. Serial No. 272,416. (No model.)

Claim.—1. In a torch of the character herein set forth, the valve-stem and its casing located above the usual oil-level, extending across but not communicating with the oil-chamber, and the handle of the torch connected with the valve-stem casing and with the base of the torch, substantially as and for the purposes set forth.



2. In a torch of the character herein set forth, the combination, with the shell provided with an air-valve, of the valve-stem casing extending through the top of the oil-chamber, but not communicating with the interior thereof, and being above the usual oil-level, said casing being threaded upon its outer end to receive the threaded valve-stem, and the burner connected with the valve-stem casing, arranged substantially as shown and described.

401,806. ANIMAL-SHEARS. ALBERT A. WHITE, Vassar, Mich. Filed July 26, 1888. Serial No. 281,068. (No model.)

Claim.—An animal-shearing instrument consisting of a casing, the shaft E, journaled therein, the gear-wheel on said shaft, the spring actuating said gear-wheel, the lever pivoted between its ends in said casing, the stationary cutting-plate, the vibratory cutting-plate working on guides on the stationary plate, the pinion J, and a limited loose connection between the shaft of said pinion and one end of said lever and between the other end of the lever and the vibratory cutting-plate, substantially as and for the purpose specified.

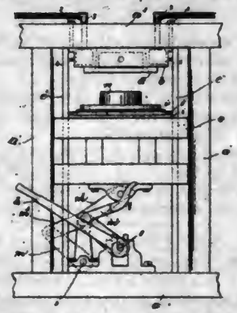
401,807. STEREOSCOPE. HAWLEY G. WHITE, North Bennington, Vt. Filed Dec. 17, 1888. Serial No. 293,806. (No model.)

Claim.—1. A stereoscope provided with a pair of stereoscopic lenses, each of which is mounted in an annular eye-piece which is fitted to and adapted to revolve in a circular opening in the lens-holder about an axis coincident with the axis of the eye of the observer, substantially as described, and for the purposes set forth.

2. The combination of lens-holder A and lenses H H, mounted in revolvable annular eye-pieces F G F G, with guiding-pins n o n o, and adjusting-pins m m, substantially as described, and for the purposes set forth.

3. The combination of the lens-holder A, provided with the two reversible stereoscopic lenses H H, mounted on the longitudinally-adjustable shaft B C, with the view-holder E, provided with the supports K K and L L, for supporting either a telescopic or a single view, substantially as described and set forth.

401,808. SHOE-FASTENING. JOSEPH G. WHITTIER and WILLIAM R. E. HERRON, Attica, Ind. Filed July 7, 1888. Serial No. 279,236. (No model.)

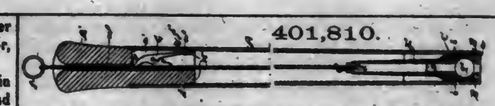


Claim.—1. As an improved article of manufacture, the fastener for overshoes, consisting of a clip-plate adapted to be secured to the shoe and a clasp-plate hinged to the clip-plate and having an upwardly-turned flange at its sides and outer end, and a series of slots shaped to receive a button attached to the shoe, substantially as set forth.

2. The combination, with the clip-plate having a sliding engagement with a button-shank, of a clasp-plate provided with a flanged rim bent integrally thereon and a series of slots or perforations cut in the clasp-plate that interlock with a stud or button shank, substantially as set forth.

3. The combination, with the slotted clip-plate having a sliding engagement with a button-shank, of a flanged clasp-plate perforated or notched at spaced intervals and a stud or button which is adapted to be secured to a shoe, substantially as set forth.

401,809. MACHINE FOR MOLDING HATS. THOMAS P. WILKINSON, Milford, Mass. Filed Jan. 31, 1889. Serial No. 298,204. (No model.)

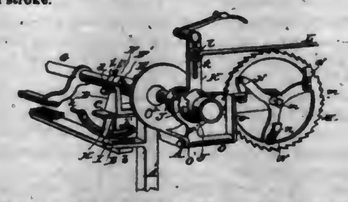


Claim.—1. In a machine for pressing hats, an outer crown-mold and an independent brim-mold, and the hollowed or chambered holder therefor, combined with the removable inner crown-mold support therefor, and the independent rim or guide i^3, and means, substantially as described, for moving vertically the said support, as set forth.

3. In a machine for pressing hats, the outer crown-mold and independent brim-mold, the support or holder therefor, and fastenings, as set-screws, for securing the said outer crown-mold in position, combined with the inner crown-mold and vertically-movable support therefor, substantially as described.

3. In a machine for pressing hats, the outer crown-mold and independent brim-mold, the support or holder therefor, combined with the inner crown-mold, the rim or guide i^3, and support for said mold and rim or guide, substantially as described.

401,810. TORPEDO-STAFF. HARRIS P. YOUNG, Lowell, Mass., assignor of one-half to Joseph L. Finder, same place. Filed Aug. 2, 1888. Serial No. 281,768. (No model.)



Claim.—1. The combination of the body or barrel provided with a recess in one end to receive a torpedo, one or more springs arranged in said recess to retain a torpedo therein, a striker, a spring to force said striker into said recess, a cord attached to said striker and provided with a knot or enlargement, a catch to engage said knot or enlargement to hold said striker out of said recess, and a spring to hold said catch in engagement with said knot or enlargement, as and for the purpose specified.

2. The combination of the body or barrel provided with a recess in one end to receive a torpedo, one or more springs arranged in said recess to retain a torpedo therein, a striker, a spring to force said striker into said recess, a cord attached to said striker and provided with a knot or enlargement, a catch to engage said knot or enlargement to hold said striker out of said recess, a spring to hold said catch in engagement with said knot or enlargement, and a stud projecting from said catch through an opening with which said body or barrel is provided to release said catch, as and for the purpose specified.

401,811. DOFFER-CLEANER FOR CARDING-MACHINES. GEORGE BERG, Indianapolis, Ind., assignor to George Merritt and Worth Merritt, same place. Filed Mar. 16, 1888. Serial No. 267,422. (No model.)

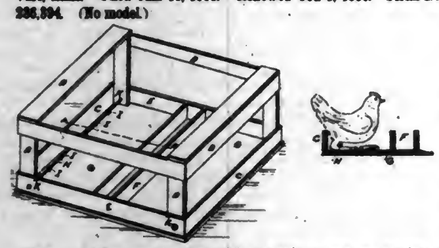
Brief.—The doffer-cleaner is brought into action at intervals by means of step-by-step mechanism and a clutch on the cleaner-shaft, and the cleaner engages the clothing on the doffer only on its downward stroke.

Claim.—1. In a doffer-cleaner, the combination of the framing provided with a box or strap for the circle-block, the circle-block having off its center a bearing for the cleaner-shaft, the cleaner-shaft provided with a cleaner and journaled in said bearing, and means for oscillating the cleaner-shaft, the said shaft and the circle-block being provided with projections or portions arranged to contact as the shaft is oscillated, whereby the oscillation of the shaft will effect the desired adjustment of the circle-block, substantially as set forth.

2. The combination of the framing, the box or strap supported by said framing, the circle-block journaled in said box or strap and provided off its center with a journal-bearing, an arm connected with said circle-block and supporting projections, the shaft journaled in the bearings of the circle-block, an arm connected with such shaft and arranged to operate between the projections of the arm of the circle-block, and the cleaner, substantially as set forth.

3. The combination of the framing, a shaft having a cleaner, the arm for oscillating such shaft, a clutch-section whereby said arm may be keyed to such shaft, a shifter-piece whereby to communicate motion to said clutch-section, a tripper whereby to engage and operate said shifter-piece, and operating means for said tripper, substantially as set forth.

4. The combination of the shaft provided with a cleaner, bearings in which said shaft is journaled, a clutch-section fixed on such shaft, a clutch-section loose with reference to the shaft and movable into and out of engagement with the fixed clutch-section, a shifter-piece having a fork engaging the movable clutch-section, and an arm by which the said shifter-piece may be operated, a toothed wheel having a projecting portion or portions arranged to engage the said shifter-piece, a pawl engaging the toothed wheel, the arm K, and oscillating means therefor, substantially as set forth.



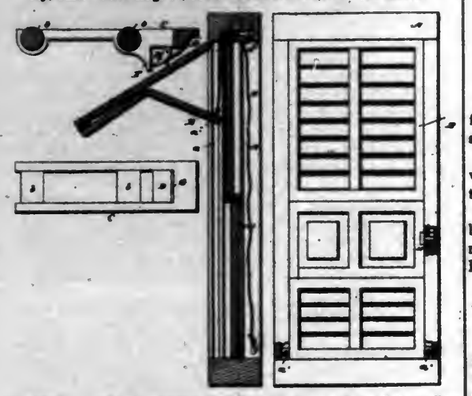
5. The combination, with the shaft having the cleaner-bar, bearings for said shaft, and the clutch having a movable section, of the shifter-piece having one arm arranged to operate the loose clutch-section, a toothed wheel having a number of projecting portions whereby to engage the shifter-piece, such portions being movable, whereby they may be set into and out of position to engage the shifter-piece, the arm K, and oscillating means therefor, and the pawl engaging the toothed wheel, substantially as and for the purpose specified.

6. The combination of the framing, the shaft having a cleaner, the clutch-section fixed on the shaft, the clutch-section loose on the shaft and having an arm by which the said clutch-section may be rocked, oscillating means for said arm, a shifter-piece having a fork

engaging the loose clutch-section, and an arm by which the shifter-piece may be rocked, a toothed wheel having projections arranged to engage the arm of the shifter-piece, and a pawl supported on the arm of the loose clutch-section and engaging the toothed wheel, substantially as set forth.

7. In a doffer-cleaner, the combination of the framing having a box or strap, the circle-block turning therein and having a bearing off its center, the shaft journaled in said bearing and having a cleaner, such shaft and circle-block being provided with projections or portions arranged to contact as the shaft is rocked, the clutch-section fixed on said shaft, the clutch-section loose on the shaft and provided with an arm, means for oscillating said arm, a shifter-piece engaging the loose clutch-section, and means for operating said shifter-piece, substantially as set forth.

401,812. **POULTRY-CARRIER.** GEORGE M. BERROWER, Cherry Vale, Kans. Filed Jan. 18, 1888. Renewed Oct. 1, 1888. Serial No. 286,594. (No model.)

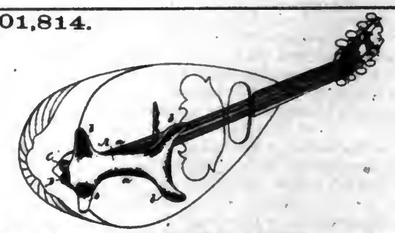


Claim.—1. The combination, with a poultry coop or carrier, of a series of eyes or staples, I, and a wire, cord, or rod, H, passing through the same, for securing the legs of the fowls, substantially as and for the purpose described.

2. The combination, with a poultry coop or carrier, of the eyes or staples I and the wire, cord, or rod H, for securing the legs of the fowls, and a board or strip, C, arranged immediately in rear of the eyes, to hold the joints of the fowls against dislodgment, substantially as and for the purpose described.

3. A poultry coop or carrier having the eyes I and wire, cord, or rod H, and a strip, C, on one side and trough F on the other, substantially as and for the purpose described.

401,818. **SHUTTER.** SAMUEL I. BLOOM and EDDY M. BLOOM, Findlay, Ohio. Filed Aug. 27, 1888. Serial No. 283,876. (No model.)



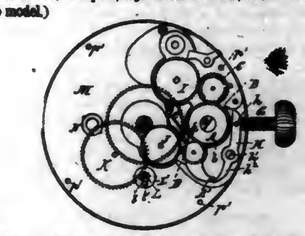
Claim.—The combination, with a window-casing, of the roller brackets secured in the upper portion thereof and bearing the rollers *b b*, and having the abutment F, the pivoted pawl D, the spring G, pressing thereon, the hinged sectional blind carrying frictional rollers traveling in ways in the casing, and the operating-rope secured to the lower section of the blind and passing over the bracket into the room, substantially as specified.

401,814. **ARM-REST FOR MUSICAL INSTRUMENTS.** JOSEPH BOHNARD, Chicago, Ill. Filed Mar. 15, 1888. Serial No. 267,204. (No model.)

Claim.—1. The combination, with a musical instrument of the class described, of an arm-rest hollowed in the direction of its length to conform to the player's arm, and standing at an angle to the top of the instrument corresponding to the natural angle of the arm, as shown and described.

2. The combination, with a musical instrument of the class described, of an arm-rest A, pivotally connected thereto, and an adjusting-screw, D, substantially as described.

401,814.



3. The combination, with a musical instrument of the class described, of an arm-rest attached to the side thereof and extending over its top at an angle thereto corresponding to the natural angle of the player's arm, and adjustable to and from the instrument, substantially as and for the purpose described.

4. An arm-rest adapted for application to a musical instrument of the class described for supporting the hand employed in picking the strings, said rest being of a height to elevate and position the hand of the player over the sound-board and to determine the extent to which his fingers can drop toward the strings, substantially as and for the purpose set forth.

5. An adjustable arm-rest adapted for application to a musical instrument of the class described in position to support the hand employed in picking the strings, substantially as and for the purpose set forth.

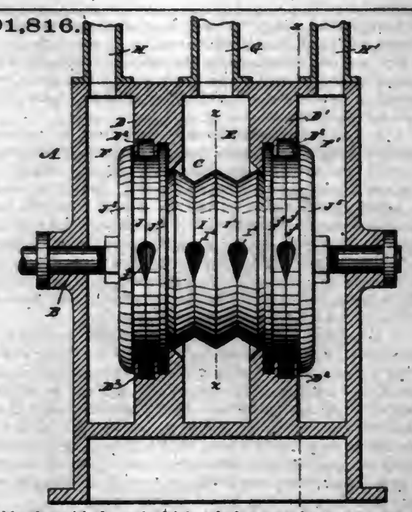
6. The combination, with a musical instrument of the class described, of an arm-rest adapted and arranged to support and position the hand of the player over the sound-bound and to determine the extent to which his fingers can drop toward the strings, substantially as and for the purpose set forth.

401,815. **STEM WINDING AND SETTING WATCH.** CASPER BORNHEIMER, Newport, Ky. Filed Nov. 23, 1887. Serial No. 256,230. (No model.)

Claim.—1. The combination of the plate M, having openings N N', fourth-wheel K, and detachable seconds-hand arbor and pinion, substantially as and for the purposes set forth.

2. The combination of plate M, having openings N N', fourth-wheel K, cap L', pinion L, and arbor *l*, swiveled in cap L', substantially as and for the purposes specified.

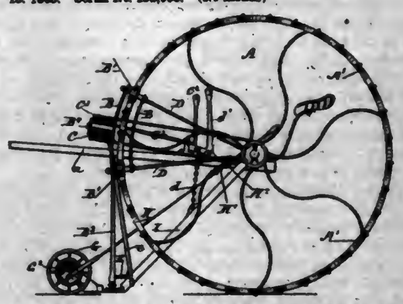
3. The combination of plate M, having openings N N', with rabbeted edges, and openings *p' p' p' p'*, seconds-wheel K, cap L', with rabbeted edges, pinion L, arbor *l*, swiveled in cap L', and dial-plate P, having four posts, *p*, substantially as and for the purposes specified



401,816. **ROTARY ENGINE.** MARCELLUS A. BUFORD, Thompson's Station, Tenn. Filed Aug. 14, 1888. Serial No. 282,710. (No model.)

Claim.—1. In a rotary engine, the combination, with a casing provided with a steam-inlet chamber and steam-exhaust chambers, of a main driving-shaft mounted to rotate in the said casing, and a wheel secured on the said shaft in the said casing and provided with central disks having inlet-openings in their peripheries, and exhaust-disks secured to the central disks and provided with outlet-openings discharging into the said exhaust-chambers, substantially as shown and described.

2. In a rotary engine, the combination, with the casing A, provided with the walls D and D', forming the chambers F and F', of the main driving-shaft B, mounted to rotate in the said casing, the wheel C, secured on the said driving-shaft and provided with the disks I I', each having the spokes I^3 and inlet-openings I^2 in its periphery, said wheel being also provided with the exhaust-disks J and J', having spokes J^2 and exhaust-disks J^3, registering with channels formed in the walls D and D', substantially as shown and described.

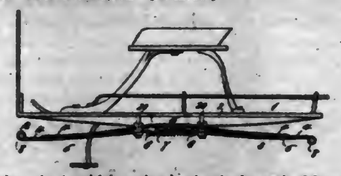


3. In a rotary engine, a casing, partition-walls formed in the said casing and provided with channels leading into the outer chambers formed by the said partition-walls, an inlet-pipe leading to the central chamber formed by the said partition-walls, and exhaust-pipes leading from the outlet-chambers formed by the said partition-walls, in

401,816.

combination with the main driving-shaft mounted to rotate centrally in the said casing, the disks I and I', secured on the said main driving-shaft between the said partition-walls, each disk being provided with spokes and inlet-openings extending from the periphery through the said spokes, and exhaust-disks secured on the said main driving-shaft and abutting against the outer faces of the said disks I and I', said exhaust-disks being fitted in the said partition-walls D and D' and provided with spokes and exhaust-openings in the periphery, said openings registering alternately with the channels in the partition-walls, substantially as shown and described.

401,817. **MOWER.** PHILIPP C. CLOSE, Augusta, Ga. Filed Jan. 15, 1886. Serial No. 152,965. (No model.)



Claim.—1. In combination with the driving-wheel A, having corrugations upon one side, and the beam B, provided with rollers bearing thereon, the tubular connecting-rod B^3, integral with said beam and having inserted into its lower end a vertical pin, B^7, having a cylindrical socket, B^8, a horizontal cylindrical pin inclosed in said socket, and a pin projecting upward from the cutter-bar and entering a socket in said cylindrical pin, substantially as and for the purpose described.

2. In a harvester, the oscillating beam B and connecting-rod B^3, rigidly attached thereto and having its lower ends provided with a tubular sleeve, the stem B^7 therein carrying the horizontal cylindrical socket B^8, and the cylindrical pin B^9 within the latter, in combination with a pin, *b*, entering a socket in said pin B^9 and secured to the cutter-bar B^2, substantially as and for the purpose described

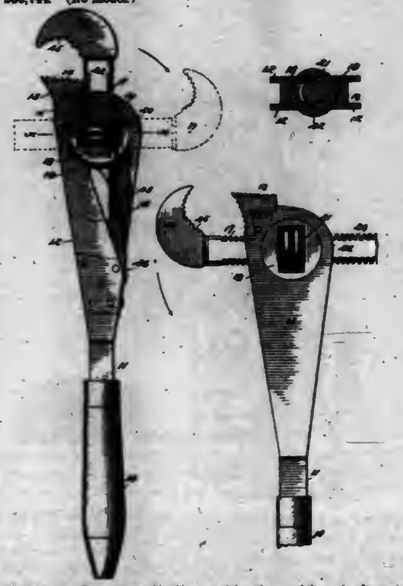
3. In a harvester, the oscillating beam B and pivot B^4 thereon, the eccentric C upon said pivot in front of said beam and provided with a handle, the band C^2 upon said eccentric, and the frame C^4, to which said band is attached, the brace *c*, and the bent spring E, having its middle portion secured to the lower end of said brace, in combination with the cylindrical socket B^8, having the stem B^7 within the socketed rod B^3 of the beam B, the horizontal pin B^4 within the socket B^8, and the vertical pin *b*, received into the pin B^9 and projecting from the cutter-bar, substantially as described.

4. In combination with the finger-bar, a raising and lowering device therefor, consisting of a disk, G^3, within the wheel G, a stud-pin, *g*, on the inner side of said disk carrying the shoe and cutter-bar attachments, and the arm *g'*, located on the outer side of the disk, a lever, H, provided with a rack, and a pin, H^3, attached to the main frame, substantially as and for the purpose described.

401,818. **VEHICLE-SPRING.** ALBERT E. COOK, Knowlton, Quebec, Canada, assignor to George W. Vasco, same place. Filed Dec. 1, 1888. Serial No. 292,331. (No model.)

Claim.—1. A vehicle-spring having its lower leaf formed in two parts, with a spring connecting the inner ends, substantially as described.

2. A vehicle-spring having its lower leaf formed in two parts, with their inner ends connected by a spring having longitudinal end-wise tension, substantially as described.



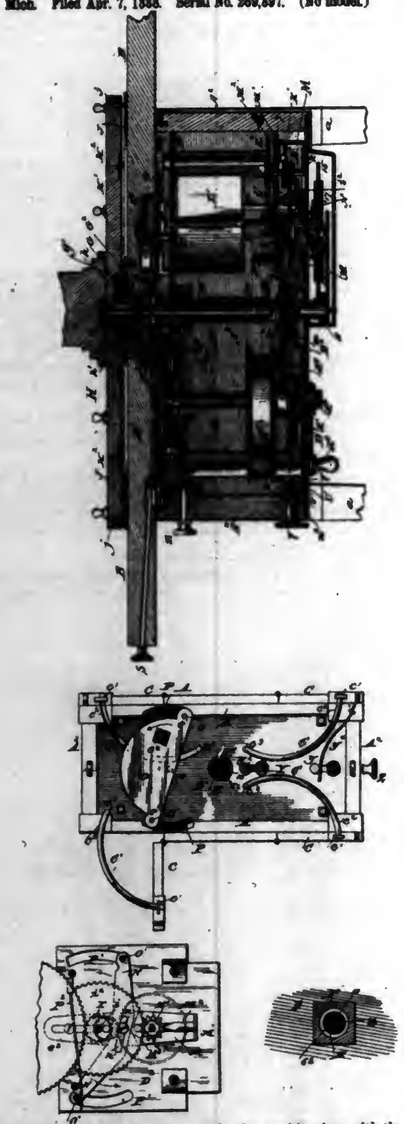
3. In a vehicle-spring, the combination, with a rocker-shaped bearing, of a vehicle-spring having its lower leaf formed in two parts, with their inner ends connected by a spring, substantially as described.

4. In a vehicle-spring, the combination, with a rocker-shaped bearing having clips with blocks formed with passage-ways, of a vehicle-spring extending through the passage-ways, and having its lower leaf formed in two parts connected at their inner ends by a spring, substantially as described.

5. A vehicle-spring, 3, formed of the leaves 4 and the bottom short leaves, 5, having their inner ends connected by a coiled spring, 7, substantially as described.

6. The combination, with rocker-shaped bearing-bar 2, having clips 20, with blocks 16, having passage-way 18, of the spring 3, extending through passage-way 18 and formed of the leaves 4 and the bottom short leaves, 5, connected at their inner ends by coiled spring 7, substantially as described.

401,819. **WRENCH.** SIDNEY COOK, Orlando, Fla., assignor of one-half to Ezra P. Sperry, same place. Filed Sept. 20, 1888. Serial No. 286,744. (No model.)



Claim.—1. In a wrench, the combination, with a body open at the top and sides and provided with a fixed jaw having teeth on its upper and outer faces, of a revolving carrier in the body and a movable jaw detachably and adjustably secured in the said carrier, substantially as described, whereby provision is made for causing the movable jaw to work with either toothed face of the fixed jaw, as set forth.

2. In a wrench, the combination, with an open body provided with a fixed jaw having teeth on its upper and outer faces, of a carrier fitted to revolve in the body and provided with apertures intersecting each other at right angles, a nut fitting in one of the aper-

tures of the carrier, a movable jaw having a screw-threaded shank and passing through the carrier and nut, and a spring secured to the body and engaging the carrier, substantially as herein shown and described.

401,820. SELF-WAITING TABLE. ANDREW DAHLSTROM, Ashton, Mich. Filed Apr. 7, 1888. Serial No. 269,897. (No model.)

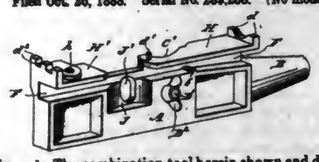
Claim.—1. In a self-waiting table, the combination, with the main table-body projections 1 formed thereon, of the extensions C, the rods C', one end of said rods secured to the extensions C, the other end having a stop projection and adapted to fold into the main frame when extensions are closed in, the spring-actuated catch 2, adapted to be engaged and held by the projection 1 upon the main body of the table, substantially as described and shown.

2. In a self-waiting table, essentially as described, the combination, with the shaft E, the hub G, mounted on said shaft, a ratchet-disk, g', formed on said hub, of the revolving table H, and a pawl, h', secured centrally to the table and adapted to be engaged by the ratchet-disk, substantially as shown and described.

3. In a self-waiting table, the combination, with the main frame and table, spring-actuated gearing supported therein and adapted to operate the table, a box-like frame centrally pivoted to the under side of the table-top, and a pawl, R, pivotally secured at one end in the said box, provided with a depending lip, r, of the pivoted plate O, provided with a slot, O^2, said plate arranged to engage the lip r of the pawl, and rods depending from the plate O and connected with a releasing device connected to the spring-gearing, said device being operated by movement of the plate O and pawl R, substantially as shown and described.

4. In a self-waiting table, the combination, with the operating-gears, of a slide-plate, M, having a projecting finger, M^3, adapted to be moved into or out of engagement with the gears, whereby the movement thereof may be stopped, a pivoted plate, O, mounted in the table-frame and connected with the plate M, a box-like frame centrally pivoted to the under side of the table-top, and a pawl, R, pivotally secured at one end in the said box, provided with a depending lip, r, adapted to normally engage the plate O and thereby hold said finger M^3 in engagement with the gearing, and means, substantially as shown and described, for operating the box-like frame and pawl, as and for the purposes hereinbefore described.

5. In a self-waiting table, the combination, with the shaft K, the spur-wheel K', and the intermediate gearing, of the sliding plate M, having a rearwardly-projecting finger adapted to engage the spur-wheel K', and a shoulder, M^3, a cross-bar, N, mounted on said plate, arranged to bear against the said shoulder, a pivoted plate, O, connected with the bar N, a box-like frame centrally pivoted upon the under side of the table-top, a pawl, R, pivotally secured at one end in the said box, provided with a projecting finger, r, adapted to engage the plate O, and means, substantially as shown, for operating the pawl R and plate O, as described, for the purpose set forth.



6. The combination, with the plate O, centrally pivoted upon the frame D', said plate provided with depending rods, a plate, M, connected to said rods, said plate provided with a projecting finger for arresting the movement of the operating-gearing devices, and a shoulder, M^3, a cross-bar, N, mounted on said plate, arranged to engage the said shoulder, and upwardly-projecting arms connecting said bar N with the plate O, said plate provided with an opening, O^3, of the swinging box Q, having a hinged pawl, R, having a beveled projection, r, adapted to enter the opening O^3, and means, substantially as shown and described, for swinging said box, whereby the plate O is swung on its pivot and the bar N caused to operate the plate M, as and for the purpose set forth.

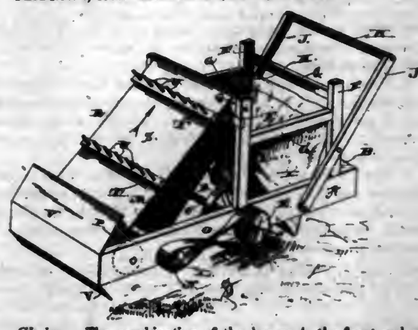
7. In a self-waiting table, the combination, with the main frame, spring-actuated gearing supported therein, the plate O, centrally pivoted on the frame D', having an opening, O^2, a releasing device, substantially as shown, connected with spring-gearing and with the plate O, the swinging box Q, centrally pivoted upon the under side of the table-top, and a pawl, R, hinged at one end in said box, provided with a downwardly-projecting finger, r, engaging the opening O^2 in plate O, of the pull-rod S, mounted in the table-top, its outer end extending beyond the table-rim and its inner end connected to the swinging box, substantially as and for the purpose described.

8. In a self-waiting table, the combination, with the table-top B, provided with a central hub, W, a recess, f^2, formed in said hub, a circular groove, F', surrounding the hub, of a spring-actuated sliding plate, Y, having an upwardly-projecting hub, y^2, fitting normally in the recess f^2, and means, substantially as shown, for withdrawing the projecting hub from the recess f^2, as and for the purpose described.

9. In a self-waiting table, substantially as described, the combination, with the plate U, having a projecting finger, u, at one end adapted to enter the cog-pinion c, and an upturned portion, u', having a screw-threaded opening, u^2, at its opposite end, of the thumb-screw V, having a screw-shank adapted to enter the screw-opening, an annular groove, v, engaged by the studs v', and the thumb-screw body passed through the side A^2 of the frame, substantially as and for the purpose specified.

401,821. COMBINATION-TOOL. SAMUEL I. HEINOLD, Anderson, Ind. Filed Oct. 26, 1888. Serial No. 289,233. (No model.)

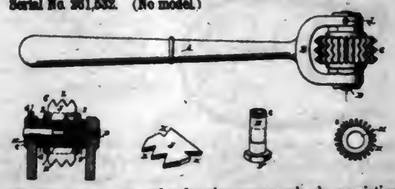
Claim.—1. The combination-tool herein shown and described, the same consisting of a main body, A, hammer, file-holding groove F, gage projections, and an eye, D, adapted for holding a handle and for dressing the drag-teeth, as set forth.



2. The main body A, formed with spaced flanges H H' and aperture J', in combination with the gage-eye D, substantially as described.

3. The main body A, formed with flanges H H' and fulcrum f, the flange H' being provided with the threaded opening h, in combination with a screw, D', substantially as described.

4. The body A, formed with recess J, flanges H H', and slot J', in combination with the eye D, having threaded shank D', and the nut D^2, substantially as described.



5. The body A, formed with the concave C', socket C^2, and aperture C, in combination with the handle E, eye D, having threaded shank D', and the nut D^2, substantially as described.

401,822. LAWN-RAKE. JOSHUA B. DETWEILER, Goshen, Ind. Filed Nov. 7, 1888. Serial No. 290,192. (No model.)

Claim.—The combination of the beams A, the front and rear standards F, erected thereon, the hooks H on the standards, the bags suspended on said hooks, the handles secured to the rear standards and the beams A, the roller Q in the front standards, the rotating axle, the roller M, the belt connecting the axle with the roller M, the endless rake moving over the rollers Q and M, and the shield secured to the front ends of the beams, as set forth.

401,823. INSTRUMENT FOR CUTTING OR GRINDING EMERY-WHEELS. WILLIAM DIEHL, Philadelphia, Pa. Filed Jan. 21, 1888. Serial No. 261,532. (No model.)

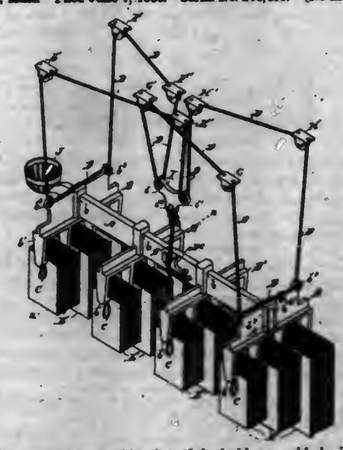
Claim.—1. A cutter for dressing emery-wheels, consisting of a central hub provided with transverse slots, in combination with cutting-teeth having dovetailed ends, clamping-disks provided with flanged edges adapted to fit over the dovetailed ends of the cutting-teeth, means, substantially as described, to draw said clamping-disks toward each other, and thereby to draw said cutting-teeth downward into the transverse slots of the hub toward the center thereof, shaft D, loosely journaled in said hub, and handle to which said shaft is secured, whereby the hub with its cutting-teeth is free to rotate on said shaft.

2. A cutter for dressing emery-wheels, consisting of a central hub provided with transverse slots and having its edges cut away or slightly beveled, in combination with cutting-teeth having dovetailed ends, clamping-disks provided with flanged edges adapted to fit over the dovetailed ends of the cutting-teeth and cut-away or beveled edges of the central hub, means, substantially as described, to draw said clamping-disks toward each other and thereby to draw said cutting-teeth downward into the transverse slots of the hub toward the center thereof, shaft D, loosely journaled in said hub, and handle to which said shaft is secured, whereby the hub with its cutting-teeth is free to rotate on said shaft.

3. In a cutter for dressing emery-wheels, a central hub, H, having transverse slots A, in combination with cutting-teeth J, having dovetailed ends K, clamping-disks I I, adapted to fit over the dovetailed ends K, means to draw said disks toward each other to clamp the teeth, shaft D, loosely journaled in hub H, and handle A B, to which said shaft is secured, whereby said hub with its cutting-teeth is free to rotate upon the shaft.

4. In a cutter for dressing emery-wheels, a central hub, H, having transverse oblique slots A, in combination with cutting-teeth J, having dovetailed ends K, clamping-disks I I, adapted to fit over the dovetailed ends K, means to draw said disks toward each other to clamp the teeth, shaft D, loosely journaled in hub H, and handle A B, to which said shaft is secured, whereby said hub with its cutting-teeth is free to rotate upon the shaft.

5. In a cutter for dressing emery-wheels, a central hub, H, having transverse slots A, in combination with cutting-teeth J, having dovetailed ends K, clamping-disks I I, adapted to fit over the dovetailed ends K, means to draw said disks toward each other to clamp the teeth, consisting of the bolt E, having head F, and the nut G, shaft D, loosely journaled in hub H, and handle A B, to which said shaft is secured, whereby said hub with its cutting-teeth is free to rotate upon the shaft.



6. In a cutter for dressing emery-wheels, a central hub having beveled or tapering edges and provided with transverse slots, in combination with cutting-teeth adapted to fit into said slots having dovetailed edges, means, substantially as described, to hold said teeth in place upon the hub, and handle A B, provided with a fixed shaft, D, upon which the hub is journaled and free to rotate.

401,824. WINDLASS FOR CLOTHES-LINES. HENRY FOOTE, Jersey City, N. J. Filed Sept. 27, 1888. Serial No. 286,541. (No model.)

Claim.—A windlass for clothes-lines, with suitable means for turning and attachment, and being composed of a standard, D, having a rectangular elbow, E, in one of its sides, and a sheave, A, having firmly attached to one side of it a cog-wheel, B, both said sheave and cog-wheel being rigidly fixed upon and turning either backward or forward, with a shaft, P, working loosely in said standard at a point above the rectangular elbow thereof, said cog-wheel B engaging with a smaller cog-wheel, C, in the same vertical plane, and rigidly fixed upon and turning either backward or forward, with a long shaft, P', loosely set at one side in the standard D and at the other side in the rectangular elbow E, all substantially as described.

401,825. HOLDER FOR PAPER BAGS. HERBERT R. GAGE, Lowell, Mass. Filed June 7, 1888. Serial No. 276,409. (No model.)

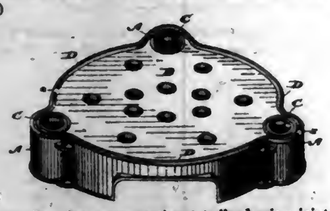
Claim.—1. The combination of the holder provided with hangers having oppositely-arranged recesses, and spring-skewers adapted to be compressed, to be placed between said hangers and by their expansion to enter said recesses, and to be thereby held in place, as and for the purpose specified.

2. The combination of the holder provided with hangers having oppositely-arranged recesses, and skewers formed of spring-wire, each of said skewers having a loop between its ends and being adapted by the compression of said loop to have its ends drawn toward each other to enter between a pair of hangers and by the expansion of said loop to force its ends into said recesses, as and for the purpose specified.

3. The combination of the holder, the yoke, one or more cords connecting the corners of said holder to said yoke and passing over pulleys between each each corner and said yoke, the diagonally-opposite corners of said holder being connected to the same end of said yoke, and another cord attached to said yoke to draw the same downward to raise said holder, and when secured to maintain said holder in a raised position, whereby depressing one side, end, or corner of said holder will have a tendency to depress to an equal amount

the other side, end, or corner of the same, as and for the purpose specified.

401,826. THILL-COUPLING. FRANK GANDY, Freeport, Ohio. Filed Dec. 26, 1888. Serial No. 294,659. (No model.)

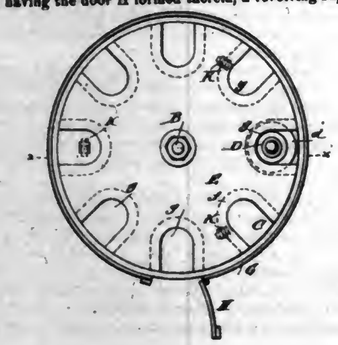


Claim.—1. The combination, with an axle-clip provided with forwardly-extending arms, of a block mounted between said arms, a spring arranged in connection with the block, a stud carried by one of the arms, the opposite arm being apertured, and a thill head or eye arranged to engage the stud, substantially as described.

2. The combination, with an axle-clip provided with forwardly-extending arms, of a block mounted between said arms, a spring arranged in connection with the block, a stud carried by one of the arms, a recessed aperture formed in the opposite arm, and a thill head or eye provided with a lug or projection which may be brought into register with the recess of the apertured arm, substantially as described.

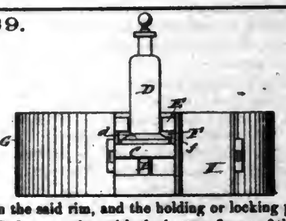
3. In a thill-coupling, the combination, with a clip formed with forwardly-extending arms, one of which is provided with a stud, 15, and formed with a recess, 16, while the other is formed with an aperture, 17, and a recess, 18, of a block mounted between the arms and supported by a pin, 21, a spring, 22, mounted in a recess formed in the clip behind the block, and a thill-head formed with a projection, 27, said head being adapted to engage the stud and enter the recess 16, substantially as described.

401,827. SECTIONAL FURNACE-JOINT. EDWARD GURNEY, Toronto, Ontario, Canada. Filed May 21, 1888. Serial No. 274,564. (No model.)



Claim.—In a hot-water sectional boiler having joints formed around its water-legs by compressible metal rings C, the combination of a softer and easier compressible packing, D, placed on the section and extending above the top surfaces of the rings C, substantially as and for the purpose specified.

401,828. PROCESS OF PREPARING SULPHATE OF SILVER. FREDERICK GUTEKUNST, San Francisco, Cal. Filed Feb. 11, 1889. Serial No. 299,504. (No specimens.)

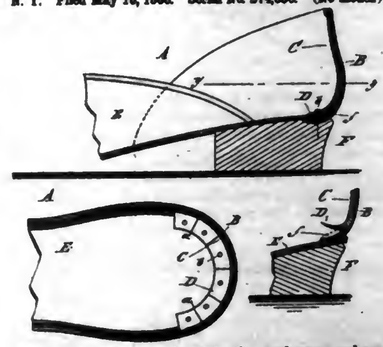


Claim.—In the process of refining silver bullion, the preparation of crystals of sulphate of silver by diluting the hot solution of sulphate of silver in sulphuric acid, by means of a steam-jet, to such concentration that on cooling the crystals will separate as a monosulphate.

401,829. BOTTLE-STAND. CHARLES K. HALL, New Orleans, La. Filed Aug. 15, 1888. Serial No. 282,794. (No model.)

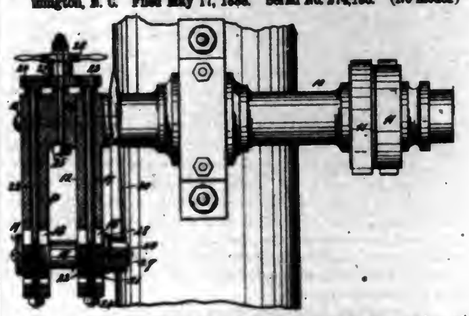
Claim.—1. The bottle-stand herein shown and described, composed of the base A and rim G, attached thereto and surrounding the same, and having the door H formed therein, a revolving support, C,

401,829.



placed within the said rim, and the holding or locking plate E above the support C, for engaging with the bottom flange of the bottle, substantially as set forth.

2. The bottom board, A, provided with stud B and surrounding rim G, having door H, in combination with the support C, intermediate board, F, and plate E, formed with spaces *g* to receive the bottles, the boards C E F being placed loosely upon the stud B to revolve thereon, substantially as described.



3. The bottom board or base, A, the surrounding rim G, secured to the base, and the door H, formed in the rim, and the central bolt, B, in combination with the horizontal support C, held by the bolt, the rollers K, placed beneath the support, and the holding-boards E F, substantially as described.

401,830. SHOE OR SLIPPER. JAMES HAHAN, Jr., New York, N. Y. Filed May 16, 1888. Serial No. 274,090. (No model.)

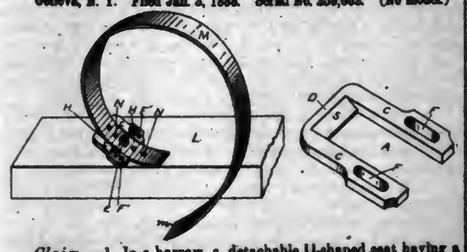
Claim.—As an improved article of manufacture, a shoe or slipper having a counter, C, bare upon its inner surface and split at its lower edge to form the narrow inner flap, D, and the narrow lower flap, *f*, secured at the heel of the shoe, substantially as described.

401,831. CUT-OFF-VALVE GEAR. ANDREW L. HARRISON, Wilmington, N. C. Filed May 17, 1888. Serial No. 274,188. (No model.)

Claim.—1. The combination, with the rock-shaft of an engine, of parallel spaced arms secured to one end of said rock-shaft, provided with aligning and straight rectangular slots near their lower ends, an eccentric-pin sliding in said slots, a nut also sliding in the slots below the said pin, rods projected downward through the arms and the pins and engaging the nuts, and a means, substantially as shown and described, for manipulating said rods, whereby provision is made for changing the lead of the valves, and also the lift or throw of the said valves, as set forth.

2. The combination, with the rock-shaft of an engine and spaced arms secured at one end, provided with an aligning rectangular slot and a vertical bore extending longitudinally from end to end, of an eccentric-pin sliding in said slots, a nut also sliding in the slots below the pin, rods threaded at their lower ends and projected through the bore of the arms and engaging said nuts, pinions attached to the upper end of said rods, and a hand-wheel journaled in the rock-shaft

above the pinion and provided with a gear-wheel meshing with the same, as and for the purpose specified.

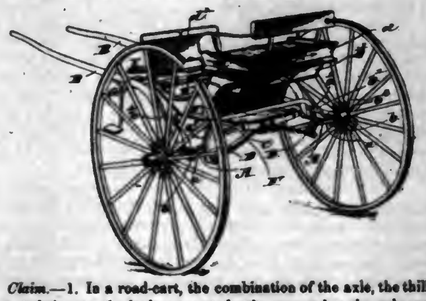


3. The combination, with the rock-shaft of an engine and spaced arms secured at one end, provided with an aligning rectangular slot and a vertical bore extending longitudinally from end to end, of an eccentric-pin sliding in said slots, a nut also sliding in the slots below the pin, rods threaded at their lower ends and projected through the bore of the arms and engaging said nuts, pinions attached to the upper end of said rods, a hand-wheel journaled in the rock-shaft above the pinions and provided with a gear-wheel meshing with said pinions, and means, substantially as described, for locking the eccentric-pin in a fixed position, as and for the purpose specified.

401,832. HANDLE. JACOB B. HARTMAN, Wooster, Ohio. Filed Aug. 23, 1888. Serial No. 283,332. (No model.)

Claim.—The combination, with the rail of a sash or blind provided with parallel mortises B B, of a plate secured to said rail and formed with perforations which register with the mortises B B, and a handle consisting of a handle proper, E, and parallel arms, which latter are provided at their ends with stops which cannot pass through the perforations in the plate after said plate is secured, substantially as set forth.

401,833. SPRING-TOOTH HARROW. EDWARD W. HERENDEEN, Geneva, N. Y. Filed Jan. 3, 1888. Serial No. 259,662. (No model.)



Claim.—1. In a harrow, a detachable U-shaped seat having a bearing portion, S, and perforated arms C C, in combination with fastening-bolts, whereby the seat is adjustable, substantially as and for the purposes described.

2. In a harrow, a tooth provided with a series of holes, in combination with the frame-bolts and a detachable U-shaped seat having a bearing portion, S, and arms C C, substantially as described.

3. A harrow provided with a curved spring-tooth and a detachable U-shaped seat, each independently attached to the harrow, substantially as and for the purposes described.

401,834. ROAD-CART. JOHN G. HESS, Westminster, Md. Filed Oct. 31, 1888. Serial No. 289,619. (No model.)

Claim.—1. In a road-cart, the combination of the axle, the thills connected thereto, the body connected at its rear end to the axle, and the cross-bar G between the thills, passing over the floor of the body in rear of the splash-board, and connected to the body, substantially as specified.

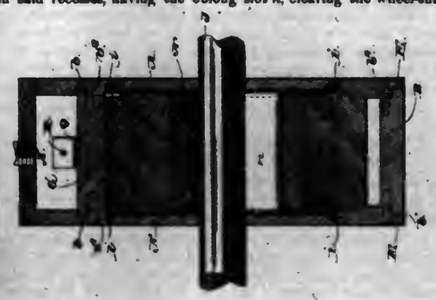
2. In a road-cart, the combination of the axle having the thills attached thereto, the body connected to the axle and having a transverse spring-bar, H, in rear of the splash-board, the cross-bar G, connecting the thills and passing over the said spring-bar; the wear-plate on the upper side of the cross-bar provided with a vertical tapered flange, *k'*, the whiffletree arranged on the upper side of the cross-bar and provided on its under side with a depending tapered flange, *l'*, fitting within the flange *k'*, and the bolt passing through registering perforations in the whiffletree, cross-bar, and spring-bar, substantially as and for the purpose specified.

3. In a road-cart, the combination, with the axle, of the thills and draft-straps *b* and inclined brace-straps *b'*, secured to the rear ends of the thills and arranged at their rear ends respectively below and above the axle, and the bolts connecting the rear ends of the said straps on opposite sides of the axle, said bolts bearing against the axle, substantially as specified.

4. In a road-cart, the combination, with a cranked axle provided with the upward offset *a* and the thills connected to the straight portion of the axle on opposite sides of the offset, of the semi-elliptical spring arranged within and below the offset and connected at its ends to the shoulders *a'* of the offset, and the body having its main portion arranged forward of the axle and its seat directly above the same, and provided with a cross-brace, F, arranged parallel with and bearing on the said spring, and the horizontal arms E, connecting the cross-brace with the rear portion of the body, substantially as specified.

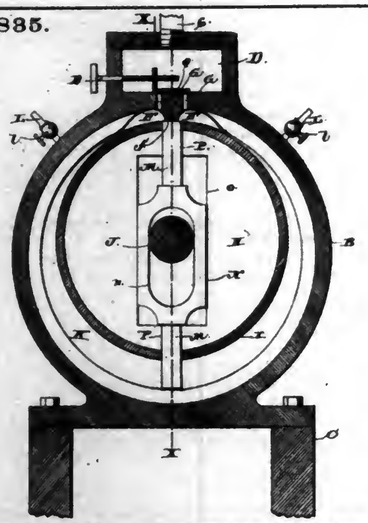
5. In a road-cart, the combination, with a cranked axle provided with the offset *a* and the shoulders *a' a'* on opposite sides of the offset, and the thills attached at their rear ends to the straight portion of the axle beyond the shoulders, of the spring C, arranged within and below the said offset and provided at its ends with swinging loops D D, passing over the axle and engaging the shoulders *a' a'*, the body provided with rearwardly-extending arms E E, the cross-brace F, connecting the rear ends of the said arms and secured to the center of the said spring, and the cross-bar G between the thills, connected to the front of the body, substantially as specified.

6. In a road-cart, the combination, with the cranked axle and the thills affixed to the axle, of the spring C, provided at its ends with swinging loops D D, passing over the axle, and the body provided at its rear end with a cross-brace, F, arranged parallel with and bearing on and affixed to the said spring, said cross-brace and said spring being arranged within and below the cranked portion of the axle, and said body being connected at its front end to the cross-bar G of the thills by a yielding or spring connection, substantially as specified.



7. In a road-cart, the axle, the thills, the body, the transverse spring-bar H, secured to the floor of the body in rear of the splash-board, the cross-bar G, connecting the thills and passing over the said spring-bar, and the whiffletree connected to the top of the cross-bar and extended at its ends beyond the side of the body, whereby the spring-bar, cross-bar, and whiffletree are all connected to the floor of the body and are arranged in rear and close to the bottom of the splash-board, as set forth.

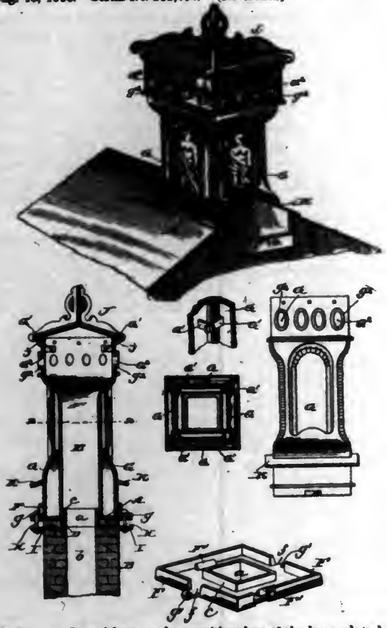
8. In a road-cart, the thills, the axle, the body, the cross-bar G, connecting the thills and extending across the bottom of the body in rear of the dash-board, said cross-bar having a spring or yielding connection with the body, and the whiffletree connected to the cross-bar and arranged within the body and extended at its ends beyond the sides of the body, as specified.



9. In a road-cart, the cranked axle, the spring C, arranged below the cranked portion of the axle and connected to the same, the cross-bar F, arranged parallel with the spring and connected to the top thereof, and also arranged within the crank of the axle, and the arms E, connected to the cross-bar F and arranged at right angles thereto and extended forward and connected to the body, as set forth.

401,835. ROTARY ENGINE. JOHN F. HIMES, Sr., San Antonio, Tex. Filed Sept. 11, 1888. Serial No. 285,115. (No model.)

Claim.—In a rotary engine, the cylinder having the ports G, the wall or offset *f* between them and the recesses F on opposite sides of said offset, the steam-chest, the valve I, the screw R, to move the same over either or both of the ports, and the independent valved escape-ports, in combination with the wheel mounted eccentrically in the cylinder and having the guide-recesses O in its heads, the block N in said recesses, having the oblong slot *n*, clearing the wheel-shaft,



401,835.

and the radial pistons M, secured to opposite ends of the block and working through openings in the periphery of the wheel, substantially as described.

401,836. CHIMNEY. JOSEPH A. RODEL, Cumberland, Md. Filed Aug. 13, 1888. Serial No. 282,757. (No model.)

Claim.—1. In a chimney, the combination of the base-plate having flanges F, short ribs F', and lateral lugs *g'*, and having the flange F recessed at *f* in line with lugs *g'*, the side plates, G, two of which have lugs *g* fitted to rest in recesses *f* and over lugs *g'*, and the other two side plates being fitted at their lower ends between the flange F and the short ribs F', the cap or top and fastenings, substantially as set forth.

2. The base-plate and the casing seated thereon, and having two of its side plates provided at their lower ends with laterally-projected lugs, combined with the anchor-rods, whereby to connect said lugs with plates anchored in the chimney-wall, and the said anchored plates, all substantially as and for the purposes specified.

3. The combination, in a chimney-top, of the base-plate having lateral perforated lugs *g'*, and an edge flange, F, formed in line with lugs *g'*, with openings or recesses *f*, the casing having lateral lugs *g*, extended through openings *f* and over the lugs *g'*, and the anchor-rods passed through lugs *g g'* and secured, substantially as and for the purposes specified.

4. The improved chimney-top consisting of the base-plate A, having openings *a*, tubes C D, lugs *g'*, and flange F, recessed at *f*, the tube E, fitted at its lower end on tube C, the casing having plates G, provided with lugs *g*, extended through recesses *f*, and also having interlocking hook-like lugs G', the cap or top, and the anchor-rods, all substantially as and for the purposes specified.

401,837. WITHDRAWN.

401,838. SUPPOSITORY-MACHINE. WAYNE J. HULL, Alexandria, Dak. Filed Sept. 27, 1888. Serial No. 286,550. (No model.)

Claim.—1. The combination, with a tube and a plunger, of a rotary circular mold journaled at the inner end of the tube and having peripheral recesses to successively register with the inner end of the tube, substantially as set forth.

2. In a machine of the character described, the sectional peripherally-recessed mold formed of disks held face to face and each having a circular series of registering recesses in their adjacent faces forming said mold-recesses, and means for holding the disks together, substantially as set forth.

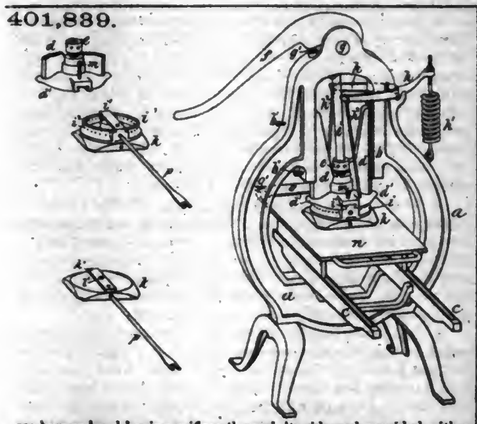
3. In a machine of the character described, a rotary peripherally-recessed mold formed of interchangeable disks held face to face and each having a circular series of recesses in the outer edge of both sides, the recesses on one side or face being of a different size from those on the opposite side, and the like recesses of each disk being similarly spaced to register, and means for holding the disks together with either set of recesses in register, substantially as set forth.

4. The combination, with a ring, a tube communicating with the interior thereof, and a plunger in the tube, of a circular rotary mold fitting in the said ring and having a series of peripheral recesses to successively register with the tube, substantially as set forth.

5. In a machine of the character described, the sectional peripherally-grooved mold consisting of the disk 12, having a central spindle, 17, projecting at both sides and threaded at its ends, pins 18, projecting from both faces of the disk, a second centrally-apertured disk, 13, having apertures in both faces to register with said pins, a knob or its stated equivalent, 25, on one end of the spindle and having apertures to receive the adjacent pins 18, a nut holding the said knob in position, and a nut on the opposite end of the spindle binding the two disks together, the said disks having a series of alternating semicircular recesses in opposite sides thereof.

6. The combination, with a frame, a tube attached thereto, and a plunger loosely held in said tube, of disks capable of side contact and rotation in the frame, said disks having pins and pin-apertures and being provided with a series of grouped semi-conical recesses produced in opposite sides of their periphery and extending toward their center, and means, substantially as described, for rotating the disks, as and for the purpose specified.

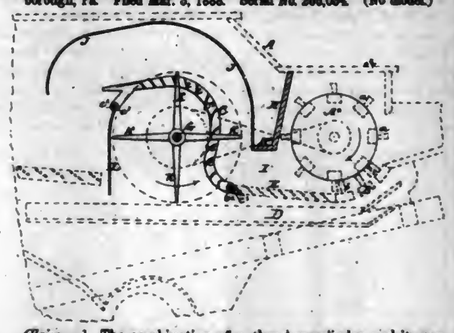
7. The combination, with a frame, a tube attached thereto, and a plunger loosely held in said tube, of disks capable of face-contact with each other and rotation in the frame, said disks being provided with a series of semi-conical recesses produced in opposite sides of their periphery and extending toward their center, pins formed upon the face of one disk adapted to enter apertures in the face of the other disk, a spindle passing through the disks provided with a detachable lock-nut at one end and a handle at the other end, all combined to operate substantially as shown and described.



8. The combination, with a frame, a tube attached thereto, and a plunger loosely held in said tube, of interchangeable disk-sections capable of rotating in the frame and provided with a series of semi-conical recesses produced alternately on opposite sides thereof, and means, substantially as shown and described, for securing the disks in contact and rotating the same, substantially as shown and described.

401,839. HAND PRINTING-PRESS. JULIUS KUHNE, Yonkers, N. Y. Filed Jan. 21, 1888. Serial No. 261,503. (No model.)

Claim.—1. The combination, with the plunger of a printing-press, of a hollow gas-burner head detachably secured thereto, said plunger having gas-passages opening into the hollow head, and said hollow head having orifices in its sides, through which the gas escapes, and when ignited impinges against the bottom of the plunger.



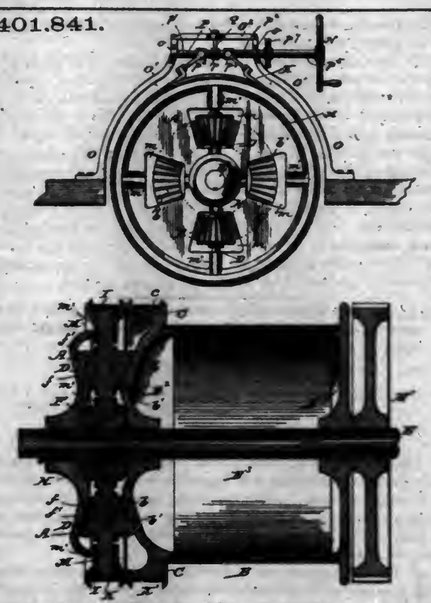
2. In a printing-press, in combination, a plunger having a circular head and a dovetail groove in the under side thereof, a hollow gas-burner head having orifices through its side and provided with a central dovetail rib adapted to fit in the groove of the plunger-head and a dovetail on its under side, and a die-head provided with a dovetail rib adapted to fit in the groove at the under side of the gas-burner head.

401,839.

3. In a printing-press, in combination, a plunger having a circular head, with a dovetail groove formed partly through the under side thereof, a gas-pipe secured thereto, and passages from the pipe extending through the bottom at either side of the groove, a hollow gas-burner head provided with orifices through its side and having a central rib dividing it into two chambers and projecting above it in the form of a dovetail to fit the groove in the plunger-head, a die-head provided with a dovetail rib adapted to fit in a groove in the under side of the gas-burner head, a die secured to the die-head by means of a central screw, and a locking-screw passing through the plunger-head and the gas-burner head into the die-head.

401,840. THRASHING-MACHINE. FRANK P. LANDIS, Waynesborough, Pa. Filed Mar. 3, 1888. Serial No. 266,084. (No model.)

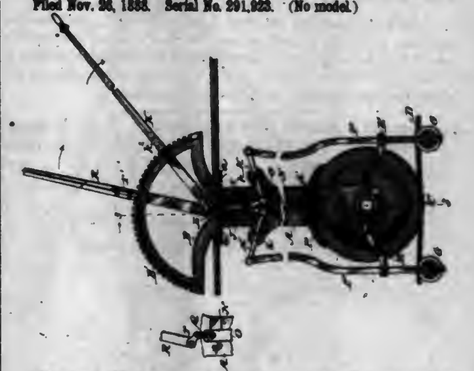
Claim.—1. The combination of a thrasher-cylinder and its concave with a stationary abruptly-rising curved grate having a series of transverse webs arranged one above the other and retained obliquely to and in the path of the grain projected in the rear of said cylinder, and revolving fingers passing through slots in said grate to elevate straw above it, substantially as described.



2. The combination of a thrasher-cylinder and its concave, an abruptly-rising curved grate in the rear of said cylinder, and revolving fingers passing through slots in said grate, with a correspondingly-curved deflector above said grate and fingers, substantially as and for the purpose described.

3. The combination of a thrasher-cylinder and its concave, an abruptly-rising curved grate having transverse webs, and revolving fingers passing through the slots in said grate, with a pendent partition between said cylinder and grate, and a correspondingly-curved deflector above said grate, substantially as and for the purpose described.

401,841. HOISTING-MACHINE. TIMOTHY W. LEMIEUX, Duluth, Minn. Filed Oct. 12, 1888. Serial No. 287,961. (No model.)

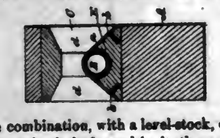


Claim.—1. In a hoisting-machine, the combination, with the power-shaft, a drum loosely mounted thereon provided with a head having an annular brake-seat and a cogged surface on its outer face, and a disk having a cogged inner face fixedly secured upon the power-shaft, of a pulley loosely mounted on the said shaft between the drum-head and the fixed disk, said pulley provided with an annular brake-seat, cog-gears journaled in the web of the pulley M, adapted to engage the cogged surfaces of the drum-head and fixed disk, and brake mechanism, substantially as shown and described, for alternately braking the drum-head and loose pulley, as and for the purpose described.

401,841.

2. The combination, with the shaft E, the drum B, and pulley M, loosely mounted on said shaft, said drum provided with a band-brake wheel, C, said pulley M provided with band-brake seat I', and the band-brakes K K', of the frame O, the screw-shafts P P, journaled in said frame, said shaft provided with right and left hand screw-sections p' p^3, sliding boxes p^3 p^4, mounted on said screw-sections p' p^3, the sliding boxes p^3, connected to the ends of the band-brake K', the boxes p^4 being connected to the ends of the band-brake K', the pulley P, provided with a hand-wheel, N, and a gear-wheel, p^5, engaging a similar wheel, p^6, on shaft P', whereby the band-brakes may be alternately engaged and disengaged from operation with their respective hand-wheels, and means for revolving said drum B and the pulley M, substantially as shown and described.

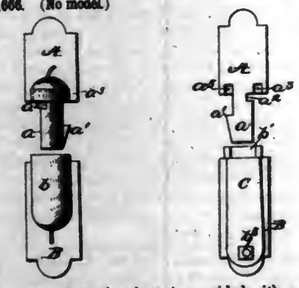
401,842. CABLE-GRIP. TIMOTHY W. LEMIEUX, Duluth, Minn. Filed Nov. 26, 1888. Serial No. 291,923. (No model.)



Claim.—1. The combination, with the standard A, adapted for connection with the car-body at its upper end, its lower end bifurcated, a central slot, N, formed in the standard and communicating with the bifurcated portion, and a sheave, C, journaled in the lower end of said bifurcated portion, said sheave adapted for frictional contact with the cable on its lower face, of the vertically-adjustable brake adapted to engage the upper face of the sheave C, said brake consisting of the shoe P and the sliding arm O, fitting and operating in the slot N in the standard, a lever, R, connected to said arm O at its upper end for operating it, and means, substantially as shown, for

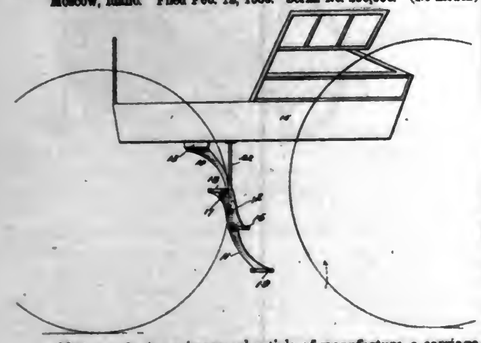
raising the cable into contact with the sheave C, substantially as and for the purpose described.

2. The combination, with the standard A, adapted for connection with the car-body at its upper end, its lower end bifurcated, a central slot, N, formed therein communicating at its lower end with the bifurcated portion, and a sheave, C, journaled in the lower end of said bifurcated portion, said wheel having an annular groove or seat to receive the cable and beveled flange to receive the brake-shoe, said wheel adapted for frictional contact with the cable, of the vertically-adjustable brake, said brake consisting of the shoe P, having beveled faces adapted to engage the flanges of the wheel C, and an upwardly-extending arm, O, fitting and sliding in the slot N in the standard, the lever R, connected to the upper end of said arm for operating it, and means, substantially as shown, for raising the cable into contact with the sheave C, substantially as and for the purpose specified.



401,848. SPIRIT-LEVEL. EVAN LEWIS and FREDERICK ARESTRONG, Kingston, Pa. Filed Jan. 9, 1889. Serial No. 295,897. (No model.)

Claim.—1. The combination, with a level-stock, of a rectangular frame having a rectangular hole formed in it through its sides that are beveled toward the inner edges of the frame, a spirit-tube located in a longitudinal groove of the frame, and two straps that bear on the body of the spirit-tube and are secured near their ends to the frame, substantially as set forth.



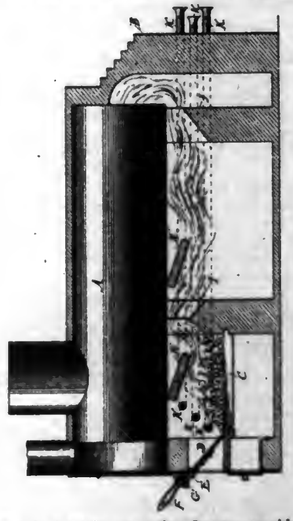
2. The combination, with a level-stock and a rectangular frame which is embedded in the stock and having a rectangular hole with beveled sides and a longitudinal groove formed in it, of a spirit-tube, a slightly-yielding bedding-piece, two bands, and screws to secure the bands in place, substantially as set forth.

401,844. CLASP. ORELOW C. MANN, Delhi, N. Y., assignor of one-half to George E. Marvine, same place. Filed June 11, 1888. Serial No. 276,666. (No model.)

Claim.—In a clasp, the plate A, provided with a half-rounded projection, *a*, having a hook, *a'*, and recess *a²*, formed thereon, the plate B, having a socket, *b*, corresponding to the said projection *a*, for receiving the same, and the spring C, secured to the plate B, for locking the parts together, as shown and described.

401,845. FOLDING STEP FOR VEHICLES. MATTIE M. MARSH, Moscow, Idaho. Filed Feb. 12, 1889. Serial No. 299,806. (No model.)

Claim.—1. As an improved article of manufacture, a carriage-step comprising an upper section and a lower section pivoted thereto, each section being provided with an outwardly-extending tread-plate at each extremity, substantially as shown and described.



2. As an improved article of manufacture, a folding carriage-step comprising two sections pivoted one to the other, the upper section provided with a tread-plate at each extremity extending at a right angle outward from one face, and a lug or shoulder integral with one edge between said tread-plates, the lower section being provided at each extremity with an outwardly-projecting tread-plate, the upper tread-plate of the lower section, when the step is unfolded to its full extent, being adapted to rest upon the shoulder of the upper section, and the lower tread-plate to extend beyond and below the similar plate of the upper section, substantially as shown and described.

3. As an improved article of manufacture, a folding step for vehicles, comprising an upper and a lower section pivotally connected, each provided at the extremities with a tread-plate extending at a right angle from the outer face, and a brace-rod attached to the pivot-pin of the sections and provided with a spring adapted for engagement with the lower section when said section is folded up parallel with the upper section, substantially as shown and described.

4. In a folding step for vehicles, the combination, with an upper section having the upper end bent outward at a right angle upon itself and horizontally inward to form an upper tread-plate, and a lower extremity bent outward at a right angle to form a lower tread-plate, and a lug integral with the forward edge between the upper and lower tread-plates, of a lower or drop section pivoted to the upper section having the extremities bent at a right angle outward to form a tread-plate, the uppermost of which plates is provided with a recess to receive the forward edge of the upper section immediately below the lug thereon, substantially as shown and described.

5. In a folding step for vehicles, the combination, with an upper section having the upper end bent outward at a right angle upon itself and horizontally inward to form an upper tread-plate, and the lower extremity bent outward at a right angle to form a lower tread-plate, and a lug integral with the forward end between the upper and lower tread-plates, of a lower or drop section pivoted to the upper section having the extremities bent at a right angle outward to form a tread-plate, the uppermost of which plates is provided with a recess to receive the forward edge of the upper section immediately below the lug thereon, a brace-rod attached to the pivot-pin of the step-sections, and a spring coiled upon the said rod capable of engaging with the lower or drop section, substantially as shown and described.

401,846. SMOKE-CONSUMER. CORNELIUS MCGIVERN, Chicago, Ill. Filed Jan. 19, 1889. Serial No. 296,928. (No model.)

Claim.—1. A smoke-consuming furnace provided with flues entering the rear of the furnace and opening above the fuel near the front of the fire-chamber for feeding heated air to the fire, an inclined door, as shown, for feeding additional air, and deflectors placed at an angle to the surface of the grate for directing the air against the surface of the fire, substantially as described.

2. A smoke-consuming furnace provided with flues for feeding heated air to the fire, an inclined door, as shown, for feeding additional air, and deflectors for directing the air against the surface of the fire, substantially as described.

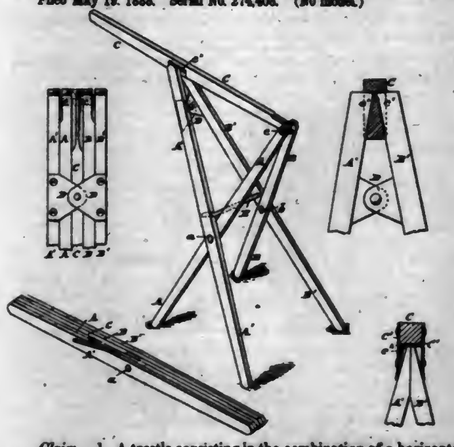
3. In a smoke-consuming furnace, two or more flues for feeding heated air to the fire, placed one above another, entering the rear of the furnace and opening above the fire at the front end of the fire-chamber, each flue opening at a point nearer the rear of the furnace than the one below it, whereby heated air is fed to the different parts of the flame in succession, substantially as described.

4. A smoke-consuming furnace provided with an inclined door for feeding air to the fire, two or more flues for feeding heated air, placed one above another, entering the rear of the furnace and opening above the fuel near the front of the fire-chamber, each flue opening above the fire at a point nearer the rear of the furnace than the one below it, and deflectors for directing the air against the surface of the fire, substantially as described.

401,847. VEHICLE-BODY. LAFAYETTE A. MELBURN, Denver, Colo. Filed Feb. 8, 1889. Serial No. 299,113. (No model.)

Claim.—1. A vehicle-body having its panels formed at their meeting ends with dovetail grooves and ribs, combined with fastening-pins engaging both said panels at their juncture, substantially as set forth.

2. A vehicle-body comprising the panels and the sills secured thereto, the said sills having their ends or corners separated from the corners of the panels, substantially as set forth.



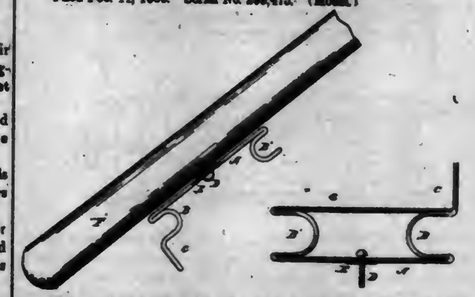
3. The combination, in a vehicle-body, of the panels and the sills secured thereto, a recess or opening being formed between the corners of the sills and the panels, substantially as set forth.

4. A vehicle-body comprising panels, the sills separated at their corners from the corners of the panels, and the fastening-screws passed from the inner side through the sills into the panels, substantially as set forth.

5. A vehicle-body having its panels provided in their inner sides with dovetail or undercut grooves, and having its seat-posts fitted to said grooves, substantially as set forth.

6. The improved vehicle-body herein described, consisting of the panels having their meeting ends formed with dovetail grooves and ribs, and having pins driven partially in each of the panels at their joints, and each panels having dovetail grooves fitted to receive the seat-posts, the seat-posts fitted in said grooves, and the sills secured to the inner sides of the panels, recesses being formed between the joints of the sill and of the panels, substantially as set forth.

401,848. FOLDING TRESTLE. JOHN T. MILLER, Chicago, Ill. Filed May 19, 1888. Serial No. 274,408. (No model.)



Claim.—1. A trestle consisting in the combination of a horizontal top bar, C, and four legs or standards, A A' B B', pivoted together in pairs at or near their mid-length by pivots *a b*, the legs A' B' being pivoted together at or near their upper ends by pivot D, the axis of which is at right angles to the axis of the pivots *a b*, and the corresponding legs A B being arranged adjacent to each other and between the corresponding legs A' B', the parts being adapted to fold together into a compact form, in the manner and for the purpose set forth.

2. A trestle consisting of four legs or standards, A A' B B', pivoted together in pairs at or near their mid-length by pivots *a b*, the legs A' B' being pivoted together at or near their upper ends by pivot D, the axis of which is at right angles to the axis of the pivots *a b*, in combination with the horizontal top bar, C, pivotally secured between the upper ends of the legs or standards, whereby the trestle parts are permanently connected together and adapted to fold into a compact form, substantially as herein described, and for the purpose set forth.

3. The combination of the legs or standards A A' B B', pivoted together in pairs and connected together by hinge D, with the corresponding legs A B arranged adjacent to each other and between the corresponding legs A' B', top bar, C, having a recess, essentially as described, for receiving the upper ends of the legs A' B', and pivot-bolt *c*, substantially as described, and for the purpose set forth.

4. The combination of the legs or standards A A' B B', pivoted together in pairs and connected together by hinge D, with the corresponding legs A B arranged adjacent to each other and between the corresponding legs A' B', top bar, C, having a recess, essentially as described, for receiving the upper ends of the legs A' B', pivot-bolt *c*, connecting the end of bar C with the tops of the legs A B, and strut or brace E, substantially as described, and for the purpose set forth.

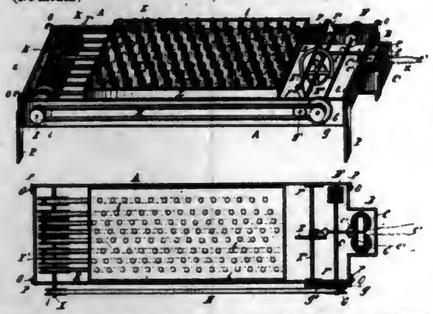
401,849. FISHING-REEL. GEORGE FADDOCK, Brooklyn, N. Y. Filed Feb. 11, 1889. Serial No. 299,473. (Model.)

Claim.—1. A reel of the character described, constructed of a central strip perforated for the reception of a securing-screw and having at each end a curved arm, one of said arms being projected to form an operating-handle, substantially as set forth.

2. A reel of the charater described, consisting of a strip adapted to be secured to the rod and provided at each end with a curved arm, one of said arms extended to and secured at the other arm, substantially as and for the purpose described.

401,850. STUMP-EXTRACTOR. JAMES A. PARIS and JAMES H. DILDAY, Gibson, Tenn. Filed Dec. 18, 1888. Serial No. 294,091. (No model.)

Claim.—1. In a stump-extractor, the combination of the standards pivoted together at their upper ends, the braces pivoted to one pair of standards and detachably engaging the other pairs, the lifting-lever fulcrumed on the pivot-bolt of the standards, the grappling-hooks suspended from the lifting-lever, and mechanism for operating the said lever, as set forth.



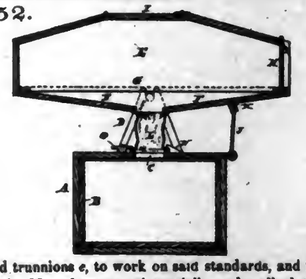
2. The combination of the standards, the lifting-lever fulcrumed at the upper ends of the standards, the grappling-hooks suspended from said lever, the windlass journaled upon the standards, the rope

secured to the lifting-lever and adapted to wind on the windlass, the ratchet-wheel on the end of the windlass, the gravity-pawl pivoted below the ratchet-wheel and engaging the same, and the operating-lever pivoted above the ratchet-wheel and provided with a loop engaging said wheel, as specified.

3. The standards pivoted together at their upper ends, the lifting-lever fulcrumed on the pivot-bolt of the standards, and the grappling-hooks suspended from the lifting-lever, as set forth.

4. The standards pivoted together at their upper ends, the lifting-lever fulcrumed on the pivot-bolt of the standards, and the grappling-hooks suspended from the lifting-lever, the windlass *a*, connected with the short arm of the lifting-lever by rope *b*, and the windlass J, connected to the long arm of said lever by rope I, as set forth.

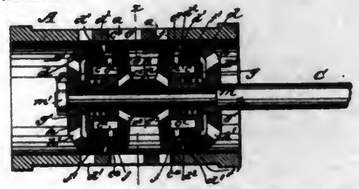
401,851. DISTRIBUTER FOR EXPLOSIVE BOMBS. HORACE W. PARSONS, Wamego, Kans. Filed Aug. 17, 1888. Serial No. 283,054. (No model.)



Claim.—1. The combination, in a device for distributing bombs, with a supporting-frame by which all the various parts of said device may be lifted, series of tubes suitable for receiving bombs fastened upon said frame, and slides capable of being moved so as to close and open the lower ends of such tubes, as specified, of a revoluble shaft journaled in said frame, spools mounted upon said shaft and connected with said slides, so as to move the same when turned, as hereinbefore described, and mechanism, substantially as specified, for turning said shaft, and spools to move said slides, all substantially as and for the purpose set forth.

2. The combination, in a device for distributing bombs adapted to be attached to balloons and other appliances capable of lifting and carrying the same, with a supporting-frame by which the distributer may be lifted and carried, tubes set upright upon said frame and arranged for carrying bombs, slides arranged to move under said tubes to open and close the bottom thereof, and mechanism, substantially as specified, for moving said slides, of an escapement to control the movement of said slides, comprising a shaft journaled in said frame, a toothed wheel mounted upon said shaft, a pinion also mounted upon said shaft to connect it with the said moving mechanism, another shaft journaled in said frame parallel to said last-named shaft, an oscillating anchor mounted upon such shaft, a lever pivoted upon said frame and connecting an armature with said anchor, an electro-magnet working said armature and said lever to oscillate said anchor, and electric conductors by which said magnet may be connected with a battery, all substantially as and for the purpose set forth.

3. The combination with the frame A A, having legs P, ears O, and recess B, the box L within said frame, and the series of tubes *l* within said box, open at both ends and adapted to receive and carry bombs, as specified, of the shaft I, journaled in said frame, the spools I′ and pulley i, mounted upon said shaft, the flexible slides *k*, working under said tubes *l* and adapted to be wound upon the spools I′, the shaft D, journaled in said frame, the spool D′, the spur-wheel S, and the pulley G, mounted upon said shaft D, the band H, connecting the pulley i and the pulley G, the shaft E′, journaled in said frame, the spur-wheel *g*′, mounted upon said shaft E″ and meshing into the spur-wheel *g*, the toothed wheel E, also mounted upon said shaft E″, the anchor E, mounted upon the shaft F and engaging the wheel E′, the shaft F, mounted in the brackets F′, the lever C, actuating the said anchor E and connecting the said anchor with the armature *c*′, the electro-magnet C, placed within the recess B of said frame and provided with connecting-wires *c*′ *c*′, the armature *c*′, working upon said magnet, the cord *d*′, wound upon the spool D′, and the weight *d*, attached to said cord, all substantially as and for the purpose set forth.



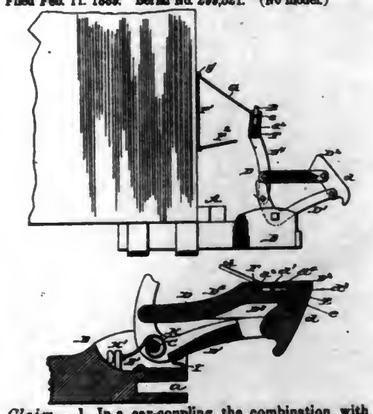
401,852. ASH-SIFTER. GEORGE M. PIERCE, Philadelphia, Pa. Filed Sept. 9, 1887. Serial No. 249,311. (No model.)

Claim.—1. The combination of receptacle A, having opening C and standards D, with sifter-compartment E, having screen G, inlet-door I, and trunnions *e*, to work on said standards, and flexible tube L, having rim M, and means, substantially as described, to secure the rim to the receptacle.

2. The combination of receptacle A, having opening C and standards D, removable drawer B for said receptacle, with sifter-compartment E, having screen G, inlet-door I, inclined bottom F, with outlets *f*, and trunnions *e*, to work on said standards, and flexible tube L, having rim M, and means, substantially as described, to secure the rim to the receptacle A.

401,853. VALVE FOR STEAM-ENGINES. WALTER S. PHELPS, St. Catalina, Guantanamo, Cuba. Filed Sept. 21, 1888. Serial No. 285,969. (No model.)

Claim.—1. A piston-valve for steam-engines, having passages through it from end to end and formed with two valve-seats, in combination with a valve held to said two seats by a spring, substantially as and for the purposes set forth.



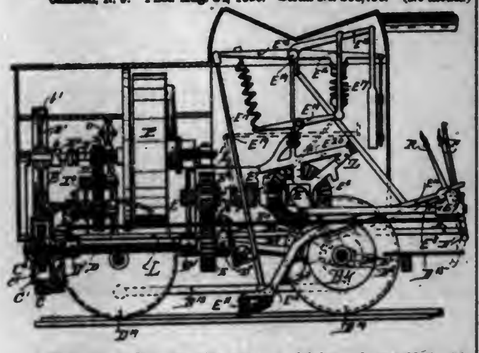
2. A piston-valve for steam-engines, having passages c^3 K, in combination with the interposed valve *g*, held by spring *g*′, substantially as described.

3. A piston-valve for steam-engines, having passages c^3 K, and side passages, c^4 c^4 d^3, in combination with the valve *g*, held by spring *g*′, substantially as and for the purposes set forth.

4. The plate *b*, formed with flange *c* and rim *c*′, and formed with passages c^3 and c^4, in combination with the ring *d*, packing-rings *f*, valve *g*, and spring *g*′, substantially as described.

5. In a valve, the ring *d*, formed with the passages c^4, flange *d*′, and recesses d^3, substantially as described.

401,854. CAR-COUPLING. JONAS POFFENBARGER, York, Nebr. Filed Feb. 11, 1889. Serial No. 299,521. (No model.)



Claim.—1. In a car-coupling, the combination, with bumpers having transverse stationary rods, of a locking-hook formed with the main part, the pivoted head having the curved lower end, the locking-lever having a spring-bolt at its forward end, and the pivoted connecting-arms, substantially as set forth.

2. The combination of the bumpers having the transverse stationary rods, the locking-hooks formed each with the main part, the pivoted head having the curved lower end, the locking-lever having the spring-actuated bolt in its forward end, and the pivoted connecting-arms and levers for unlocking and raising said hooks.

3. The combination of bumpers having the transverse rods, the locking-hooks formed each with the main part, the pivoted head, the locking-lever having the spring-actuated bolt in its forward end, and the pivoted connecting-arms, levers for unlocking and raising said hooks, and the draw-springs having the tension-adjusting screws, substantially as set forth.

4. The combination, with the hooks, of the springs arranged beneath the same to break the jar of the falling hooks.

401,855. MOTOR FOR STREET-RAILWAYS. BENJAMIN C. POLE, Camden, N. J. Filed Aug. 24, 1886. Serial No. 211,756. (No model.)

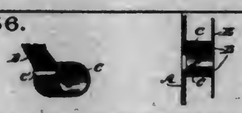
Claim.—1. In a traction-motor, a driving-axle provided with flanged driving-wheels keyed thereto, with sliding pinions and fixed central collar, combined with a removable arm provided with a removable intermediate shaft which is provided with a universal coupling connecting it with the driving-shaft of the motor, said driving-shaft having an elastic connection with the operating mechanism, substantially as and for the purposes described.

2. In a traction-motor, a driving-axle provided with flanged driving-wheels keyed thereto, with sliding pinions and fixed central collar, combined with a removable arm provided with a removable intermediate shaft which is provided with a universal coupling connecting it with the driving-shaft of the motor, which shaft has an elastic connection with the differential wheels provided with escapement devices, whereby the speed of the motor may be changed, substantially as and for the purposes set forth.

3. In a traction-motor, a driving-axle provided with flanged driving-wheels keyed thereto, with sliding pinions and fixed central collar, combined with a removable arm provided with a removable intermediate shaft which is provided with a universal coupling connecting it with the driving-shaft of the motor, which shaft has an elastic connection with the differential wheels provided with friction and escapement devices, whereby the speed of the motor may be changed, substantially as described, for the purposes set forth.

4. In a traction-motor, the carrying-wheels and auxiliary traction devices other than said carrying-wheels, in combination with the differential wheels provided with the escapement-pawl, substantially as and for the purposes described.

5. In a traction-motor, the combination, with the feet and driving-wheels, of the elastic escapement-wheel C, the shaft D, and device adapted to operate either the foot mechanism or the driving-wheel mechanism, substantially as and for the purposes set forth.



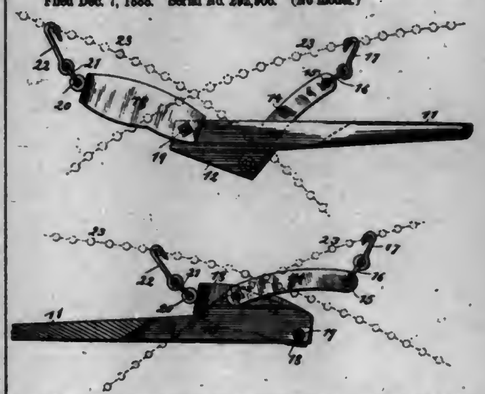
6. In combination with a driving-shaft, a wheel provided with a fixed arm, a yoke within said arm and loose on said shaft, a ratchet-wheel keyed to said shaft and provided with a pawl, and an elastic connection between said fixed arm and said yoke, for the purposes specified.

7. In a traction-motor, the operating-shaft provided with an elastic connection and escapement, C, and the differential wheels provided with escapement devices, whereby the speed of the motor may be changed, substantially as and for the purposes set forth.

8. In a traction-engine, a universal joint, D^9, having a central opening for the end of a shaft, and the shaft D^9, provided with arms D^{10} D^{11}, connected by a link, D^{12}, substantially as and for the purposes set forth.

401,856. INKING-RIBBON SPOOL FOR TYPE-WRITING MACHINES. HARVEY RAY, Mobile, Ala. Filed June 8, 1887. Serial No. 240,632. (No model.)

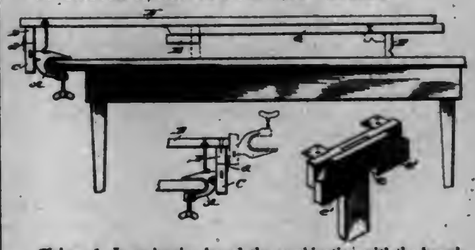
Claim.—1. An inking-ribbon bobbin provided with a clamp on its outer surface, and with an inwardly-extending projection on its inner surface, substantially as described.



2. The inking-ribbon bobbin C, formed of a plate bent into cylindrical form and provided at one end with an inbent lip, *c*, and at the other end with a ribbon-clamp, *c*′, substantially as shown and described.

3. The inking-ribbon bobbin C, provided at one end with an inbent lip, *c*, and at its other end with a clamp, *c*′, combined with an inking-ribbon, D, held at one end by the clamp *c*′, and wound upon the bobbin, substantially as herein set forth.

4. The combination, in an inking-ribbon spool for a type-writer, of a side part, A, having a hub, B, slotted at *b*, a bobbin, C, fitted to said hub and having a tongue, *c*, entering said slot and adapted to hold the end of the inking-ribbon, and an opposite side part, E, having a hub, F, fitting the hub B of part A, substantially as described, for the purposes set forth.



401,857. LOAD-BINDER. THOMAS A. ROGERS, Bloomdale, Ohio. Filed Dec. 7, 1888. Serial No. 292,906. (No model.)

Claim.—1. In a load-binder, the combination, with the head 10, having a handle portion, 11, a curved arm pivoted at the inner lower edge of the head, and a grab-hook linked in the outer extremity of said arm, of an essentially U-shaped or clip-like arm pivoted to the outer extremity of the head, near the upper edge thereof, and a grab-hook swiveled to the body portion of the U-shaped arm, substantially as shown and described.

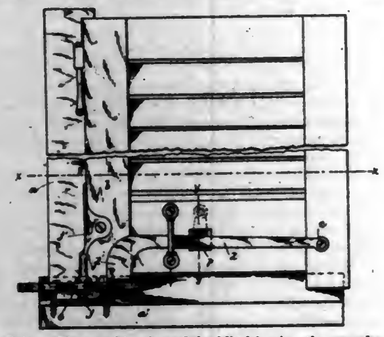
2. In a load-binder, the combination, with a longitudinally-slotted head, 10, provided with one straight and one inclined longitudinal edge, a curved arm, 14, pivoted in the slot near the lower end of the inclined edge, and a grab-hook linked in the outer end of said arm, of the essentially U-shaped or clip-like arm 18, pivoted upon the outer end of head, near the straight edge, and a grab-hook swiveled in the vertical wall of the arm 18, said inclined edge of the head adapted to engage the vertical wall of the clip 18 when the binder is in its locked position, all arranged substantially as and for the purpose described.

401,858. IRONING-BOARD. ALBERT T. SCANLAND, Dunn Loring, Va. Filed June 16, 1888. Serial No. 277,396. (No model.)

Claim.—1. In an ironing-board, the combination, with the board proper, of a clamp at one end thereof, whereby to secure it to a table or like support, a leg, G, hinged at one end to such board, and prop hinged to leg G and arranged near the hinged and free ends of such leg, such props being independent, whereby one or the other may be set into operative position, substantially as set forth.

2. In an ironing-board, the combination, with the board proper,

of the leg G, hinged at one end to such board, and the prop E, notched or recessed between its ends at *e*, hinged at the base of such recess to the leg, and provided at its ends with portions *d d*, arranged, when such prop is adjusted to operative position, to extend upon opposite sides of the leg G and bear directly against the under side of the board, substantially as set forth.

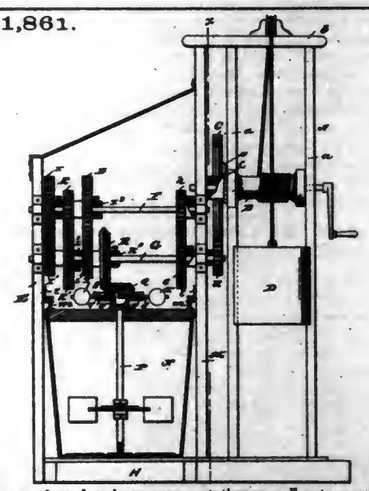


3. The improved ironing-board herein described, consisting of the board proper provided with strip D, the board C, hinged to strip D and provided with the clamps, and the leg hinged to the board proper and provided with the props, substantially as and for the purposes specified.

401,859. SWEAT-PAD FASTENER. LAWRENCE H. SCRUGGS, Huntsville, Ala. Filed June 12, 1888. Serial No. 276,868. (No model.)

Claim.—The herein-described sweat-pad fastener, consisting of a hook adapted to be hinged to a sweat-pad and to clasp the fore roll of a collar and having the end of the hook bent back upon itself over the outer face of the hook, the extremity of the bent portion being turned or curved outward to provide a handle, *a'*, the bent portion of the hook extending over the face thereof a sufficient distance so that when the hames are applied the handle *a'* will be outside of the hames, whereby the hook may be released from the fore roll without removing the hames or unbuckling the collar, as set forth.

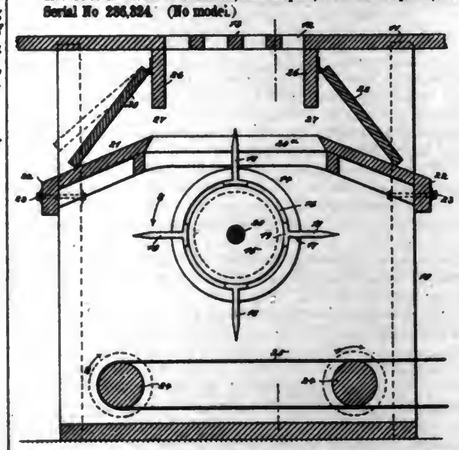
401,860. SHUTTER-FASTENER. CHARLES J. SEYMOUR, Brookline, Mass. Filed June 4, 1888. Serial No. 276,008. (No model.)



Claim.—The combination of the blind having the angular plate secured thereto, the pintle projecting from said plate, the latch pivoted at one end to the front of the blind and provided at its other end with a downwardly-projecting wedge-shaped tenon, the fixed plate below the blind provided with the series of tenon-fitting slots, the sides of which are beveled outwardly and having the pintle-receiving socket, the handle *r*, projecting from said latch through an aperture of said blind, and the button designed to bear on said handle, substantially as shown and described.

401,861. MOTOR FOR OPERATING CHURNS. EDWIN N. SHAFER and JOHN D. KING, Kiowa, Kans. Filed Nov. 19, 1888. Serial No. 291,201. (No model.)

Claim.—1. In a churn-operating mechanism, the combination of an upright frame, a weight arranged to travel thereon, a drum journaled therein, a rope connecting the weight with the drum, gearing for rotating a dasher-shaft, and a governor arranged upon the said shaft, whereby both the movements of the shaft and the falling of the weight may be controlled, substantially as specified.



2. In a churn-operating mechanism, the combination of a vertical rotative shaft having a beveled gear at its upper end for rotating the same, a governing device arranged upon the under side of the gear and consisting of two pivoted brake-shoes, two pivoted weighted arms or levers, and rods adjustably connecting one end of each of the respective shoes with the respective weighted arms, whereby said

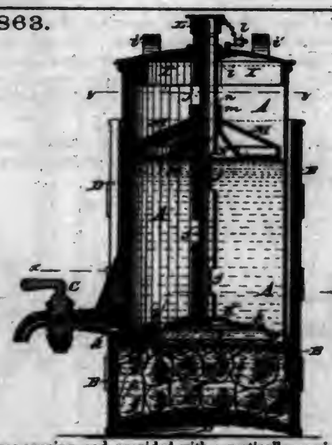
401,861.

shoes are adapted to bear upon a stationary collar to regulate the speed of the gearing, substantially as specified.

401,862. MACHINE FOR PULVERIZING CLAY AND EXTRACTING STONE. JOHN W. SHAFFER, Philadelphia, Pa. Filed Sept. 25, 1888. Serial No. 286,324. (No model.)

Claim.—1. In a pulverizer, the combination, with a casing having an opening in its top and downwardly-projecting partitions 26 at each end of the casing-opening, of a toothed cylinder journaled in the casing, an adjustable grating above the cylinder and having its ends at the termination of the grating inclined downwardly, and gates hinged to the said partitions and having their lower free ends resting on the inclined ends of the grating, substantially as described.

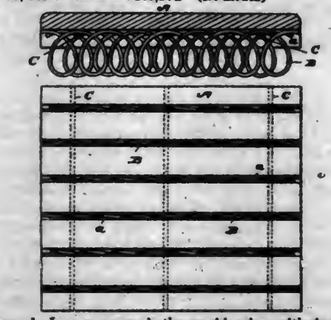
2. In a pulverizer, the combination, with a casing, 10, provided with the grated opening 12 13 in its top and with the downwardly-projecting partitions 26, of the grating 20 21, the gates 28, pivoted to the partitions 26 and having their free ends resting on the said grating, the toothed cylinder 14, journaled in the casing below the grating, with its teeth projecting through said grating, and the apron 25 below the cylinder, substantially as herein shown and described.



3. A pulverizing-cylinder consisting of the series of disks 15, each provided with the annular groove 16 and the radial grooves 17, and the teeth 18, having T-shaped heads 19, substantially as herein shown and described.

401,868. MILK-CAN. AGNES W. H. SMITH, Beaver Dam, Wis. Filed May 8, 1888. Serial No. 273,168. (No model.)

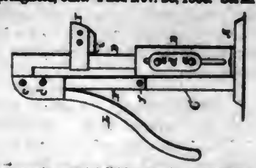
Claim.—1. The combination, with the can and its top, having a central opening, of a dasher having a central aperture, a tube registering with said aperture and having side apertures extending above the line reached by the milk, and having an opening above the top of the can, substantially as set forth.



2. The combination, with a milk-vessel having an apertured cover, of a dasher having a hollow handle, open at its ends, fitted through

401,863.

said cover-opening, and provided with a vertically-ranging series of side apertures, and a float fitted around the dasher-handle and provided with an enlarged gas-chamber at its under side adapted to register with one of said apertures, substantially as herein set forth.

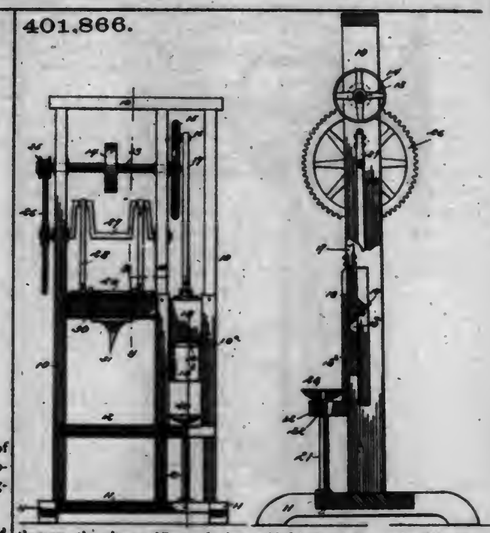


401,864. CURRY-COMB. OSCAR SMITH, Winona, Minn. Filed Feb. 25, 1888. Serial No. 265,274. (No model.)

Claim.—1. In a curry-comb, the combination, with the body having its face provided with grooves extending its entire length or width, of wires coiled and secured in the said grooves, substantially as specified.

2. A curry-comb consisting of a back having its face provided with parallel grooves, and a series of coils of wire arranged in rows in the said grooves and having the coils of one row arranged in a plane between the loops or coils of the adjacent row, substantially as specified.

401,865. LIFTING-JACK. ADDISON J. SOUDERS, Brimfield, assignor to Delos Hart, Springfield, Ohio. Filed Nov. 20, 1888. Serial No. 291,519. (No model.)



Claim.—The herein-described lifting-jack, consisting of the base A, slotted post B, lifting-bar D, having holes *e* in its front edge and united with the post B by rivets *a* and washer *d*, and bearing the jaw I, having the projection *i*, and the lever L, pivoted to the upper end of the bar D and united with the post B and brace C by the link F and rivet *f*, all constructed and arranged substantially as shown.

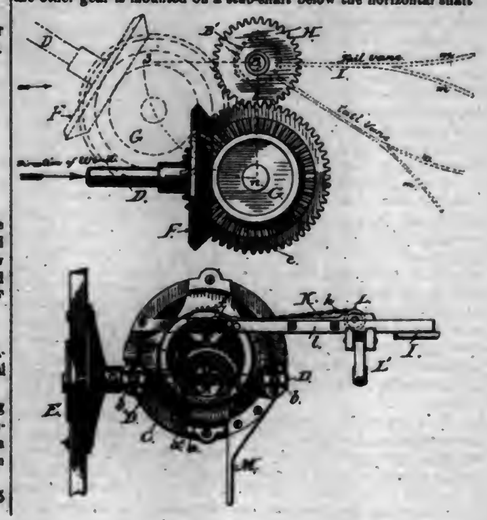
401,866. COMBINED BLOCK BARKING AND SPLITTING MACHINE. OTIS W. STEARNS, Johnson, Vt. Filed June 2, 1888. Serial No. 275,900. (No model.)

Claim.—1. The combination, in a block barking and splitting machine, of a reciprocating slide, a bark-cutter projecting at an incline through said slide to plane off the bark from the blocks, and a reciprocating cross-head carrying a splitting-knife, both operated from the one main shaft at different speeds, substantially as described.

2. The combination, with the main shaft 13, the fly-wheel 15

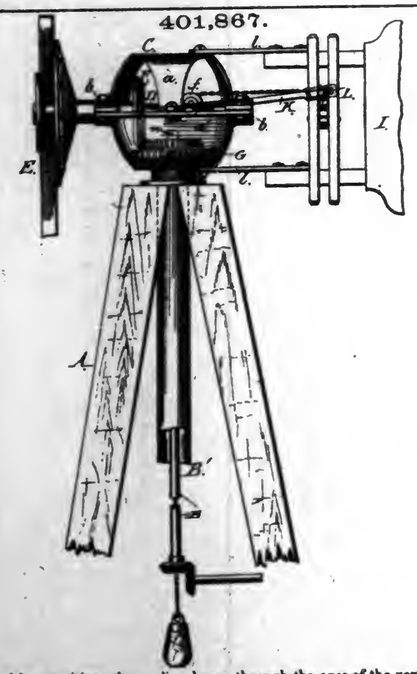
401,866.

thereon, the pitman 17, cranked to said fly-wheel, the pinion 25, carried by the shaft 13, and the vertically-reciprocating slide 18, of the gear-wheel 26, the cranked shaft 27, on which the gear-wheel 26 is keyed, and the reciprocating cross-head 30, carrying a splitter-knife and connected with shaft 27, substantially as shown and described.



3. A barking and splitting machine comprising the frame, a main shaft journaled therein, a vertical slide, 18, operated from said shaft and having an inclined knife or bit, 19, projecting beyond its working-face to plane the bark off the blocks, a table below and in front of the said slide, and a vertically-reciprocating splitter, also operated from said main shaft, substantially as set forth.

4. The combination, with the frame and the vertically-reciprocating bark-planing cutter, of the post 21, stepped at its lower end to rock toward and from the frame and cutter, and the table on the upper end of the post, substantially as set forth.



5. The combination, with the shaft 13 and the reciprocating slide 18, operated from said shaft, of the cranked shaft 27, also operated from shaft 13 through pinion 25 and gear-wheel 26, the connecting-rods 28, the rod 29, and the cross-head 30, carrying a splitting-knife, 31, substantially as described.

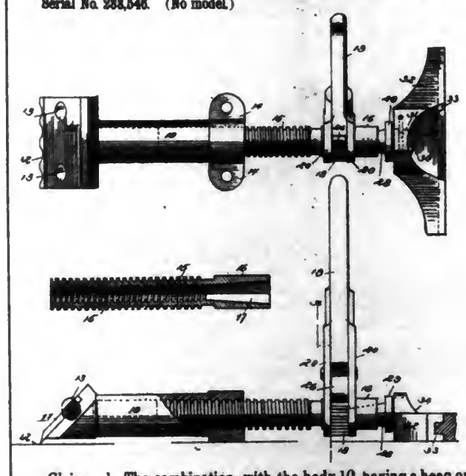
401,867. WINDMILL. GEORGE P. THURSTON, San Francisco, Cal. Filed Dec. 5, 1888. Serial No. 292,736. (No model.)

Claim.—1. In a windmill, the combination, with the horizontal wheel-shaft, the vertical turning-post, and the power-shaft having a gear-wheel at its top, of suitable gearing located to one side of the power-shaft, one of said gears being on the horizontal shaft, while the other gear is mounted on a stub-shaft below the horizontal shaft

401,867.

and in a position where a line drawn through the axes of the vertical and stub shafts will be at right angles with the wheel-shaft, substantially as herein described.

2. In a windmill, the vertical turning-post, a power-shaft having a gear at its top, a wind-wheel having its shaft journaled to one side of said post, a gear on said wheel-shaft, and a double-faced gear journaled on a vertical stub-shaft whose axis is in line with the power-shaft, said double gear having one of its faces engaged by the gear on the wheel-shaft, while its other or spur face engages the gear on the power-shaft at its side portion, whereby, when the wind-wheel falls out of the wind, the double gear traverses that portion of the gear between its side and front portion, substantially as and for the purpose described.



3. In a windmill, a wheel-shaft with a wind-wheel and gear-wheel thereon, a tail-vane, a vertical power-shaft having a gear-wheel at its top, and a double-face gear on a stub-shaft at one side of said power-shaft, said double gear being engaged by the gears on the wheel-shaft and power-shaft and being adapted to move around the circumference of the gear on the power-shaft a distance approximating one-quarter thereof, whereby the windmill is held into the wind, substantially as herein described.

4. In a windmill, the combination of a vertical power-shaft having a gear-wheel at its top, a horizontal wheel-shaft at one side of said power-shaft and carrying a wheel and beveled gear, a gear-wheel intermediate the gears on the power-shaft and horizontal shaft and traversing the gear on the power-shaft, a frame movable with the turning-post, in which the gears and shaft are mounted, said frame having a turning-post located at one side of its center, and a tail-vane, substantially as described.

5. In a windmill, the vertical turning-post, the two-part frame, with its journal-boxes, a wind-wheel having its horizontal shaft journaled in said boxes at one side of the center of the turning-post and having a beveled gear-wheel keyed to it, a vertical power-shaft journaled to turn within the post and having a spur-gear keyed to its upper end, in combination with an independent loosely-turning gear or idler at one side of the vertical power-shaft, one part of said gear having spur-teeth to engage with the gear upon the vertical power-shaft and the other beveled teeth to engage with the gear upon the wind-wheel shaft, said idler being journaled in a plane passing vertically through the axis of the wind-wheel shaft and to one side of and at right angles to the vertical power-shaft, substantially as herein described.

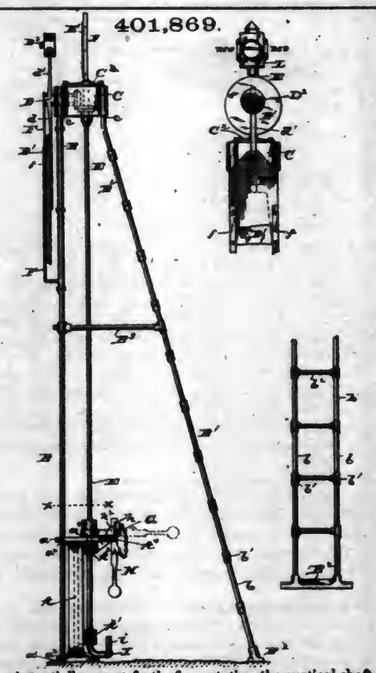
6. In a windmill, a two-part frame having a turning-post, a vertical power-shaft extending through said post at one side of the center, with a spur-gear wheel secured to the upper end of said power-shaft, a horizontal wind-wheel shaft journaled in boxes upon the frame at one side of the vertical power-shaft and having a beveled gear-wheel secured to it, a loosely-turning independent gear or idler having beveled and spur teeth to engage, respectively, with the beveled gear of the wind-wheel shaft and the spur-gear of the vertical power-shaft, in combination with the tail-vane loosely hinged to a turning-post, and a chain or cord attached thereto passing over guide-pulleys and down through the central vertical hollow shaft, substantially as described.

401,868. FLOORING-JACK. HERMAN F. TOWNSEND, Plainfield, Vt., and CHARLES T. WINSLOW, Woodsville, N. H. Filed Oct. 19, 1888. Serial No. 288,546. (No model.)

Claim.—1. The combination, with the body 10, having a head or base at its outer end and a screw-threaded bore extending inwardly from its inner end, of the screw-threaded spindle 15, entering said bore and having a socket, 17, in its outer end, a removable headed plug, 28, inserted in said socket, a block turning freely on said plug, and the operating-lever connected to the spindle, substantially as set forth.

2. The combination, with the body 10, having a screw-threaded bore extending inwardly from its inner end, of the tubular spindle 15, provided with a ratchet-lever and having exterior and interior threads extending from its inner end to a point near its outer end, a socket, 17, in said outer end, and a detachable headed plug inserted in said socket and provided with a freely-turning head, substantially as set forth.

3. The combination, with an interiorly-threaded body, a toothed plate attached at one end of the body, and a threaded spindle screwed into the said body, of a ratchet-wheel fast upon the spindle, a lever pivoted upon the spindle, a V-dog pivoted in the lever, a tapering headed plug inserted in one end of the spindle, and a clamping-block detachably secured to the said plug, substantially as shown and described.

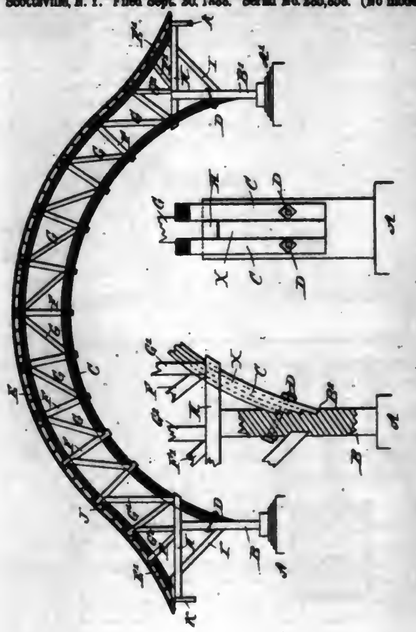


4. The combination, with an interiorly-threaded body, a toothed plate detachably secured at one end of the same, and a threaded tubular spindle screwed into the said body, of a ratchet-wheel fast upon the spindle, a lever pivoted upon the spindle, a spring-actuated notched head-block held in the lever, a pivoted V-dog engaging the ratchet-wheel and head-block, a headed plug held in one end of the spindle, and a clamping-block detachably attached to said plug, substantially as shown and described.

401,869. SWITCH-SIGNAL. KIRTLAND H. WADE, Chicago, Ill. Filed May 10, 1888. Serial No. 273,417. (No model.)

Claim.—1. The combination, with a switch and a vertical crank-shaft for operating said switch, of a column having bearings in which said shaft is journaled, a housing secured to the top of said column, having vertical and horizontal bearings and a removable top, a bevel-gear and target secured to the vertical shaft, a shaft journaled in the horizontal bearing of the housing and provided at its ends with a semaphore-arm and bevel-gear, a U-shaped screen secured to the column below the housing, and a lever for rotating the vertical shaft, substantially as and for the purposes described.

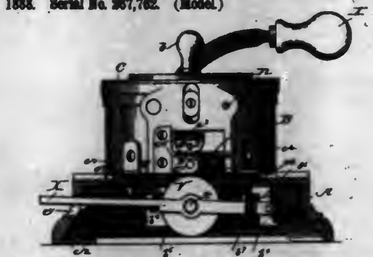
2. A skeleton semaphore switch-stand consisting of a base having vertical bearings, uprights secured to said base and provided at top with a housing having vertical and horizontal bearings, a vertical crank-shaft journaled in the bearings of the base and housing and provided within the housing with a bevel-gear, a shaft journaled in the horizontal bearing of the housing and provided at its ends with a bevel-gear and semaphore-arm, a U-shaped screen having one leg secured to the uprights below the housing and the upper end of its other leg supported by the outer end of the horizontal shaft, and



401,869.

means, substantially as set forth, for rotating the vertical shaft, substantially as and for the purposes described.

3. A semaphore switch-stand consisting of a base having vertical apertures, vertical tubular uprights secured at their lower ends within said apertures, a housing having apertures for the reception of the upper ends of said uprights, and inclined tubular uprights secured at their lower ends to an anchor and at their upper ends within apertures of the housing, said inclined uprights being constructed of short sections of tubing connected by T-couplings arranged in pairs and short lengths of tubing secured at their ends within the stems of the T-couplings of a pair, substantially as and for the purposes described.



401,870. TRUSS FOR BUILDINGS OR BRIDGES. JOHN T. WELLS, Scottsville, N. Y. Filed Sept. 20, 1888. Serial No. 285,558. (No model.)

Claim.—1. The combination, with an inner arch and main posts supporting the same, of an outer arch held concentric to the inner arch and curved outwardly at its lower ends, radial posts secured to the said two arches, and braces held between the said radial posts and arches, substantially as shown and described.

2. The combination, with main posts and horizontal beams supported on the said posts, of an inner arch secured with its ends on the said posts, and an outer arch held concentric to the inner arch and fastened to the same by radial posts, the ends of the said outer arch being supported on the said horizontal beams, and the vertical bars G' G^2 extending from the upper faces of the inner ends of the horizontal beams and fastened to the lower faces of the radial posts at their upper ends, substantially as shown and described

401,871. CHECK-PROTECTOR. EDWIN O. ABBOTT, Chicago, Ill., assignor to the Abbott Machine Company, same place. Filed Mar. 19, 1888. Serial No. 267,762. (Model.)

Claim.—1. In a check-protector, the combination of a punch and oscillating lever for operating the punch, and a vertically-sliding block, G, interposed between the lever and the punch, substantially as described.

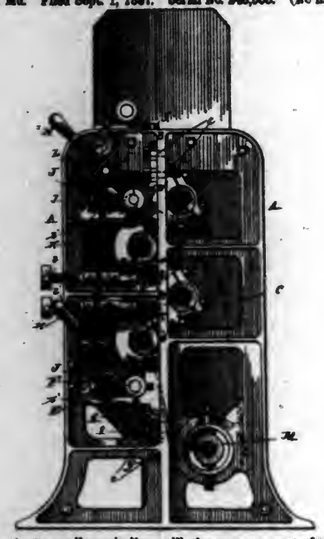
2. In a check-protector, the tenon-shaped block g, having the cap c^3, and screw c^3, provided with a seat for the end of a spring, in combination with the slotted shell B and spring c^4, substantially as described.

3. In a check-protector, the combination of a movable cylinder, reciprocating punches carried thereby, a stop-pin, and the casing having a slot, said pin and slot adapted to be brought into engagement with each other upon the movement of a punch, substantially as described.

4. In a feeding device for a check-protector, the combination of a stationary feed-roll, a rotatable shaft fixed at one end and movable at the opposite end, a feed-roll mounted on the movable end of the shaft, and a lever engaging with the shaft for moving it to carry the feed-rolls from contact, substantially as described.

5. In a feeding device for a check-protector, the combination of a stationary feed-roll, a rotatable shaft mounted at one end in fixed bearings, a feed-roll mounted upon the opposite end of the shaft, a lever carrying the latter end of the shaft, whereby to move it to carry its feed-roll from the stationary feed-roll, and a spring for normally holding the feed-rolls in contact, substantially as described.

6. In a check-protector, the combination, with the feed-rolls, of two ratchet-wheels mounted to rotate together and having teeth oppositely arranged, a plate provided with a projection and carrying an operating-pawl engaging with one of the said wheels, and a stop-pawl independent of the said plate, normally engaging with the other of the said wheels and arranged in position to be engaged by the projection of the said plate as it moves the pawl backward and to be disengaged by the said projection after the operating-pawl and the ratchet-wheel have partly completed their forward movements, whereby the said stop-pawl is away from its ratchet-wheel at the commencement of the forward movement of the wheel, and is held away therefrom until the point of a ratchet-tooth has passed the point of the stop-pawl, but is permitted to engage with the wheel before it completes it forward movement, substantially as set forth.



7. In a check-protector, the combination, with the feed-rolls, of two ratchet-wheels mounted to rotate together and having teeth oppositely-arranged, a plate mounted between the ratchet-wheels and provided with a projection and carrying an operating-pawl engaging with one of the said wheels, and a stop-pawl normally engaging with the other of the said wheels and provided with a projecting lip arranged in position to be engaged by the projection of the said plate as it moves the operating-pawl backward and to be disengaged by the said projection after the operating-pawl and the ratchet-wheel have partly completed their forward movements, substantially as set forth.

8. In a check-protector, the combination, with the feed-rolls, of the shaft T, carrying one of the said rolls, the ratchet-wheels b^3 and b^3, carried by the said shaft and having their teeth oppositely arranged, the plate a^3, pivotally supported on the shaft and having the

projection b^3 and the feed-pawl b', and the stop-pawls b^3 and b^7, for the ratchet-wheels, the latter being arranged in position to be engaged by the projection b^3 on the plate a^3 when the latter is moved to carry the feed-pawl into its backward position, substantially as set forth.

9. In a check-protector, the combination of the shell B, having stop or bracket p, the shaft H, having dog K, spring m, arm a^7, connecting-link a^8, plate a^9, having projection b^3, and crank I, having the leg o, and the rod n, all constructed, arranged, and operating substantially as shown and described, and for the purpose set forth.

401,872. GRINDING-MILL. JAMES B. ALLFREE, Indianapolis, Ind., assignor of one-half to Robert Shriver and Harrison Swartzwelder, Cumberland, Md. Filed Sept. 1, 1887. Serial No. 248,555. (No model.)

Claim.—1. In a roller grinding-mill, the arrangement of two fixed and two adjustable rolls in combination with deflecting shelves or chutes, the rolls being arranged, as shown and described, relatively to each other, to secure three reductions, as hereinbefore set forth.

2. In combination with the casing A, provided with a rib, B, the angle-brackets E, adjustably connected to said rib, and adjusting-screws g, substantially as set forth.

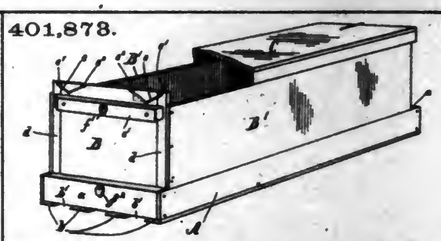
3. The angle-brackets E, adapted to be secured to the casing, as described, and formed with an opening, J, therein, in combination with the sliding block A, throw-out shaft F, spring i, and roller-bearings G, substantially as and for the purpose hereinbefore set forth.

4. The roller-bearing G, pivotally connected with the eccentric end of the throw-out shaft F, in combination with the brackets E, blocks A, and spring i, substantially as and for the purpose set forth.

5. In combination with the adjustable roll D', roller-bearing G, bracket E, and throw-out shaft F, formed with eccentric d, the lever H, substantially as and for the purpose set forth.

6. The combination and arrangement of the roller-bearing G, bracket E, throw-out shaft F, formed with eccentric d, lever H, and link L, substantially as and for the purpose set forth.

7. The combination, with the two adjustable rollers, brackets E, and roller-bearing G, connected with the frame of the machine, of the two throw-out shafts F, levers H, and the adjustable connecting-rod K, substantially as and for the purpose set forth.



8. The deflecting shelves or chutes N' N'', pivoted at their lower ends and connected and held in position at their upper ends to the extensions O by means of turn-buttons P, substantially as and for the purpose set forth.

401,873. KNOCKDOWN CASE FOR EGGS, &c. WILSON M. BAKER, Urbana, Ohio. Filed Feb. 14, 1889. Serial No. 299,892. (No model.)

Claim.—1. The combination, with the base portion provided with end pieces having grooves or slots therein, of the end boards having cross-pieces adapted to fit in said slots, and an upper cleat at the upper end, side boards having upright pieces secured thereto adapted to join to said end boards, and means for connecting said upright strips to said end boards, substantially as specified.

2. The combination, with the base portion consisting of a rectangular box having end boards connected thereto, of the side boards provided with upright strips secured at right angles thereto and

401,878.

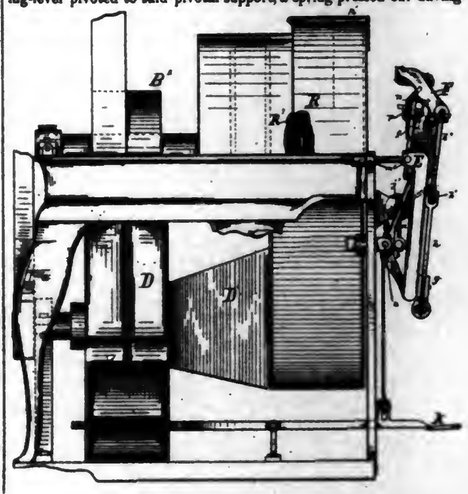
adapted to join said end pieces, and a cover to fit over said end pieces and upright strips, substantially as specified.

3. The combination, with the base portion consisting of a rectangular box and end pieces connected to the inside of said box, of side boards adapted to be inserted in said base portion and join the said end pieces, and a fastening-loop on said end boards to engage in the notches in said end pieces, substantially as specified.

4. The combination, in an egg-case having end pieces notched on either side at the top, of a cover provided with longitudinal strips arranged to come opposite the partitions in the egg-case filler, the said longitudinal strips being extended at each side of said cover and adapted to rest in the notches in the end boards, substantially as specified.

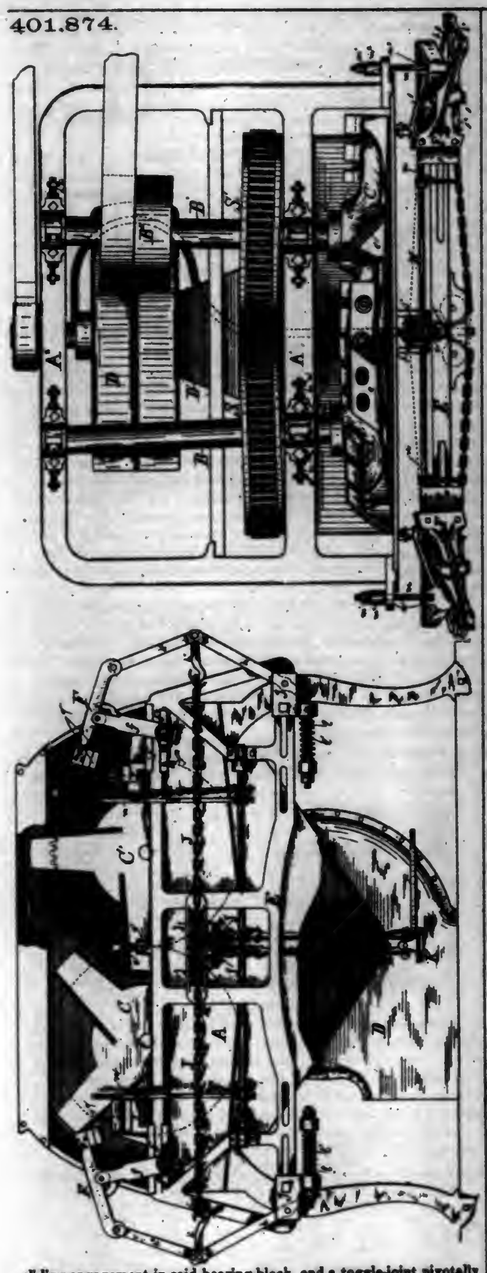
401,874. MACHINE FOR JOINTING STAVES. ABIA M. BENSON, Cleveland, Ohio. Filed June 23, 1888. Serial No. 278,420. (No model.)

Claim.—1. In a stave-jointing machine, the combination, with a stave-rest and a clamping-arm, of a pivotal spring-pressed support in which said clamping-arm is pivotally supported, substantially as set forth.



2. In a stave-jointing machine, the combination, with a stave-rest and a movable support, of a spring-pressed clamping-arm pivotally engaging with said movable support, substantially as set forth.

3. In a stave-jointing machine, the combination of a stave-rest, a swinging spring-pressed support, a clamping-arm pivotally engaging with said support, and toggle-joint-actuating mechanism connected with said clamping-arm, substantially as set forth.



4. In a stave-jointing machine, the combination of a stave-rest, a movable support, a clamping-arm connected with said support, a toggle-joint to one arm of which said clamping-arm is pivotally secured, and a spring-pressed rod pivotally engaging with the opposite arm of said toggle-joint, substantially as set forth.

5. In a stave-jointing machine, the combination of a bearing-block adjustable longitudinally of the machine, a clamping-arm, toggle-joint mechanism pivotally engaging with said clamping-arm, and having pivotal supporting engagement with said bearing-block, actuating mechanism engaging with said toggle-joint mechanism and adapted to straighten the same, and automatic spring mechanism engaging with said toggle-joint, whereby the latter is thrown out of right-line position, substantially as set forth.

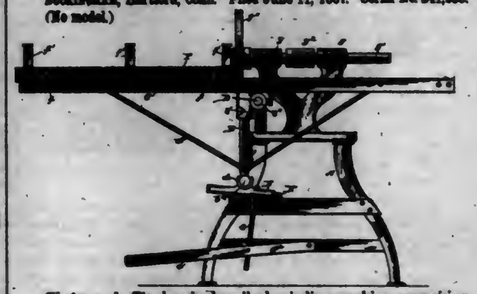
6. In a stave-jointing machine, the combination of a swinging table provided at its upper portion with a pivotal clamping-arm support and at its lower portion with a bearing-block, said support and bearing-block each adjustable longitudinally of the machine, a clamping-lever pivoted to said pivotal support, a spring-pressed bar having

401,874.

sliding engagement in said bearing-block, and a toggle-joint pivotally connected with said clamping-arm, said bearing-block, and said spring-pressed rod, substantially as set forth.

7. In a stave-jointing machine, the combination, with a frame provided with openings and a swinging table, E, of rods m, movably secured at one extremity to said table and loosely fitting in the openings in said frame, said rods provided on their opposite extremities with nuts, substantially as set forth.

8. In a stave-jointing machine, the combination, with frame A, provided with lugs m^3, said lugs provided with openings, and a swinging table, E, of rods m, movably secured at one extremity to said table and loosely fitting in said openings in the lugs, the opposite extremity of said rods being provided with nuts m', and with flexible washers m^3 intermediate of said lugs and nuts, substantially as set forth.



9. In a stave-jointing machine, the combination, with stave-jointing mechanism, and a hopper inclosing the lower portion of the same, of an exhaust-fan connected with said hopper and located substantially in the same horizontal plane therewith, substantially as set forth.

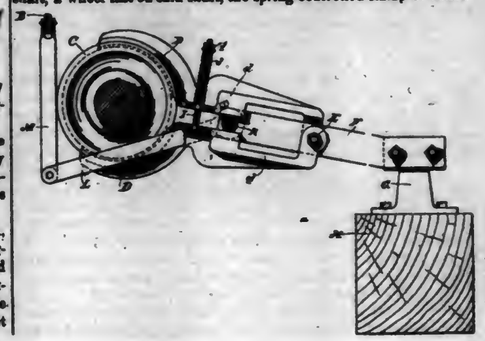
10. In a stave-jointing machine, the combination of cutter heads and knives, a tight-box inclosing the upper portion of said cutter heads and knives, a hopper inclosing the lower portion of the same, and an exhaust-fan connected with said hopper, substantially as set forth.

11. In a stave-jointing machine, the combination of cutter heads and knives, a box and a V-shaped hopper connected together and respectively inclosing the upper and lower portions of said cutter heads and knives, and an exhaust-fan connected with said hopper, substantially as set forth.

12. In a stave-jointing machine, the combination, with stave-jointing mechanism journaled in the machine-frame, and a hopper inclosing a portion of said jointing mechanism, of an exhaust-fan connected with said hopper and located in a plane below the journaling-point of said jointing mechanism, substantially as set forth.

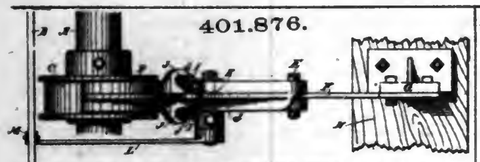
401,875. GRINDING AND SHARPENING MACHINERY. HIRAM BUCKINGHAM, Hartford, Conn. Filed June 11, 1887. Serial No. 241,066. (No model.)

Claim.—1. The herein-described grinding-machine, comprising the stand or table, the longitudinally-tilting table, the central supporting bar or arm, the sliding table designed to move on said tilting table and having rollers on either side, the horizontally-disposed sliding shaft to which said supporting bar or arm is connected, and the emery-wheel, substantially as shown and described.



2. The combination, with the stand or table having the bracket provided with journal-boxes, of the longitudinally-tilting table, the horizontally-disposed sliding shaft, the sliding table designed to move on said tilting table and having overhanging clamps, and the emery-wheel, substantially as shown and described.

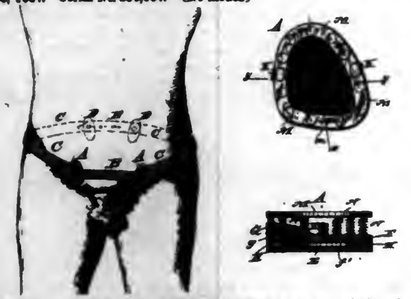
3. The combination, with the stand or table and the stationary plate secured thereto, of the sliding plate having a cylinder, the spring-held finger or rod, the foot-lever, the central supporting arm or bar having a cylindrical end, the tilting table, the sliding table having rollers and clamps, and the emery-wheel, all arranged substantially as shown and described.



4. The combination, with the stand or table having the bracket supporting the journal-boxes, of the horizontally-disposed sliding shaft, the tilting table, the central supporting bar or arm secured thereto, the collar or sleeve secured on said bar or arm and to a collar on said shaft, the ball-and-socket-like connection, and the supporting V-shaped bar, substantially as shown and described.

401,876. SAW-MILL SET-WORKS. WILLIAM A. CAMPBELL, Portland, Oreg. Filed Sept. 11, 1888. Serial No. 285,139. (No model.)

Claim.—In saw-mill set-works and in combination with the set-shaft, a wheel fast on said shaft, the spring-controlled clamp or brake



401,876.

applied thereto and consisting of opposing hinged jaws with shanks, and the means for relieving the clamp or brake, consisting of the rock-cam or eccentric seated between the jaw-shanks, the lever connected with the cam or eccentric, and a connection of the lever with the disengaging-lever of the set-works, substantially as described.

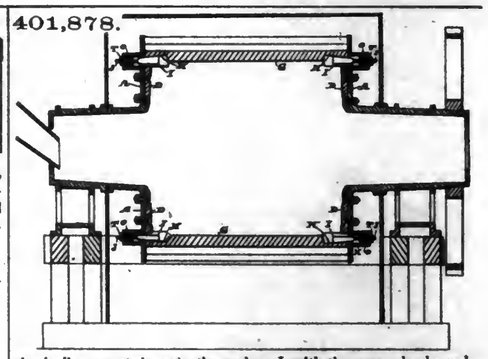
401,877. TRUSS. ALEXANDER DALLAS, Bayonne, N. J. Filed Nov. 23, 1887. Serial No. 256,337. (No model.)

Claim.—1. A truss-pad having a pressing-face provided with a recess or cavity opening to the lower edge or margin of the pad and extending upward along the line of the inguinal canal when the pad is applied to avoid pressure on the spermatic vessels, while the face of the pad at both sides of and above said recess bears on the ruptured parts, substantially as described, for the purposes set forth.

2. A truss-pad having a pressing-face provided with a recess or cavity opening to the lower edge or margin of the pad and extending upward along the line of the inguinal canal when the pad is applied to avoid pressure on the spermatic vessels, while the face of the pad at both sides of and above said recess bears on the ruptured parts and the lower edge of the pad inclined to fit the flesh fold between the abdomen and leg, substantially as described, for the purposes set forth.

3. A truss-pad having a pressing-face provided with a recess or cavity opening to the lower edge or margin of the pad and extending upward along the line of the inguinal canal when the pad is applied to avoid pressure on the spermatic vessels, while the face of the pad at both sides of and above said recess bears on the ruptured parts, and the general pressing-face of the pad concaved transversely of said recess or cavity, and the lower edge of the pad inclined to fit the flesh fold between the abdomen and leg, substantially as described, for the purposes set forth.

4. A truss-pad having a pressing-face provided with a recess or cavity opening to the lower edge or margin of the pad and extending upward along the line of the inguinal canal when the pad is applied to avoid pressure on the spermatic vessels, while the face of the pad at both sides of and above said recess bears on the ruptured parts, in combination with a back plate adapted for attachment of fastening strape or belts, and springs interposed between said strap-plate and presser-plate, substantially as described, for the purposes set forth.



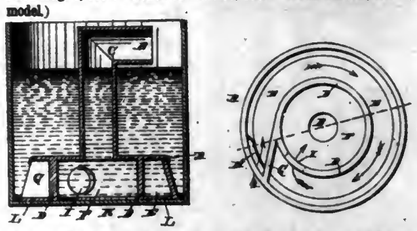
401,878. ROTARY PULVERIZER. MILES R. DODGE, San Francisco, Cal., assignor to Parke & Lacey, same place. Filed May 23, 1888. Serial No. 274,819. (No model.)

Claim.—1. A rotary pulverizer comprising a polygonal drum having channeled heads and having its sides composed of parallel bars, the ends of which are fitted in said channels, locking-bars parallel with and adjacent to the side bars and having inclines at their ends, wedges fitting said inclines, and screw-shanks and nuts by which said wedges are drawn out and locked, substantially as described.

2. A rotary pulverizer comprising a polygonal drum having channeled heads, parallel bars forming the sides of said drum, locking-bars G, lying parallel with and adjacent to each of the sides and having inclines at their ends, wedges acting upon said inclines, screw-shanks and nuts by which the wedges are drawn out and locked, and the elastic springs or buffers upon which the pressure is exerted and by which the wedges are automatically adjusted, substantially as and for the purpose described.

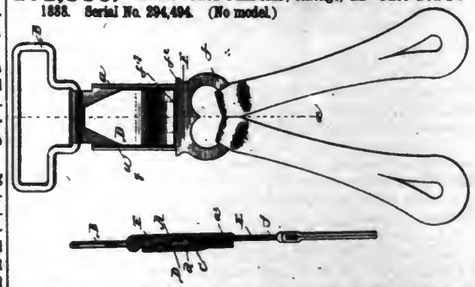
3. In a rotary pulverizer, a rotary drum having its sides composed of bars lying parallel with each other, the locking-bars G, with

401,878.



the inclines at their ends, the wedges I, with the screw-shanks and nuts, and the elastic springs or buffers O, in combination with the exterior plates or washers, P, having outer sides chambered to receive the said nuts, the nut-locking plates V, and the guard-plates W, substantially as herein described.

4. The locking-bars G, having the inclined surfaces at their ends, the wedges I, pressing upon said inclines and having the screw-shank J, by which they are operated, in combination with the cylindrical extension from the head of the rotary drum, into which the wedges are drawn, the keys or lugs M on the extensions, the springs O, and the exterior plate or washer with the corresponding keyways or channels by which the washer is prevented from turning upon the cylinder, substantially as herein described.



5. A rotary pulverizer comprising the polygonal drum, the parallel bars forming the sides thereof, wedge-shaped locking-bars having screw-shanks adjacent to said side bars, the cylindrical extension K, through which the screw-shank of the wedge-shaped bars passes, the springs O, the exterior washers or plates, P, the nuts resting against said plates, and the arms Q upon said washers or plates and engaging lugs or grooves, whereby the washers are prevented from turning, substantially as herein described.

401,879. WASH-BOILER. WILLIAM W. FORD, Elmira, N. Y. Filed Aug. 6, 1887. Renewed Mar. 27, 1889. Serial No. 305,045. (No model.)

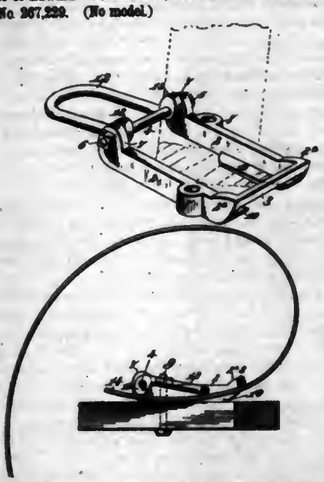
Claim.—The herein-described wash-boiler, having a cylindrical body, the circular casing A within said body, which casing has the central chamber, F, with its floor removed, and the circular passage or channel E, surrounding the said chamber, the incline partition G, between the opening H in the outer wall of the passage E and the opening I in the inner wall thereof, and the pipe B, rising from the roof of the casing around a central opening therein and discharging water back into the body of the boiler.

401,880. CLASP. PAUL FRANTZEN, Chicago, Ill. Filed Dec. 24, 1888. Serial No. 294,494. (No model.)

Claim.—A buckle or clasp one member whereof comprises a plate, A, having at its sides the flanges *a*, and having at its lower or outer end a shoulder, *a'*, in combination with a retaining-plate, D, pivoted to and extending between the flanges *a* to form the back of the buckle or clasp, and having its free end extending over the shoulder *a'*, a spring, E, at the upper end of the said retaining-plate, and a member, F, consisting of a plate of a size to fit between the flanges *a*, and having an eye or seat at a distance from its free end to engage with the shoulder *a'* of the member A, substantially as described.

401,881. FLEXIBLE SHAFT. THOMAS GARE, Stockport, County of Chester, England. Filed May 1, 1888. Renewed Feb. 25, 1889. Serial No. 301,165. (No model.) Patented in England Nov. 3, 1887, No. 14,895.

Claim.—A flexible shaft consisting of a metal bar of flat section coiled on its edge or narrower side, the coils of which internally are close to and externally a little apart from each other, substantially as and for the purpose specified.

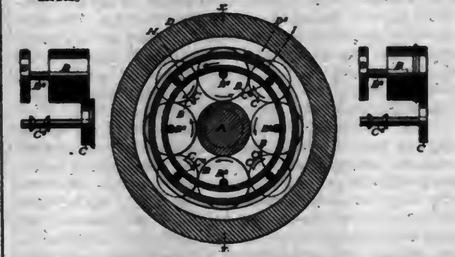


401,882. ELECTRIC BELT. CHARLES H. GRIMLEY, New York, N. Y. Filed Feb. 5, 1889. Serial No. 298,734. (No model.)

Claim.—1. As an improved article of manufacture, a therapeutic electric belt consisting, essentially, of a webbing belt having punctures arranged in pairs, a positive and a negative electrode respectively provided with a puncture to match those of the web and arranged to overlap one another, an interposed cloth strip for the electrodes, eyelets securing the interposed strip and electrodes to the web, and a flap, F, of suitable material, as specified.

2. A therapeutic electric belt having a series of disconnected batteries composed of a positive and a negative electrode overlapping one another, and an interposed cloth strip, all secured to the web, substantially as specified.

401,888. TOOTH-HOLDER. JOHN W. HARNER, Shippensburg, Pa., assignor to Edward W. Herendeen, Geneva, N. Y. Filed Mar. 15, 1888. Serial No. 267,229. (No model.)



Claim.—1. The combination, with the spring-tooth and the tooth-bar of a cultivator, of the shoe comprising side bars, 2, a cross-bar, 3, at one end thereof, between which and the tooth-bar the spring-tooth passes, a spindle, 4, at the other end of the side bars, and a cam-lever journaled on said spindle to bind against the tooth and clamp it to the tooth-bar, substantially as described.

2. In a harrow, plow, or cultivator, the combination, with a shoe composed of parallel side bars connected at one end by an integral bar and at the other by a spindle, of a yoke having cams turning upon said spindle and a spring-tooth lying between said bars and beneath the cams, substantially as described.

3. In a harrow, plow, or cultivator, the combination, with a shoe composed of parallel side bars connected at both ends and having internal flanges upon their lower edges, of cams mounted upon the spindle connecting one end of said bars, and having a yoke-lever operating them, and a spring-tooth lying between the side bars of the shoe, upon the flanges, and beneath the cams, substantially as described.

401,884. ROLLER-BEARING. REUBEN W. HENT, San Francisco, Cal. Original application filed Apr. 16, 1887, Serial No. 235,040. Divided and this application filed Aug. 3, 1888. Serial No. 281,880. (No model.)

Claim.—1. In a roller-bearing, the combination, with a series of bearing-rollers and a series of separating-rollers bearing only on the bearing-rollers, of a ring bearing at its periphery on journals of the separating-rollers and at its inner side on journals of the bearing-rollers, substantially as set forth.

2. In a roller-bearing, the combination, with the series of bearing-rollers B, having journals B^3, and the series of rollers C, bearing only on the rollers B and having journals C^3, of the ring H, bearing at its periphery on the journals C^3 and at its inner side on the journals B^3 substantially as shown and described, and for the purposes set forth.

3. In a roller-bearing, the combination, with a series of bearing-rollers, a series of separating-rollers bearing on the bearing-rollers only, and a ring bearing at its inner side on journals of the separating-rollers, of a smaller ring bearing at its periphery on said journals and at its inner side on journals of the bearing-rollers, substantially as set forth.

4. In a roller-bearing, the combination, with the series of rollers B, bearing on and projecting beyond the sleeve A' and the sleeves D', and having journals B^3, the series of rollers C, bearing only on the rollers B at their projections and having journals C^3, and the ring I, bearing at its inner side on the journals C^3, of the ring H, bearing at its periphery on the journals C^3 and at its inner side on the journals B^3, substantially as shown and described, and for the purposes set forth.

5. In a roller-bearing, the combination of a series of bearing-rollers bearing on the central journal and the bearing-casing, and having journals bearing on the inner side of a ring, and a series of separating-rollers bearing on the bearing-rollers only and having journals bearing on the periphery of said ring and on the inner side of a larger ring, all constructed and arranged substantially as set forth.

6. In a roller-bearing, the combination of the series of rollers B, bearing on and projecting beyond the sleeve A' and the sleeves D', and having journals B^3, bearing on the inner side of the ring H, and the series of rollers C, bearing only on the rollers B at their projections, and having journals C^3, bearing on the periphery of the ring H and on the inner side of the ring I, all constructed and arranged substantially as shown and described, and for the purposes set forth.

7. In a roller-bearing, the combination, with two rings of different diameters, of a series of bearing-rollers bearing on the central journal and the bearing-casing, and having journals bearing on the inner side of the smaller ring, and a series of separating-rollers keeping the bearing-rollers separate from each other and bearing on the bearing-rollers only, and having journals bearing on the periphery of said smaller ring and on the inner side of the larger ring, all constructed and arranged substantially as and for the purposes set forth.

8. In a roller-bearing, the combination, with the rings H and I, of the series of rollers B, bearing on and projecting beyond the sleeve A' and the sleeves D', and having journals B^3, bearing on the inner side of the ring H, and the series of rollers C, bearing only on the rollers B at their projections, and keeping the latter rollers separate from each other, and having journals C^3, bearing on the periphery of the ring H and on the inner side of the ring I, all constructed and arranged substantially as shown and described, and for the purposes set forth.

9. In a roller-bearing, the combination, between the shaft and casing, of a sleeve upon the shaft and sleeves within the casing, two rings of different diameters, a series of bearing-rollers bearing on and projecting beyond said sleeves and having journals bearing on the inner side of the smaller ring, and a series of separating-rollers bearing only on the bearing-rollers at their projections, each separating-roller on and between two bearing-rollers to keep the latter rollers separate from each other, and having journals bearing on the periphery of said smaller ring and on the inner side of the larger ring, keep-

ing the separating-rollers from contact with the casing, all constructed, arranged, and operating substantially as and for the purposes set forth.

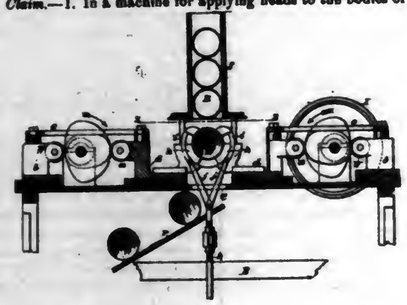
10. In a roller-bearing, the combination, between the shaft A and casing D, of the sleeve A′ and the sleeves D′, having their outer ends in the planes of the ends of the sleeve A′, the rings H and I, the series of rollers B, bearing on and projecting beyond the sleeves and having journals B^3, bearing on the inner side of the ring H, and the series of rollers C, bearing only on the rollers B at their projections, each roller C on and between two rollers, B, to keep the latter rollers separate from each other, and having journals C^3, bearing on the periphery of the ring H and on the inner side of the ring I, keeping the rollers C from contact with the casing, all constructed, arranged, and operating substantially as and for the purposes set forth.

11. A roller-bearing comprising the central journal, the bearing-casing, two rings of different diameters, a series of bearing-rollers bearing only portions of their lengths on the central journal and the bearing-casing and having journals bearing on the inner side of the smaller ring, a series of separating-rollers keeping the bearing-rollers separate from each other and bearing only on the portions of the bearing-rollers not bearing on the central journal and bearing-casing, each separating-roller on and between two bearing-rollers, and having journals bearing on the periphery of said smaller ring and on the inner side of the larger ring, keeping the separating-rollers from contact with the casing, all constructed, arranged, combined, and adapted to operate substantially as shown and described, and for the purposes set forth.

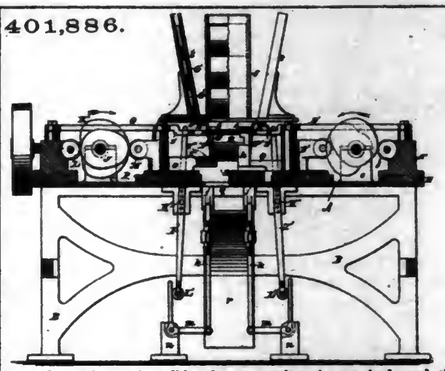
12. A roller-bearing comprising the shaft A, the sleeve A′, the casing D, the sleeves D′, having their outer ends in the planes of the ends of the sleeve A′, the series of rollers B, bearing on and projecting beyond the sleeves and having journals B^3, bearing on the inner side of the ring H, the series of rollers C, keeping the rollers B separate from each other, and bearing only on the rollers B at their projections beyond the sleeves, each roller C on and between two rollers, B, and having journals C^3, bearing on the periphery of the ring H and on the inner side of the ring I, the said ring H interposed between and bearing on the journals C^3 at its periphery and the journals B^3 at its inner side, and the said ring I bearing at its inner side on the journals C^3 and keeping the rollers C from contact with the casing, all constructed, arranged, combined, and adapted to operate substantially as shown and described, and for the purposes set forth.

401,885. THILL-COUPLING. JAMES A. HIBSON, Des Moines, Iowa.

Filed Mar. 19, 1888. Serial No. 267,773. (No model.)



Claim.—1. An axle-clip having an integral socket, B, composed of parallel sides C, that have coinciding perforations *d*, an integral thill-iron support, *f*, and an integral projection, *h*, for retaining a rubber cushion or block in the rear portion of the socket, substantially as shown and described.



2. An improved thill-coupling composed of an axle-clip having an integral joint-socket and an integral thill-iron rest at the front end and bottom of said socket, a rubber cushion or elastic block fitted in the rear end of the socket, a thill-iron having an enlarged circular end and eccentric, and a perforation corresponding in size and shape with perforations in the parallel sides of the socket, and a key-bolt, constructed and combined in the manner set forth.

401,886. MACHINE FOR APPLYING HEADS TO TIN-CAN BODIES. WILLIAM HIPPERLING, New York, N. Y., assignor to Stephen A. Ginna, Plainfield, N. J., and Richard A. Donaldson, Brooklyn, N. Y.

Filed Nov. 30, 1888. Serial No. 292,237. (No model.)

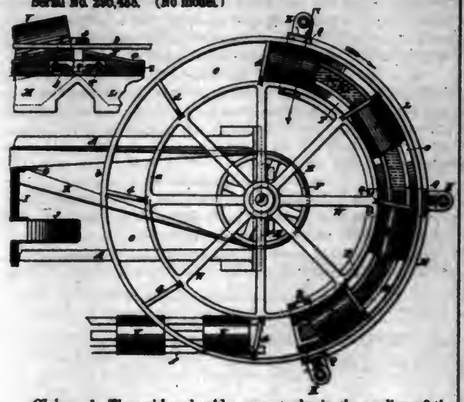
Claim.—1. In a machine for applying heads to the bodies of tin

cans, the reciprocating slides for supporting the can-body and the reciprocating slides carrying former-heads for embracing the can-body on opposite sides, combined with the reciprocating former-jaws for shaping said body, the plates for moving the can-heads upon the opposite ends of said body, and mechanism, substantially as described, for moving said plates toward and from the ends of the can-body, substantially as and for the purposes set forth.

2. In a machine for applying heads to the bodies of tin cans, the reciprocating slides for supporting the can-body and the reciprocating slides carrying former-heads for embracing the can-body on opposite sides, combined with the reciprocating former-jaws for shaping said body, the plates for moving the can-heads upon the opposite ends of said body, and mechanism, substantially as described, for moving said plates toward and from the ends of the can-body, the chute for feeding the can-bodies, and the chutes on either side thereof for the can-heads, substantially as set forth.

3. In a machine for applying heads to the bodies of tin cans, the reciprocating slides for supporting the can-body and the reciprocating slides carrying former-heads for embracing the can-body on opposite sides, combined with the reciprocating former-jaws for shaping said body, arranged in guiding-grooves in said former-heads, the links connecting said jaws, mechanism, substantially as described, for moving said links vertically, the hinged plates for moving the can-heads upon the opposite ends of said body, mechanism, substantially as described, for moving said plates toward and from the ends of the can-body, and cam mechanism arranged to have a simultaneous movement for acting upon said slides, substantially as and for the purposes described.

4. In a machine for applying the heads to the bodies of tin cans, the reciprocating slides N O, the latter to support the can-body, the reciprocating slides *b d*, the latter carrying former-heads for embracing the opposite sides of said body, rods connecting the slides N O and *b d*, respectively, cams between said slides for imparting a reciprocating movement thereto in opposite directions toward and from the center of the machine, the plates F, hinged to the slides O and connected with the sliding rods D′ for moving the can-heads upon the opposite ends of said body, and the reciprocating former-jaws *i*, for shaping the can-body previous to the action of said plates F′, substantially as and for the purposes set forth.



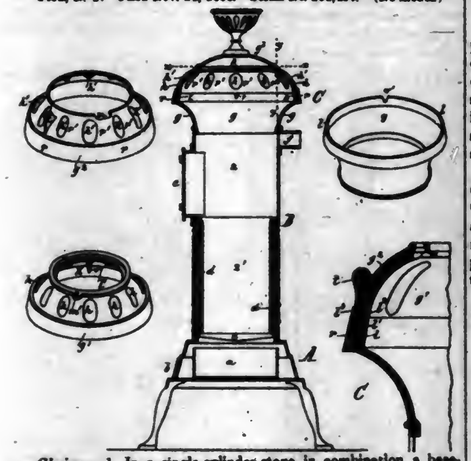
5. In a machine for applying heads to the bodies of tin cans, the reciprocating slides for supporting the can-body, the reciprocating slides carrying former-heads for embracing the opposite sides of said body and the reciprocating former-jaws, the plates F′, hinged to the said supporting-slides for moving the can-heads upon opposite ends of said body, the reciprocating rods D′, pivoted to said plates, and intermediate mechanism, substantially as set forth, between the reciprocating rods D′ and the links connecting the former-jaws, whereby the motion of the former may be communicated to the latter, substantially as and for the purposes set forth.

6. In a machine for applying heads to the bodies of tin cans, the oppositely-reciprocating slides for supporting the can-body, the oppositely-reciprocating slides carrying former-heads for embracing the opposite sides of said body, and the reciprocating former-jaws for shaping said body, combined with the slides A′ B′, rods D′, connecting said slides, cams *w x*, for reciprocating said slides, and the plates F′, pivoted to the inner ends of said rods D′ and hinged to the said supporting-slides for moving the can-heads upon the opposite ends of said body, substantially as and for the purposes set forth.

7. In a machine for applying heads to the bodies of tin cans, the reciprocating slides for supporting the can-body and the reciprocating slides carrying former-heads for embracing the opposite sides of said body, combined with the plates hinged to the said supporting-slides for moving the can-heads upon the opposite ends of said body, and mechanism, substantially as described, for moving said plates toward and from the can-body, substantially as and for the purposes set forth.

401,887. MACHINE FOR SOLDERING TIN CANS. WILLIAM HIPPERLING, New York, N. Y., assignor to Stephen A. Ginna, Plainfield, N. J., and Richard A. Donaldson, Brooklyn, N. Y.

Filed Jan. 5, 1888. Serial No. 295,488. (No model.)



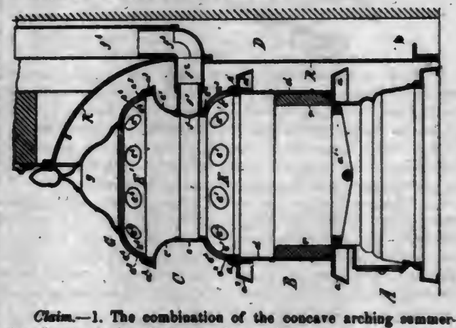
Claim.—1. The acid and solder receptacles in the outline of the arc of a circle, and the bars O P, arranged upon said receptacles, to receive and operate as a tramway for the can-bodies, combined with the wheel W, having at the end of its spokes the rim *a*, the rim *b*, and the bars *d*, connecting said rims and forming spaces to receive the can-bodies over said tramway, substantially as set forth.

2. The acid and solder receptacles L M in the outline of the arc of a circle, combined with the segmental bars O P, secured by angle-plates Q, having elongated slots S to receive the bolts securing said bars, combined with the wheel W, having rims connected by bars, forming spaces to receive the can-bodies, and adapted to move them through the acid and solder baths, substantially as set forth.

401,888. SINGLE-CYLINDER STOVE. JOHN H. KETNER, New York, N. Y.

Filed Nov. 21, 1888. Serial No. 291,467. (No model.)

Claim.—1. In a single-cylinder stove, in combination, a base-section, A, of ordinary suitable construction, a single cylinder, B, having a feed-opening, draft-passage to the chimney-flue, a fire-chamber and a grate, and an enlarged dome-shaped top section forming a gas-chamber above the said draft-passage, provided with air vent or entrance perforations *h h′* in its bulged portion, through which air is allowed to enter and pass unobstructedly down to the burning coal on the grate through the chamber formed by the said cylinder and top section, and at the same time the flame can be seen, whether the eye is on a plane with or above the perforations, substantially as and for the purpose described.

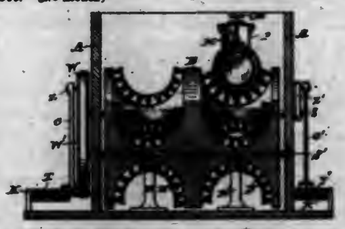


2. In a single-cylinder stove, in combination, an ordinary suitable base-section, A, a single cylinder, B, having a feed-supply opening, draft-passage to the chimney, a fire-chamber and a grate, and an enlarged dome-shaped top section, C, above the draft-passage which spans the horizontal area of the cylinder which it surmounts and overhangs, and is provided with air-vents or entrance-passages *h h′*, through which, while air is entering, the flame is exposed to a sidewise as well as a downward view, substantially as described.

3. In a single-cylinder stove, in combination, an ordinary suitable base-section, A, a cylinder, B, having a feed-supply opening, a draft-passage to the chimney, a fire-chamber and a grate, and an enlarged dome-shaped top section, C, comprising a movable perforated air-vent ring, g^4, having a skirting, *r*, and a stationary air-vent ring, *g′*, substantially as and for the purpose described.

4. In a single-cylinder stove, in combination, an ordinary suitable base-section, A, a cylinder, B, having a feed-supply opening, a draft-passage to the chimney, a fire-chamber and a grate, and an enlarged dome-shaped top section, C, above the draft-passage, comprising the base portion *g*, bulged stationary perforated air vent ring *g′*, and the bulged movable perforated air-vent ring g^4, said rings having overhanging skirtings as encircling peripheries, and their openings adapted for exposing the flame to view while air is entering through them, substantially as and for the purpose described.

5. The combination of the imperforated ring-base portion *g*, a perforated stationary air-vent ring portion, *g′*, and a perforated movable air-vent ring portion, g^4, the ring *g′* being provided with a projection, *w′*, and the ring g^4 with a slot, *m*, and the ring *g′* provided with a tapering projection, *v*, and the base-rim portion *g* having an opening, *v′*, substantially as and for the purpose described.

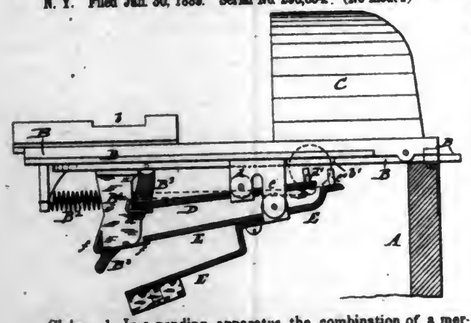


401,889. STOVE. JOHN H. KETNER, New York, N. Y. Filed Nov. 23, 1888. Serial No. 291,690. (No model.)

Claim.—1. The combination of the concave arching summer-piece B and a single-cylinder fire-place coal-stove having only a direct-draft exit, *f*, and formed of sections A B C, sections B and C being each provided with a stationary perforated draft-ring and with a sliding perforated downdraft register-ring, said rings being respectively below and above the draft-exit *f″* of the stove and all around sections B and C, and throwing light upon the curved surface of the said summer-piece and into the room, substantially as described.

2. A single-cylinder fire-place coal-stove, having only a direct-draft exit, *f*, and formed of sections A, B, and C, the sections B and C being provided each with a stationary perforated downdraft-ring and with a sliding perforated downdraft register-ring, said rings being respectively below and above the draft-exit *f″* of the stove, and exposing the flame of both sections B and C, substantially as and for the purpose described.

401,890. MACHINE FOR BLACKING AND POLISHING SHOES. ARTHUR KITSON, Philadelphia, Pa. Filed Sept. 21, 1887. Serial No. 250,302. (No model.)

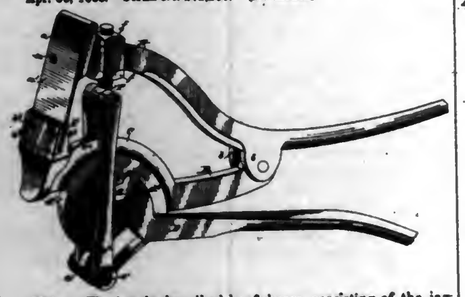


Claim.—1. In combination with a rotary grooved blacking-brush, a perforated blacking-receiver curved to fit the groove of the brush, substantially as described.

2. In combination with a rotary grooved blacking-brush, a perforated blacking-receiver curved to fit the groove of the brush, said perforations being covered with an absorbent material, and a supply-vessel connected to said receiver, substantially as described.

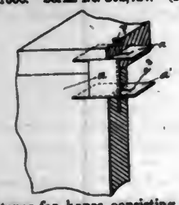
3. In a machine for blacking and polishing boots and shoes, the combination, with two circular double-grooved brushes, of means for simultaneously revolving them, and a blacking-supply for applying blacking to each of the two brushes at one end of the machine, substantially as described.

4. In a machine for blacking and polishing boots, the combination, with two shafts, each having upon it two grooved brushes, one shaft being arranged slightly above the plane of the other, of a blacking-supply, and a foot-rest arranged between each pair of grooved brushes, whereby the toe of the boot will be operated upon by one brush and the heel by the other brush, and whereby the boot, after being blackened by one pair of brushes may be polished by the other pair, substantially as described.



401,891. VENDING APPARATUS. WILLIAM LANE, Brooklyn, N. Y. Filed Jan. 30, 1889. Serial No. 298,054. (No model.)

Claim.—1. In a vending apparatus, the combination of a merchandise-delivery slide having a slot for dropping the coin, a primary locking-lever, a locking-bar on said delivery-side having a stop or keeper for the primary locking-lever, an auxiliary weighted locking-lever, a stop or keeper on the locking-bar for the latter, and a fixed incline above the front end of the auxiliary locking-lever adjoining the bottom opening of the coin-chute, substantially as set forth.

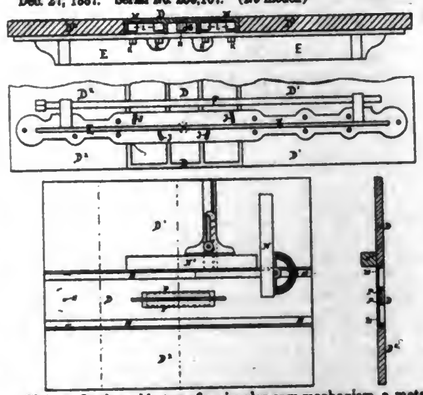


2. The combination, in a vending apparatus, of a merchandise-delivery slide having a slot for the passage of the coin, a coin-chute above said slot, a fulcrumed and weighted locking-lever, a locking-bar attached to the delivery-slide and provided with a stop or keeper for said locking-lever, and a fixed incline arranged vertically above the front end of the locking-lever and adjoining the bottom opening of the coin-chute, substantially as set forth.

401,892. HOOF-SHEARS. JOSEPH P. LEE, Wyalusing, Pa. Filed Apr. 30, 1888. Serial No. 272,280. (No model.)

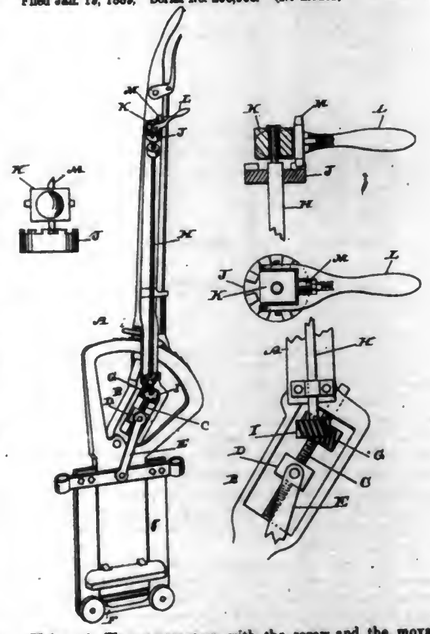
Claim.—The herein-described hoof-shears, consisting of the jaw or arm A, carrying a knife at one end, the jaw or arm B, pivotally secured at its inner end to said jaw or arm A at about the center thereof, and having a curved groove or recess and a block at its outer end, the slotted cam or eccentric working in said groove or recess and having a rearwardly-extending handle, the pitmen connected to said cam or eccentric, and the adjusting-bolt secured to the jaw-handle A, and to which said pitmen are connected, substantially as set forth.

401,893. BOX-FASTENER. JOHN L. LILIENTHAL, San Francisco, Cal. Filed Dec. 5, 1888. Serial No. 292,727. (No model.)



Claim.—1. A fastener for boxes, consisting of a strip, *a*, having integral therewith plates *a'*, overturned in parallel planes at right angles to said strip, each plate provided with an opening adapted to receive a fastening-pin, *p*, as and for the purposes indicated, substantially as described.

2. The combination, with the conjoining edges of the walls of a package, of plates *a'*, inserted therein, said plates being overturned at right angles to a strip, *a*, integral therewith, and secured in place by a pin, *p*, passing bodily into the material of the package and through openings of said plates, substantially as described.

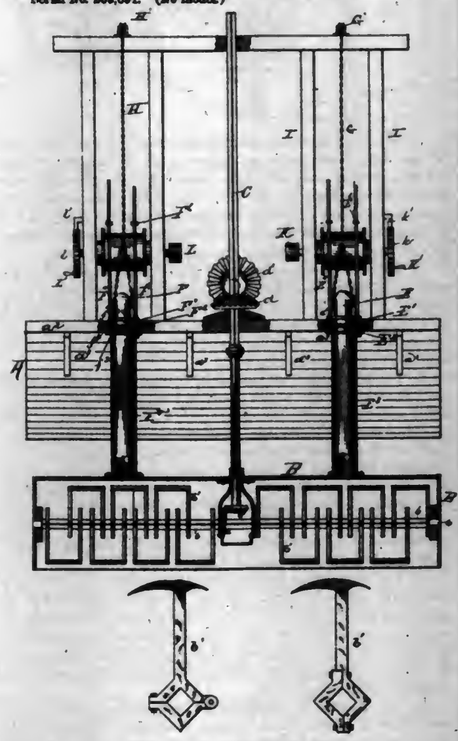


3. A fastener for boxes, consisting of plates *a'*, overturned at right angles to an integral connecting-strip, *a*, said plates being wider than the connecting-strip, each provided with slitted openings, the edges of which are adapted to be forced downwardly by a pin, *p*, when driven against said slits, as and for the purposes indicated, substantially as described.

401,894. TABLE-TOP FOR CIRCULAR SAWS. IRVING G. MARSTON, Boston, Mass., assignor to I. G. Marston & Co., same place. Filed Dec. 27, 1887. Serial No. 259,167. (No model.)

Claim.—In the table-top of a circular-saw mechanism, a metallic center piece extending the length of the table having a slot for the saw, and grooves for guides to present the work to the saw, the same being adapted to adjust the grooves on a line with the saw by means of a pivot and set-screws, as described.

401,895. CABLE-GRIP. SAMUEL F. McDILL, San Francisco, Cal. Filed Jan. 19, 1889. Serial No. 296,908. (No model.)



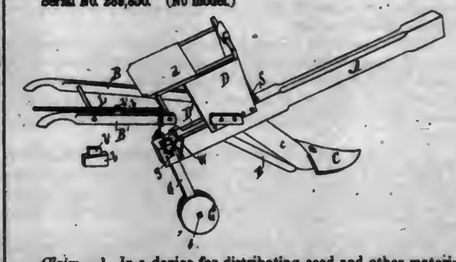
Claim.—1. The combination, with the screw and the movable nut whereby the grip-jaws are adjusted, of the shaft journaled upon the side of the grip-lever, the means for turning said shaft, a pinion upon the lower end of the shaft, and a corresponding pinion upon the screw-shaft, whereby the latter may be turned, substantially as described.

2. The grip-lever having the movable nut connected with the grip-jaw, the screw passing through said nut, a pinion upon the screw-shank, a shaft journaled upon the side of the grip-lever, and a corresponding pinion engaging the one upon the screw-shank, and a pawl-and-ratchet mechanism upon the upper end of the lever-shaft, whereby the latter may be turned, substantially as described.

3. The shaft journaled upon the side of the grip-lever, a screw-shank journaled in the lower part of the grip-lever and connected with the gripping-jaws, pinions upon the screw-shank and the lever-shaft engaging with each other, and a double ratchet fixed upon the upper end of the lever-shaft, in combination with a double-acting pawl and handle, substantially as herein described.

4. The pinion-shaft journaled upon the side of the lever, having the double-toothed ratchet-wheel fixed to its upper end, a swivel-head turning upon the upper end of the shaft above the ratchet, and a handle pivoted to said swivel-head and having the pawls projecting upon opposite sides thereof, so as to be engaged with the ratchet-wheel upon either side of the vertical shaft, and a spring whereby the handle is retained in either position, substantially as described.

401,896. HYDRAULIC DREDGING-MACHINE. JOHN McFARLANE, Washington, D. C., assignor, by direct and mesne assignments, of part to George J. Bessler and Henry Wex, same place. Filed Apr. 6, 1888. Serial No. 269,891. (No model.)



Claim.—1. In a hydraulic dredge, a box or case, telescopic suction-pipes leading therefrom, and a shaft journaled horizontally within said box or case, in combination with alternating cutters bolted to said shaft and adapted to rotate in a vertical plane, each of said cutters having its center beyond the axis of rotation of the shaft, as and for the purposes set forth.

2. In a dredging-machine, the combination, with a vertically-movable box, a shaft journaled horizontally therein, and cutters on said shaft, of telescopic suction-pipes, each of the sections of which is provided with a projection, guiding and controlling rods on either side of each of said pipes, one of which rods is bolted to the projection of the intermediate section of the pipe and passes through the projection on the upper section thereof, and the other of which rods is secured to the projection on the bottom section of the pipe and passes through the projection on the intermediate section thereof, all substantially as and for the purposes set forth.

3. In a dredging-machine, a vertically-movable box or case, a shaft journaled horizontally therein, and alternating cutters secured on either side of said shaft, the blades of which are curved in the arcs of circles whose centers fall without the axis of rotation of said shaft, in combination with telescopic suction-pipes each of the sections of which is formed with a projection at its upper end, guiding and controlling rods on opposite sides of said suction-pipes, and respectively secured to different sections thereof, means for raising and lowering the box or case, and means for operating the shaft carrying the cutters, all substantially as and for the purposes set forth.

4. In a dredging-machine, a cutter the extremity of the shank of which is formed with projections extending obliquely in opposite directions, and one of which has a perforated lip, and a correspondingly-shaped piece hinged to one of said projections, whereby a rectangular opening will be formed, as shown, and also having a perforated lip, and a bolt passing through said lips, for the purpose set forth, in combination with a horizontal shaft passing through the rectangular opening of the cutter.

401,897. SEED-PLANTER. JACK MITCHELL, Dade, Ky., assignor of one-half to Albert W. Dreyfoos, same place. Filed Nov. 2, 1888. Serial No. 289,850. (No model.)

Claim.—1. In a device for distributing seed and other material, provided with a hopper attached upwardly upon a draft-beam, the lever-arm L, pivotally resting upon the pin *b'* of an obliquely-faced post, *b*, uprising from one of the handles of the machine, said lever having pivoted thereto a hasp, H, meshing with a bell-crank lever, W adjusted to impinge against an outward shoulder of a horizontally-reciprocating slide, whereby the aperture of said slide will be projected into and maintained within the hopper until released from pressure of said lever, as and for the purpose indicated, substantially as described.

2. In a seed-planter having a hopper provided with opposite apertures for passage of an orificed reciprocating slide, the combination therewith of the following elements: the bell-crank lever W, linked to the lever L, adjusted to swing upon the pin *b'* of an obliquely-faced post, *b*, uprising from a handle of the device, obliquely-inclined chute E, and follower-wheels G', having their inner faces obliquely inclined from periphery to hub, said coverers being journaled at the lower end of the common beam in alignment with a forward plowshare, as and for the purpose indicated, substantially as described.

401,898. PROCESS OF MAKING GAS-INCANDESCENTS. LEONARD PAGET, New York, N. Y., assignor of one-half to Charles J. Kintner, same place. Filed Mar. 30, 1889. Serial No. 305,436. (No specimens.)

Claim.—1. The within-described process of preparing an incandescent, which consists in causing an incandescing substance to penetrate the pores of a non-friable base or support, substantially as described.

2. The within-described process of preparing an incandescent, which consists in causing an incandescing substance to penetrate the pores of a non-friable base or support and continuing this process until a coating of the desired thickness is had upon the exterior surface of the support, substantially as described.

3. The described process of preparing an incandescent, which consists in heating a metallic base or support in a solution containing an incandescing substance to the required temperature and for the necessary time to cause the expanded pores of the metal to absorb the desired quantity of the incandescing substance, substantially as described.

4. The described process of producing an incandescent, which consists in electrically heating a metallic base or support in an alcoholic solution containing an incandescing substance, substantially as described.

5. The described process of producing an incandescent, consisting in electrically heating a metallic base or support while immersed in an alcoholic solution containing a salt that will produce a highly-refractory substance, as oxide of magnesium, substantially as described.

6. The described process of producing an incandescent, consisting in electrically heating a metallic base or support therefor in a so-

lution of alcohol and a salt that will produce a refractory substance, and continuing this action until the surface pores of the base or support are filled and a coating of the desired thickness is formed about said base or support, substantially as described.

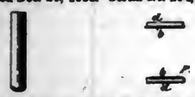
401,899. GAS-INCANDESCENT. LEONARD PAGET, New York, N. Y., assignor of one-half to Charles J. Kintner, same place. Filed Mar. 30, 1882. Serial No. 305,437. (No specimens.)

Claim.—1. As a new article of manufacture, an incandescent consisting of a non-friable base or support having an incandescing substance embedded in its pores, whereby integrality of connection exists between the base or support and the incandescing substance, substantially as described.

2. As a new article of manufacture, an incandescent consisting of a non-friable base or support holding an incandescing substance in its surface pores and an exterior coating of said incandescing material attached to the embedded material and to the surface of the base or support, substantially as described.

3. As a new article of manufacture, an incandescent consisting of a metallic base or support having a coating of an incandescing material which penetrates the surface pores of the base or support, substantially as described.

4. As a new article of manufacture, an incandescent consisting of a metallic base or support having a coating of an incandescing material of highly-refractory nature, which penetrates the surface pores of the base or support and forms also a coating about the exterior surface, the two being thus integrally united, substantially as described.



5. As a new article of manufacture, an incandescent consisting of a metallic wire base or support coated with an incandescing material which penetrates the surface pores of the wire and thus becomes integrally attached to said base or support, substantially as described.

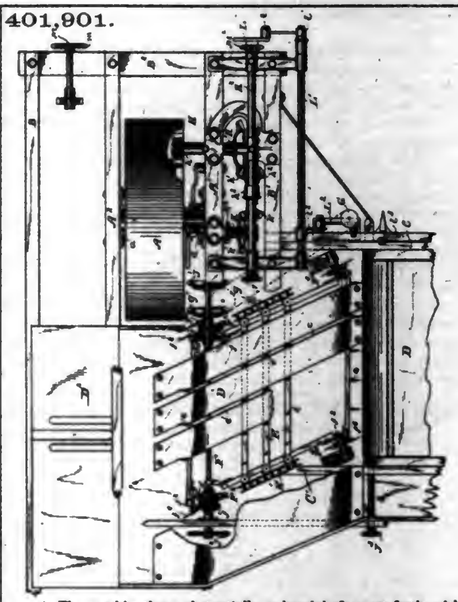
6. As a new article of manufacture, an incandescent consisting of a non-friable base or support having magnesium oxide embedded in its surface pores, substantially as described.

7. As a new article of manufacture, an incandescent consisting of a non-friable base or support having magnesium oxide embedded in its surface pores and also a coating of said oxide on the surface of said base or support, substantially as described.

8. As a new article of manufacture, an incandescent consisting of a metallic base or support having magnesium oxide embedded in its surface pores and covering also the entire surface of the base or support, substantially as described.

401,900. PLATING STOCK FOR JEWELRY. JOHN S. PALMER, Providence, R. I. Filed Dec. 26, 1888. Serial No. 294,629. (No model.)

Claim.—The described improvement in the art of making plated metal shells or thimbles for use in the manufacture of jewelry, consisting in forming suitable-sized disks of the precious metal, in forming separate disks of nearly the same size of a baser metal, then soldering each of such precious disks to one of the baser ones, and then converting such plated disks into shells, all substantially as set forth.



401,901. HARVESTER-BINDER. HENRY R. PRIDMORE, Chicago Ill., assignor to the McCormick Harvesting Machine Company, same place. Filed June 6, 1885. Serial No. 167,906. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the main wheel, the finger-bar practically abreast the axle on which said main wheel turns, the platform, the diagonal elevator trending rearwardly from the delivery end of the platform, the binding table or receptacle parallel with the plane of the main wheel, and the binding devices operating upon the gavel at right angles to said line.

2. The combination, substantially as hereinbefore set forth, of the elevator-frame trending diagonally to the rear from the end of the platform, the sprocket-wheels arranged at the head and foot of said elevator, the chains connecting said wheels, and the rake-bars universally jointed to links of said chains.

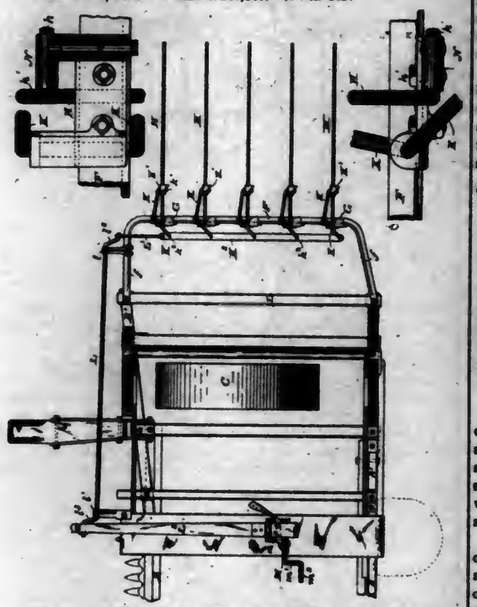
3. The combination, substantially as hereinbefore set forth, of the diagonal elevator-frame, the through-shaft at one end thereof, the bevel-pinions on said shaft, the blocks or brasses encircling the shaft in proximity to said gears and secured to the frame, oblique bearings on said brasses, the sprocket-wheels mounted on said bearings and having face-teeth which mesh with the bevel-pinions, the sprocket-wheels at the opposite end of the elevator-frame turning upon oblique bearings, the chains connecting the sprocket-wheels at the top of the elevator with the corresponding wheels at the foot, and the rake-bars universally jointed to links of said chains.

401,901.

4. The combination, substantially as hereinbefore set forth, with the main wheel and its axle, the finger-bar practically abreast of said axle, the platform arranged in the rear of the axle, the oblique elevator trending rearwardly, and the binding mechanism outside of the plane of said wheel, of the driving-gearing located on the grain side of the main wheel and in advance of the oblique tilting axis between the axle of the main wheel and the axle of the grain-wheels.

5. The combination, substantially as hereinbefore set forth, of the main wheel, the prime pinion engaging with said main wheel in advance of its axle, the counter-shaft driven by the prime-pinion shaft, the diagonal elevator, the through-shaft at the head of said elevator, the sprocket-wheel at the front end thereof, and the sprocket-wheel at the rear end of the counter-shaft.

6. The combination, substantially as hereinbefore set forth, of the main wheel, the prime pinion engaging with said wheel in advance of the main axle, the counter-shaft driven by the prime-pinion shaft, the sprocket-wheel at the rear end of the counter-shaft, the elevator-shaft and its sprocket-wheel, the wrist-wheel at the front end of the counter-shaft beyond the front tie-beam to communicate motion to the cutter-bar, the sprocket-wheel on the counter-shaft adjacent to said wrist-wheel, the driving-shaft for the binder parallel with said counter-shaft outside of the main wheel, and the sprocket-wheel on said binder-driving shaft, whereby it may be driven from the sprocket-wheel at the front of the counter-shaft.



7. The combination, substantially as hereinbefore set forth, of the main wheel, the prime pinion engaging therewith in advance of the main axle, the counter-shaft driven by the prime-pinion shaft, the sprocket-wheel at the rear end of the counter-shaft, the wrist-wheel and sprocket-wheel at the front end of said counter-shaft, the reel-driving shaft and its sprocket-wheel, and the bevel-gears connecting said shaft to the counter-shaft.

8. The combination, substantially as hereinbefore set forth, of the main wheel, the prime pinion engaging therewith in advance of the main axle, the counter-shaft driven by the prime-pinion shaft, the sprocket-wheel at the rear of the counter-shaft, the diagonal elevator, the through-shaft at the head of said elevator, sprocket-wheels at front and rear of said through-shaft, the platform-apron, and a sprocket-wheel at the rear end of the gudgeon of the inner roller of said platform-apron, whereby motion may be communicated by chains from the counter-shaft to the elevator-shaft and from the elevator-shaft to the platform-apron.

9. In a grain-binder in which the gear and cam wheel is operated from the constantly-driven packer-shaft by means of two intermediate idle-gears, the combination, substantially as hereinbefore described, with the first idle-gear, of a driver alongside thereof, a tripping-clutch engaging the driver with the idle-gear, and a trip-latch whereby said clutch is disengaged from the idle-gear.

10. The combination, substantially as hereinbefore set forth, of a pinion fixed to the end of the constantly-driven packer-shaft, the loose pinion engaging therewith and having driving-lugs on its face, the second loose pinion alongside the other on the same axle and having a driving-dog to engage with said lugs, and the hooked trip-latch.

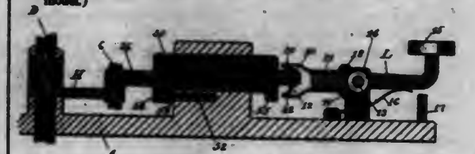
401,902. SHEAF-CARRIER. HENRY R. PRIDMORE, Chicago, Ill., assignor to the McCormick Harvesting Machine Company, same place. Filed Oct. 4, 1888. Serial No. 287,165. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with the carrier-frame bar, of a series of curved fingers projecting transversely therefrom, horizontal journals upon the inner ends of said fingers set at an angle to the length thereof, bearings upon the frame-bar receiving said journals and adapted to permit them to swing in a horizontal direction, a series of bell-crank levers mounted one to the side of each of said fingers and having one arm connected therewith, and a common operating-rod for each of said levers, whereby the fingers may be simultaneously swung to the rear and rocked upon their journals to drop their outer ends.

2. The combination, substantially as hereinbefore set forth, with the carrier-frame bar, of a series of curved fingers having an inner straight portion and horizontal journals at their inner ends set at an angle to the length of said fingers, bearings upon said frame-bar receiving said journals and adapted to permit them to swing horizontally therein, a series of bell-crank levers mounted in bearings one in advance of each of said fingers, a sleeve playing upon the inner straight portion of each finger and pivoted to the outer arm of each lever, and an operating-rod connected to the inner arms of said levers.

3. The combination, substantially as hereinbefore set forth, of the carrier-frame bar, the horizontal quadrant-bearings mounted thereon, the carrier-fingers having horizontal journals playing in said bearings and rocking therein, the vertical bearings on said frame-bar, the bell-crank levers mounted therein, the sleeves upon the fingers pivoted to the outer arms of said levers, the operating-rod connected to the inner arms of said levers, and a lever upon the harvester, whereby said rod is controlled.

401,903. PROCESS OF MANUFACTURING IRON AND STEEL. JACOB REESE, Pittsburg, assignor to the Bessemer Steel Company, (Limited,) Philadelphia, Pa. Filed June 27, 1878.



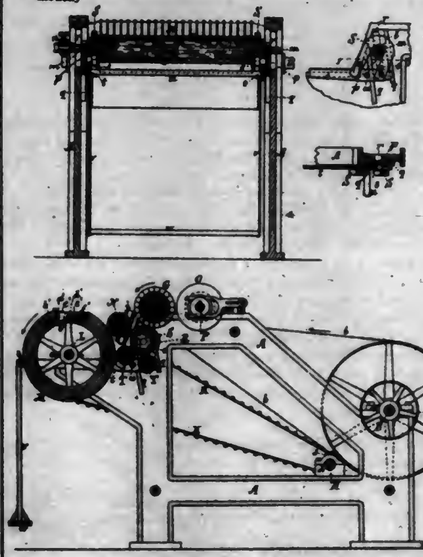
Claim.—1. The process herein described for dephosphorizing in the manufacture of ingot iron and steel, which consists in decarburizing and desiliconizing the metal in a Bessemer converter and immediately conveying it into an open hearth for the purpose of keeping it in a fluid state by the use of other fuel than that contained in the metal, and therein dephosphorizing it by the action of a basic bath and recarburizing and deoxodizing by the use of a manganesic carbide of iron, and further refining it by the action of the basic bath, substantially as herein set forth.

2. In the manufacture of ingot iron and steel, the process herein described, which consists in decarburizing and desiliconizing the metal in a Bessemer converter, and then transferring it while in a molten condition to a converting-furnace, and therein maintaining its fluid condition by means of heat obtained by the use of fuel extraneous to the metal, and subjecting it to the action of a basic bath, substantially as hereinbefore described.

3. In the manufacture of ingot iron and steel, the process of first decarburizing and desiliconizing the metal in a Bessemer converter, then running the molten metal into an open hearth having a calcareous lining, and then exposing it under the influence of additional heat obtained by the use of extraneous fuel to the action of a basic bath for the purpose of dephosphorizing the metal, substantially as hereinbefore described.

4. In the manufacture of ingot iron and steel, the process hereinbefore described of first desiliconizing the metal in a Bessemer converter, then transferring the molten metal to a converting-furnace, and exposing it therein to the action of basic reagents under the influence of additional heat for the purpose of dephosphorizing it, substantially as described.

401,904. MECHANICAL MOVEMENT. FRANCIS H. RICHARDS, Springfield, Mass., assignor to Darius W. Dodson, Wilkes-Barré, Pa. Filed Mar. 30, 1887. Renewed May 21, 1888. Serial No. 272,585. (No model.)



Claim.—1. The combination, in a latch mechanism of the class described, of a reciprocating latch, a tripping-bar, and four catches arranged in two engaging pairs, two of said catches being on the latch and two of them operatively connected to said bar, and those on one said part being constructed and arranged to be successively engaged with and disengaged from those on the other said part, substantially as described, and for the purpose specified.

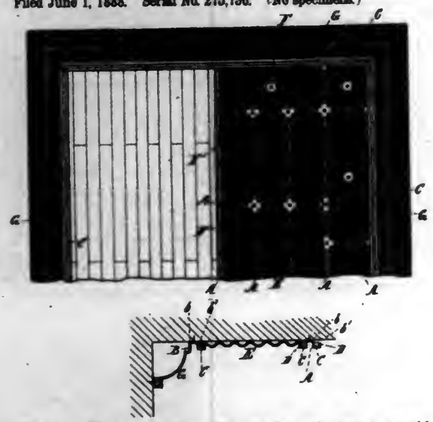
2. The combination, in a latch mechanism of the class described, of a reciprocating latch, fixed oppositely-disposed catches on said latch, a tripping-bar, and oppositely-disposed spring-catches on said bar, one of said spring-catches being constructed and arranged to engage sooner than the other with the corresponding fixed catch, substantially as described, and for the purpose specified.

3. The combination, in a latch mechanism of the class described, of the latch having fixed catches 10 12, lever L, having the projecting end 21, and the spring-catches 20 22, carried on said lever, all constructed to operate substantially as described.

401,905. MACHINERY FOR SHAVING OR DRESSING GREEN HIDES OR SKINS. JOHN ROON, Salem, Mass., assignor to Reed & Vaughan, same place. Filed July 27, 1888. Serial No. 281,183. (No model.)

Claim.—1. In a machine for shaving or dressing hides or skins, the yielding bed, substantially as described, its body being hollow and filled with an elastic substance or with a fluid under pressure, as set

forth, said bed being supported in slides arranged in the frame and operated or moved therein by the levers *t* and the treadle *w*, connected therewith, in combination with the cutter-cylinder and grinding-wheel arranged and provided with mechanism, essentially as explained, for operating said cylinder and wheel, as set forth.



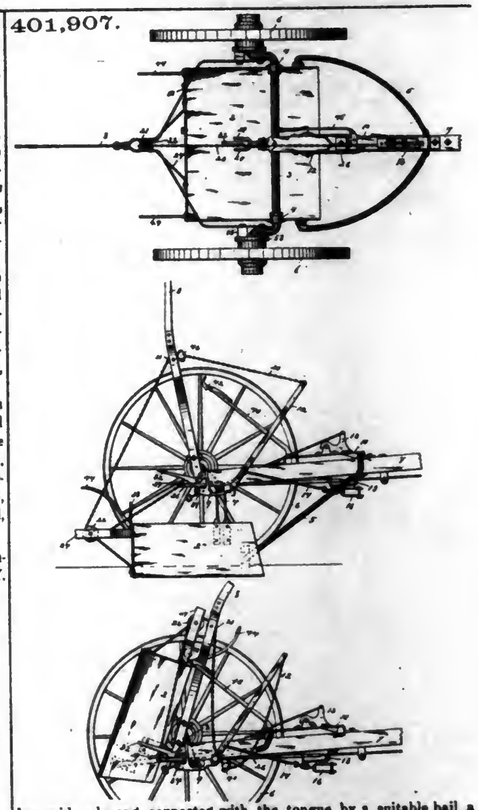
2. The yielding bed, substantially as described, its body being hollow and filled with an elastic substance or with a fluid under pressure, essentially as set forth, said bed being supported in slides in the frame and having yokes S arranged on it, as shown, for supporting the bed-sustaining rolls T T, the whole being operated or moved by the levers *t* and the treadle *w*, connected therewith, combined with the drum M, provided with the clamping mechanism, the cutter-cylinder, and grinding-wheel arranged and provided with mechanism, essentially as explained, for operating said drum, cylinder, and wheel, as set forth.

3. The yielding bed formed with a hollow body and filled with an elastic substance or with a fluid under pressure, as set forth, said bed being supported in slides arranged in the frame and having mechanism for moving it toward the cutter-cylinder, as shown, in combination with the corrugated roll N and the cutter-cylinder and grinding-wheel arranged and provided with mechanism, essentially as explained, for operating said cylinder and wheel, as set forth.

4. The yielding bed formed with a hollow body and filled with an elastic substance or with a fluid under pressure, as set forth, said bed being supported and having mechanism for moving it toward the cutter-cylinder, as shown, in combination with the corrugated roll N, the drum M, provided with the clamping mechanism, and the cutter-cylinder and grinding-wheel arranged and provided with mechanism, essentially as explained, for operating said drum-cylinder and wheel, as set forth.

401,906. METALLIC CEILING. LOUGLEY L. SAGENDORPH, Cincinnati, Ohio, assignor of one-half to Charles N. Harder, Philmont, N. Y.

Filed June 1, 1888. Serial No. 275,736. (No specimens.)



Claim.—The combination of the sheets and cleat A, provided with the ridge B, having flat top *b*, flanges C, and upturned edges D, and cornice G, having ridge B, and flange C, with upturned edge D, substantially as and for the purposes specified.

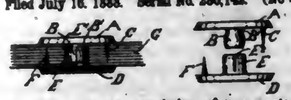
401,907. WHEELED SCRAPER. CHARLES H. SAWYER, Minneapolis, Minn., assignor of one-half to H. A. Smith, same place.

Filed June 18, 1888. Serial No. 277,491. (No model.)

Claim.—1. In a machine of the class described, the combination with the cranked axle, of the pan or shovel 2, suspended from said axle, a bail, 5, securing the front of the pan to the tongue, and a snitable casting securing the axle to the tongue, and a slot, 9, in said casting, which receives the axle, allowing it to slide in said slot, in the manner and for the purpose substantially as described.

2. In a machine of the class described, the combination, with the crank-axle, of a lever secured to said axle, a pan suspended below said axle and connected with the tongue by a suitable bail, a snatch-bar located beneath said tongue, a lever, 12, pivoted upon the tongue and connected with the draft-bar, and the chain 20, connecting the end of said lever 12 and the snatch-bar and passing over the lever 8 and connected with the end of the pan, substantially in the manner and for the purpose as described.

3. In a machine of the class described, the combination, with the crank-axle, of a lever operating said axle, a pan suspended below said axle and connected with the tongue by a suitable bail, a snatch-bar located beneath said tongue, a lever, 12, pivoted upon the tongue and connected with the draft-bar, a chain connecting the end of the lever 12 with the snatch-bar, and a block or stop secured to the chain and arranged to be brought in contact with the operating-lever and draw it downward and raise the pan, substantially as described.

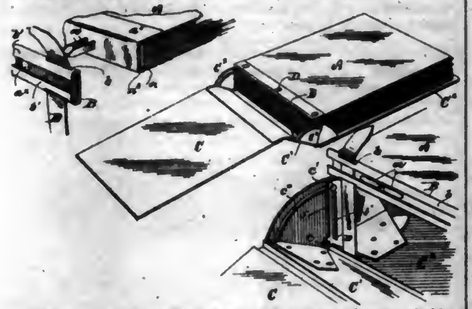


4. In a machine of the class described, the combination, with the tongue, of the snatch-bar located beneath the said tongue, the lever 32, pivoted on the said tongue, and a latch, 30, pivoted in said lever and engaging said snatch-bar, in the manner and for the purpose substantially as described.

5. In a machine of the class described, the combination, with the cranked axle, of a pan suspended from said axle, a lever for operating said axle, and a chain, 20, operating to draw the lever and pan together by the draft on the snatch-bar, substantially as described.

6. In a machine of the class described, the combination, with the draft bar or evener, of the lever 12, pivoted to the tongue and connected with the said evener, the snatch-bar sliding on said tongue, a locking device located on said tongue and engaging said snatch-bar, and a chain connecting the end of the snatch-bar with the lever 12, in order that as the said lever is thrown forward the snatch-bar will be drawn back and brought in engagement with the locking device, in the manner and for the purpose substantially as described.

401,908. SEPARABLE BUTTON. GUSTAVUS A. SCHLICHTER, Reading, Pa.



Filed July 16, 1888. Serial No. 280,142. (No model.)

Claim.—A button or badge consisting of two parts with engaging shanks, substantially as described, each of said parts having a pin projecting from its inner face parallel with the shank, for the purpose set forth.

401,909. PAD-BOOK. JOHN R. SCHOMACKER, Springfield, Ohio, assignor to the Book Metal Company, same place.

Filed Mar. 17, 1888. Serial No. 267,560. (Model.)

Claim.—1. A pad-book composed of a series of section-holders hinged together independently of the case or cover and provided with detachable pads, substantially as and for the purpose set forth.

2. The combination, with the case or covers, of flexible binding-strips and the removable section-holders having the folded edges, as described, and openings through which said binding-strips are adapted to pass, substantially as and for the purpose set forth.

3. The combination, in a pad-book, of the removable section-holders joined together by the flexible strips, and the detachable pads secured to said section-holders, substantially as set forth.

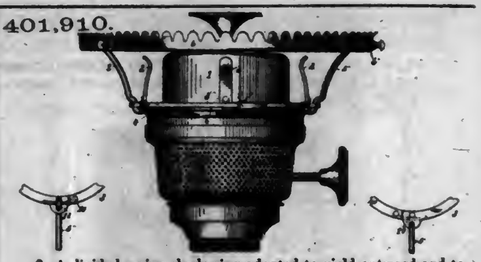
4. The combination, in a pad-book, of a series of pads each provided with a metallic plate secured to one end thereof and having flexible projecting points or cleats adapted to pass through a section-holding device and be clinched thereto, substantially as and for the purpose set forth.

5. The combination, in a pad-book, of the section-holders having the folded edges and arranged in series, of the flexible strips, as described, and the detachable pads, each having the metallic plate and projecting points or cleats, said points or cleats being adapted to pass through openings in said section-holders and be clinched thereto, substantially as and for the purpose set forth.

6. The combination, in a pad-book, with the cover formed of three parts, the bottom and end portions of which are hinged together by pivoted sectors, one of which is provided with a slotted opening and the other with a stationary pin or stud adapted to move in said slot, of a series of section-holders secured to said cover adapted to turn independent thereof, and detachable pads connected to said section-holders, substantially as and for the purpose set forth.

7. The combination, with the section-holders having a metallic plate with projecting flexible points or cleats, said plate being first covered with a strip of cloth glued or otherwise firmly secured to the end of said pad, of a binding-strip passed around said cloth-covered plate and the ends thereof glued or otherwise secured to the top and bottom of said pad, substantially as and for the purpose set forth.

8. The combination, with a hinged cover, as described, of the flexible binding-strips secured at the lower end to said cover, the removable section-holders having folded edges with openings therein through which said binding-strips are adapted to pass, a series of pads each provided with a metallic plate having projecting flexible points or cleats, and openings in said section-holders through which said cleats are adapted to pass and be clinched for the purpose of holding said pads in position on said section-holders, substantially as and for the purpose set forth

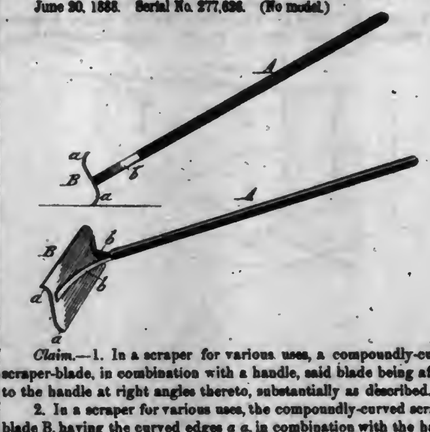


9. The combination, with a case or cover, of the series of section-holders and their attached pads, said section-holders being extended beyond the sides of said pads and adapted to rest against a flange or projection to keep the same in line, as set forth.

10. The combination, with the covers of a book or case, of a hinge formed of pivoted sectors, one of which is provided with a stud adapted to operate in a slotted opening in the other, substantially as and for the purpose set forth.

401,910. SHADE-HOLDER. GEORGE H. SOMERS, Bridgeport, Conn., assignor to The Bridgeport Brass Company, of Connecticut.

Filed Sept. 15, 1888. Serial No. 285,473. (No model.)

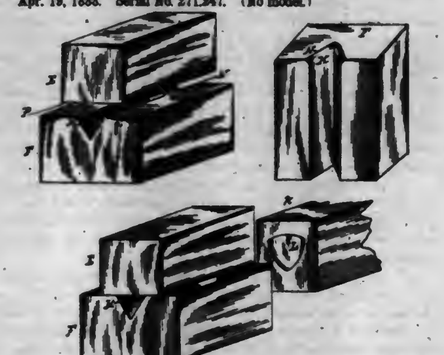


Claim.—1. A divided spring shade-ring adapted to yield outward and to contract in a horizontal plane, whereby it is retained in position on burners of varying size, one end of said ring having a guide and the other end constructed to slide freely therein, so that both of said ends are held against springing in any direction except away from each other.

2. A divided spring shade-ring adapted to yield outward and to contract and having shade-arms, the ends of which pass twice through the ring, forming loops 11 on the under side, one end of said ring having a guide-rod, 10, constructed to engage one of said loops on the other end, whereby both ends are held against movement except toward or from each other in the horizontal plane.

401,911. SCRAPER. ARCHIBALD STEWART, Keota, Iowa.

Filed June 30, 1888. Serial No. 277,636. (No model.)



Claim.—1. In a scraper for various uses, a compoundly-curved scraper-blade, in combination with a handle, said blade being affixed to the handle at right angles thereto, substantially as described.

2. In a scraper for various uses, the compoundly-curved scraper-blade B, having the curved edges *a a*, in combination with the handle A and the braces *b b*, substantially as described.

3. In a scraper for various uses, the combination of the handle A, the compoundly-curved scraper-blade, and the braces for securing said blade to the handle at right angles thereto, all the parts being arranged so that the said device may serve as a pulling scraper or as a pushing scraper, substantially as described.

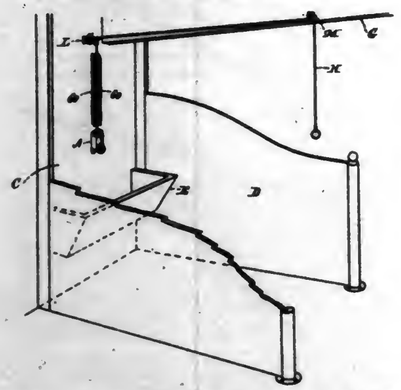
401,912. GRIPPING-DIE. WILLIAM TAYLOR, Allegheny, Pa.

Filed Apr. 19, 1888. Serial No. 271,247. (No model.)

Claim.—1. In a wire-nail machine, a pair of gripping-dies constructed to have or present by the junction of said dies a receiving-cavity all of whose transverse sections are substantially equal triangles, and the faces of which triangular cavity extend to and intersect exposed faces of the dies, whereby the said faces of the cavity are accessible, substantially as set forth.

2. In a wire-nail machine, a pair of gripping-dies constructed to have or present by the junction of said dies a wire-receiving cavity all of whose transverse sections are substantially equal triangles, said cavity having three substantially equal faces or walls, and the two

dies being separable on a plane which coincides with the line of intersection of two of the said faces or walls, substantially as set forth.



401,918. METAL CAN, BOX, OR OTHER RECEPTACLE. Gustavus A. Warner, New York, N. Y. Filed Feb. 25, 1889. Serial No. 301,094. (No model.)

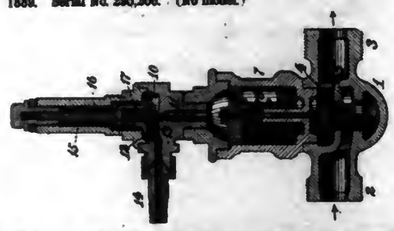
Claim.—1. A metal can, box, or receptacle having around its perimeter a projection on the margins or corners of which are incisions, substantially as specified.

2. A metal can, box, or receptacle having around its perimeter a projection on the margins or corners of which are incisions, and a tongue upon said projection, substantially as specified.

401,914. ANIMAL-RELEASING DEVICE. Gilbert A. Watenhouse, Quincy, Mass. Filed Oct. 27, 1888. Serial No. 289,260. (Model.)

Claim.—1. In an animal-releasing device, the combination of a hollow body provided with a slot for receiving a detachable bar, a bar provided with a wedge-shaped inwardly-projecting portion and a retaining-stud on its side, a coiled spring disposed in said body and detachably securing the bar therein, and a lever pivoted to said bar and adapted to overcome the pressure of said spring, whereby the bar may be released from the body, substantially as set forth.

2. In an animal-releasing device, the combination of a hollow body provided with a slot for receiving a releasing-bar, a bar adapted to be disposed in said body and provided with an inwardly-projecting wedge, a retaining-stud, and a central opening for receiving a releasing-cord, a spring disposed in said body for detachably securing the bar therein, a lever pivoted to said bar and provided with openings for the releasing-cord and a beveled portion to engage the wedge on said bar, and a releasing-cord disposed in the openings in said bar and lever, whereby the bar may be released from said body when the cord is pulled, substantially as described.



3. In an animal-releasing device, the hollow body A, having the slot *d*, in combination with the spring *i*, provided with the projection *l*, and the bar B, provided with the stud 15, said bar being fitted to enter said body and be detachably secured therein by said spring, substantially as set forth.

4. In an animal-releasing device, the combination of the body A, provided with the slot *d*, the bar B, adapted to enter said slot, and provided with the wedge portion *z* and stud 15, the spring *i*, having the projection *l*, for engaging said bar and detachably securing it in said body, and the lever K, provided with the beveled edge 55, whereby the pressure of said spring may be overcome and the bar released, substantially as described.

5. In an animal-releasing device, the bar B, provided with the hole *x*, wedge *z*, and a stud, 15, in combination with the body A, provided with the slot *d*, for receiving said bar, the spring *i*, for detachably securing the bar within said body, the lever K, pivoted to said bar and provided with the opening 35 and eye 45, and the cord H, disposed in said bar and lever, substantially as and for the purpose described.

6. In an animal-releasing device, the combination of the body A, provided with the slot *d*, the bar B, adapted to be disposed in said body and provided with the extension *g*, ring F, opening *x*, wedge *z*, and retaining-stud 15, the spring *i*, disposed in said body and acting torsionally to secure the bar therein, the lever K, pivoted to said bar and provided with the opening 35, eye 45, and beveled portion 55, the cord H, disposed in the opening in said bar and lever, and the spring-clamps L M, for detachably supporting said cord, all being arranged substantially as described.

401,915. AUTOMATIC PUMP-GOVERNOR FOR BRAKE MECHANISMS. George Westinghouse, Jr., Pittsburg, Pa. Filed Jan. 2, 1889. Serial No. 295,906. (No model.)

Claim.—1. The combination of a valve-body having supply and delivery connections, an unbalanced regulating-valve controlling communication between said connections and having its opening movement in the direction of delivery, a piston positively connected to the regulating-valve and working in a chamber secured to the valve-body, a spring exerting pressure upon said piston conjointly with the unbalanced supply-pressure on the regulating-valve, a movable abutment working in a chamber having a connection communicating with a brake-pipe, an air-pressure valve connected to said abutment and controlling an air-supply port leading from the chamber thereof to the piston-chamber, a spring exerting pressure on said abutment in opposite direction to the brake-pipe pressure thereon, and an exhaust-port leading out of the piston-chamber, substantially as set forth.

2. The combination of a valve-body having supply and delivery connections, an unbalanced regulating-valve controlling communication between said connections and having its opening movement in the direction of delivery, a piston positively connected to the regulating-valve and working in a chamber secured to the valve-body, a spring exerting pressure upon said piston conjointly with the unbalanced supply-pressure on the regulating-valve, two movable abutments working in chambers having connections communicating, respectively, with a brake-pipe and with a main air-reservoir, two air-pressure valves each connected to one of said abutments and controlling an air-supply port leading from the chamber thereof to the piston-chamber, springs exerting pressure on the abutments in opposite direction to the brake-pipe and reservoir-pressure thereon, and an exhaust-port leading out of the piston-chamber, substantially as set forth.

401,916. ENGINEER'S BRAKE-VALVE. George Westinghouse, Jr., and Frank Moore, Pittsburg, Pa. Filed Jan. 2, 1889. Serial No. 295,912. (No model.)

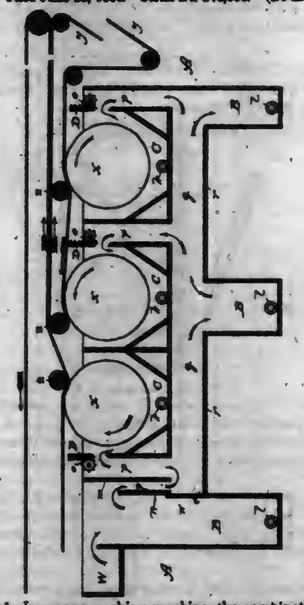
Claim.—1. In an engineer's brake-valve, the combination of a movable abutment and a connected discharge-valve controlling the exhaust of air from a brake-pipe, said abutment being adapted to open the discharge-valve by a disturbance of equilibrium of pressure on its opposite sides, and to close and maintain the closure of the discharge-valve in and by the restoration of such equilibrium, substantially as set forth.

2. In an engineer's brake-valve, the combination of a discharge-valve controlling the exhaust of air from a brake-pipe, a movable abutment connected to the discharge-valve, and a regulating-valve controlling ports by which, respectively, an equilibrium of pressure is established and a difference of pressure is effected on opposite sides of the abutment to maintain the closure and effect the opening and closure of the charge-valve, substantially as set forth.

3. In an engineer's brake-valve, the combination of a movable abutment fitted to work in a chamber communicating with a brake-pipe connection on one side of the abutment, a discharge-valve connected to said abutment and controlling a pipe leading from the brake-pipe connection to the atmosphere, a supply-port for establishing equilibrium of brake-pipe pressure in the chamber on opposite sides of the abutment, an exhaust-port for relieving pressure in the chamber on the side of the abutment opposite that which is in communication with the brake-pipe connection, and a regulating-valve controlling said supply and exhaust ports, substantially as set forth.

4. In an engineer's brake-valve, the combination of a valve casing or chamber, a main air-reservoir connection and a brake-pipe connection leading thereinto, a direct supply-port formed in a valve-seat in the chamber and adapted to establish direct communication between said connections, a movable abutment fitted to work in a chamber in the casing communicating on one side of the abutment with the brake-pipe connection, a discharge-valve connected to said abutment and controlling a passage from the brake-pipe connection to the atmosphere, an equalizing supply-port leading from the abutment-chamber to the valve-seat on the side of the abutment opposite to that which is open to the brake-pipe connection, and a regulating-valve working on the valve-seat and controlling the direct supply and equalizing ports, substantially as set forth.

5. In an engineer's brake-valve, the combination of a valve casing or chamber, a main air-reservoir connection, and a brake-pipe connection leading thereinto, a direct supply-port formed in a valve-seat in the chamber and adapted to establish direct communication between said connections, a loaded valve governing an extra pressure-port leading from the valve-seat to the brake-pipe connection, a movable abutment fitted to work in a chamber in the casing communicating on one side of the abutment with the brake-pipe connection, a discharge-valve connected to said abutment and controlling a passage from the brake-pipe connection to the atmosphere, a primary and a secondary equalizing-port, each leading from the abutment-chamber to the valve-seat on the side of the abutment opposite to that which is open to the brake-pipe connection, and a regulating-valve working on the valve-seat and controlling the several port-openings therein, substantially as set forth.



6. In an engineer's brake-valve, the combination of a valve casing or chamber, a main air-reservoir connection and a brake-pipe connection leading thereinto, a direct supply-port formed in a valve-seat in the chamber and adapted to establish direct communication between said connections, a movable abutment fitted to work in a chamber communicating on one side of the abutment with the brake-pipe connection, a discharge-valve connected to said abutment and controlling a passage from the brake-pipe connection to the atmosphere, an equalizing supply-port leading from the abutment-chamber to the valve-seat on the side of the abutment opposite to that which is open to the brake-pipe connection, an exhaust-port leading from the valve-seat to the atmosphere, and a regulating-valve working on the valve-seat and controlling the several port-openings therein, substantially as set forth.

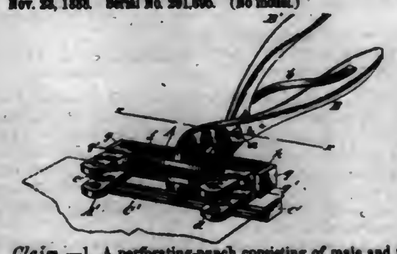
7. In an engineer's brake-valve, the combination of a valve-casing or chamber, a main air-reservoir connection and a brake-pipe connection leading thereinto, a direct supply-port formed in a valve-seat in the chamber and adapted to establish direct communication between said connections, a direct exhaust-passage leading from the valve-seat to the atmosphere, and a regulating-valve working on the valve-seat and controlling the direct supply-passage and having a recess or cavity adapted to establish communication between the brake-pipe connection and the direct exhaust-passage, substantially as set forth.

8. In an engineer's brake-valve, the combination of a valve casing or chamber, a main air-reservoir connection and a brake-pipe connection leading thereinto, a direct supply-port formed in a valve-seat in the chamber and adapted to establish direct communication between said connections, a direct exhaust-passage leading from the valve-seat to the atmosphere, a discharge-valve controlling an independent exhaust-passage from the brake-pipe connection, a movable abutment connected to the discharge-valve, and a regulating-valve controlling ports by which, respectively, an equilibrium of pressure is established and a difference of pressure is effected on opposite sides of the abutment, and also controlling communication between the direct supply-port and the brake-pipe connection and between the brake connection and the direct exhaust-passage, substantially as set forth.

9. In an engineer's brake-valve, the combination of a movable abutment fitted to work in a chamber communicating with a brake-pipe connection on one side of the abutment, a supplemental reservoir communicating with said chamber on the other side of the abutment, a discharge-valve connected to said abutment and controlling a pipe leading from the brake-pipe connection to the atmosphere, a supply-port for establishing equilibrium of brake-pipe pressure in the chamber on opposite sides of the abutment, an exhaust-port for relieving pressure in the chamber on the side of the abutment opposite that which is in communication with the brake-pipe connection, and a regulating-valve controlling said supply and exhaust ports, substantially as set forth.

401,917. PAPER-MAKING MACHINERY. Samuel Wilmot, Lockport, Ill. Filed June 25, 1888. Serial No. 278,006. (No model.)

Claim.—1. In a paper-making machine, the combination of the pulp-reservoir W, cylinders X, separate cylinder-vats C, provided with controllable outlets *k*, conduits leading to said vats, and gates D, whereby one vat may be filled or emptied independently of the other or others, substantially as described.



2. In a paper making machine, the combination of a vat, A, cylinders X, separate cylinder-vats C, provided with controllable outlets *k*, supported within the vat A above its floor and forming a passage, *g*, passages *p*, and gates D, substantially as described.

3. In a paper-making machine, the combination of cylinders X and independent cylinder-vats C, having inlet-gates D and controllable outlets *k*, the side walls of the vats, converging toward said outlets, substantially as described.

4. In a paper-making machine, the combination of the pulp-reservoir W, cylinders X, cylinder-vats C, and suitable conduits leading from the pulp-reservoir to the cylinder-vats provided with traps or settling-boxes, substantially as described.

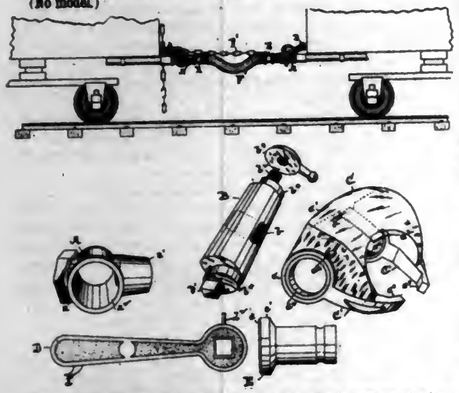
5. In a paper-making machine, the combination of a pulp-reservoir, a vat, A, cylinders X, cylinder-vats C, provided with controllable outlets *k*, supported within the vat A above its floor and forming a passage, *g*, passages *p*, partitions *m* and *n*, gates D and *a'*, and traps or settling-boxes B, having controllable outlets *l*, substantially as described.

401,918. PUNCH. William H. Woglom, Brooklyn, N. Y. Filed Nov. 23, 1888. Serial No. 291,895. (No model.)

Claim.—1. A perforating-punch consisting of male and female punching-jaws A A', having handles B B', crossed and pivoted together, the punching-jaws branched laterally and the respective branches formed with two punches and dies, and one of the jaws provided with guiding projections *g g*, projecting from it past the other jaw, and formed with perpendicular faces engaging opposite guiding-faces on the other jaw, whereby the lateral displacement of the jaws is prevented.

2. A perforating-punch consisting of male and female punching-jaws A A', having handles B B', crossed and pivoted together, the punching-jaws branched laterally and the respective branches formed with two punches and dies, and one of the jaws formed with two aligned grooves crossing its branches in a direction parallel with the pivotal axis, and a side guide, C, consisting of a plate adjustable longitudinally in said grooves, and a set-screw for fastening said plate to the jaw.

401,919. COFFEE OR TEA POT. GALE W. ADAMS, Candor, N. Y., assignor of one-half to Frank J. Horton, same place. Filed Feb. 5, 1889. Serial No. 298,738. (No model.)



Claim.—1. In a coffee or tea pot, an interior cylinder, B, of slightly less diameter than the diameter of the pot, with a packing-ring connected with the said cylinder B, and a vent through the wall of the said cylinder below the line of the packing, substantially as described.

2. In a coffee or tea pot, an interior cylinder, B, a packing-ring on the outer circumference of said cylinder, forming a steam-tight chamber below the same between the walls of the cylinder and the coffee-pot, and a condenser in the top of said cylinder, substantially as described.

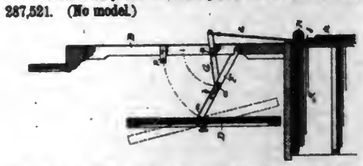
3. In combination with a coffee or tea pot, a cylinder, B, having a perforated bottom, a packing-ring around the outer circumference thereof, a safety-vent through the wall of the cylinder below the packing-ring, a condenser in the top of said cylinder, and a cover, substantially as described.

401,920. STEAM-PIPE COUPLING FOR RAILWAY-CARS. LORIN ALDRICH, Indian Orchard, Mass. Filed Feb. 7, 1888. Serial No. 263,317. (No model.)

Claim.—1. The pipe-coupling herein described, composed of two members, one of said members comprising a plug-cock for closing the passage through the coupling, the plug of said cock having at or near each end portions which are eccentric to its axial center, and two clamping-jaws for engaging the second member, said jaws at their rear ends being swiveled upon said eccentric portions of said plug, substantially as described, whereby rotation of said plug will impart a bodily movement to said jaws.

2. The pipe-coupling herein described, composed of two members, one of said members consisting of shell A, having transverse chamber a^2, plug B, having orifice b therein seated in said chamber, jaws C, mounted upon said plug upon each side of shell A and operating-lever D, and the other of said members consisting of tubular head E, having peripheral flange e' thereon, substantially as set forth.

3. The pipe-coupling herein described, composed of two members, one of said members consisting of shell A, having annular bearing-face a' and chamber a^2, plug B, having orifice b and eccentric portions b^4, frame C, having journals c and jaws C', and the second member consisting of head E, having annular bearing-face e and flange e', substantially as and for the purpose set forth.



4. The pipe-coupling herein described, one member of which consists of the plug-cock A B, the plug of which is provided with the eccentric portions b^4, frame C, carrying jaws C' and having journals c to receive said eccentric portions of the plug, a lever fitted at one end to said plug; and a stop projecting from said frame C into the path of movement of said lever, and the second member of which consists of head E, arranged and operating substantially as described.

5. In a pipe-coupling, a first member consisting of plug-cock A B, and jaws C', having both a rocking and reciprocating movement upon said cock, said jaws having at their outer ends the inclined surfaces c^3, and a second member consisting of head E, having flange e' thereon, the rear face of which is inclined to correspond with the inclination of said surfaces c^3 of jaws C', arranged and operating substantially in the manner and for the purpose described.

6. In a pipe-coupling, a first member consisting of shell A, plug B, having eccentrics b^4 at each end thereof, frame C, carrying jaws C', said frame having journals c to receive said eccentrics b^4, and having stops c' c^4 and spring c^5, and lever D, having stop d^3 thereon, and a second member consisting of head E, having flange e' thereon, substantially as described.

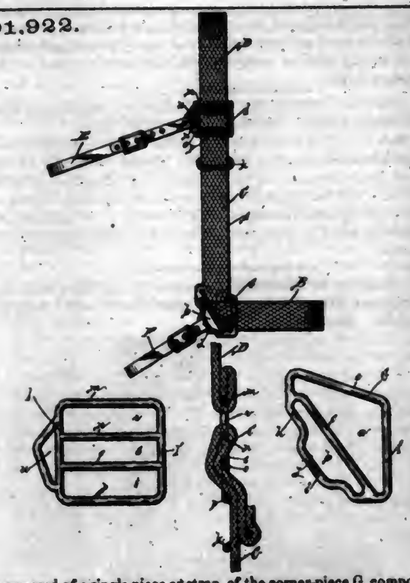
7. As a means of connecting the ends of the steam-heating pipes of two adjoining cars with the ends of a short flexible pipe extending between the cars, the coupling herein described, composed of a first member adapted to be secured to the ends of the pipes on the cars, and a second member adapted to be secured to the ends of the intermediate pipe, said first member consisting of shell A, plug B, having eccentrics b^4, frame C, mounted upon said eccentrics and carrying jaws C', said frame having stops c^3 c^4, and lever D, having lug d' and stop d^3 thereon, and said second member being composed of tubular head E, having flange e', in combination with a chain or similar device connected at one end to one of the cars and detachably secured at its opposite end to the lever D on the adjoining car, said chain being of less length than the intermediate pipe, whereby said lever will be automatically operated by a movement of the cars away from each other, substantially in the manner and for the purpose set forth.

401,921. HANGER FOR MIRRORS OF BUREAUS. JOSEPH R. ANDERSON, Philadelphia, Pa., assignor of two-thirds to Franklin B. Reeves and Charles Henry Reeves, same place. Filed Oct. 8, 1888. Serial No. 287,521. (No model.)

Claim.—1. The combination of the frame of a bureau or like article of furniture, a mirror adapted to said frame, and a hanging device consisting of arms pivoted to the mirror and to the frame and levers pivoted to said arms and to the frame having longitudinal play at one set of pivots, all substantially as specified.

2. The combination of the frame of a bureau or like article of furniture, the mirror adapted to said frame, the hanger-arms pivoted to the mirror and to the lower portion of the frame, levers pivoted to said arms and to the lower portion of the frame, and one or more springs acting on said levers and serving to counterbalance the weight of the mirror, all substantially as specified.

3. The combination of the frame of a bureau or like article of furniture, the mirror adapted to said frame, the hanger-arms pivoted to the mirror and to the frame, levers pivoted to said arms and to the frame and having longitudinal play on the latter pivots, and one or more counterbalance-springs acting on the levers, all substantially as specified.



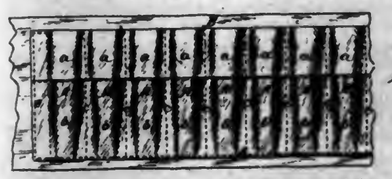
4. The combination of the frame of a bureau or like article of furniture, a mirror adapted to said frame, pivoted hanging devices at the opposite ends of the mirror, cord or chains connected to said hanging devices, a winding-drum for said cords or chains, and one or more springs acting on said drum and serving to wind up the cords or chains thereon, substantially as specified.

5. The combination of the frame of a bureau or like article of furniture, the mirror adapted to said frame, the hanger-arms pivoted to the mirror and to the frame, levers hung to said arms and to the frame, and catches whereby the arms are held in their upright or normal position, all substantially as specified.

401,922. HALTER. EDWARD BARNARD, Rome, N. Y. Filed Oct. 4, 1888. Serial No. 287,209. (No model.)

Claim.—1. The combination, with a halter having crown, cheek, nose, chin, and throat pieces, with the cheek-strap C and nose-strap

401,922.



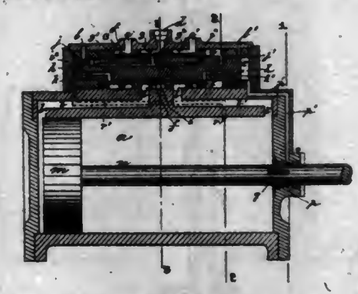
B, composed of a single piece or strap, of the corner-piece G, composed of its inclosing sides, and the diagonal cross-bar c, forming the slots a and b between the cross-bar c and the inclosing sides of the corner-piece, substantially as and for the purpose set forth.

2. The combination, with the herein-described halter, of the corner-piece G, having the cross-bar c extending diagonally across the corner-piece, the sides e and f meeting at an angle with their adjacent extremities opposite to the bar c and forming the triangular slot e, interposed between said sides e and f and the cross-bar c, the side i, substantially parallel to the cross-bar, forming the slot b, interposed between the side i and the cross-bar c, and having the enlargement d formed by a depression in the side i, substantially as and for the purpose set forth.

3. The combination, with a halter having crown, cheek, and nose straps formed of a continuous piece or strap, of the corner-piece G, composed of its inclosing sides, and the diagonal cross-bar c, forming the slots a and b between the cross-bar c and the inclosing sides of the corner-piece, and means for adjustably connecting the crown-strap and cheek-strap, substantially as and for the purpose set forth.

4. The combination, with a halter having crown, cheek, and nose straps formed of a continuous piece or strap, of the corner-piece G, composed of its inclosing sides, and the diagonal cross-bar c, forming the slots a and b between the cross-bar c and the inclosing sides of the corner-piece, with a buckle or loop, I, formed with a series of slots for adjustably connecting together the extremities of the halter-strap, substantially as and for the purpose set forth.

401,923. POCKET FOR CARTRIDGES. GEORGE BARNARD, Chicago, Ill. Filed Feb. 7, 1889. Serial No. 299,047. (No model.)



Claim.—1. A cartridge-holding pocket consisting of an upper yielding portion and a lower non-yielding portion, and having both portions fluted and united at the side edges to a backing, substantially as and for the purposes specified.

2. A cartridge-holding pocket consisting of an upper yielding portion and a lower non-yielding portion, and having both portions fluted and united at the side edges to a backing, with the non-yielding portion closed at the end, substantially as and for the purposes specified.

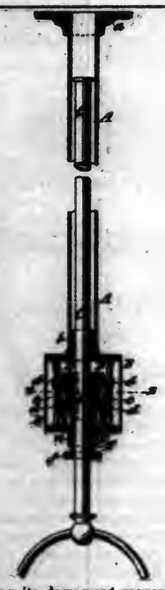
3. A cartridge-holder consisting of a number of pockets, A, having a yielding upper portion, a, and a non-yielding lower portion, b, and a backing-strip, B, for receiving and retaining cartridges of different sizes, substantially as specified.

401,924. VALVE FOR STEAM-ENGINES. GUSTAV A. BARTH, St. Louis, Mo., assignor to Pierre Chouteau, same place. Filed Feb. 2, 1889. Serial No. 298,473. (No model.)

Claim.—1. In a steam or other motive power engine, the combination of a cylinder having inlet and exhaust ports and passages, a steam-chest having inlet and exhaust ports and containing a slide or distribution valve provided with an auxiliary valve having passages opening from and into the steam-chest, a piston fitted within a cylinder, and a piston-rod having a groove or passage, with separate relief-passages opening from the cylinder into the steam-chest, substantially as shown, and for the purpose described.

2. In a steam or other motive power engine, the combination of a cylinder having combined inlet and exhaust ports and passages, a steam-chest having inlet and exhaust ports and containing a slide or distribution valve, an auxiliary valve fitted in and projecting through the distribution-valve into the recessed ends of the steam-chest, said auxiliary valve having a passage opening from the main inlet-passage of the distribution-valve into the steam-chest behind each end of the distribution-valve and relief-passages opening, respectively, from the steam-chest behind the corresponding ends of the distribution-valve through outlet-ports in the recessed ends of the steam chest into the external air, (or exhaust,) a piston fitted within the cylinder and having a rod passing through the cylinder-cover, said rod having a longitudinal groove or passage, with separate relief-passages opening from the cylinder into the steam-chest behind the respective ends of the auxiliary valve, all operating to hold and reverse the distribution-valve, and so control the admission and exhaust of steam or other motive fluid to and from each side of the piston alternately, substantially as shown and described.

3. The combination of a cylinder, a, having inlet and exhaust ports and passages b b', steam-chest c, having inlet-port d, exhaust-ports e e', and outlet relief-passages l l', a slide or distribution valve, f, located in steam-chest c and formed with circumferential grooves or passages g g' g^2, an auxiliary valve, h, having steam-passages i i' i^2 and relief or exhaust passages j k and j' k', a piston, m, fitted within the cylinder a and provided with a rod, n, passing through a stuffing-box, o, in the cylinder-cover and having a longitudinal groove or passage, q, with separate relief-passages, p p' and r r', substantially as shown, and for the purpose described.

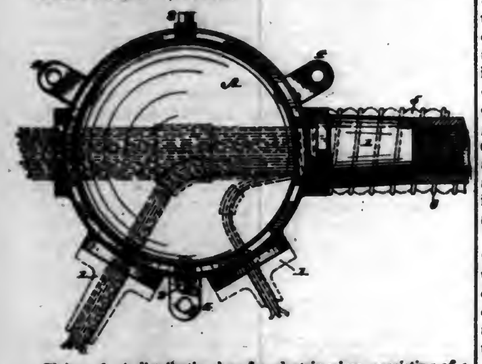


4. The combination of the cylinder a, steam-chest c, distribution-valve f, auxiliary valve h, and piston-rod n, passing through stuffing-box o in cylinder-cover, all being provided with openings and passages, substantially as set forth, the said auxiliary valve h having its respective end portions of different diameters and adapted to slide longitudinally and steam-tight within the correspondingly-recessed ends of the steam-chest c, with the piston m, substantially as shown, and for the purpose described.

401,925. EXTENSION LIGHT-FIXTURE. GEORGE W. BAYLEY, Brooklyn, N. Y. Filed Sept. 13, 1888. Serial No. 285,269. (No model.)

Claim.—In an extension light-fixture, the combination, with a fixed part, of an extensible part, a cylindrical case or shell on the fixed part, guide-rods within said shell extending at a downward incline and secured at their upper and lower ends to the top and bottom of the case or shell, brakes having faces adjacent to the extensible part and provided with lugs or projections, through which said guide-rods loosely extend, and elastic cushions upon the lower ends of said brakes, said brakes being moved to clamp the movable part of the fixture by

401,925.



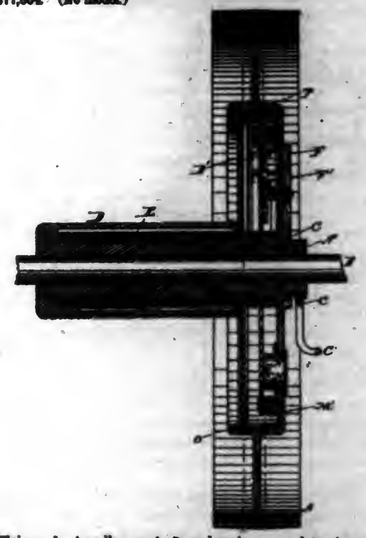
said movable part during its downward movement, substantially as specified.

401,926. PIPE-WRENCH. LEWIS J. BERRENDAHL, Pendleton, Oreg. Filed Dec. 27, 1888. Serial No. 294,811. (No model.)

Claim.—In a pipe-wrench, a rein or handle having an enlarged integral formation at one end, comprising V-shaped gripe with an intersecting space, and pairs of lugs with openings between them arranged in rear of said gripe, a chain connected to and mounted between one pair of said lugs, and a revoluble hooked rod mounted in said handle in rear of the other pair of lugs and adapted to be engaged by the links of the said chain, substantially as described.

401,927. BOX FOR THE DISTRIBUTION OF ELECTRIC WIRES. DAVID ROGERS, Jr., Philadelphia, Pa., assignor to the Electric Cable Construction and Maintenance Company, same place. Filed Nov. 26, 1888. Serial No. 291,982. (No model.)

Claim.—1. A distributing-box for electric wires, consisting of a metallic box with screw-cap and provided with side openings of uniform diameter, nipples for said openings, plugs on opposite sides of said box, and ears at the back thereof, said parts being combined substantially as described.



2. A distributing-box for electric wires, consisting of a metallic box with screw-cap and provided with side openings and nipples therefor, and having plugs on opposite sides, substantially as and for the purpose set forth.

401,928. INSECTICIDE. MELVIN B. CHURCH, Grand Rapids, Mich. Filed Apr. 1, 1887. Serial No. 233,267. (No specimens.)

Claim.—1. As a new article of manufacture, the insecticide hereinbefore described, being an impalpable powder containing an intimate mixture of gypsum and paris-green, in the proportions set forth.

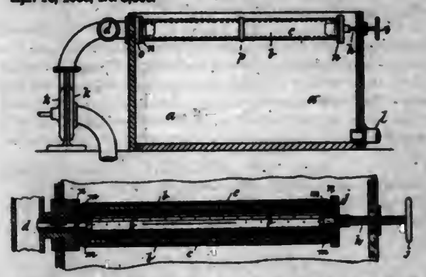
2. As a new article of manufacture, the insecticide hereinbefore described, being an impalpable powder consisting of an intimate and uniform mixture of gypsum, paris-green, and flour, in the proportions set forth.

401,929. POWER-METER. FRANK M. CLARK, Tilton, N. H., and FREDERICK R. LOW, Chelsea, Mass. Filed June 22, 1888. Serial No. 277,864. (No model.)

Claim.—1. A pulley, a shaft, and an interposed torsion-spring, in combination with each other, and in further combination with a registering mechanism integral therewith, and an actuating mechanism driven from a stationary gear concentric with said shaft and with two cams severally fastened to said shaft or pulley and automatically separated at their ends, according to the torsion of the spring, and with an automatic clutch connected with said stationary gear and adapted to engage with and drive the registering mechanism, all substantially as and for the purpose described.

2. The combination of a driving-pulley, a driven shaft, and a torsion-spring between them, one end of which is fast to the driving member of the train, and the other end of which is fast to the driven member of the train, and an actuating-rim mounted concentrically around the center of revolution of said mechanism revolved with it, and also constantly and differentially revolved relatively to it around the common center, according to the speed of revolution of the said mechanism, and a registering-rim mounted concentrically around the same center of revolution, revolved with it, and intermittingly and differentially revolved in relation to it in each revolution through an angular distance corresponding to the moment of stress of the torsion-spring between the driving and the driven member of the mechanism, and an intermittently-actuated clutch which connects the actuating and registering rims in their revolution for an angular distance corresponding to the moment of stress of said torsion-spring, substantially as and for the purpose described.

3. In combination with a driving-pulley and a driven shaft connected together by a torsion-spring, a pair of cams concentric with the center of revolution of said shaft and pulley, one of which pair of cams is in fixed relation with the driving and the other of which pair of cams is in fixed relation with the driven member of the mechanism, and an automatic tripping-clutch actuated by said cams, and a registering-rim, substantially as and for the purpose described.



4. A power-register containing a torsion-spring interposed between the driving and driven members of a power-transmitting mechanism, a pair of cams, one of which is in fixed relation with the driving mechanism and the other of which is in fixed relation with the driven mechanism, the distance of which cams from each other measures the

stress of the torsion-spring, an actuating-rim independently and continuously revolved relatively to and differentially from the said driving and driven mechanisms, an automatic clutch carried by said actuating-rim and thrown into and out of engagement by said cams for a greater or less proportion of each revolution, according to their separation, and a registering-rim actuated by said clutch independently, differentially, and intermittently revolved for a fraction of a revolution, according to the stress of the torsion-spring, all in combination with each other, substantially as described.

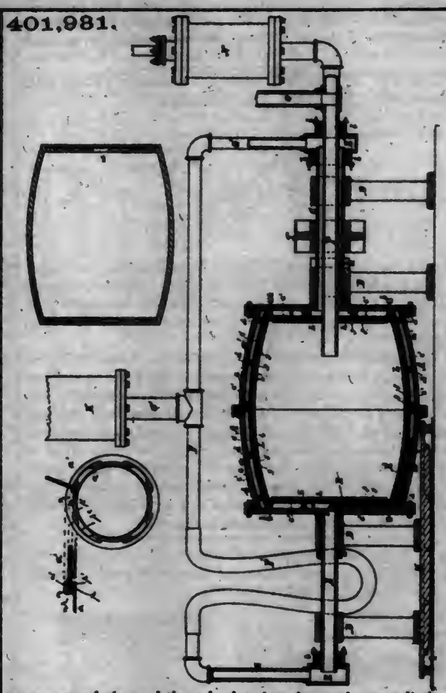
5. The combination of a transmitting-dynamometer, a train of gearing actuated by the revolution thereof and moved at a proportional speed, a registering-rim independent of said train of gearing, but automatically engaged with it and moved by it at intervals, which correspond in angular distance with and are proportional to the strain between the driving and driven members of said dynamometer, and a counter which records the revolutions of said registering-rim, substantially as described.

6. The combination of the transmitting-dynamometer, one member of which drives an actuating-pawl, with said actuating-pawl moved at a proportional speed, and with a registering-rim moved by said actuating-pawl and engaged therewith automatically at intervals and for periods which correspond in angular distance with and are proportional to the strain between the driving and the driven members of the dynamometer, and a counter which registers the revolutions of the registering-rim, substantially as described.

401,930. FILTERING APPARATUS. ROBERT COOPER, HERBERT F. CLAYTON, and GEORGE H. HOLDROYD, Huddersfield, England. Filed July 5, 1888. Serial No. 278,144. (No model.) Patented in England Apr. 18, 1888, No. 5,906.

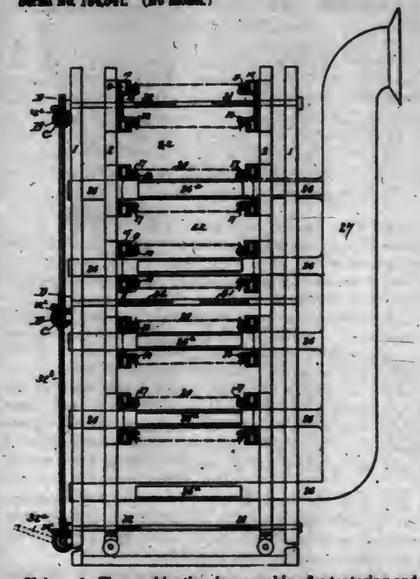
Claim.—1. In a filtering apparatus, one or more perforated tubes, each tube having an exterior covering composed of a filtering medium turned inward over the ends, combined with a tapering nozzle adapted to enter and support one end of the tube, and a tapering plug adapted to enter and support its other end, as and for the purposes described.

2. The combination, in a filtering apparatus, of perforated tubes having rounded or beaded ends, a filtering-cloth wrapped externally on such tubes and having its ends turned inward over such beaded ends and projecting into the tubes, and nozzles and plugs severally projecting into opposite ends of the tubes and holding the tubes to place, all substantially as and for the purposes set forth.



3. In a filtering apparatus, perforated tubes covered externally with filtering-cloth turned at its ends inside said tubes, combined with and supported by tapering plugs and nozzles inserted in the tube end, and elastic packing-rings placed between the ends of the tubes and the said plugs or nozzles to form tight joints and to prevent the cutting of the filtering material, substantially in the manner described.

401,931. MECHANISM FOR THE MANUFACTURE OF BARRELS. WILLIAM H. CRAM, North Windham, Me. Filed July 26, 1888. Serial No. 280,187. (No model.)

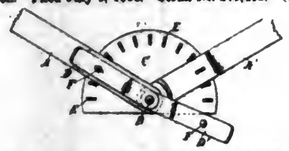


Claim.—1. The mechanism, substantially as described, consisting in the perforated mold and its surrounding case, each made in section separable, and arranged as represented, the tubular shafts projecting from the said case and supported on bearings in standards, the air-exhaust boxes at the outer ends of such shafts, the air-exhaust pump and its pipes leading from such boxes, the railway and carriage for supporting the standards of one of such tubular shafts, the air-pressure pump and pipe, and the pulp-charging pipe, all being arranged to operate essentially as set forth.

2. The combination of the water-discharge pipe with the mechanism, substantially as described, for pressing a barrel in one piece from paper or wood pulp, as explained, such mechanism consisting of the perforated mold and its surrounding case, each made in sections separable, and arranged as represented, the tubular shafts projecting from the said case and supported in bearings on standards, the air-exhaust boxes at the outer ends of such shafts, the air-exhaust pump and its pipes leading from such boxes, the railway and carriage for supporting the standards of one of such tubular shafts, the air-pressure pump and pipe and the pulp-charging pipe, such water-discharge pipe being applied to one of the tubular shafts and extended therefrom down within the space between the next adjacent heads of the case and the mold, as specified.

401,981.

401,982. MACHINE FOR TENTERING AND DRYING FABRICS. FRED. CRAVEN, Brighouse, County of York, England. Filed Dec. 3, 1888. Serial No. 184,541. (No model.)

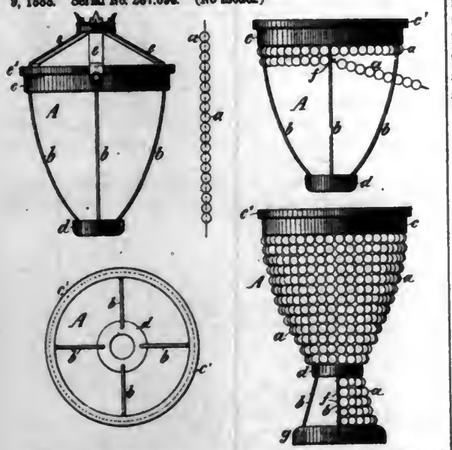


Claim.—1. The combination, in a machine for tentering and drying fabrics, of side frames, a main exhaust-pipe having a series of branch pipes, 26, closed at their outer ends and having elongated slits or air-entrance ways, 26*, steam-pipes 24, and the endless chain 9, having hackle-pins 17, with projecting partition slide-piece 18, all for the purpose and substantially as set forth.

2. In machines for tentering and drying fabrics, the outer frame, the inner adjustable frames, 2, the expansible rollers 3, the chains 9,

supporting-slides 13, having projecting partition-pieces 18, and hackle or tentering pins 17, for the purpose and substantially as set forth herein.

401,933. **FRACTURE APPARATUS.** WILLIAM H. DE CAMP, Grand Rapids, Mich. Filed July 9, 1888. Serial No. 279,463. (No model.)



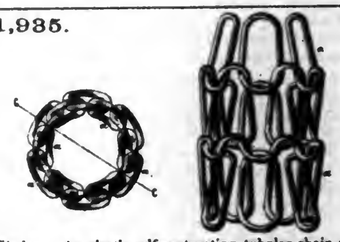
Claim.—1. In combination with surgeons' splints, connecting-bars having a joint, and a disk with its center coincident with the axis of said joint, said bars and disk having openings equidistant from said axis, and stop-pins engaging with said openings, substantially as described.

2. In combination with surgeons' splints, connecting-bars having a joint, auxiliary bars having a similar joint and attached to said connecting-bars, said bars embracing a disk with its axis coincident with that of the said hinges, said bars and disk provided with openings, and stop-pins engaging with said openings, substantially as described.

3. In combination with surgeons' splints, the combination of jointed bars having openings for a stop-pin, a disk with center coincident with the joint of said bars and having corresponding openings for said stop-pin, and a stop-pin attached to a flexible spring pivoted at the center of said disk, substantially as described.

401,934. **GLOBE OR SHADE FOR LAMPS OR LANTERNS.** PAUL R. DE F. D'HUBY, Clapham Rise, County of Surrey, England. Filed Oct. 9, 1888. Serial No. 287,698. (No model.)

Claim.—1. A globe, shade, glass, lamp, or lantern for the electric or other light, consisting of a strong frame or foundation covered with chains of threaded translucent beads or crystals, substantially as herein shown and described.



2. A globe, shade, glass, lamp, or lantern for the electric or other light, consisting of a strong frame or foundation and supplemental frames covered with chains of threaded translucent beads or crystals fixed thereto, substantially as herein shown and described.

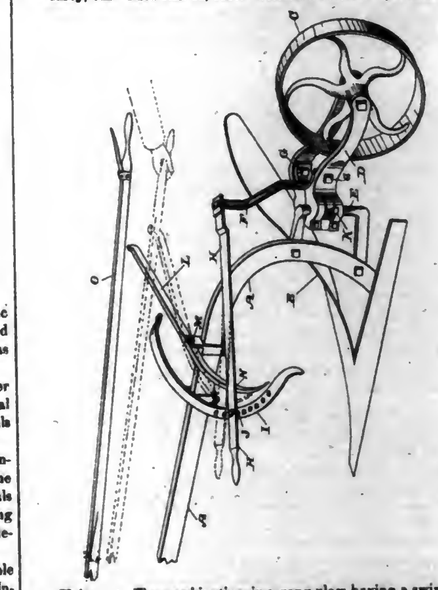
3. In the manufacture of globes, shades, glasses, lamps, or lanterns for the electric or other light, the combination of a strong frame or foundation with chains of threaded translucent beads or crystals fixed thereto by means of fine binding-wires, and the electroplating process over the metallic parts, substantially as herein shown and described.

4. In a shade for lamps, &c., the combination, with a suitable frame having projections, of a string containing a number of translucent beads, crystals, or equivalent articles wound upon said frame and having the string engaged by said projections.

5. In a shade for lamps, &c., the combination of a suitable frame, a string containing a number of translucent beads or equivalent articles mounted on a stiff core and applied to said frame with the desired bending or curving of said core between parts of the frame, and securing wires by which the said core is bound to the parts of the frame where it crosses the same, substantially as set forth.

401,935. **CHAIN.** WILLIAM C. EDER, Newark, N. J. Filed Jan. 17, 1889. Serial No. 296,652. (No model.)

Claim.—An elastic self-contracting tubular chain composed of elongated links *a a*, that are arranged in spiral order, each link interlocking at each end with two other links and each link being fastened to the links interlocking with it near one end, but free to slide on the links with which it interlocks near the other end, substantially as described.

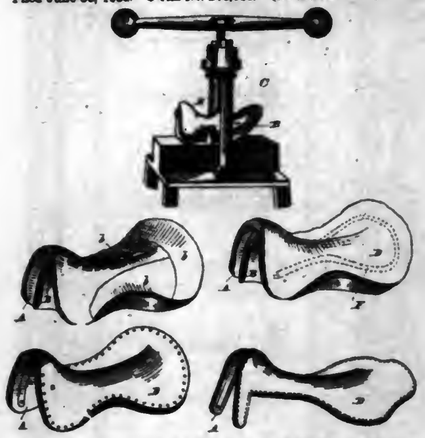


401,936. **ELECTRIC CONDUCTOR.** THOMAS EGLESTON, New York, N. Y., assignor to the Plume & Atwood Manufacturing Company, Waterbury, Conn. Filed June 16, 1885. Serial No. 168,906. (No specimens.)

Claim.—1. A wire or conductor having applied directly to its surface an insulating-covering of fibrous material impregnated with a liquid fireproofing material consisting of a hydrated silicate of an alkali or alkaline earth and a binding material, the impregnated fibrous material forming of itself the insulating-covering for the wire or conductor, substantially as herein described.

2. A wire or conductor having applied directly to its surface an insulating-covering of fibrous material impregnated with a liquid fireproofing material consisting of a hydrated silicate of an alkali or alkaline earth and a binding material, the impregnated fibrous material forming of itself the insulating-covering for the wire or conductor, and also having applied to it an external waterproofing material as a protector to the insulating material, substantially as herein described.

401,937. **GANG-PLOW ATTACHMENT.** EDWARD H. FARMER, Gilroy, Cal. Filed Jan. 11, 1889. Serial No. 296,063. (No model.)



Claim.—1. The combination, in a gang-plow having a swivel rear wheel, of the fork D, the post E, secured to the plow-beam and forming the axis about which the fork turns, the standard F, secured to the fork and connected with the lever N, and the holding-rack, substantially as described.

2. The combination, with a gang-plow and the rear swivel-wheel thereof, of a mechanism whereby the swivel-wheel may be temporarily locked and prevented from turning and released so as to turn freely, and a lever for tripping the locking devices, substantially as described.

3. A gang of plows having the rear wheel swiveled thereto, a lever connected with a swivel-wheel frame, and a rack and locking mechanism for arresting the motion of the swivel-wheel, in combination with a second lever fulcrumed upon the plow-beam, one end extending beneath the swivel-wheel lever and the other beneath the lever O, so as to be actuated thereby, substantially as described.

401,938. **PROCESS OF FORMING FLEXIBLE SADDLE-TREES.** JOHN M. FINK, Louisville, Ky., assignor to Fink & Feldhaus, same place. Filed June 30, 1888. Serial No. 278,618. (No model.)

Claim.—The improved process of forming flexible saddle-trees of layers of leather or other flexible material, consisting in first moistening the layers, then building the saddle-tree from said moistened flexible layers, filling in at proper places with strips *b* to give it the desired shape, placing the cover upon the portion thus formed, then subjecting the tree to pressure between suitable dies, and finally trimming the edges of the layers and strips to the desired shape and size, substantially as specified.

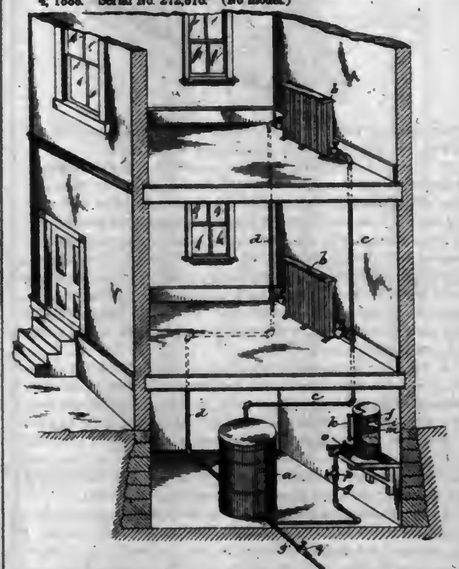
401,939. **FOLDING CARRIAGE.** JOHN F. FLAD, Philadelphia, Pa. Filed Feb. 7, 1889. Serial No. 298,979. (No model.)

Claim.—1. A folding body having axles which are pivoted to said body, and provided with arms which are fitted on rods or guides attached to the body, substantially as described.

2. In a folding carriage, the arms 3, connected with the pivoted axle, the guides 5, attached to the body, said arms adapted to slide on said guides, and the catch 6, engaging with either of said arms, the parts being combined and operating substantially as described.

3. In a folding carriage, the sockets 9 and catch 10, connected with the body thereof, in combination with the handle of the carriage fitted to said sockets and engaged by said catch, substantially as described.

4. In a folding carriage, the springs thereof formed with journals which are mounted on the body thereof, and provided with arms which are connected with rods or guides connected with said body, substantially as described.



5. A folding carriage having a folding body, a handle and wheels removably connected with said body, folding axles pivoted to said body, arms attached to the axle and engaging with the body, and hooks secured to the body for hanging the wheels and handle thereon, said parts being combined substantially as described.

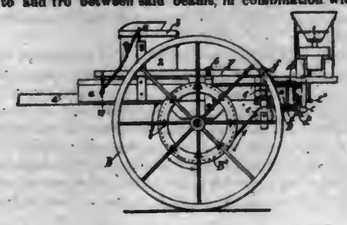
6. In a folding carriage, a sectional hinged body in combination with a spring-frame having its upper ends bent and forming journals having bearings in the sections of said body, substantially as described.

7. In a folding carriage, a sectional hinged body in combination with a spring-frame having its upper ends bent and forming journals having bearings in the sections of said body, and axles pivotally connected to the said frame, substantially as described.

8. A folding carriage consisting of a hinged sectional body with flexible sides, spring-frame with upper ends bent inwardly forming journals having bearings in the under side of the body, arms rising from the spring-frame and having loops at their upper ends, and rods secured to the sides of the sections of the body and having looped ends forming stops, said parts being combined substantially as and for the purpose set forth.

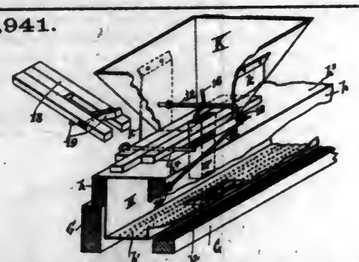
401,940. **HEATING APPARATUS.** EUGENE N. GATES, Fitchburg, Mass., assignor of one-half to H. F. Cogswell, same place. Filed May 4, 1888. Serial No. 272,810. (No model.)

Claim.—1. The combination, with a water heating and circulating system, of a chamber connected at its lower portion with said system and partly filled with the water of the system, a body of air which is compressed by the water-pressure, and a safety-valve whereby water may be released from the system when the pressure on the air exceeds a predetermined degree, as set forth.



2. The combination, with a water heating and circulating system, of a chamber connected at its lower portion with said system and partly filled with the water of the system, a body of air which is compressed by the water-pressure, and a mobile diaphragm interposed between the air and water in said chamber, as set forth.

3. The combination, with a water heating and circulating system, of a chamber connected at its lower portion with said system and partly filled with the water of said system, a body of air in said chamber supporting the pressure of the water, and a diaphragm of oil supported by the water in the chamber, as and for the purpose specified.



4. The combination, with a water heating and circulating system, of a water-supply pipe, *g'*, connected directly with said system and provided with a shut-off cock, *g*, an air-chamber, *f*, a pipe, *g*, connecting the chamber *f* with the said system, and a shut-off cock, *p*, in the pipe *g*, whereby the air-chamber may be shut off from the water heating and circulating system without interfering with the supply of water thereto by the supply-pipe *g'*.

401,941. **INSECT-POWDER DUSTER.** CHARLES B. GLOVER, Houston, Tex., assignor of one-half to William Owen Ellis, same place. Filed June 25, 1888. Serial No. 278,197. (No model.)

Claim.—1. A device for spreading insect-exterminating powder or distributing other material over a field, mounted on wheels, having on rearward extensions of the truck-frame a transverse sifting-box provided with a foraminous bottom, said box having side cleats resting upon beams, extending crosswise of the truck, and adapted to move to and fro between said beams, in combination with hoppers

401,941.

having eduction-spouts passing through ports in the top of the box into and within the sifter-box, substantially as described.

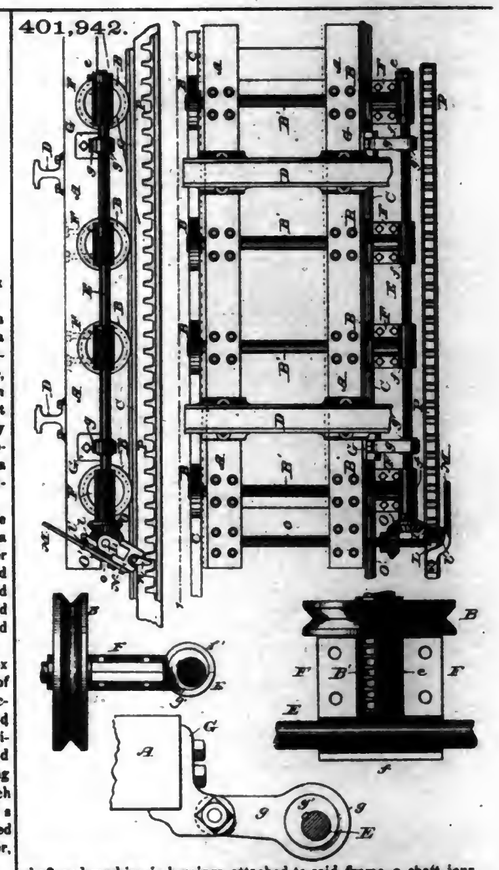
2. In a device for spreading material over a field, mounted upon a propellable truck, to one traction-wheel of which is attached a pulley, B^2, adapted to turn with said wheel, in combination with revoluble shaft C, journaled between beams a^2 a^3, crossing the truck-frame, said shaft having at its rear end a disk-wheel, *c*, provided with an extension-stud, c^2, said wheel B^2 and shaft C geared to rotate at right angles to each other by operative band L, which band intermediately of said shaft and wheel takes onto the grooved peripheries of guide-pulleys d^2 d^3, journaled between upper and lower flanges *d d* of a metal plate, D, connected to the rear end of one side of the truck-frame, substantially as described.

3. In a device for spreading material over a field, having at one of its sides a lever, F, pivoted about midway of its length at 6 to a post uprising from the side of the truck, the forward end of said lever taking onto a fastening device, 10, and having pivoted to its rear end a vertical bar, E', within the lower hooked end of which is journaled a pulley, *e*, all in combination with the gearing of the machine, said gear adapted to be tightened by depression of said lever and released from tension by elevation thereof, substantially as described.

4. In a device for spreading material over a field, the sifter-box H, adjusted to reciprocatingly move transversely across the rear of a propellable truck-frame, said frame having hoppers K, having eduction-spouts extending through port-holes at the top of said box, and having within the mouth of each hopper oscillating stirrer-arms radiating from rods 12, extending within and across each hopper, one end of each rod 12 reaching through one side of each hopper and having a terminal hook, 13, in combination with wire 14, one end of which takes into said hook 13 and the opposite end firmly adjusted to a side, A, of the sifter-box H, whereby, as said box has motion imparted thereto, the stirrer-arms 16 will agitate the contents of each hopper, as and for the purpose intended, substantially as described.

5. In a device for spreading material over a field, having rearwardly of a propellable truck a sifter, H, movable transversely on said truck, provided with feed-hoppers K, the trap-cover shown and described, consisting of a bifurcated strip, 18, having pivoted within its forked opening a tongue, 19, in combination with said hoppers K and sifter H, as and for the purpose intended, substantially as described.

6. In a machine for distributing material over a field, provided with a sifter-box, H, the rotatable disk *c*, having a forward hub, c', extended upon the rear end of a rotatable shaft, C, in combination with pitman-rod 20, one end of which is pivoted to a stud, c^2, extending outwardly from the disk *c* and eccentric from the center of said disk, the opposite end of said pitman being attached to the bottom of the sifter-box H, whereby, when the shaft C is rotated, said box will be reciprocatingly moved transversely across the truck-frame, substantially as described.

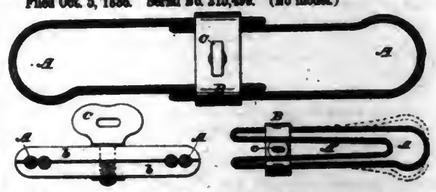


401,942. OFFSET MECHANISM FOR SAW-MILL CARRIAGES. WILLIAM GOWEN, WARREN, Wis. Filed Oct. 5, 1886. Serial No. 215,461. (No model.)

Claim.—1. The combination, in a saw-mill carriage, of a log-frame movable laterally upon its supporting-axles, one set of boxes connected with said log-frame, another set of boxes connected with its axles, a shaft supported lengthwise of said carriage in one set of boxes, eccentrics fixed upon said shaft and working in the other set of boxes, and means for turning the eccentric-shaft, whereby said frame is moved lengthwise of said axles, substantially as and for the purposes set forth.

2. The combination, in a saw-mill carriage, of a log-frame movable laterally upon its supporting-axles, a shaft journaled lengthwise of said carriage in cross-boxes mounted upon said axles, eccentrics fixed upon said shaft, straps or links hinged to said log-frame and working with the peripheries of said eccentrics, and means for turning said eccentric-shaft, substantially as and for the purposes set forth.

3. The combination, in a saw-mill carriage, of a log-frame movable laterally upon its supporting-axles, of a shaft supported in suitable bearings lengthwise of the carriage, eccentrics fixed upon said

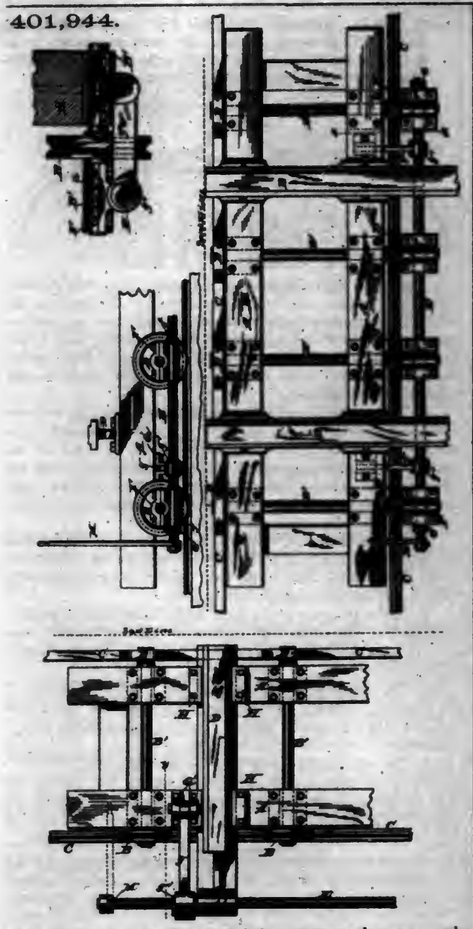


401,942.

shaft and working in bearings attached to said frame, a shaft journaled transversely to the carriage and geared with the eccentric-shaft, and an arm or lever attached to said transverse shaft, substantially as and for the purposes set forth.

4. The combination, in a saw-mill carriage, of a log-frame movable laterally upon its supporting-axles, eccentrics mounted upon a shaft set lengthwise of said carriage and working in bearings attached to said frame, a transverse shaft geared with said eccentric-shaft, and an arm mounted upon said transverse shaft and working in the direction of the travel of the carriage, and a rack or rail to actuate said eccentrics and move said log-frame lengthwise of its axles, substantially as and for the purposes set forth.

401,943. GARMENT-HANGER. WILLIAM GOWEN, WARREN, Wis. Filed Oct. 5, 1886. Serial No. 215,499. (No model.)



Claim.—The combination, in a garment-hanger, of a central supporting-clamp composed of two sections, a screw connecting said sections, and two arms held between the sections of said clamp and longitudinally adjustable therein, substantially as and for the purposes set forth.

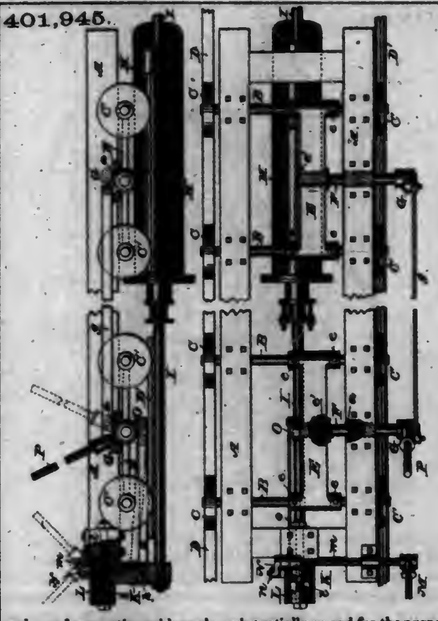
401,944. OFFSETTING DEVICE FOR SAW-MILL CARRIAGES. WILLIAM GOWEN, WARREN, Wis. Filed Dec. 27, 1886. Serial No. 222,607. (No model.)

Claim.—The combination, in a saw-mill carriage, with a guiding-track, of a log-supporting frame, and its wheels and axles having a fixed position transversely to said track, cross-boxes mounted upon

401,944.

said axles and restrained from endwise movement thereon, a rock-shaft journaled lengthwise of said carriage in said cross-boxes and connected with said log-supporting frame, and a lever connected with said rock-shaft and arranged to turn the same and to move said log-supporting frame transversely with reference to the track upon which the carriage travels, substantially as and for the purposes set forth.

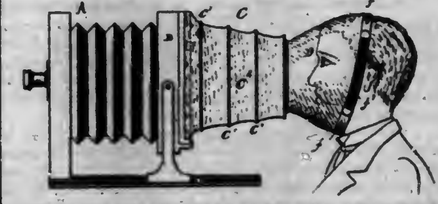
401,945. OFFSETTING DEVICE FOR SAW-MILL CARRIAGES. WILLIAM GOWEN, WARREN, Wis. Filed Jan. 18, 1887. Serial No. 224,704. (No model.)



Claim.—1. The combination, in a saw-mill, with a carriage having a log-supporting frame laterally movable upon its axles, of a yoke mounted and laterally immovable upon its axles, offsetting mechanism connecting said frame and yoke, a crank connected with and arranged to operate said offsetting mechanism, and a carriage-feeding piston having a sliding connection with said frame and connected with said crank, substantially as and for the purposes set forth.

2. The combination, in a saw-mill, of a carriage having a log-supporting frame laterally movable upon its wheels and axles, offsetting mechanism connecting said frame with said axles and wheels, a carriage-feeding piston having a sliding connection with said frame, and a detachable connection with said offsetting mechanism, substantially as and for the purposes set forth.

3. The combination, in a saw-mill, with a carriage having a log-supporting frame laterally movable on its wheels and axles, of a yoke mounted upon two or more of said axles and laterally immovable thereon, and a screw-shaft connecting said frame and yoke and arranged to shift said frame laterally upon its axles, substantially as and for the purposes set forth.



4. The combination, in a saw-mill, with a carriage having a log-supporting frame laterally movable on its wheels and axles, of yokes, each mounted upon two or more of said axles and laterally immovable thereon, screw-shafts connecting said yokes with the log-frame,

401,945.

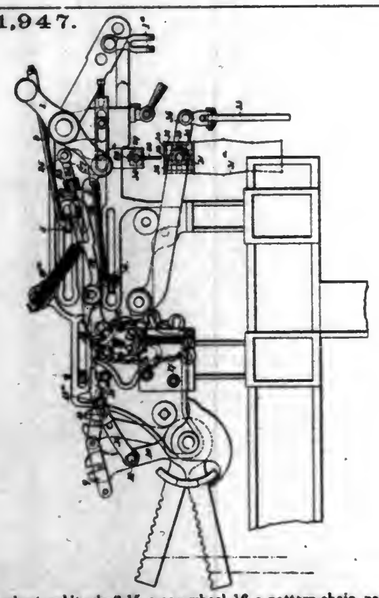
and a rod connecting said cranks, substantially as and for the purposes set forth.

401,946. PHOTOGRAPHIC CAMERA. ROBERT HACKH, New York, N. Y. Filed Sept. 6, 1886. Serial No. 214,715. (No model.)

Claim.—1. A focusing-cloth attachment for photographic cameras, formed of a folding body and of a folding hood or head-piece applied to said body and provided with straps for attaching it to the head, substantially as set forth.

2. The combination, in a photographic camera, with a focusing-frame, of a focusing-cloth attachment composed of a folding body and a cap or head-piece adapted to turn on said body, substantially as set forth.

3. In a photographic camera, the combination, with a focusing-frame, of a folding body formed of wire frames of diminishing size and a connecting-fabric, and a ring-shaped guide-frame connected to the outermost wire frame, and a cap or head-piece connected to said guide-frame and provided with straps for attachment to the head, substantially as set forth.



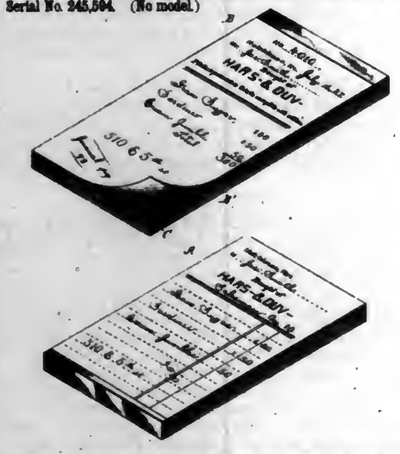
401,947. SHEDDING MECHANISM FOR LOOMS. CHARLES HAMLO, CHARLES R. LUMBROSO, and THEOPHILUS HANSON, Bradford, County of York, England. Filed May 8, 1888. Serial No. 273,942. (No model.) Patented in England June 1, 1887, No. 7,917.

Brief.—The pattern-chain and its described connections act to shift the needle-carrying bar laterally, and in this way the needles may be presented to any one of several series of holes provided in the pattern-cards, thus effecting a reduction in the number of cards required in the formation of any particular pattern.

Claim.—1. In a pattern mechanism for looms, the combination, with a heald-lever, 10, of a pawl, 11^a, operated thereby, shaft 15, star-wheel 14, cog-wheel 16, a pattern-chain, 17, a spring, 18, bearing on said chain, a pivoted lever, 19, supporting the spring 18, pattern-pins, a rock-shaft, 25, connections therefrom to the pattern-pins, and connections from the said rock-shaft to the pivoted lever 19, substantially as described.

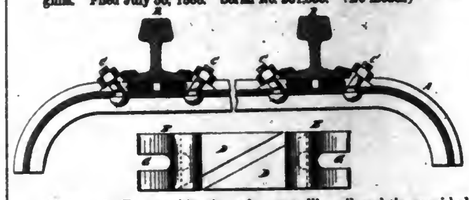
2. In combination with a heald-lever and arm, 11, a pawl, 11^a, adjustably secured to said arm, means for effecting said adjustment,

401,947.



a star-wheel and its shaft 15, a cog-wheel, 16, a pattern-chain, pattern-pins, and connections between the pattern chain and pins, consisting of a pivoted lever, 19, in connection with the pattern-chain at one end, and a rock-shaft, 25, in connection with the pivoted lever 19, and a connection between the shaft 25 and the pattern-pins, consisting of the arms 27 and bar 29, substantially as described.

3. The combination, with the card-barrel, of the pattern-pins 28, a swinging frame carrying said pins, a pattern-chain, and connections therefrom to the pins, consisting of the spring 18, operated by the pattern-chain, and a shaft, 25, rocked by the movement of the spring 18, and intermediate connections, substantially as described, between said spring and shaft, the swinging frame carrying the pins being mounted on the shaft 25, substantially as described.



4. The combination, with a heald-lever, of the arm 11 and its attached adjustable pawl 11^a, star-wheel 14, cog-wheel 16, tappet-chain 17, blade-spring 18, pivoted and slotted lever 19, rod 22, arm 24, shaft 25, pendent arms 27, pivoted bar 29, pattern-pins 28, and barrel 31, substantially as described, and for the purposes set forth.

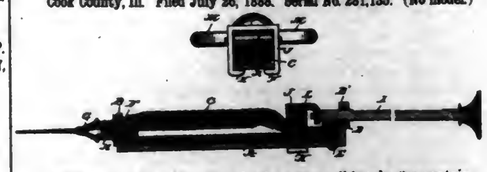
401,948. COMBINED RECORD AND SALES BOOK. JOHN P. HARSHA and CLAUDE DUVAL, Hutchinson, Kans. Filed July 29, 1887. Serial No. 245,594. (No model.)

Claim.—The combination of the tab or scratch-ticket book A, as described, with an auxiliary co-operative book that is numbered for purposes of identification and comprising a series of leaves detachably bound together at one end or side, and a carbon sheet detachably located between contiguous leaves of said auxiliary book, as set forth.

401,949. METALLIC RAILROAD-TIE. ARTHUR J. HARTFORD, New York, N. Y., assignor, by direct and mesne assignments, to the A. J. Hartford Steel Railway Tie Manufacturing Company, of West Virginia. Filed July 30, 1888. Serial No. 281,355. (No model.)

Claim.—1. The combination of a metallic railroad-tie provided with two rail-holding clips adjustable laterally of the length of the rail, thereby adjusting the rail upon the tie, and two screws, one engaging with each of said rail-holding clips, and serving, by the rotation upon the screw-thread, to draw said clips laterally tightly against the said rail, as well as to hold the clip vertically against the rail, substantially as described.

2. The combination of a metallic railroad-tie provided with two rail-holding clips adjustable laterally of the length of the rail, and a rail held within said clips, thereby adjusting the rail upon the tie, and two screws, one engaging with each of said rail-holding clips, and serving, by the rotation upon the screw-thread, to draw said clips laterally tightly against the said rail, as well as to hold the clip vertically against the rail, substantially as described.



3. The combination of the rail R, the metallic tie A, the clips D D, the bolts C C, and slots G G, whereby the rail can be laterally adjusted upon the tie, while at the same time it is locked in position when so adjusted, substantially as described.

4. The combination of the tie A, having longitudinal channel B, the clips D D, each capable of longitudinal adjustment in said channel, and bolts, as C C, for locking said clips when adjusted, substantially as described.

5. The combination of the tie A, having longitudinal channel B, the clips D D, resting in said longitudinal channel and having slots G G, the bolts C C, passing through the tie and through the slots G, and the rail R, substantially as described.

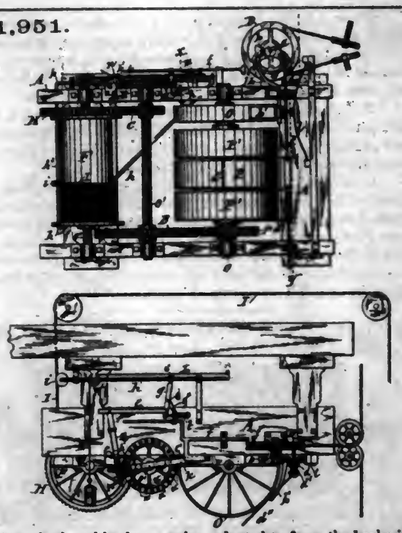
6. The combination of the tie A, having longitudinal channel B, the clips D D, resting in said longitudinal channel and having slots G G, the bolts C C, having their heads at an angle to the axis of the bolts, and passing through the tie and through the slots G, and the rail R, substantially as described.

401,950. HYPODERMIC SYRINGE. HERMANN HAUSMANN, Chicago, assignor of two-thirds to Sola B. Dunn and James C. McComb, Cook County, Ill. Filed July 26, 1888. Serial No. 281,135. (No model.)

Claim.—1. In a syringe, an elastic compressible tube for containing the injecting-fluid, in combination with mechanism for compressing said tube, substantially as described.

2. In a syringe, a compressible tube for containing the fluid, in combination with a reciprocating roller for compressing said tube, substantially as described.

3. In a syringe, a compressible tube for containing the fluid, in combination with a reciprocating carriage, a roller mounted therein and compressing said tube, and a piston-rod for reciprocating said carriage, substantially as described.



4. In a syringe, the frame-plate provided with the upturned ends, a compressible tube rigidly secured at one end to said plate, a nipple working through one end of said frame, upon which the opposite end of said tube is sleeved, the angular carriage, a sliding connection between said carriage and frame, a roller mounted in said carriage for compressing said tube, and a piston-rod working loosely through the other upturned end of said frame and secured to said carriage, substantially as described.

5. In a syringe, a compressible tube for containing the liquid, composed of elastic material and having a wrapping or covering of textile fabric, in combination with a reciprocating roller for compressing said tube, substantially as described.

401,951. BELT-SHIPPER FOR ELEVATORS. EDGAR W. HOUSER, Syracuse, N. Y. Filed Jan. 30, 1888. Serial No. 262,096. (No model.)

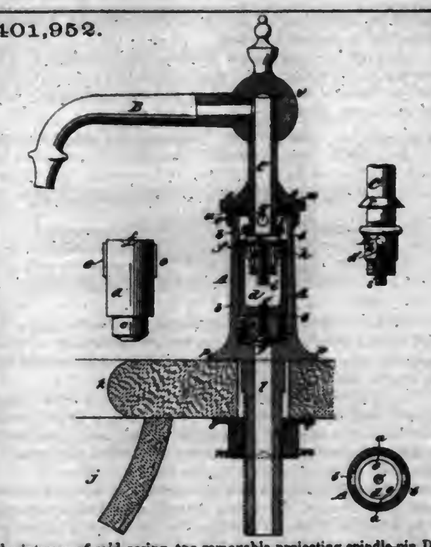
Claim.—1. In combination with the hoisting mechanism, belt-

401,951.

shipping wheel, and brake, a spring adapted to force the brake into its operative position, a lever adapted to force the brake out of its operative position, and a cam turning with the belt-shipping wheel and actuating the brake-lever in opposition to the aforesaid spring, substantially as described and shown.

2. The combination, with the hoisting mechanism, belt-shipper, brake, and hoisting-cable, of a spring adapted to force the brake into operative position, a cam operating in unison with the belt-shipper and adapted to hold the brake out of operative position, a wheel moving in unison with the hoisting mechanism and provided with a series of catches, a push-bar adapted to engage said catches, and a rod arranged to transmit motion from the aforesaid wheel to the belt-shipper, substantially as set forth.

3. In combination with the hoisting mechanism, hoisting-cable I, and belt-shipping wheel D, the frame *h*, arranged movably at right angles to the travel of the cable and formed with the shaft *h'* parallel with the axis of the cable-drum, the roller *i*, pivoted to and adapted to slide longitudinally on the shaft *h'*, a weight or spring forcing the frame *h* toward the cable, the wheel *u*, moving in unison with the hoisting mechanism and provided with a series of catches, levers actuated by the frame *h* and adapted to throw the push-bar out of engagement with the wheel *u*, and a rod transmitting motion from the push-bar to the belt-shipping wheel, as set forth.

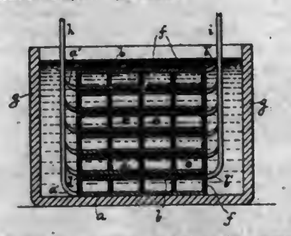


4. In combination with the hoisting mechanism, hoisting-cable, belt-shipping wheel D, and brake, a spring adapted to force the brake into its operative position, the cam *a*, rigidly attached to said wheel, the brake-lever *b*, pivoted to the stationary frame and having one end engaging said cam and its opposite end connected with the brake, the wheel *u*, moving with the hoisting mechanism and provided with a series of catches, a push-bar adapted to engage said catches, a spring pressing the push-bar into engagement with the catches, cams arranged to throw the push-bar out of said engagement at the ends of the strokes, the frame *h*, arranged movably at a right angle to the travel of the cable and formed with the shaft *h'*, parallel with the axis of the cable-drum, the roller *i*, pivoted to the shaft *h'* and adapted to slide longitudinally thereon, a weight or spring forcing the frame *h* toward the cable, the collar *v*, attached to the frame *h*, the lever *g*, held in engagement with said collar, the lever *n*, actuated by the lever *g* and provided with the catch *n'*, adapted to support the free end of the push-bar *h'*, and the rod *f*, transmitting motion from the push-bar to the shipping-wheel D, substantially as described and shown.

401,952. BASIN-FAUCET. BERNARD JOHNSON, New York, N. Y. Filed June 28, 1888. Serial No. 278,411. (No model.)

Claim.—1. In a swing basin-faucet, the combination, with the discharge-tube spindle and the plunger-valve, of the removable transverse projecting spindle-pin for closing the valve, an adjusting-nut and thread on said spindle for regulating the distance of said pin from the end of the spindle, and a clamp-screw for securing the pin when adjusted, substantially as described.

2. In a swing basin-faucet, the combination, with the cylindrical valve-casing A, having guide-grooves *a* and water-ways *b*, the elastic valve *c*, and the plunger *d*, to which it is attached, the latter having wings *e* to enter the said guide-grooves *a*, and having a notch, *f*, in one side only of its rim, of the discharge-tube B and the spindle C thereof, the latter having an opening, *g*, connecting its interior with



401,952.

the interior of said casing, the removable projecting spindle-pin D to ride around the rim of the plunger and enter the notch *f* thereof, the adjusting-nut *h*, for regulating the distance of said pin D from the end of the spindle, and clamp-screw *i*, for securing the pin when adjusted, substantially as described.

3. In a faucet, the combination, with a hollow spindle, of a discharge-tube and a joining-globe, with which said spindle and discharge-tube are connected by means of screw-threads, the discharge-tube when in place acting as a stop to prevent the rotation of the spindle within the joining-globe, substantially as specified.

401,953. SECONDARY BATTERY. WILLIAM P. KOOKOGEY, Brooklyn, N. Y., assignor to the Kookogey Electric Company. Filed Jan. 28, 1889. Serial No. 297,801. (No model.)

Claim.—1. A storage-battery consisting of a receptacle for containing the electrolyte and a series of pairs of positive and negative plates placed horizontally therein, each pair consisting of a positive and a negative plate placed together with insulating material between them, and the positive plate of each of these pairs being placed on top, substantially as and for the purpose described.

2. In a storage-battery, the combination of a positive plate, a negative plate, and a grid or net-work of low-conducting material placed between them and dividing each of them into isolated sections, substantially as and for the purpose described.

3. A storage-battery consisting of a receptacle containing the electrolyte, a series of pairs of positive and negative plates placed horizontally therein, each pair consisting of a positive and a negative plate placed together with insulating material between them, and the positive plate of each pair being placed on top, and a grid or net-work of low-conducting material placed between the successive pairs and dividing the exposed surfaces of the plates into isolated sections, substantially as and for the purpose described.

4. A storage-battery consisting of a receptacle for containing the electrolyte and a series of pairs of positive and negative plates placed horizontally therein, each pair consisting of a positive and a negative plate placed together with insulating material between them, substantially as and for the purpose described.

5. A storage-battery consisting of a receptacle for containing the electrolyte and a series of pairs of positive and negative plates, each pair consisting of a positive and a negative plate placed together with insulating material between them, and the several pairs being laid horizontally and resting by gravity upon strips of insulating or low-

conducting material placed between the successive pairs, substantially as and for the purpose described.

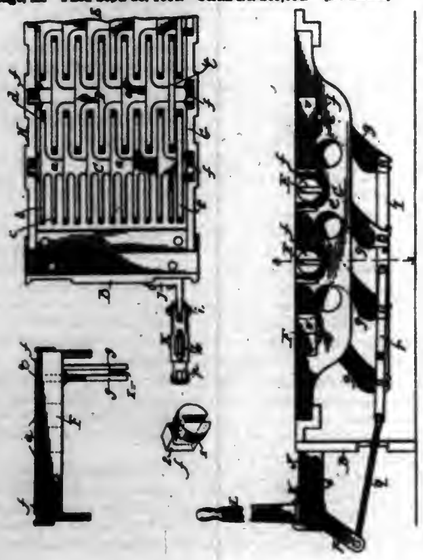
6. A storage-battery plate consisting (before reduction) of two sheets of lead in contact with a sheet of insulating material which lies between them and insulates them from each other, substantially as and for the purpose described.

401,954. PUMP-BUCKET. CHARLES LA DOW, Albany, N. Y. Filed Nov. 7, 1887. Serial No. 254,456. (No model.)

Claim.—1. A bucket or cup comprising a bottom or base or support and side walls composed of a series of superimposed vertically-separable layers of metal resting successively upon each other and upon the bottom, substantially as described.

2. A bucket or cup whose walls are composed of a series of superimposed vertically-separable layers of metal, with a bottom or base provided with or attached to a suitable support, said layers resting successively upon each other and upon the bottom, substantially as described.

3. A bucket constructed and composed of a series of superimposed layers of metal, which form the walls, and which are separable in the direction of the axis of the bucket, and a base or bottom provided with means for attaching it to a rod or chain and serving as a support for the walls, substantially as and for the purpose described.



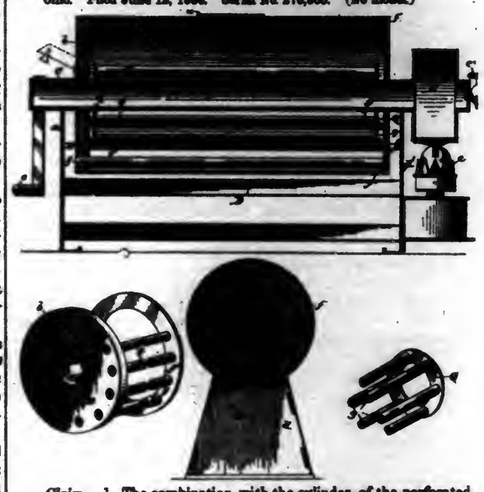
4. A bucket constructed and composed of a series of superimposed layers of metal, which form the walls, and which are separable in the direction of the axis of the bucket, and which are laterally expansible, and a base or bottom provided with means for attaching it to a rod or chain and serving as a support for the walls, substantially as and for the purpose described.

5. A bucket comprising a bottom or base provided with means for attaching it to a rod or chain and side walls composed of a series of superimposed layers of metal which overlap so as to be capable of lateral expansion, said layers being also separable in the direction of the axis of the bucket, substantially as and for the purpose described.

6. A pump-bucket whose walls are composed of a series of metal coils, the lower coil being connected with and supported by a socket adapted to be connected to a pump rod or chain, substantially as and for the purpose described.

7. A pump-bucket formed of superimposed coils of metal which gradually diminish in diameter toward the bottom, the lower coils forming a socket for the reception of a pump rod or chain, substantially as shown and described.

401,955. GRATE FOR FURNACES. WILLIAM H. LANHAM, Chicago, Ill. Filed Sept. 20, 1888. Serial No. 286,061. (No model.)



Claim.—1. The combination of the bracket J, provided with a notch, *j*, head K, provided with a socket to receive a lever, a sliding bolt located in the head K and provided with a socket, *l*, the end walls of which are inclined, as shown, and the lever L, formed with the notch *k*, substantially as and for the purpose specified.

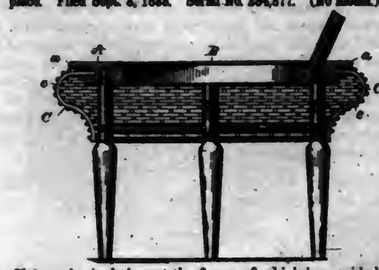
2. In combination with the head K, having a socket, *l*, a sliding bolt located in the head and having a socket, *l*, the end walls of which are inclined, as shown, and a lever, L, provided with a notch, *k*, substantially as and for the purpose specified.

3. In a furnace, a series of grate-sections, each consisting of a series of finger-bars supported by a bar, F, in combination with a frame having circular recesses, as *e*, in the sides thereof, in which the bars F are supported, and guides *f*, one on each end of each bar F, said guides having slots in them open at their under side to receive the supporting-bars and allow the same to project below them, substantially as and for the purposes specified.

401,956. WASHING-MACHINE. WILLIAM S. LAMEY, Lithopolis, Ohio. Filed June 12, 1888. Serial No. 276,805. (No model.)

Claim.—1. The combination, with the cylinder, of the perforated steam-pipe passing through the cylinder and journaled at its ends and the steam-generating drum mounted wholly and entirely on one end of the said steam-pipe and communicating therewith, the said drum and pipe revolving together, substantially as hereinbefore set forth.

2. In a washing-machine, the combination of the cylinder having a door in its side, the heads closing the ends of the cylinder, one head having a door, the ring, as *f'*, and the rubbing-bars having their ends fitted in the head and in the ring *f'* at the end of the cylinder opposite the said head, substantially as described.

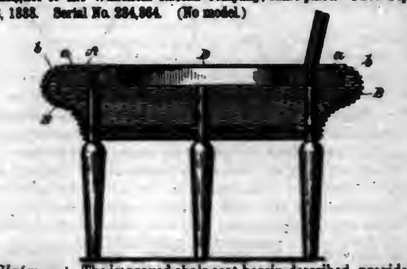


3. The herein shown and described washing-machine, composed of the stand, the cylinder having rubbing-bars which are supported at their ends in the cylinder-heads, the perforated steam-pipe passing through the cylinder and having its ends journaled in the stand, and the steam-generating drum mounted wholly on the steam-pipe and communicating therewith and revolving with the cylinder and steam-pipe, substantially as and for the purpose described.

401,957. HAME-TUG. LOUIS LATIL, Baton Rouge, La. Filed Oct. 8, 1888. Serial No. 287,490. (No model.)

Claim.—The herein-described hame-tug having the body portion provided with the pivoted hook a^2, and the loop B, made integral with said body portion, and the integral inwardly-bent cross-bar a^3, provided with the hinged tongue a^4, whereby when the trace is in position the upper surface of the sides of the buckle will be in the same plane with the under face of the rear portion of the trace, substantially as specified.

401,958. REED OR RATTAN CHAIR, &c. HENRY T. LEAVIS, Wakefield, Mass., assignor to the Wakefield Rattan Company, same place. Filed Sept. 8, 1888. Serial No. 284,877. (No model.)

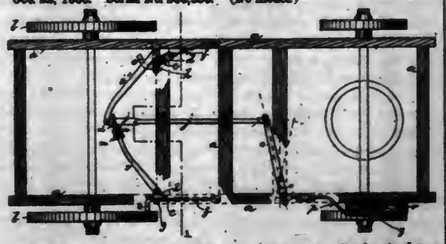


Claim.—1. A chair-seat the frame of which is provided with an outwardly-extending projection and a border or curtain attached thereto below said projection, substantially as described.

2. A chair-seat the frame of which is provided with an outwardly-extending projection and a woven reed or rattan border or curtain the base or warp strands of which are attached to said seat-frame beneath said projection, substantially as described.

3. A chair-seat the frame of which is provided with an outwardly-extending projection, a woven rattan border or curtain the base or warp strands of which are attached to said seat-frame beneath said projection, and a securing-strip for the same, substantially as described.

401,959. REED CHAIR, &c. JOHN LEHMAN, Wakefield, Mass., assignor to the Wakefield Rattan Company, same place. Filed Sept. 8, 1888. Serial No. 284,964. (No model.)



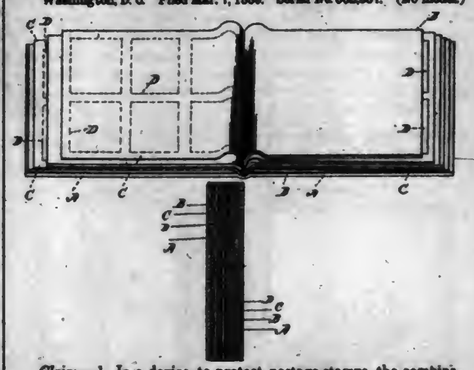
Claim.—1. The improved chair-seat herein described, provided with a woven border or curtain, the warp-pieces of which are secured to the seat-supporting frame below the upper surface of the same, the whole of said border or curtain being below the upper face of the seat-frame.

2. The herein-described chair-seat, provided with a woven border or curtain, the warp-pieces of which are secured to the seat-supporting frame below the upper surface of the same, and a securing-piece for said warp-pieces, the whole of said border or curtain being below the upper face of the seat-frame.

3. The combination, with a seat and its supporting-frame provided with a rabbet on the outer edge of the same, of a border or curtain, the warp-strands of which are secured to said frame and at an angle to the vertical wall of said notch, the whole of said border or curtain being below the upper surface of the seat-frame, substantially as described.

401,960. VEHICLE-BRAKE. JOHN W. MARTIN, St. Louis, Mo., assignor to the St. Louis Dead Lock Brake Company, of Illinois. Filed Oct. 22, 1888. Serial No. 288,830. (No model.)

Claim.—1. In a wagon-brake, the combination of a hooked bar having a longitudinal slot and pivoted to a lever hinged to the wagon-bed, and a chain connecting the hooked bar to the wagon-bed, with mechanism for moving the said lever in the direction of the wheels, substantially as described.

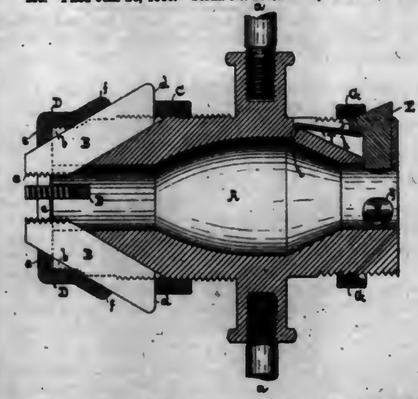


2. In a wagon-brake, the combination of hooked bars having longitudinal slots and pivoted to levers hinged to the bed, and chains connecting the hooked bars to the wagon-bed, with mechanism for moving the said levers in the direction of the wheels, substantially as shown, and for the purpose described.

3. In a wagon-brake, the combination of hooked bars having longitudinal slots and pivoted to levers hinged to the wagon-bed, chains connecting the hooked bars to the wagon-bed, and arms fulcrumed to the said levers and inclined transversely beneath the wagon-bed, with mechanism for vibrating said arms, substantially as shown, and for the purpose described.

4. In a wagon-brake, the combination of hooked bars having longitudinal slots and pivoted to levers hinged to the wagon-bed, chains connecting the hooked bars to the wagon-bed, arms fulcrumed to the said levers and inclined transversely beneath the wagon-bed, and a rod coupled to said arms, one of which is slotted and provided with a spring device for rendering it adjustable endwise with said rod, with means for moving the rod longitudinally beneath the wagon-bed, substantially as shown, and for the purpose described.

5. In a wagon-brake, the combination of the hooked bar *c*, having longitudinal slot *d* and pivoted lever *h*, chain *f*, arm *i'*, and rod *j*, with mechanism for moving said rod longitudinally beneath the wagon-bed *a*, substantially as described.



401,961. DEVICE FOR PROTECTING POSTAGE-STAMPS. HIRAM R. MCCALMONT, Warren, Pa., assignor of one-half to William J. Johnston, Washington, D. C. Filed Mar. 7, 1888. Serial No. 302,357. (No model.)

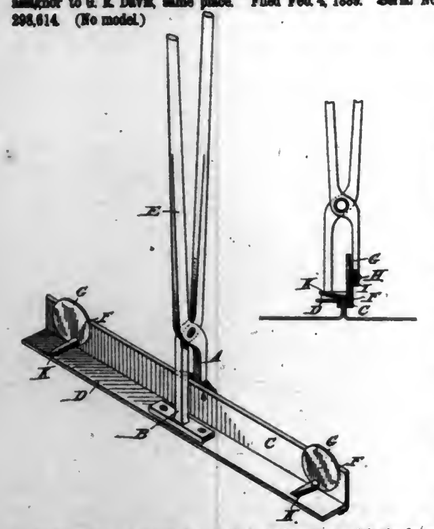
Claim.—1. In a device to protect postage-stamps, the combination, with a thin sheet of tissue paper, thin fabric, or their equivalents, to which the stamps are to be gummed, of one or more sheets of thicker absorbent paper or material, arranged substantially as and for the purpose described.

2. As a new article of manufacture, a stamp-protector consisting of a series of sheets of tissue-paper, thin fabric, or their equivalents, to which the stamps are to be gummed, and interposed alternately between a series of sheets of blotting-paper and a pair of inclosing-covers of pasteboard, wood, or other suitable substance, all combined or arranged substantially as and for the purpose described.

401,962. THREAD-CUTTING DIE. JOHN E. MCCANNA, Baltimore, Md. Filed Jan. 26, 1889. Serial No. 297,607. (No model.)

Claim.—1. In a thread-cutting tool, the stock provided with angularly-placed slots and threading-cutters seated in said slots, com-

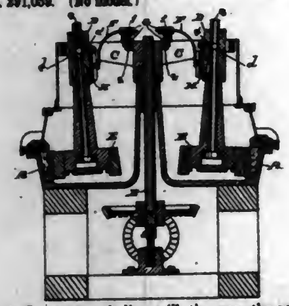
bined with a cap having an angular face adapted to fit against the outer surface of the said cutters, substantially as and for the purpose specified.



2. In a thread-cutting tool, the stock thereof provided with a series of angularly-placed thread-cutting blades seated in slots, combined with a cap having an angular face which bears against the said blades and an adjusting-nut to clamp the same, substantially as and for the purpose specified.

3. In a thread-cutting tool, the stock thereof having a series of centering-bolts with inclined outer ends, combined with a nut with an inclined inner face which fits over the said ends and springs to hold the said bolts out and against the said nut, substantially as and for the purpose specified.

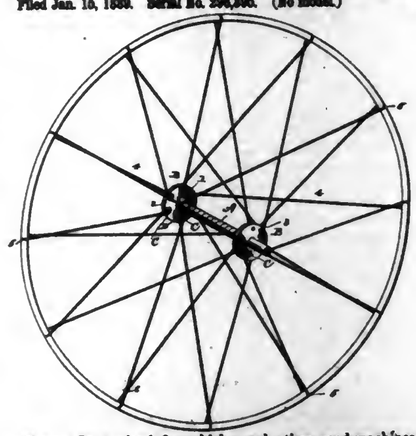
4. In combination with the stock A, having the radially-placed holes *g*, the bolts E, having the projections *j*, springs F, and nut G, screwed on the outside of the said stock, substantially as and for the purpose specified.



5. In a thread-cutting tool, the stock exteriorly threaded and provided with angularly-placed slots, combined with a cap having an angular inner face, screwed on the stock, and threading-cutters seated in the slots in the stock, with their outer inclined edges in contact with the inner face of the cap and their threading ends projecting through the cap, substantially as and for the purpose specified.

401,963. ROOFING-TONGS. ROBERT B. MCCONNELL, Paducah, Ky., assignor to S. R. Davis, same place. Filed Feb. 4, 1889. Serial No. 298,614. (No model.)

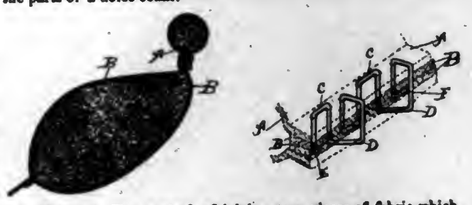
Claim.—In a gripping device, the combination, with the lower blade having circular recesses formed therein and gage-plates having an eccentric projection adjustably secured therein, of an upper blade adapted to engage said lower blade, substantially as shown and described.



401,964. ORE-GRINDING MILL. JOSEPH MCKENZIE, El Dorado Co., assignor to De Witt C. Morgan, same place. Filed Nov. 16, 1888. Serial No. 291,069. (No model.)

Claim.—1. In an ore grinding mill, the pan, the rotating driver having the pivoted hangers and the series of centrifugally-swinging rollers suspended from said hangers, in combination with springs secured by one end to the driver and having a wearing-knob on the other and the wearing-plates secured to the pivoted hangers and having grooved faces in which the wearing-knobs of the springs are fitted and play, substantially as herein described.

2. In an ore-grinding mill, the pan, the rotating driver having the pivoted hangers, and the series of centrifugally-swinging rollers suspended from said hangers, in combination with the springs acting to throw the rollers outwardly, the grooved and slotted castings on the driver to which the inner ends of the springs are fitted, and the bolts adjustably securing said ends to the castings, the grooved wearing-plates secured to the pivoted hangers, and the wearing-knobs on the outer ends of the springs fitted to and playing in the grooved wearing-plates, substantially as herein described.

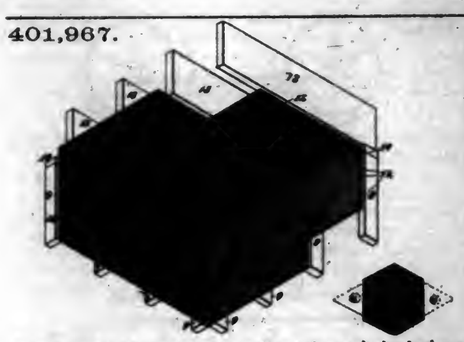


401,965. VEHICLE-WHEEL. JOHN HIPP, Jr., New Castle, Ind. Filed Jan. 16, 1889. Serial No. 296,895. (No model.)

Claim.—In a wheel for vehicles and other road-machines, the combination of the axle carrying a stationary and an adjustable hub, studs on the said hubs, a tire having transverse grooves or channels in its periphery, a continuous wire passing around the studs and resting in the grooves or channels in the tire, strengthening-wires at the points where the wires cross each other near the tire, and a jam-nut on the axle for adjusting the said wires, substantially as described.

401,966. METHOD OF SEWING. ANDREW ORTMAYER, Chicago, Ill., assignor to A. Ortmayer & Son, same place. Filed Jan. 2, 1889. Serial No. 295,945. (No model.)

Brief.—This method is particularly applicable to sewing together the parts of a horse-collar.



Claim.—1. The method of joining two pieces of fabric which consists in placing the edges of one piece within the edges of the other in passing a thread or thong first through all the thicknesses of fabric to be joined, then carrying it along substantially parallel to the edges of the fabrics and passing it again through all the thicknesses, then carrying it obliquely to the edges of the outer piece, then through the thicknesses of the inner piece, then back and through all the thicknesses, as before, and so on, alternately, whereby the fabrics are firmly bound together, substantially as described.

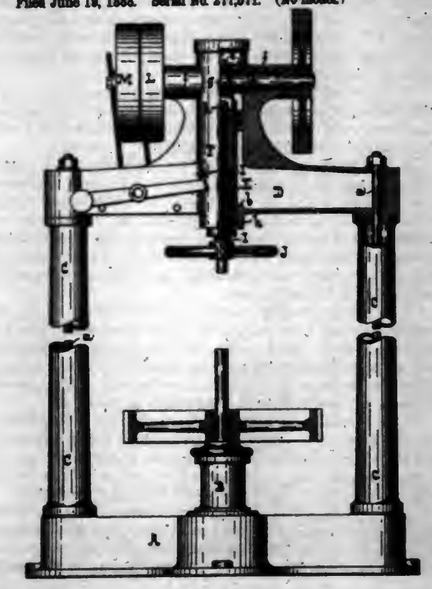
2. The method of joining the rim of a horse-collar to the shoulder thereof, which consists in placing the edges of the shoulder within the edges of the rim, then passing a thread or thong through all the thicknesses of rim and shoulder, carrying it along substantially parallel to the rim, and again passing it through all the thicknesses, then carrying it obliquely to the edges of the rim, passing it through the thicknesses of the shoulder only, carrying it obliquely back and passing it through all the thicknesses, as before, and so on in alternation, whereby the rim and shoulder are held firmly together and the edges of the former prevented from being torn, substantially as described.

401,967. FIRE-PROOF PLASTER-CLOTH FOR CEILINGS AND WALLS. ALFRED J. PARR, St. Louis, Mo. Filed Feb. 27, 1889. Serial No. 301,379. (No specimens.)

Claim.—1. In fire-proof plaster-blocks for ceilings and walls, &c.,

401,967.

the combination of the plaster layer 8, and the enveloping burlap or other fiber layers and folds that entirely inclose it, substantially as described, and for the purpose set forth.



2. In fire-proof plaster-blocks for ceilings and walls, &c., the combination of a layer of plaster constructed in accordance with the formula specified and the envelope of burlap or other fiber on which said layer of plaster rests and extensions of which fold over both sides and ends of said plaster layer and are arranged to hold it from disintegration, substantially as described, and for the purpose set forth.

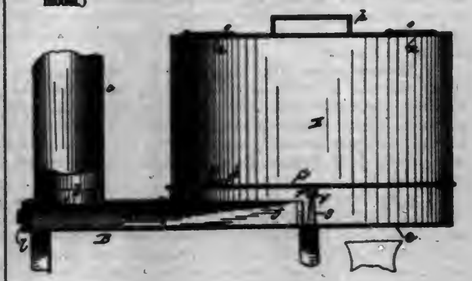
3. In fire-proof plaster-blocks for ceilings, walls, &c., the combination of the enveloping layers of burlap or other fiber and the intervening layer of plaster, composed of quicklime, plaster-of-paris, sand, pulverized coke, and glue, as herein specified, the burlap being folded entirely around the plaster and its meshes filled therewith, substantially as described, and for the purpose set forth.

4. In fire-proof plaster-blocks for ceilings, walls, &c., the combination of the plaster layer 8, constructed in accordance with the formula herein specified, the burlap or other fibrous cover that entirely envelops said layer and holds it from disintegration, the burlap on one side across the middle of said block being scored and the block bent along said line until each half is at a right angle to the other, substantially as described, and for the purpose set forth.

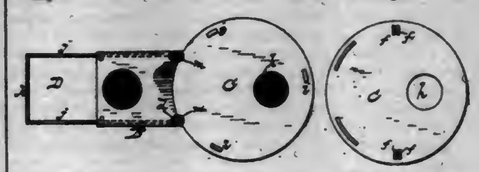
5. In fire-proof plaster-blocks for ceilings, walls, &c., the burlap envelope-blank cut in approximate form to that of the letter-envelope, the central oblong portion of which blank fits within the mold in which the blank is pressed, the plaster layer 8, composed of quicklime, plaster-of-paris, sand, pulverized coke, and glue, as herein specified, the angle flaps 16 and 17 of said burlap or other fiber cloth being folded over said plaster-envelope to entirely inclose the same and hold it from disintegration, substantially as described, and for the purpose set forth.

401,968. MACHINE FOR DRIVING MANDRELS, KEYS, &c. JOHN RICHARDS, San Francisco, Cal., and JOHN WALKER, Cleveland, Ohio. Filed June 19, 1888. Serial No. 277,571. (No model.)

Claim.—1. In a machine for driving mandrels, &c., a reciprocating ram having a head which is rigidly connected thereto by means of a threaded bar, and a hand-wheel to turn the said bar, substantially as and for the purpose specified.



2. In a machine for driving mandrels, &c., a reciprocating ram having a head rigidly connected thereto by means of a threaded bar, and means whereby the said bar may be turned to feed down the said head independently of the reciprocating motion of the said ram, substantially as and for the purpose specified.



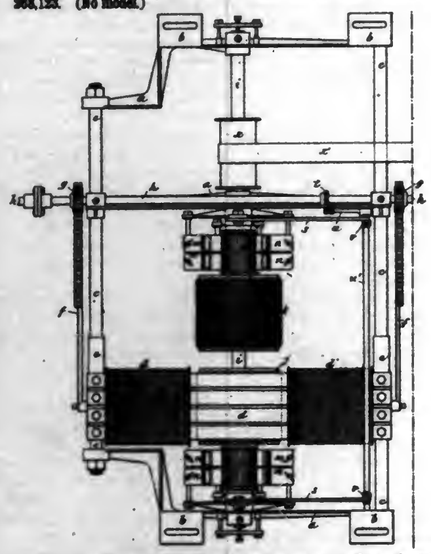
3. In a machine for driving mandrels, &c., the combination of a sleeve, a ram confined within the said sleeve and adapted to have a reciprocating motion therein, a driving-shaft extending through the said sleeve, which is provided with bearings to support the said shaft, an eccentric formed in the said shaft, and means, substantially as described, to connect the eccentric with the ram, a ram-head united with the ram by means of a screw carrying a hand-wheel, and an anvil-block situated under the said ram-head, substantially as and for the purpose specified.

4. In a machine for driving mandrels, &c., the combination of a frame carrying a sleeve with laterally-placed bearings, a ram adapted to slide in the said sleeve, a ram-head connected to the ram by means of a threaded bar having means whereby it may be turned in the said ram, a driving-shaft supported in the said lateral bearings on the sleeve extending through the sleeve and provided with an eccentric, a laterally-sliding box to communicate motion from the eccentric to the ram, and means to effect the revolution of the said driving-shaft, substantially as and for the purpose specified.

5. In a machine for driving mandrels, the combination of a ram adapted to have a reciprocating motion within a sleeve, a ram-head connected to the ram by means of a screw carrying a hand-wheel, and an anvil-block fitted with removable reducers situated under the said ram-head, substantially as and for the purpose specified.

401,969. OVEN AND FLAT-IRON HEATER. SYLVANUS K. ROBINSON, Newark, N. J. Filed Jan. 30, 1889. Serial No. 298,107. (No model.)

Claim.—1. A portable stove having a rear extension forming a flue and provided with a sliding support or shelf, for the purpose set forth.



2. The stove provided with the rear extension forming a horizontal flue, a sliding support therein provided with end stops to limit the extension of the support when drawn out, as and for the purpose set forth.

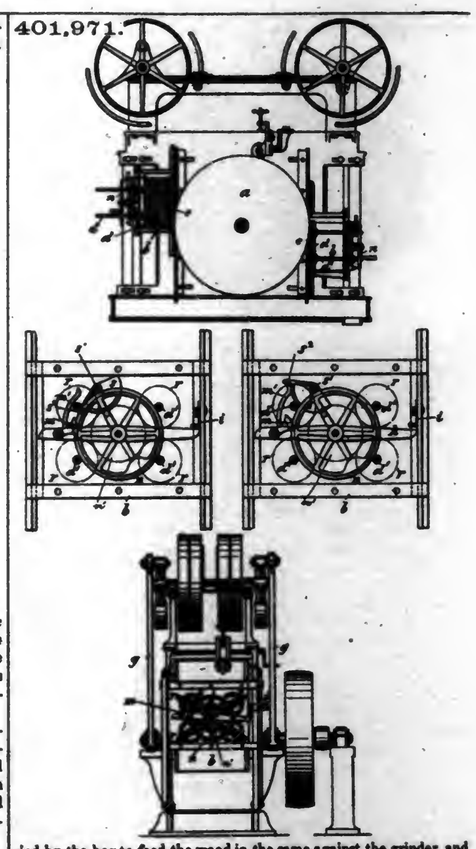
3. In a portable stove, the same provided with the lugs *g* on its inner face or wall, adapted to engage lugs *f f* on the stove-plate, as and for the purpose set forth.

4. The oven provided with the fastening-lugs *q* on its wall and the lugs *i* on the stove-plate, in combination with the lugs *g* on the inner wall of the stove-body, and the lugs *f f* on the stove-plate, the whole adapted to operate as and for the purpose set forth.

5. The within-described portable stove, consisting of the body constructed with a rear extension forming a horizontal flue, a sliding frame or shelf within this flue having stop-lugs, the inner wall of the body provided with the lugs, the removable plate having lugs on its under side and fastening-lugs on its upper face, said plate adapted to serve the double purpose of a plate for said stove and a bottom for the oven, which latter is provided with the openings in the top having lids, a handle for removing it, and fastening-lugs on its wall to engage the lugs on the plate, all as and for the purposes set forth.

401,970. ELECTRIC MOTOR FOR TRAMWAY-VEHICLES. WILLIAM D. SANDWELL, London, England. Filed Mar. 22, 1888. Serial No. 268,123. (No model.)

Claim.—1. The combination, with a tram-car, of an electric motor operatively connected therewith, consisting of field-magnets and two armatures, the said magnets and armatures being movable the one with relation to the other, whereby a movement of magnets or armatures reverses the direction of rotation of the armatures, substantially as described.



2. The combination, with a tram-car, of an electric motor operatively connected therewith, consisting of two armatures and field-magnets movable with relation thereto, a commutator for each of said armatures, movable brushes for said commutators, and a connection between said brushes and said magnets, whereby a movement of said magnets reverses the direction of rotation of said armatures, substantially as described.

3. In an electric motor, the combination, with two revoluble armatures, each provided with a commutator and movable brushes for said commutator, of the movable field-magnets, a shaft and connections between the same and said movable field-magnets, and connections between said shaft and said movable commutator-brushes, whereby a movement of said shaft effects a movement of said field-magnets and commutator-brushes, substantially as described.

4. In an electric motor, the combination, with two revoluble armatures, each provided with a commutator and movable brushes for said commutators, of movable field-magnets provided with rack-bars, a shaft provided with pinions engaging said rack-bars, a rock-shaft provided with a segment and connected with said movable brushes, and a pinion on said shaft engaging said segment, substantially as described.

5. In an electric motor having field-magnets and two armatures, said field-magnets and armatures being the one movable in relation to the other, combined with two commutators, each having two sets of brushes, one set adapted to move the motor in one direction and the other set in the opposite direction, said brushes being movable into and out of position, substantially as described.

401,971. APPARATUS FOR GRINDING WOOD. FRIEDRICH H. SCHMIDT, Schindler's Werk, near Bochau, Saxony, Germany. Filed July 23, 1888. Serial No. 281,330. (No model.)

Claim.—1. In a wood-grinding machine, the combination of a grinding-box, into which the wood to be ground is placed, a feed-plate in the box to feed the wood against the grinder, gearing to force in the feed-plate, and a pitman connected to the grinding-box to reciprocate the same, and thereby operate the gearing to move the feed-plate inwardly, substantially as described.

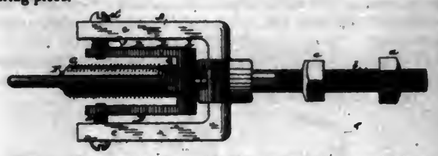
2. In a wood-reducing machine, the combination of a reciprocating grinding-box adapted to receive the wood to be ground, means for reciprocating the same, a feed-plate in the box to feed the wood against the grinder, gearing to move the plate, and a stationary stop adapted to be engaged by and operate said gearing as the box reciprocates, substantially as described.

3. In a wood-reducing machine, the combination of a reciprocating grinding-box to receive the wood to be ground, gearing carried by the box to feed the wood in the same against the grinder, and a lever to operate said gearing moving with the box and adapted to engage and be rocked by a stationary part as the box reciprocates, and thereby actuate the gearing, substantially as described.

4. In a wood-grinding machine, the combination of a reciprocating grinding-box adapted to receive the wood to be ground, a pressure-plate in the box to feed the wood against the grindstone, gearing to move the pressure-plate, a stationary stop, and a lever moving with the grinding-box to be rocked by the stop as the box reciprocates, and thereby operate the gearing to feed the wood, substantially as described.

5. In a wood-grinding machine, the combination of a reciprocating grinding-box adapted to receive the wood to be ground, a pitman to reciprocate the same, and a pressure-plate in the box to feed the wood against the grindstone, substantially as described.

6. In a wood-grinding machine, the combination of a reciprocating grinding-box to receive the wood to be ground, a pressure-plate in the box to feed the wood against the grindstone, a ratchet-wheel carried by the box, gearing connecting the pressure-plate and ratchet-wheel to operate the plate to feed when the wheel is turned, an adjustable stop, and a lever moving with the box and provided with a pawl to rotate the ratchet-wheel when the lever is rocked by said stop as the box reciprocates.



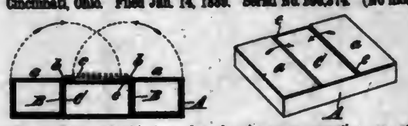
7. In a wood-grinding machine, a grinding-box to receive the wood to be ground, a pressure-plate to feed the wood against the grindstone, one or more rods to force in the plate, gearing to operate the rods, and a weighted pivoted segment adapted to disconnect the gearing from its driving-power and stop the feed when the rods have forced the plates in a certain distance, substantially as described.

8. In a wood-grinding machine, the combination of the grinding-box adapted to receive the wood to be ground, a pressure-plate movable in the box to feed the wood against the grinding-stone, gearing to move the plate, and a pivoted lever or segment to stop the feed when the wood in the box is exhausted, substantially as described.

9. In a wood-grinding machine, the combination of a reciprocating grinding-box to receive the wood to be ground, a pressure-plate movable in the box to feed the wood against the grindstone, one or more rods secured to the plate to move the same, gearing to operate the rods, a ratchet-wheel to operate the gearing, a lever provided with a pawl to rotate the ratchet-wheel when the lever is rocked, means to intermittingly rock the lever as the box reciprocates, and a pivoted lever or segment to automatically throw the lever-pawl from engagement with the ratchet-wheel and stop the feed when all the wood in the box is exhausted.

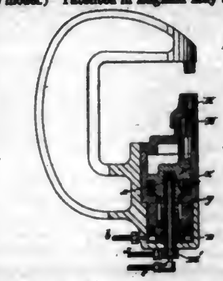
401,972. TEMPLE FOR GUIDING THE EDGES OF FABRICS. JOSEPH J. SCHOLFIELD, Providence, R. I. Filed Jan. 28, 1889. Serial No. 297,813. (No model.)

Brief.—A pivoted temple-frame contains a guide-roller, a frictional bearing-piece for the running edge of the web, and a spring, the spring being adapted to hold the temple-frame in the proper oblique position to draw the edge of the web outward until the pressure exerted by the same is overcome by the friction of the web against the bearing-piece.



Claim.—The combination, with the pivoted frame and its support, of the guide-roller, the frictional bearing-piece, the spring, and the limiting-stop to the movement of the pivoted frame, substantially as described.

401,973. HARNESS. ADAM SCHUSCK, Celina, Ohio. Filed Jan. 30, 1889. Serial No. 298,106. (No model.)

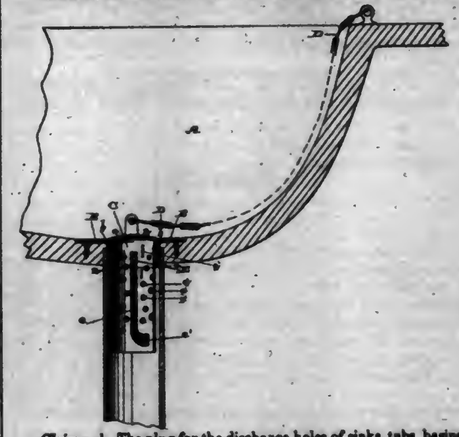


Claim.—In a harness-pad, the flat leather strip or filling C, the coarse textile material or bagging D enveloping the same, the facing-strip E, surrounding the filling and the bagging, the edges of which meet on the center line on the outside, and the facing-strip secured to the other parts by two rows of stitching, substantially as described.

401,974. DISPLAY-BOX. HARRISON D. SMITH and FRED A. SMITH, Cincinnati, Ohio. Filed Jan. 14, 1889. Serial No. 296,374. (No model.)

Claim.—In a display-box for chewing-gum, candies, or other goods, the combination, with the body or box proper, A, divided into end compartments, B, and intermediate blind compartment, C, or its described equivalent, of the plane-faced lids *a a*, hinged at their inner edges to the said blind compartment on its opposite edges, whereby said lids are adapted to be turned or opened inwardly within the compass of the box and rest flatly upon said blind compartment, which forms a foundation therefor to support them safely and entirely out of the way of contact, substantially as herein set forth.

401,975. HYDRAULIC MACHINE FOR RIVETING. HUGH SMITH, Glasgow, County of Lanark, Scotland. Filed Aug. 22, 1887. Serial No. 247,587. (No model.) Patented in England May 26, 1887, No. 7,651.

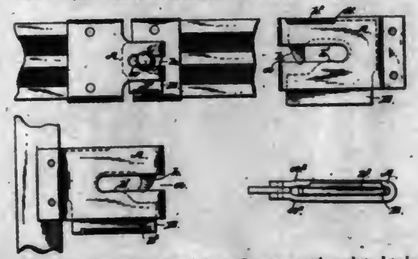


Claim.—1. In a hydraulic riveting-machine, the combination, with the plate-closing snap and the rivet-closing snap, of the traveling plate-closing and rivet-closing cylinders opening in opposite directions and having their heads abutting, and stationary and traveling plungers in said cylinders, respectively, the traveling plunger being adapted to impart pressure to the one and the cylinders to the other of said snaps, substantially as set forth.

2. In a hydraulic riveting-machine, the combination, with the plate-closing snap and the rivet-closing snap, of the traveling plate-closing and rivet-closing cylinders, of equal diameters, and the said cylinders having their heads abutting, stationary and traveling plungers in said cylinders, respectively, the said cylinders and traveling plunger being adapted to impart pressure to the plate-closing snap and the rivet-closing snap, respectively, and an auxiliary ram for forcing said cylinders forward, substantially as set forth.

3. The combination, with the plate-closing and rivet-closing snaps adapted to close toward each other and the cylinders and plungers for operating them, of a duct leading from the back of the one plunger to the front of the other plunger, whereby the back-pressure in one cylinder will decrease the forward pressure of the other plunger, as set forth.

4. The combination, with the plate-closing snap and the rivet-closing snap, of traveling cylinders, stationary and traveling plungers in said cylinders for causing pressure upon said snaps, the stationary cylinder N, snap L, and plunger O, for imparting pressure to said snap L, as set forth.



401,976. PLUG FOR SINKS, TUBS, &c. WILLIAM R. SMITH, San Francisco, Cal. Filed Jan. 16, 1889. Serial No. 296,533. (No model.)

Claim.—1. The plug for the discharge-holes of sinks, tubs, basins, and other vessels, consisting of the sliding hollow or tubular piece having a closed top, an open bottom, and apertures in its sides, in combination with the means for holding the plug in position to permit the escape of the water through its apertures, consisting of a fixed pin or stud in the discharge-hole, and a slot in the side of the plug, in which the fixed pin or stud fits, said slot having a curved lower end, with which the pin or stud engages, substantially as described.

2. The plug for the discharge-holes of sinks, tubs, basins, and other vessels, consisting of the sliding hollow or tubular piece having a closed top, an open bottom, and apertures in its sides, and having also in its side an elongated slot terminating below in a portion curved to one side, in combination with the protecting-plate B of the discharge-hole, having a fixed pin or stud entering the elongated slot of the plug and engaging its curved lower portion to hold the plug up, substantially as described.

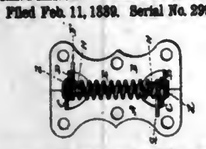
401,977. CLASP. FREDERICK B. SPOONER, Brooklyn, N. Y. Filed Jan. 17, 1889. Serial No. 296,642. (No model.)

Claim.—1. A clasp consisting of a supporting-plate having an automatically-operating latch loosely and inseparably mounted thereon and unattached thereto, adapted for use with a stud or analogous device, substantially as described.

2. A clasp consisting of a bent sheet-metal slotted supporting-plate having an unattached sliding latch mounted therein, adapted to engage a stud or analogous device, substantially as described.

3. A clasp consisting of a slotted supporting-plate having a cam-slotted latch loosely mounted therein, adapted for use with a stud or analogous device, substantially as described.

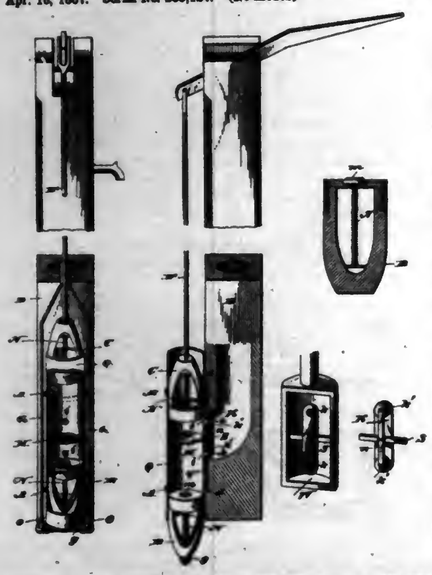
4. A clasp consisting of a doubled slotted plate and a latch having a slot with a cam projection loosely mounted in said plate for use in connection with a stud or analogous device, as set forth.



5. A clasp consisting of a slotted supporting-plate, and a cam-slotted latch loosely mounted therein, having a guard with a bent edge for use with a stud or analogous device, substantially as described.

6. A clasp consisting of a slotted supporting-plate constructed from a single strip of sheet metal having the two opposing parts thereof slightly bent outward, and a latch having a cam-slot loosely and inseparably mounted in said plate for use in connection with a stud or analogous device, as set forth.

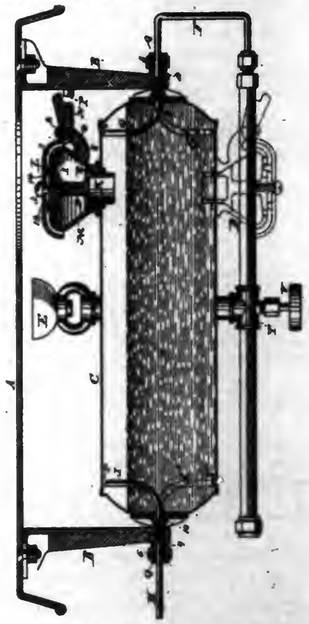
7. A clasp consisting of a slotted plate with an upper recessed edge, and a cam-slotted latch having an upper projecting guard adapted to engage with the top recess of said plate for use with a stud or analogous device, as set forth.



8. A corset-fastening comprising a corset steel or busk with a series of studs thereon, and a slotted plate attached to an opposite steel or busk, in which an automatically-operating latch is loosely mounted to freely slide therethrough and adapted to engage and secure a stud on the oppositely-situated steel or busk, substantially as described.

401,978. SPRING-HINGE. JAMES SPRUCE and ASA M. COMSTOCK, Waterbury, Conn. Filed Feb. 11, 1889. Serial No. 299,386. (No model.)

Claim.—In a spring-hinge composed of the leaves A B, having corresponding ears projecting therefrom, and so that the ears of the one part will stand, respectively, the one inside and the other outside of the ears of the other part, a pintle through each pair of ears, the pintle interlocked with the inside ear of each part, the pintle extending through the outside ear of the other part and upon which the said outside ear may turn, and a spiral spring arranged axially between the said inside ears, the spring surrounding the respective pintles, and the ends of the spring at the said pintles turned outward to bear upon the leaf with which the pintle is interlocked, substantially as and for the purpose described.

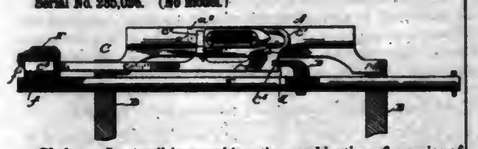


401,979. PUMP. GEORGE W. STAFFORD, Postville, Iowa. Filed Apr. 16, 1887. Serial No. 235,127. (No model.)

Claim.—1. In a pump of the character described, the combination of the pump-stock or tube provided at its lower end with a water-chamber, an open-ended cylinder rigidly secured to said stock to close the open side of said chamber and provided with two openings, *i*, communicating therewith, an imperforate diaphragm secured within the cylinder between said openings, a pump-rod carrying two valved pistons, one for each chamber of the cylinder, and a single plate-spring arranged within the water-chamber of the pump-stock and provided at each end with a valve to close the openings *i* of the cylinder, substantially as described.

2. In combination with a pump-stock or tube having a water-chamber at its lower end, an open-ended cylinder provided at one side with a block provided with projecting edges which fit snugly within the open side of said water-chamber, a diaphragm secured centrally within the cylinder, a discharge-opening above and below the diaphragm leading to the water-chamber, a single spring within the water-chamber provided at each end with a valve to close said discharge-openings, and valved pistons arranged one in each end of the cylinder and connected with a single pump-rod, substantially as described.

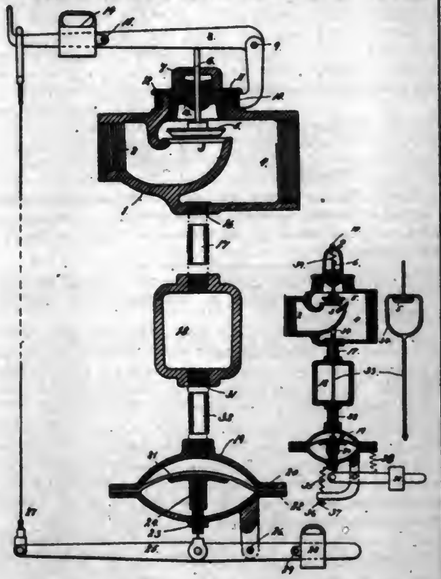
401,980. RESERVOIR FOR HOLDING LIQUIDS UNDER PRESSURE. WILLIAM H. THAYER, Melrose, Mass. Filed May 31, 1888. Serial No. 275,575. (No model.)



Claim.—1. A pivoted liquid-holding reservoir having an inlet or filling orifice, an outlet or discharge orifice, and an inlet for compressed air, all of which are located near together or upon the same side of the reservoir, which is capable of adjustment by turning upon its pivots, whereby the said orifices will be raised above the level of the liquid contained in the reservoir when it is turned into proper position for filling, and said orifices will be lowered beneath the liquid and sealed therewith when the reservoir is turned into position for discharging the same, substantially as described, and for the purpose specified.

2. A rotatory reservoir for holding and distributing liquids under pressure, provided with hollow journals having a pipe extending from each into the reservoir, to serve, respectively, as an inlet for compressed air and an outlet for liquid, and both of said pipes terminating near the periphery of the reservoir upon the same side thereof as the filling-orifice.

3. A pivoted liquid-holding reservoir having a filling-orifice at one side and suitable pipes for the ingress of compressed air and the egress of the contained liquid, a valve for closing said filling-orifice, a plate connected with said valve, a suitable support for the reservoir having a catch thereon, and a latch pivoted to the reservoir and engaging the catch at one end when the valve is open and the plate at the other when the valve is closed, substantially as described.



4. A pivoted liquid-holding reservoir having a filling-orifice, an inlet for compressed air and an outlet for oil, all located upon the same side thereof, combined with a hydrocarbon-oil-burning stove, in the manner and for the purpose substantially as described.

401,981. SHUTTLE-CARRIER FOR QUILTING-MACHINES. JOS. THOMAS and GEORGE CRETER, New York, N. Y. Filed Sept. 10, 1888. Serial No. 285,096. (No model.)

Claim.—In a quilting-machine, the combination of a series of races, a series of shuttle-carriers each having a lug on its sides, a notch at one end and a shoulder at the other, and a shuttle-driving bar having a curved shoulder entering the said notch and a hinged clamp to engage the shoulder, substantially as described.

401,982. VALVE FOR REDUCING AND REGULATING PRESSURE OF FLUIDS. WILLIAM P. THOMPSON and ROBERT P. THOMPSON, Philadelphia, Pa. Filed Jan. 29, 1889. Serial No. 297,951. (No model.)

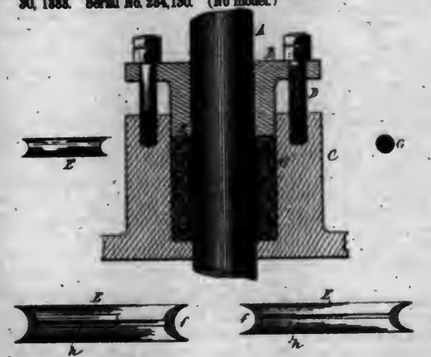
Claim.—1. The combination of a valve opening outwardly from a high-pressure pipe to a low-pressure pipe with a loaded lever and an adjustable weight, or the desired equivalent thereof, combined with a diaphragm in fluid communication with the low-pressure pipe and connected to the valve with a rod arranged to close, but not to open, the valve, and with a lever and an adjustable weight, or their described equivalent, arranged to counteract the fluid-pressure on the diaphragm and increase the pressure required in the low-pressure pipe required to cause closure of the valve, substantially as set forth.

2. In an apparatus for reducing fluid-pressure from a high pressure and adjustably regulating such low pressure, and limiting automatically the reduction of the high-pressure supply in such operation, the combination of a valve opening outwardly from a high-pressure pipe to a low-pressure pipe, and closed by a loaded lever having a fulcrum arranged to rotate about the axis of said valve, with a water-chamber screwed to the low-pressure pipe, and a connected bowl and diaphragm located below the valve-chamber, and all in the same axial line therewith, and a second adjustable loaded lever bearing upwardly against the diaphragm and arranged to receive downward motion from the diaphragm, and connected by a link transmitting a closing motion through the valve-lever, substantially as and for the purpose set forth.

401,983. CUT-OFF VALVE. JOHN J. TOMLIN, Oswego, N. Y., assignor to Thomson Kingsford, same place. Filed Jan. 30, 1889. Serial No. 298,055. (No model.)

Claim.—1. A slide-valve provided with an exhaust-port arranged at right angles to the line of travel of the valve, and with steam-ports disposed diagonally to said line of travel, in combination with a valve-seat provided with correspondingly-arranged exhaust and steam ports, as set forth.

2. A slide-valve provided with an exhaust-port arranged at right angles to the line of travel of the valve, and with steam-ports disposed diagonally to said line of travel, in combination with a valve-seat provided with correspondingly-arranged exhaust and steam ports, a valve-support arranged movably at right angles to the travel of the valve, and a governor-stem connected to said valve-support parallel with the plane of said valve, substantially as set forth.



3. The combination of the valve-seat A, provided with the exhaust-port *a*, ports *a' a'* at opposite sides of and parallel with the said exhaust-port, steam-passages *b b*, extending from the ports *a' a'* to opposite ends of the cylinder, and steam-ports *c c*, intersecting said passages, and the valve V, formed hollow and with steam-inlets to the interior thereof, and with the exhaust-port *d* in cage D over said port, and steam-ports *f f* at opposite sides of said cage, substantially as described and shown.

4. The valve V, formed hollow and with steam-inlets to its interior, the exhaust-port *d* at right angles to the line of travel of the valve, the cage D, over said port, and steam-ports *f f*, disposed diagonally in relation to the line of travel of the valve, in combination with the valve-seat A, provided with the exhaust-port *a*, likewise at right angles to the line of travel of the valve, ports *a' a'* at opposite sides of and parallel with the port *a*, the steam-passages *b b*, extending from the ports *a' a'* to opposite ends of the cylinder, steam-ports *c c*, disposed diagonally and correspondingly with the steam-ports of the valve and intersecting the steam-passages *b b*, the slide *h*, supporting the valve, and the governor-stem *l*, connected with said slide, substantially as described and shown.

5. The combination of the slide-valve V, provided with the eyes *i i*, elongated in directions parallel with the plane of the valve, the valve-stem C, passing through said eyes, nuts *n n* on the valve-stem, washers *e e* on the ends of the valve, the slide *h*, supporting the valve, and the governor-stem *l*, connected with said slide at right angles to the line of travel and parallel with the plane of the valve, substantially as described and shown.

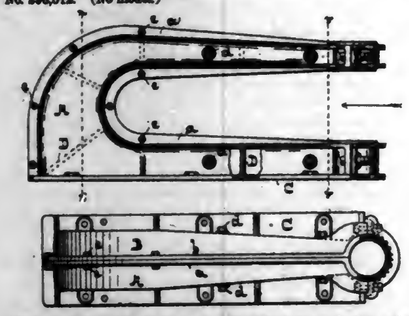
6. The combination of the hollow slide-valve provided with steam-inlets to its interior, and with eyes *i i*, elongated in directions parallel with the plane of the valve, the valve-stem passing through said eyes, the sleeve *l*, surrounding the valve-stem inside of the valve and terminating flush with the end faces of the valve, the washers *e e* on the said faces and on the ends of the sleeve, the nuts *n n* on the valve-stem, the slide *h*, supporting the valve, and the governor-stem *l*, connected to said slide at right angles to the line of travel and parallel with the plane of the valve, substantially as described and shown.

401,984. ROD-PACKING. SIVERT UNSTAD, Aurora, Ill. Filed Aug. 30, 1888. Serial No. 284,130. (No model.)

Claim.—1. The metal packing-rings E of crescent form in cross-section, and having an annular groove, A, made centrally of its inner and convex side, combined with a stuffing-box and gland extending beyond the periphery of said rings, all as and for the purposes described

2. In combination, the metal rings described, crescent shape in cross-section and provided with the annular groove A at the crest of their convex inner sides, and the packing-rings having a cylindrical cross-section conforming substantially to the cross-section of the groove *f*, and whereby the packing shall project materially beyond the outer edges of the rings.

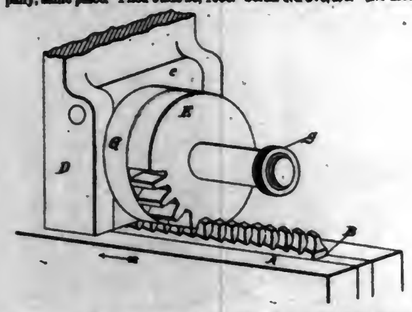
401,985. FOUNTAIN-PEN. WILLIAM VAN DENARK, Phelps, N. Y. Filed Feb. 3, 1888. Serial No. 262,915. (No model.)



Claim.—1. The combination, in a fountain-pen, of the overflow ink-chamber H, placed on the under side of the pen, for the purpose of receiving the surplus ink and returning it to the reservoir, with the pen-chamber B and reservoir A, as described.

2. The pen D, provided with the lip I, extending across the under side of the pen and firmly secured thereto, as described.

3. The feeding-plug E F G, with its channels for conducting the ink to the pen and overflow-chamber, in combination with the overflow-chamber H and pen-chamber B, as described.

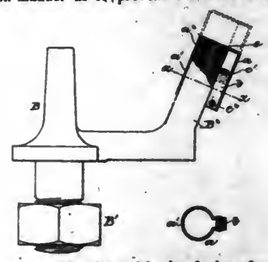


4. A fountain-pen comprehending in its construction the overflow-chamber H, constructed to receive the surplus ink and return it to the reservoir, pen D, provided with the lip I, extending across the under side of the pen, and the feeding-plug E F G, with its channels for conducting the ink to pen and overflow-chamber, all arranged, in combination with the pen-chamber B and reservoir A, substantially as described.

401,986. SHEAVE-SUPPORTING FRAME FOR CABLE RAILWAYS. JOHN WALKER, Cleveland, Ohio. Filed Feb. 2, 1888. Serial No. 263,512. (No model.)

Claim.—A frame for the purpose described, formed of two dished sections having flanges, which are bolted together, and provided with interior strengthening ribs or brackets, substantially as and for the purpose specified.

401,987. MACHINE FOR CUTTING GEARS. JOHN S. WATERMAN, Providence, R. I., assignor to The Brown & Sharpe Manufacturing Company, same place. Filed June 28, 1888. Serial No. 278,490. (No model.)

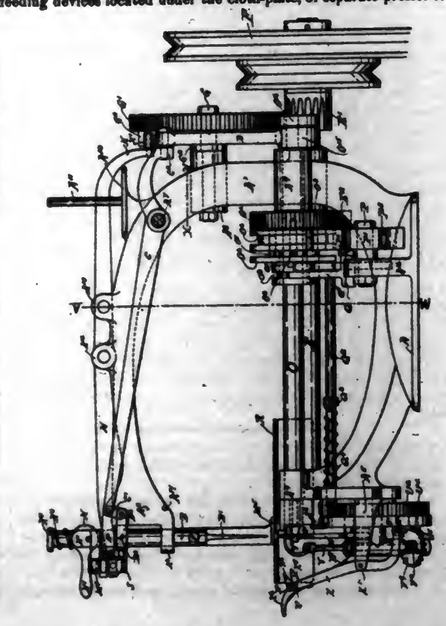


Claim.—1. The combination of a holder for a gear-blank, in which holder the blank shall be adjustable to successive positions, and a traveling bed carrying a progressively-cutting broaching-tool for cutting the spaces between adjacent teeth, the said holder and the said broaching-tool being arranged to be movable relatively toward or from one another, substantially as described.

2. The combination of a holder for a gear-blank, in which holder the blank shall be adjustable to successive positions a traveling bed carrying a progressively-cutting broaching-tool for cutting the spaces between adjacent teeth, the said holder and the said broaching-tool being arranged to be movable relatively toward or from one another, and a tooth-spacing mechanism for fixing the successive adjustments of the blank to the broaching-tool, substantially as described.

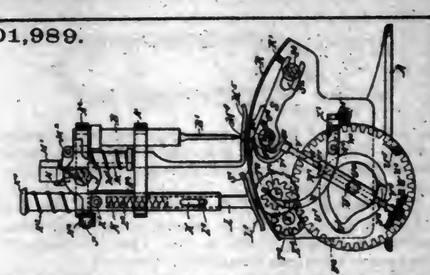
401,988. SUPPORT FOR SPINNING-SPINDLES. FRANKLIN H. WHEAT, Lowell, assignor to George Draper & Sons, Hopedale, Mass. Filed Feb. 14, 1888. Serial No. 299,865. (No model.)

Brief.—The invention has for its object to provide the oil-feeder of a spindle-support with a cap or cover, which shall be secured thereto in such manner as to prevent the same becoming detached and lost.



Claim.—The combination, with the feeder of a bolster support or bearing, of a sliding cap having an oil-hole, and a pin-and-slot connection to connect the said cap and feeder loosely, as and for the purposes described.

401,989. SEWING-MACHINE. GEORGE A. XANDER, Hamburg, and JOHN G. XANDER, Reading, Pa. Filed Sept. 5, 1888. Serial No. 284,665. (No model.)



Brief.—This mechanism makes three stitches through the material, the same being looped together. The thread is cut and two of the loops pulled through the other, and the thread at the same time is tightened. The material is then moved along and another series of three stitches made at a little distance from the first series.

Claim.—1. In a sewing-machine having a single reciprocating needle, the combination, with two separate feeding devices located under the cloth-plate, with their feeding-surfaces projecting through the same, of separate presser-feet located above said feeding devices and mechanism, substantially as described, for raising said presser-feet alternately, substantially as and for the purpose set forth.

2. In a sewing-machine, the combination, with the two separate feeding devices located under the cloth-plate, of separate presser-feet

401,989.

located above said devices, a rocker-bar with opposite arms engaging said presser-feet, substantially as described, mechanism for vibrating said rocker-arm, and a lever adapted to operate one of said presser-feet independently, all arranged substantially as set forth.

3. In a sewing-machine, the combination, with the two separate feeding devices located under the cloth-plate, of separate presser-bars K and M, located above said feeding devices, said bar K consisting of two parts, one of which has a limited movement in the other and is depressed therein by a spring, separate springs K^4 and M^3, adapted to raise the bar K and to depress the bar M, and mechanism, as rocker-bar J, for simultaneously raising one presser-bar and depressing the other, substantially as set forth.

4. In a sewing-machine, the combination, with a presser-bar and a rotating shaft, E, with cog-wheel E^3, of a feeding device located under said bar, and consisting of a plate loosely supported on said shaft and provided with a stud, T, and a combined cog and feed wheel removably supported on said stud and engaging the wheel E^3, said plate being adjustably fastened to the machine, all substantially as and for the purpose set forth.

5. In a sewing-machine, the spacing-feed T^2 and the presser-foot mechanism, both operated by a continuously-rotating shaft, E, and connected mechanism, substantially as described, in combination with a stitch-feed, S', a needle, and a looper, all operated by a shaft, O, and connected mechanism, substantially as described, said shaft O being intermittently rotated by said shaft E, substantially as and for the purpose set forth.

6. In a sewing-machine, the combination, with a continuously-rotating main shaft and a spacing-feed, T^2, and presser-bars K and M, operated thereby, as set forth, of a counter-shaft, O, carrying a feed, S', and a rotary looper, a needle-bar, operated by said counter-shaft, as set forth, and mechanism, as wheels O^2, O', and P', and clutch O^3, for regularly engaging and disengaging said counter-shaft, all substantially as and for the purpose set forth.

7. In a sewing-machine, the combination with a reciprocating needle, a rotary looper, and a feeding device, of a draw-hook, W, pivoted below said looper and having a curved hook end, substantially as set forth, and mechanism for vibrating the same, whereby a loop formed on said looper is drawn through a later-formed loop, substantially as set forth.

8. In a sewing-machine, the combination, with a reciprocating needle, a rotary looper, a feeding device, and a draw-hook, of an oscillating take-up hook, V', located below said looper, and mechanism for operating the same, substantially as described, whereby a stitch formed by said machine is tightened, substantially as and for the purpose set forth.

9. In a sewing-machine, the combination, with a reciprocating needle, a rotary looper, a feeding device, a take-up hook, V', and mechanism for operating said parts, substantially as described, of a thread-cutter pivoted below said looper and means, substantially as described, for vibrating the same in an approximately-vertical plane, whereby the thread is cut while held taut by said take-up hook, substantially as set forth.

10. In a sewing-machine, the combination of a reciprocating needle, a rotary looper, a feeding device, a draw-hook, W, a take-up hook, V', and a vibrating cutter, all arranged and operated substantially as set forth.

11. In a sewing-machine, the combination of a needle, the looper, the stitch-feed S', the draw-hook, the take-up hook, and the cutter, with a separate feed, T^3, to regulate the space between stitches, and mechanism for operating the same, all arranged substantially as and for the purpose set forth.

12. In a sewing-machine, the combination of a needle, the looper, the stitch-feed S', the draw-hook, and the take-up hook, with a separate feed, T^3, to regulate the space between stitches, and mechanism for operating the same, all arranged substantially as and for the purpose set forth.

13. In a sewing-machine, the combination, with the needle, the looper, and the stitch-feed, of the rotating cam-disk U' and the draw-hook W, pivoted to the machine and operated by said cam, substantially in the manner and for the purpose set forth.

14. In a sewing-machine, the combination, with a reciprocating needle, a rotary looper, and a feeding device, all operated by an intermittently-rotating shaft, substantially as described, and with a draw-hook, W, of the take-up hook and mechanism arranged to operate it while said needle, looper, and feeding device are at rest, substantially as and for the purpose set forth.

15. In a sewing-machine, the rotating disk U', with teeth U^4, in combination with the take-up hook V', its shaft V, pinion V^3, spring V^2, stop V^4, and bearing U^3, all arranged substantially as set forth.

16. The combination, with a needle, a looper, and a feeding device, of the draw-hook W, the take-up hook V', the thread-cutter, and the rotating cam-disk U', engaging said draw-hook, take-up hook, and thread-cutter, substantially as described, and all arranged to operate substantially in the manner set forth.

17. In a sewing-machine, the combination, with the presser-bars K and M, the feeds T^2 and S', and the rocker-bar J, engaging said presser-bars, of a pivoted lever, H, connected to said rocker-bar and operated by a cam, G^2 G^4, substantially as and for the purpose set forth.

18. In a sewing-machine, the combination, with the two separate feeding devices located under the cloth-plate, of separate presser-bars K and M, located above said feeding devices, said bar K consisting of two parts, one of which has a limited movement in the other and is depressed therein by a spring, a separate spring adapted to depress the bar M, and a rocker-bar mechanism, substantially as described, for simultaneously raising one presser-bar and depressing the other, substantially as set forth.

401,990. TYPE-WRITING MACHINE. GEORGE W. N. YOST, New York, N. Y., assignor, by mesne assignments, to the American Writing Machine Company, of New York. Filed June 28, 1880. Serial No. 12,604. (Model.)

Claim.—1. The stationary indicator *i'*, in combination with the rotating and longitudinally-moving platen S and the lever *w*, constructed substantially as described, whereby the operator is enabled to supply an omission or make a correction in the printing, substantially as set forth.

2. The rotating bar *t*, having a shoulder, *u*, in which is pivoted the lever *w*, having a spring tension laterally, in combination with the ratchet-wheel *l* and platen S, substantially as set forth.

3. In a type-writing machine, a plate or disk for indicating when the end of the line has been nearly reached, in combination with an arm which may be adjusted to throw the disk at the proper time, substantially as set forth.

4. In a type-writing machine, a disk or indicator hung behind a casing of a different color, in combination with an adjustable arm which is attached to the paper-carriage frame and which will throw the indicator from behind the disk when the end of the line to be printed has been nearly reached, substantially as set forth.

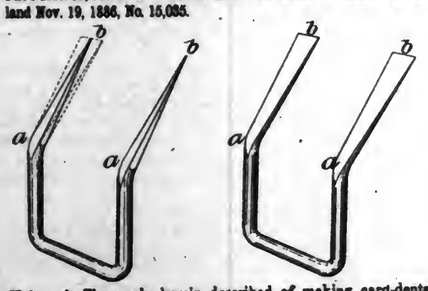
5. The indicator *i*, hung behind the casing *h* by means of the arm *j*, in combination with the adjustable arm *g*, substantially as set forth.

6. The indicator *i*, of a light color, hung behind the casing *h* of darker color, by means of the arm *j*, having a flange, *k*, upon its upper edge, in combination with the adjustable arm *g*, substantially as specified.

7. The frame L, having a spring tension toward the left and mounted upon the guide-rail K, in combination with the paper-carriage frame O, hinged to frame L, platen S, bars W, and a means of revolving the platen, substantially as shown and described.

8. The paper-carriage frame composed of two cylindrical rods with end bars, P, and provided with the adjustable spring-bars W, as described, and the guide-wire F', in combination with the cylindrical platen S, substantially as and for the purpose set forth.

9. The arm *g*, having a check, *f*, and loosely pivoted to the adjustable sleeve *d*, in combination with the disk or indicator *i*, hung behind a casing by the arm *j*, having a flange, *k*, upon its upper end, substantially as set forth.



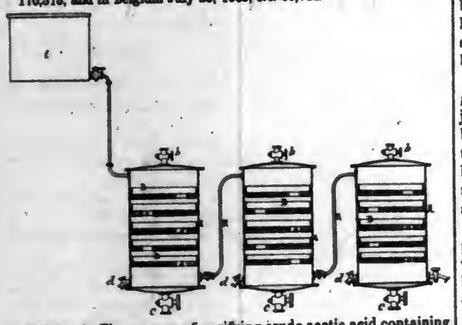
10. The pivoted space-regulator *p*, having a spring tension and provided with the faces *r s*, in combination with the lever *n*, dog *m*, ratchet *l*, and platen S, substantially as specified.

11. The combination of the lever *n*, extending in front and down toward the key-board and having pivoted on its upper end the dog *m*, having curved branches, with bar *t*, loosely mounted on the platen-axle, and lever *w*, substantially as and for the purpose described.

12. As a paper-table for a type-writer, the spring-bars W, adjustable upon the rod N, and having their lower ends curved under the platen S and their upper ends curved upward and toward the rear thereof, in combination with cylindrical platen S, substantially as specified.

401,991. MODE OF MAKING CARD-TEETH.

George Ashworth and Elijah Ashworth, Manchester, County of Lancaster, England. Filed Mar. 15, 1887. Serial No. 231,005. (No model.) Patented in England Nov. 19, 1886, No. 15,035.



Claim.—1. The mode herein described of making card-dents, said mode consisting in first flattening the wire at the points which form the back and front of the dent-points, then removing the metal at the sides, and thereby producing card-teeth the wires of which are tapered from about the bend to the points, all substantially as set forth.

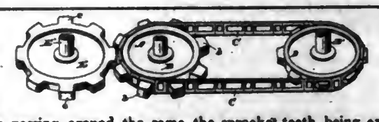
2. The mode herein described of making wire cards, said mode consisting in first flattening the parts of the wires forming the dent-points at the back and front, then inserting the flattened dents in the foundation, and finally grinding the dents at the sides, to produce tapering points, substantially as set forth.

401,992. PROCESS OF PURIFYING ACETIC ACID.

Ivar A. F. Bang and Marie C. A. Ruffin, Paris, France. Filed Dec. 19, 1888. Serial No. 294,105. (No specimens.) Patented in France July 25, 1885, No. 170,313, and in Belgium July 25, 1885, No. 69,711.

Claim.—1. The process of purifying crude acetic acid containing pyroligneous matter, which process consists in bringing such acid in a liquid state into intimate contact with a carbon compound, such as specified, which will not mix with the acid, whereby the said impurities are dissolved, and then separating the acid from the purifying agent and the impurities which it has absorbed, substantially as described.

2. In the process of purifying acetic acid containing pyroligneous matter, the improvement consisting in bringing the same while in a liquid state into contact with a hydrocarbon of the benzine series, whereby the said impurities are dissolved, substantially as described.



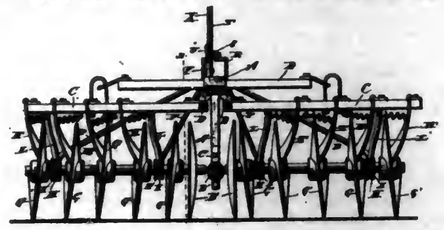
3. The process of purifying crude acetic acid by first blowing air through the same and thereby forming resinous compounds, distilling off the acid, and completing the purification by bringing the acid into intimate contact with a carbon compound (such as herein specified) which will not mix with the acid, substantially as described.

401,993. GEARING.

Milton R. Benedict, Perry, N. Y. Filed July 9, 1888. Serial No. 279,443. (No model.)

Claim.—1. The combination, with the sprocket-wheel and the

401,993



chain passing around the same, the sprocket-teeth being extended beyond the chain between them, of the gear having teeth projecting between and engaging with each of the carrying-teeth on the sprocket, substantially as described.

2. The combination, with the gear-wheel, of the sprocket-wheel and chain, the carrying-teeth on the sprocket having a broad operating-surface and extending beyond the chain a sufficient distance for the engagement of the gear, substantially as described.

3. The combination, with the sprocket-wheel having the extended carrying-teeth and the chain, of the gear-wheel having its teeth circumferentially extended to engage those on the sprocket-wheel without any lost motion, substantially as described.

401,994. DISK HARROW AND CULTIVATOR.

Edward C. Boyer, Dayton, Ohio. Filed Dec. 23, 1888. Serial No. 294,880. (No model.)

Claim.—1. The combination, with the tongue and gang-beams, the former being provided with a horizontal bolt or rod, of plates D, secured to the inner ends of the gang-beams and provided with horizontal slots for the passage of the said bolt, whereby the beams will have a limited vibratory movement, but will be prevented from lifting at their inner ends, substantially as set forth.

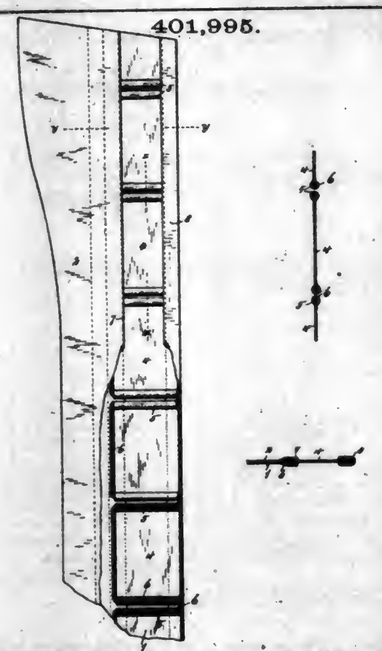
2. The combination of a tongue and gang-beams, a horizontal stationary bolt secured to the under side of the said tongue near its rear end, and lugs carried by the gang-beams at their inner ends and provided with horizontal slots for the passage of the said bolt, substantially as described.

3. The combination of a tongue, bearings secured upon the under side of the said tongue, a horizontal bolt secured removably in these bearings and provided with a head or nut, gang-beams provided with lugs at their inner ends, these lugs being provided with horizontal slots for the passage of the said horizontal bolt, and washers upon this bolt between the said lugs, substantially as described.

4. In a disk harrow, the combination of a tongue, the vibrating gang-beams loosely attached to the tongue, independent gang-shafts journaled in bearings attached to the said vibrating beams, this shaft being provided with pulverizing-disks, a hanger, A', depending from the said tongue and provided with a divided spherical socket at its lower end, and a ball loosely confined in this socket and adapted to receive the end-thrusts of the said vibrating gang-shafts, substantially as herein set forth.

5. The combination of the tongue and gang-beams, lugs or plates provided with horizontal slots, and a horizontal stationary bolt whereby the gang-beams will be allowed a limited lateral vibratory movement, but will not be permitted to rise at their inner ends, substantially as described.

6. The combination, with the drag axles or shafts provided with a series of spiral cutters or disks, of the concavo-convex disks or wheels secured to their adjacent ends, substantially as and for the purposes set forth.

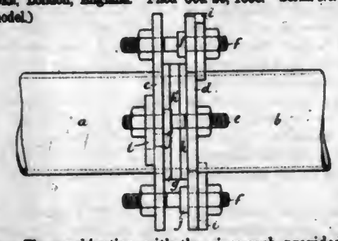


401,995. METHOD OF MAKING BUTTON-HOLE STRIPS.

Morris P. Bray, Ansonia, Conn., assignor of one-half to Chauncey L. Olmstead, West Brookfield, and Albert D. Nason, Springfield, Mass. Filed Aug. 9, 1888. Serial No. 282,334. (No model.)

Claim.—1. The method of making button-holes in garments, which consists in forming pockets at the opposite edges of stay-pieces, then passing a cord backward and forward through said pockets, and finally stitching a binding at one edge of the stay-pieces and stitching the opposite edges to the garment, substantially as described.

2. The method of making button-holes, which consists in forming pockets at the opposite edges or ends of stay-pieces, then passing a continuous cord backward and forward through said pockets and from one stay-piece to another at the front or outer edges thereof, thus looping the cord around the front or outer ends of the button-holes formed by the stay-pieces, then stitching the inner edges of the



401,995.

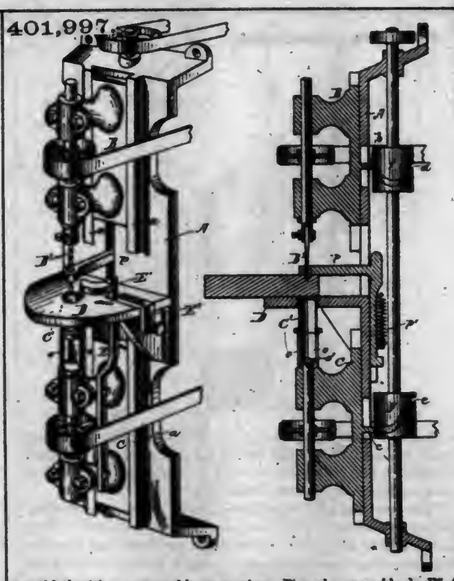
stay-pieces between the plies of the garment, and stitching a binding over the outer edges of the stay-pieces and over the loops of the cord.

401,996. COUPLING FOR PIPES OR TUBES.

George W. H. Broeden, London, England. Filed Oct. 20, 1888. Serial No. 288,615. (No model.)

Claim.—The combination, with the pipes each provided with a flange adjacent to its ends, of rings or flanges encircling said pipe and engaging said flanges, consisting of two parts, each provided at one end with an offset to receive the plain end of the other part, and bolts having one end extending through the ends of the portions of said ring, each bolt having a shoulder engaging the inner face of said ring and a nut on said bolt engaging its outer face, the free ends of said bolts being adapted to engage apertures in the opposing flange and provided with nuts, substantially as described.

401,997. MACHINE FOR FORMING SPOOL-BLANKS.

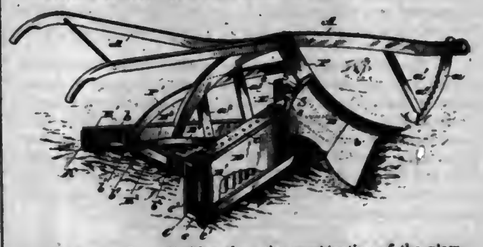


Charles A. Broughton, Conway, N. H. Filed Dec. 16, 1886. Serial No. 221,744. (No model.)

Claim.—1. In a machine for forming cylindrical perforated blanks, the combination, with a horizontal table for supporting the stock from which the blanks are to be cut, of a hollow saw operating upwardly through the table and adapted to cut or saw the said blank from the stock, an abutment or stop above the stock provided with an adjustment for regulating the lowest position of the said abutment above the table, and a spring for permitting the said abutment to move upwardly under the excessive upward pressure upon the stock, substantially as set forth.

2. In a machine for forming spool-blanks, the combination, with the saw C and its operating devices, substantially as set forth, of a gage against which the stock may be held to determine its lateral position, this gage consisting of a spring-arm, E, provided with a removable gage-piece, E', the said spring-arm being mounted upon the carriage which moves the saw, all substantially as set forth.

3. In a machine for forming spool-blanks, the combination, with the saw C and its operating devices, substantially as set forth, of the spring-arm E, mounted upon the carriage which moves the saw, and



401,997.

provided with a removable gage-piece, E', and a gage-block, E'', for regulating the amount of motion outwardly of the spring-arm, the said gage-block being provided with an adjusting-screw whereby it may be moved in or out over the table D, all substantially as set forth.

401,998. DITCHING-PLOW.

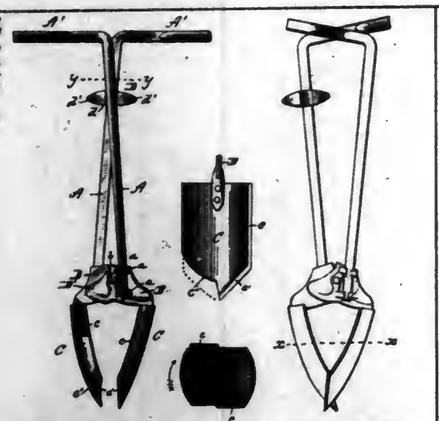
William Burton, Lake Village, Ind. Filed Nov. 28, 1888. Serial No. 292,117. (No model.)

Claim.—1. In a ditching-plow, the combination of the plow-frame and a belt-carrying frame adjustable vertically at its front and laterally at its rear end, substantially as described.

2. In a ditching-plow, the combination of the plow-frame and a belted roller-frame adjustably secured at front to the plow-standard and connected at rear to the extended landside by adjustable braces, substantially as described.

3. In a ditching-plow, the combination of the plow-frame having an extended landside, the belted roller-frame secured at front to the plow-standard by a swivel-joint, adjustable braces connecting the extended landside with the rear end of the roller-frame near the bottom, and a brace pivoted at one end to the top of the roller-frame and adjustably secured at its other end to the adjustable brace, substantially as described.

4. In a ditching-plow, the combination of the plow-frame having an extended landside, the belted roller-frame provided at front with a plate having a vertical series of apertures, a swivel secured at one end to the plow-standard and adjustably connected at its other end to said plate, a horizontal brace connecting the extended landside with the rear end of the roller-frame near the bottom, and a brace pivoted at one end to the top of the roller-frame and adjustably connected at its other end to the horizontal brace, substantially as described.



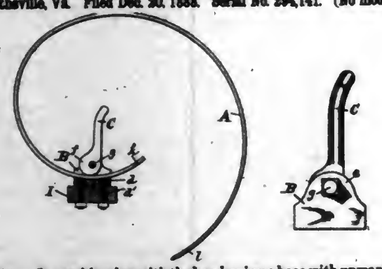
5. In a ditching-plow, the combination of the plow-frame having an extended landside, B', a belted roller-frame pivoted at its forward end to the plow-standard and connected at its rear end to the rear end of the landside by adjustable braces, and a long blade, K, secured to and projecting below the landside, to prevent lateral movement of said landside, substantially as described.

401,999. POST-HOLE AUGER.

Henry C. Cloyd, Union City, Ind. Filed Aug. 23, 1888. Serial No. 283,517. (No model.)

Claim.—1. The combination of the operating-rods, the angular

401,999.



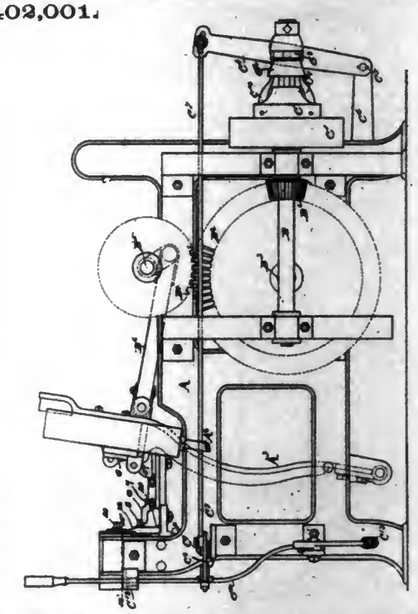
plates secured to the said operating-rods by means of malleable lugs *a*, formed integral with the said plates, the bolt *b* for pivoting these plates together, and the blades secured to downward extensions of the plates, substantially as described.

2. The combination of the pivoted angular plates, the operating-handles secured thereto, and the two concavo-convex blades C C, these blades being each pointed at its lower end and sharpened upon one of its vertical edges, each blade also having a portion of its lower pointed end cut away, as at *c'*, the cut-away portions being upon opposite sides of the auger, whereby, when the blades are brought together after boring, the space between their lower ends will be entirely closed, as and for the purpose set forth.

3. The combination of the blades, the angular arms or plates pivoted together, the operating-rods attached to the said arms or plates, and provided with oppositely-projecting handles, and the catch D, attached to one of the said rods, and provided with a notch in its face and oppositely-projecting inclined or beveled lips, as and for the purpose herein set forth.

4. The combination of the operating-rods A A, provided with the handles A' A', projecting in opposite directions, the catch D, secured to one of the said rods, and provided with oppositely-projecting inclined lips *d' d'*, the angular plates B B, secured, respectively, to the lower ends of the operating-rods and pivoted together, each of these plates being provided with oppositely-projecting extensions or guides B' B', and the blades C C, curved and pointed, as described, and provided with notches *c'* at their lower ends upon opposite sides of the auger, all arranged as and for the purpose described.

402,000. SPRING-TOOTHED HARROW. THOMAS R. CRANE, Heathsville, Va. Filed Dec. 20, 1888. Serial No. 294,141. (No model.)

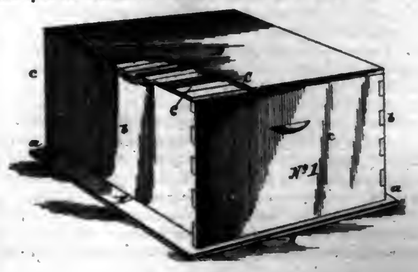


Claim.—In combination with the box having a base with upwardly-extending vertical ears formed integral with the base, a cam-lever pivoted between said ears, a space between the lever and base, and a spring harrow-tooth secured in said space, substantially as specified.

402,001. STOP MECHANISM FOR LOOMS. GEORGE CROMPTON and HORACE WYMAN, Worcester, Mass.; Mary C. Crompton administratrix of said George Crompton, deceased; said Mary C. Crompton and Horace Wyman assignors to the Crompton Loom Works, same place. Filed Feb. 19, 1886. Serial No. 192,519. (No model.)

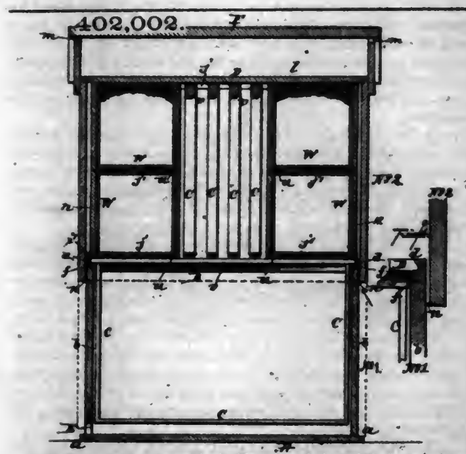
Brief.—The dagger controlled by the weft-feeler drops when the weft-thread fails, and through mechanism engaged and operated thereby effects the release of the shipper-handle from its retaining-notch, while at about the same time and during the same forward beat of the lay a finger operated by the weft-stop mechanism raises a bunter and places it in position to be struck by a lug upon the lay, whereby its further forward movement is arrested and consequently all the other parts of the loom are caused to stop.

402,001.



Claim.—1. The lay, means to move it, a stand attached to it between the selvages of the fabric to be woven, a feeler pivoted on the said stand at the front of the lay, a dagger pivoted below the feeler, means to connect the feeler and dagger, a dog acted upon by the dagger, a rock-shaft mounted in bearings at the under side of the breast-beam and having projection 45 and lug 86, and the bunter, and means between the said dog and the said projection 45 to operate the said shaft to place the said bunter in the line of movement of and to arrest the lay as the latter is moved forward after the breaking of the filling, substantially as described.

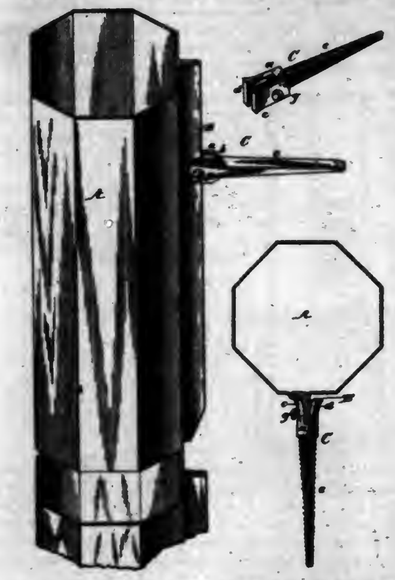
2. The lay, the two stands thereon, the two weft-feelers, each pivoted, as shown and described, at the front of the lay, the two daggers, and means to connect each feeler with its dagger, and a rock-shaft having attached dagger-lifters, combined with means to actuate the said rock-shaft and move both daggers together, substantially as described.



3. The lay, an attached stand, a weft-feeler pivoted thereon at the front of the lay, a dagger, and means to connect it with the feeler, a rock-shaft, the dagger-lifter thereon, and an arm, 64, attached to the said rock-shaft at a distance from the dagger-lifter, combined with a bracket, *g*, at or near one side of the loom and near the line of selvage, and with means, substantially as described, carried by the said bracket, to operate the said arm and turn the said rock-shaft and dagger-lifter, substantially as described.

402,002. BEE-HIVE. FRANCIS DANNENBAKER, Claymont, Del. Filed Aug. 17, 1888. Serial No. 282,905. (No model.)

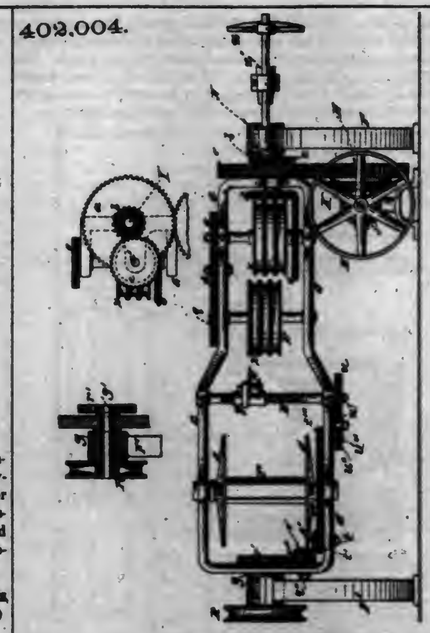
Claim.—1. The combination of body No. 1, consisting of the brood-chamber, with body No. 2, consisting of a casing open at the top and at the bottom enveloping said body No. 1, the dimensions of the two bodies being such that a space, *s*, is left between said bodies, the cleats *i* on two of the sides of the inner walls of body No. 2, and a cleat or cleats, *i'*, arranged over said space or spaces, whereby said body No. 2 may be adjusted to close said spaces or to leave one of them open for ventilation, substantially as described.



402,002.

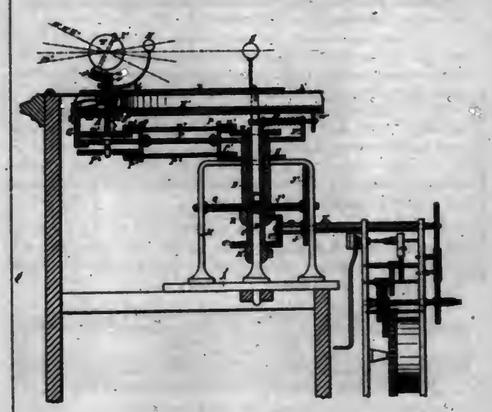
2. The combination of body No. 1, consisting of the brood-chamber having the upper edges of its ends *b b* rabbeted at *d*, the removable strips *f f*, fitted in said rabbets, and comb-frames having their bars supported upon said strips, with body No. 2, consisting of a casing open at the top and at the bottom provided with comb-frames and section-crates and supported upon said top bars, so as to leave the bee-space *f'*, as described.

402,003. SUPPORT FOR WATER-CONDUCTORS. JOHN DAVIS, Allegheny, Pa. Filed Feb. 1, 1889. Serial No. 298,314. (No model.)



Claim.—1. A support for water-conductors, having a head provided with a slot, arms curved outwardly at their free ends, and suitable means for securing it to a conductor, substantially as described.

2. A support for water-conductors, having a head provided with a slot, arms curved outwardly at their free ends, and a screw for securing it, in combination with a water-conductor having a projection or fold on one side, substantially as described.

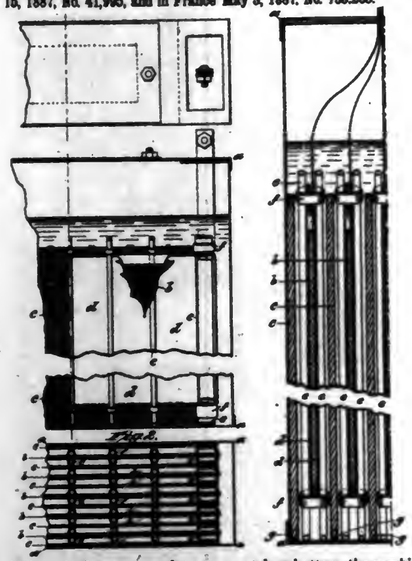


402,004. REEL FOR MACHINES FOR FORMING AND REELING ROPES OR STRANDS. MOSES H. DAY, Brookline, Mass. Filed July 29, 1887. Serial No. 245,631. (No model.)

Claim.—In a collapsible reel for receiving a rope or strand as produced in a machine such as described for forming ropes or strands, the combination, with the heads having mortises, of the semi-cylindrical blades having a tenon at each end to fit in said mortises, the tenons being secured by pins in the mortises of one head and detachable from the mortises in the other head, substantially as specified.

402,004.

402,005. TELLURIAN. LOUIS DEICHMANN, Cassel, Germany. Filed Sept. 18, 1888. Serial No. 285,782. (No model.) Patented in Germany June 28, 1887, No. 43,274; in France Aug. 31, 1887, No. 186,568, and in Belgium Feb. 6, 1888, No. 80,583.



Claim.—1. The combination consisting of the clock mechanism, the rotary shaft K, pinion J, gear-wheel J', toothed wheel C^3, crown-wheel C', sleeve C, rotary shaft B, crown-wheel *n*, pinion *n'*, support or journal *p*, arbor or shaft n^2, support or journal q, pinion n^3, crown-wheel n^4, sleeve t^2, sleeve *u*, spring *f*, support G, and the spheres M and S, helical spring *w*, wheel *w'*, and arm F', and collar E', substantially as shown and described.

2. The combination consisting of the clock mechanism, the shaft K, pinion J, wheel J', worm J^2, worm-wheel J^3, sleeve D, crown-wheel N, pinion p', arbor or shaft p^2, pinion p^3, crown-wheel P^3, shaft *t*, and wheels *a*, sphere T, and axis *t'*, wheels a' a^2, elliptical disk E', the indicator Z, dial E, and collar E, substantially as shown and described.

3. The combination consisting of the clock mechanism, the rotary shaft K, gear-wheels J J', pinion C^3, crown-wheel C', shaft B, worm and wheel J^2 J^3, sleeves C D, crown-wheels N *n*, pinions n' p', shafts or arbors n^2 p^2, arm F, pinions n^3 p^3, crown-wheels n^3 P^3, shaft and sleeve t t^2, support G, spring *f*, wheels *a* a' a^2, sleeve *u*, axis *t'*, spheres T M S, indicator Z, dial E, helical spring *w*, shaft Q, and bracket H and plate A', substantially as shown and described.

402,006. SECONDARY BATTERY. CAMILLE DESMAZURES, Paris, France; James L. Norris, administrator of said Camille Desmazures, deceased, assignor to Marie Antoinette Desmazures, Paris, France. Filed Mar. 31, 1887. Serial No. 233,175. (No model.) Patented in England June 15, 1886, No. 7,966, and Mar. 21, 1887, No. 4,219; in Germany Mar. 15, 1887, No. 41,995, and in France May 3, 1887, No. 183,285.

Claim.—1. In an accumulator or secondary battery, the combination, with an alkaline liquid, of pure porous metallic plates, substantially as described.

2. In an accumulator in which an alkaline liquid is employed at the positive pole, the positive electrodes *b b*, composed of pure porous copper, substantially as described.

3. In an accumulator, the combination, with an alkaline liquid and pure porous-metal plates, of parchment-paper envelopes for said plates, whereby a metal may be employed whose oxide might dissolve in the electrolyte, substantially as described.

4. In an accumulator in which an alkaline liquid is employed, the electrolyte liquid composed of chlorate of soda with zincate of soda or of potash, substantially as described.

5. In an accumulator in which an alkaline liquid is used, the combination of the glass rods *e e* and india-rubber rings *f f* to separate and support the positives and negatives.

402,007. SPLICE-BOX FOR ELECTRIC CABLES. THOMAS J. DREWRY, Palmyra, N. J., assignor to the Electric Cable Construction and Maintenance Company, of Pennsylvania. Filed Feb. 23, 1889. Serial No. 300,809. (No model.)

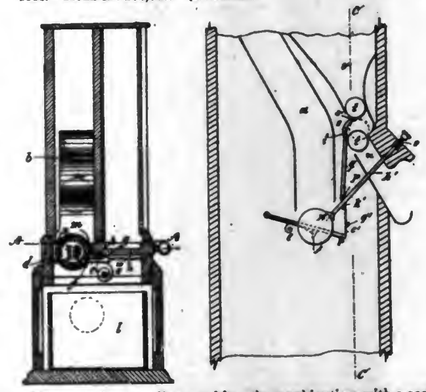
Claim.—1. The combination of a cable of electric wires having a spliced joint, a sheath or box inclosing said splice and having packing-receiving sockets at each end, soft packing-rings in said socket portions, and couplings screwed into said socket portions and compressing the washer upon the cable.

2. The combination, with the spliced cable, of a protecting metal sheath or cylinder adapted to cover the spliced portion of said cable, washers of soft material surrounding said cable on each side of the splice, and means, substantially as described, to force said washers in contact with the cable to form a water-tight section.

3. The combination, with the spliced cable and an inclosing metal tube inclosing said cable, of a protecting metal sheath or box adapted to cover the spliced portion of said cable, couplings encircling said cable at each end of said sheath or box and uniting the tube and sheath or box, and washers of soft material between said coupling ends and the ends of the sheath or box, whereby, when said parts are drawn together, the washers are forced against the cable and make a tight joint.

4. The combination, with the spliced cable, of a protecting sheath or box adapted to cover the spliced portion of said cable, having screw-threaded ends, couplings encircling said cable at each end of said sheath or box and provided with screw-threads upon their outer surfaces to screw into the sheath or box, and washers of soft material between said couplings and the ends of the sheath or box, whereby, when said parts are screwed together, they force the washers against the cable.

5. The combination of the cable A, having the spliced portion, the box or sheath D, having projecting parts or collars E, couplings C, screwing into the projecting parts or collars, metallic rings F, having inner beveled edges, *f*, arranged within the projecting parts, and washers G, adapted to be compressed within the projecting parts or collars to make tight joints at each end of the splice-box.



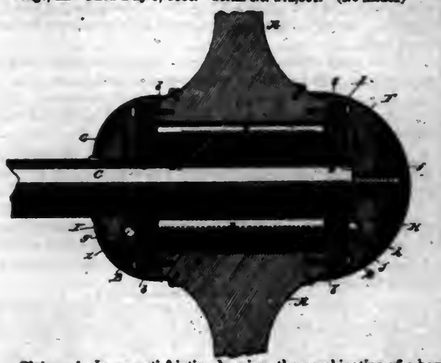
6. The combination of a spliced cable, an inclosing metal splice-box having its edges beveled and provided with an internally-screw-threaded part projecting beyond the beveled edges, soft washers or packing-rings within said projecting parts, and couplings which screw into the projecting part of the splice-box and compress the washers.

7. The combination of a cable of electric wires having a spliced joint, a sheath or box inclosing said splice and having packing-receiving sockets at each end, soft packing-rings in said socket portions, packing-receiving metallic rings upon each side of the packing, and couplings screwed into said socket portions and compressing the washer upon the cable.

8. The combination of the sheath or box D, having its ends provided with collars E, forming socket portions at each end, annular rings H and F within said socket portion, a soft washer, G, between the annular rings, and couplings C, screwed into said socket portions to compress the rings H upon the washer.

9. The combination of the sheath or box D, having its ends provided with collars E, forming socket portions at each end, annular rings H and F within said socket portions, a soft washer, G, between the annular rings, couplings C, screwed into said socket portions to compress the rings H upon the washer, and the conduit-pipe B, screwed into the couplings, substantially as set out.

402,008. VENDING-MACHINE. GUSTAV J. DOLLINGER, Hamburg, Germany, assignor to Josef Steindecker, same place. Filed Nov. 28, 1888. Serial No. 292,070. (No model.)

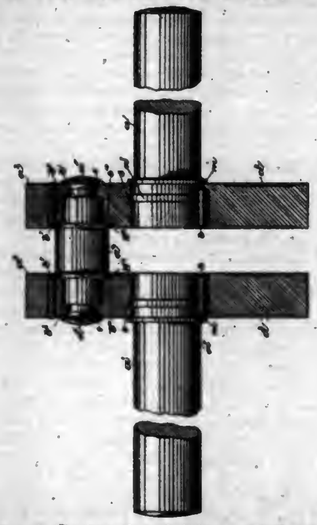


Claim.—1. In a vending-machine, the combination, with a casing and a coin-hopper, of a slotted lever adapted to receive and hold the coin and to be depressed by the latter, a delivery device adapted to engage the pivoted lever, and a spring adapted to hold the lever up in position, all substantially as shown, whereby, when a coin is placed upon the lever, the latter will be depressed and thrown out of engagement with the delivery device.

2. In a vending-machine, the combination, with a casing provided with a coin-hopper, of a spring-sustained slotted lever pivoted to the case and provided with spring-arms to receive and hold the coin, a delivering device adapted to engage the pivoted lever when in its normal position, and an arm or rod connected with the delivering device, all substantially as shown, whereby, when a coin is placed on the lever, it causes the disengagement of the latter from the delivering device and permits the arm or rod carried by the latter to force the coin through the slotted lever.

3. In a vending apparatus, the combination, with the box or casing provided with a coin-hopper, *a*, of the slotted lever *c*, pivoted to the case, as at *d*, and provided with spring-arms *f*, to clasp the coin projecting through the slot in the lever, a hook, *g*, secured to the free end of the lever, a delivery-slide, *h*, provided with a hook, *k*, to engage the hook on the lever, and a spring, *e*, secured to the case and adapted to hold the lever *c* up in engagement with the hook on the delivery-slide.

402,009. BEARING FOR JOURNALS. WILLIAM R. ELLIOTT, Chicago, Ill. Filed May 5, 1888. Serial No. 272,881. (No model.)



Claim.—1. In an anti-friction bearing, the combination of a box having in its ends annular grooves provided with inclined bearings, a series of bearing-cylinders, and a series of separating-cylinders, said separating-cylinders being provided with contracted journals having rounded ends engaging said inclined bearing in and free to traverse the annular groove, the circle traversed by the journals of the separating-cylinders being within the corresponding circle of the journal-bearing cylinders, substantially as described.

2. In an anti-friction bearing, the combination of a box having in its ends inclined bearings, and also annular grooves, a series of bearing-cylinders having rounded corners engaging said inclined bearings, and a series of separating-cylinders provided with contracted journals projecting in and free to traverse the annular grooves, the circle traversed by the journals of the separating-cylinders being within the corresponding circle of the journal-bearing cylinders, substantially as described.

3. In an anti-friction bearing, the combination of a box having at its ends inclined bearings, and also annular grooves having similar bearings, and a series of bearing and separating cylinders having rounded corners respectively engaging said inclined bearings, said separating-cylinders being provided with contracted journals projecting in and free to traverse the annular groove, the circle traversed by the journals of the separating-cylinders being within the corresponding circle of the journal-bearing cylinders, substantially as described.

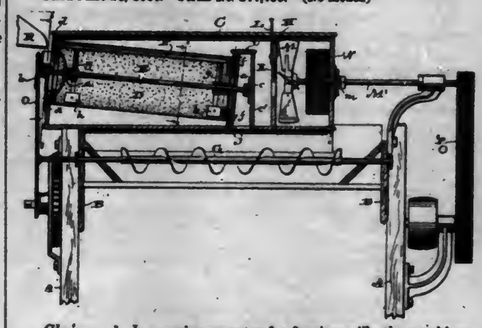
402,010. CRANK-SHAFT. CHARLES FOSDICK, Fitchburg, Mass. Filed Dec. 4, 1888. Serial No. 292,678. (No model.)

Claim.—1. The journals, and disks carried thereby, provided with chambers having shoulders b^3, combined with the hollow sleeve to abut against the said shoulders, and the headed pin or bolt extended through the said sleeve and disks, substantially as described.

2. The journals, and the disks secured thereto, and provided with chambers having shoulders b^3, and countersinks 8, combined with the hollow sleeve, and the bolt extended through the disks and sleeve and filling the said countersinks, substantially as described.

3. The journals and their connected disks, provided with chambers having shoulders b^3 and b^{10}, and the sleeve having flanges b^{10}, combined with the bolt extended through the said disks and sleeve to hold them together snugly, substantially as described.

4. The combination, with the journals having each an annular projection, of the disks each having a bore provided with an annular groove to embrace the annular projection, and each provided with a chamber having a shoulder, b^3, and the hollow sleeve and headed pin or bolt extended through the said sleeve and disks, substantially as described.

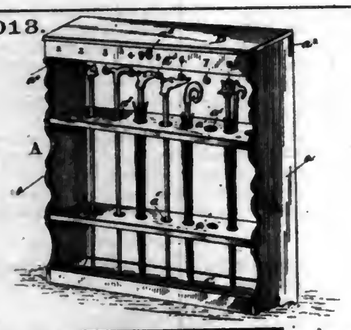


402,011. FINGER-RING. MOSES FREED, New York, N. Y. Filed Nov. 27, 1888. Serial No. 291,949. (No model.)

Claim.—1. In a ring having a head provided with a recess, the combination of a stone adapted to be received within said recess, a metallic plate upon the back of the stone, recesses or pockets formed by the metallic plate between the latter and the stone, projections upon the ring-head extending into certain of said recesses, and a locking-pin extending into another of said recesses, substantially as specified.

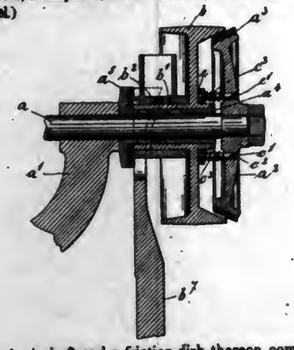
2. In a ring having a head provided with a recess, the combination of a stone adapted to be received within said recess, a metallic plate upon the back of the stone, recesses or pockets formed by the metallic plate between the latter and the stone, projections upon the ring-head extending into certain of said recesses, a locking-pin extending into another of said recesses, and a letter upon the front side of the stone provided with prongs extending through the stone and the metallic plate, by which both the letter and the plate are secured to the stone, substantially as specified.

402,012. GRAIN-SEPARATOR. STEPHEN FREEMAN, Racine, Wis. Filed June 21, 1888. Serial No. 277,753. (No model.)



Claim.—1. In a grain-separator for fanning-mills, the combination, with a housing, of a gauze cylinder located therein, a fan and fan-chamber, a conduit between the fan-chamber and the cylinder-housing, and a chamber leading from the interior of the cylinder, the walls of which last-named chamber form a partition between the housing and the interior of the cylinder, so that the draft from the fan will be drawn through the walls of the cylinder, substantially as described.

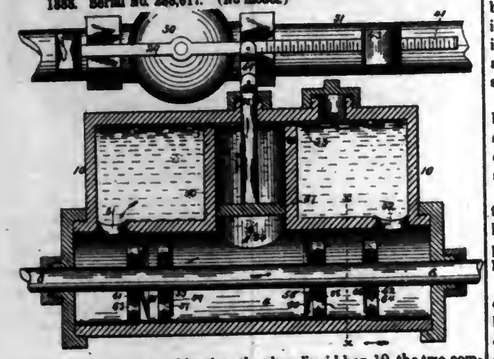
2. The combination, in a grain-separator, of an inclined gauze cylinder and housing therefor, a fan and fan-chamber, the latter communicating with the cylinder-housing, and a chamber inclosing the inner end of the cylinder and leading therefrom, substantially as described.



402,018. UMBRELLA OR CANE RACK. WILLIAM GABLE, Shamokin, Pa. Filed Aug. 15, 1888. Serial No. 282,777. (No model.)

Claim.—The combination, in an umbrella or cane rack, of the vertical side pieces, the horizontal cross-pieces connecting the vertical sides and provided with a series of apertures adapted to receive and hold the canes or umbrellas deposited in the rack, a drip-pan located in the bottom of the rack, and a single cover hinged upon one side of the rack at its top part and adapted to overlap and cover the entire series of apertures or receptacles and the articles placed therein, substantially as and for the purpose set forth.

402,013.



402,014. CLUTCH. LOUIS GODDU, Winchester, assignor to James W. Brooks, principal trustee, Cambridge, and Frank P. Stanley, associate trustee, Swampscott, Mass. Filed July 9, 1888. Serial No. 279,423. (No model.)

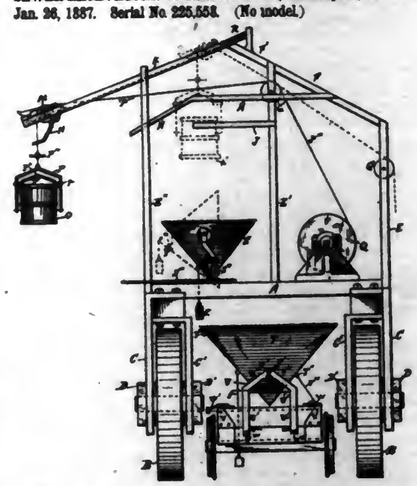
Claim.—1. A shaft and a friction-disk thereon, combined with a free and disconnected sleeve loose on said shaft and capable of longitudinal and rotary movement on said shaft, a pulley loose on said sleeve, and means to move the pulley longitudinally on the sleeve, substantially as and for the purpose specified.

2. A shaft and a friction-disk thereon, combined with a free and disconnected sleeve provided with a flange, and loose on said shaft, a pulley loose on said sleeve, a hub, b^2, and a shipper-rod acting on said hub to move the said pulley, substantially as described.

402,015. HYDRAULIC GOVERNOR FOR ENGINES. WILLIAM H. GRAY and JAMES D. GRAY, West Falls, Md. Assignors to the Gray Automatic Steam Governor Company of Alexandria, Va. Filed Oct. 20, 1888. Serial No. 288,617. (No model.)

Claim.—1. In combination, the close liquid-box 10, the two communicating cylinders 4 and 50 therein, having communication therewith at 51, 52, and 54, the pistons and diaphragms at opposite sides of the opening 54, and the pistons 67, with rod 68, passing through the top of box 10, as set forth.

2. In combination, a liquid box or reservoir, a cylinder therein having near each end a stationary diaphragm with inward-opening valve, a piston-rod in the cylinder carrying two heads with inward-opening valves, a second cylinder communicating with the first and with the liquid-box, a valve to control the opening to the liquid-box, and a piston in the second cylinder whose rod connects with and operates the supply-valve, as set forth.



3. In combination, the liquid-cylinder, the supplementary cylinder communicating therewith, the liquid-box communicating with both cylinders, and the valve between the supplementary cylinder and liquid-box, having a pointer and graduated scale to indicate the speed, as set forth.

4. In combination, the liquid-box, the liquid-cylinder, and the supplemental cylinder having communication with each other, the valve between the supplemental cylinder and the liquid-box, and the pin in its plug to limit the extent of its adjustment in either direction, as set forth.

5. In combination, the rod 68, having teeth 79, the supply-pipe valve, its stem, the disk mounted thereon having teeth to engage those on the rod, and the lever 80, engaging therewith, as set forth.

6. In combination, the extensible lever having curved pieces 81 and 82 at its ends and mounted upon the supply-valve stem, the cord 83, having weight 84 at one end and the handle 88 at the other end of the lever, the disk on the valve-stem, and the stop 87 thereon, as and for the purposes set forth.

402,016. LOADING AND UNLOADING MECHANISM FOR SEWER-EXCAVATORS. NELSON R. GREEN, Minneapolis, Minn. Filed Jan. 26, 1887. Serial No. 225,553. (No model.)

Claim.—1. The combination, with a carriage adapted to receive a car beneath the same, of a pivoted automatic dumping-receptacle mounted in fixed bearings on said carriage and adapted to empty its contents into a car beneath the carriage, substantially as described.

2. The combination, with a carriage adapted to receive a car beneath the same, of a pivoted automatic dumping-receptacle mounted in fixed bearings on said carriage and adapted to empty its contents into the car beneath the carriage, and a hoisting-bucket adapted to automatically dump into the pivoted receptacle, substantially as described.

3. The combination, with a carriage adapted to receive a car beneath the same, of a dumping-receptacle pivoted above and to one side of the center of gravity of the said receptacle and adapted to discharge into a car beneath the carriage, and a counter-balance for said receptacle, substantially as described.

4. In combination, the hoisting-bucket having a bail pivoted to the same below the center of gravity, keepers sliding on the bail, said keepers being connected by a bridge or bail provided with a cross-bar projecting at right angles to the bridge or bail, and guides for the bucket-bail having inclined portions, substantially as described.

5. The combination, with a hoisting-bucket, of the rigid bucket-dumper J, located at one side of and slightly within the path of the bucket-body in its dumping position and at one side of the pivotal axis of the bucket, whereby the bucket is brought into contact with said dumper in its emptying position and is forced to turn always in one direction to discharge its contents, substantially as described.

6. A trolley consisting of a frame having a sheave provided with a notched hub, a gravity sheave-lock consisting of a pivoted bar having a projection on its under side in position to engage the notched hub, and a cam, in combination with a trolley-track having a projection and a lock for the trolley separate from the other parts named, substantially as described.

7. A bail-guide for a hoisting-bucket, consisting of two guiding-bars of unequal length having outer curved portions, substantially as described.

8. The combination, with a hoisting-bucket provided with a bail, of a movable support for the bucket, a guide for the movable support for the bucket, and a bail-guide consisting of two guiding-bars having at one end outwardly-curving portions, said curving portions being located at different distances from the other end of the guide, substantially as described.

9. In combination, the bucket O, provided with the lugs p', the bail P, pivoted below the center of gravity to said bucket, the false bail P', having the keepers p, sliding on the bail P, and provided with the cross-bar P'', the combined guides and tripping-bars H H', the metallic spring bucket stop and dumper J, attached to the post E, provided with the bends J'', J''', and J''', and suitable mechanism, substantially as described, for removing said bucket from its filling to its emptying position.

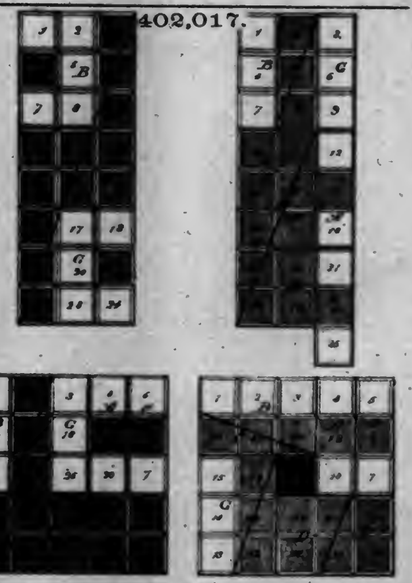
10. In combination, the trolley M, consisting of a frame, a grooved sheave, e, provided with the notched hub d, anti-friction journal-rollers f, the gravity sheave-lock g, provided with the lugs h and cam-surface k, guide K, provided with cam-surface L', the gravity trolley-frame lock N, pivoted at l to the under side of the guide K, and provided with the cam-faced hooks m, and the downwardly and outwardly extended loop-shaped portion n, the cable P'', provided with the disk P'', and the winding-drum Q, substantially as described, for the purpose set forth.

11. In combination, the sheave-carrying trolley M, the trolley-track K, the hoisting-bucket O, the cable P''', and the bucket-guides H and H', fixed to the main frame above the receiving-receptacle and extending outward and downward on opposite sides of the path of the bucket-bail and provided with laterally-curved extremities, as set forth, whereby the bucket-bail is always caught lengthwise between the guides, and the bucket is directed truly to its dumping position.

12. In an apparatus of the class described, the main platform, in combination with the vertical braces C C', the horizontal braces D D', connected with the truck-platform, and independent wheels journaled in said horizontal braces, as set forth.

13. The herein-described carriage for loading and unloading mechanism, provided with horizontal braces D D' for the wheels of the carriage, substantially as described.

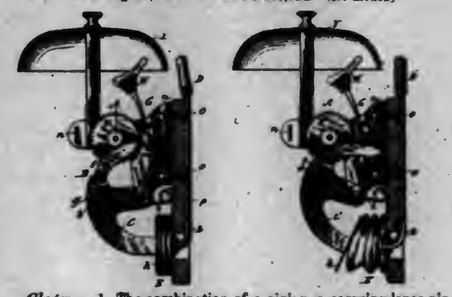
14. The apparatus comprising a hoisting device and the supporting-platform therefor, the said hoisting device extending beyond the platform at one side, parts depending from each side of the platform with a clear space between through which a car may be passed, wheels mounted in the depending parts, horizontal braces for said wheels, and an automatic dumping-receptacle on said platform adapted to receive material from the hoisting device and to dump the same into a car beneath the platform, substantially as described.



15. In combination with a hoisting-cable, a dumping hoisting-bucket provided with a bail and connected to said cable, a suitable support adapted to sustain said bucket and cable in their movement from the bucket's filling position in one vertical plane to its dumping position in another vertical plane, and a bail-guide consisting of two guiding-bars of unequal length extending from beyond said dumping-plane outward toward said filling-plane, both bars curving away from each other at their outer ends, the curved portion of one bar being nearer the filling-plane than the curved portion of the other, substantially as and for the purpose set forth.

16. In combination with the automatically-dumping hoisting-bucket provided with a bail, a support for said bucket adapted to sustain the same in its movement from its filling to its emptying position, a bail-guide for said bucket, consisting of two guiding-bars of unequal length having outer curved portions, said curved portions being located at different distances from the other end of said bail-guide, and a bucket-dumper located adjacent to the bucket in its emptying position, adapted to force said bucket always to dump in one direction, substantially as described.

17. The apparatus comprising a carriage adapted to receive a car beneath the same, a pivoted automatic dumping-receptacle mounted on said carriage and adapted to empty its contents into the car beneath the carriage, a hoisting-cable, an automatically-dumping hoisting-bucket provided with a bail attached to said cable and adapted to empty its contents into said pivoted receptacle, a suitable support adapted to sustain said bucket and cable in their movement from the bucket's filling position to its emptying position, a bail-guide consisting of two guiding-bars of unequal length having outer curved portions, said curved portions being located at different distances from the other end of said bail-guide and adapted to direct said bucket to its dumping position, and a bucket-dumper located adjacent to the bucket in its dumping position and adapted to force said bucket always to dump in one direction, all substantially as described, and for the purpose set forth.



402,017. PUZZLE. FRED HOWARD, Hyde Park, Ill. Filed May 25, 1888. Serial No. 275,675. (No model.)

Claim.—1. In a game or puzzle, the combination of a number of blocks having the form of parallelograms, trapezoids, and triangles, and substantially of the numbers and proportions described in the specification, whereby, when arranged in one way, they produce a figure of a certain superficial area, and when arranged in another way a figure of an apparently different superficial area, substantially as described.

2. In a game or puzzle, a square divided into parallelograms, trapezoids, and triangles by dividing the whole square into two rectangular portions or parallelograms, one containing about two and the other three fifths of its superficial area, dividing the larger portion of the original square on lines parallel to its end at about one-fifth and two-fifths of its length, and dividing the remaining part of the larger portion diagonally on a line from a point on one side about one-third to a point on the opposite side about two-thirds of the length of its side, dividing the smaller portion of the original square into two triangles, and dividing these triangles on a line parallel to their shorter base at a point on their longer base about two-fifths of their length, measuring from the shorter base, whereby the parts may be rearranged to form a hollow square of the same apparent dimensions as the original solid square, a right parallelogram, or a right parallelogram of the same apparent dimensions, with a small square projecting at one corner, substantially as described.

402,018. MECHANICAL MOVEMENT. JOHN HUNT, New York, N. Y. Filed Aug. 24, 1888. Serial No. 283,634. (No model.)

Claim.—1. The combination of a pinion, a carrying-lever pivoted on an axis below the axis of the pinion, and a sector having teeth normally concentric with said axis and engaging said pinion, and said sector eccentrically pivoted to said lever on an axis normally to one side of said lever-axis, and which ascends as the lever is moved, whereby when the lever is moved to communicate rotation through the sector to the pinion the sector is caused to readily free itself by gravity at the completion of its active movement.

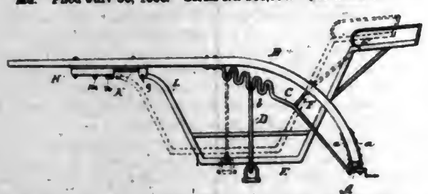
2. The combination of a pinion, a carrying-lever pivoted on a relatively-fixed axis, and a toothed sector having teeth normally concentric with said axis and engaging said pinion, said sector pivoted eccentrically to said carrying-lever at a point normally to one side of the center of gravity of the sector, so that its weight holds it in mesh with said pinion, but which point in the movement of the carrying-

lever passes to the opposite side of said center of gravity, so that the sector falls out of mesh with the pinion, and said sector having a toothless space, *f*, to enable it to thus fall out of mesh and free itself from the pinion independently of the continued rotation of the latter.

3. The combination of a pinion, a carrying-lever pivoted on a relatively-fixed axis, and a toothed sector having teeth normally concentric with said axis and engaging said pinion, said sector pivoted eccentrically to said carrying-lever at a point normally to one side of the center of gravity of the sector, so that its weight holds it in mesh with said pinion, but which point in the movement of the carrying-lever passes to the opposite side of said center of gravity, so that the sector falls out of mesh with the pinion, and said lever and sector having reciprocal shoulders arranged to limit the disengaging movement of the sector and as the lever is returned to draw back the sector.

4. The combination of a pinion, a carrying-lever pivoted on a relatively-fixed axis, and a toothed sector having teeth normally concentric with said axis and engaging said pinion, said sector pivoted eccentrically to said carrying-lever at a point normally to one side of the center of gravity of the sector, so that its weight holds it in mesh with said pinion, but which point in the movement of the carrying-lever passes to the opposite side of said center of gravity, so that the sector falls out of mesh with the pinion, and said lever and sector having reciprocal shoulders, consisting of the walls of a slot formed in one part and a screw fixed to the other part entering said slot and having an overhanging head, serving to hold the two parts together, while limiting their relative movement.

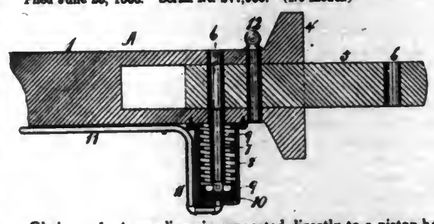
5. The combination of a pinion, a carrying-lever pivoted on a relatively-fixed axis, and a toothed sector having teeth normally concentric with said axis and engaging said pinion, said sector pivoted eccentrically to said carrying-lever at a point normally to one side of the center of gravity of the sector, so that its weight holds it in mesh with said pinion, but which point in the movement of the carrying-lever passes to the opposite side of said center of gravity, so that the sector falls out of mesh with the pinion, and a spring arranged to exert a retractile tension against said carrying-lever.



402,019. SLED. VICTOR D. JOHNSON, Mount Pleasant, Iowa. Filed Jan. 3, 1887. Serial No. 223,266. (No model.)

Claim.—1. A sled or sleigh runner having a shoe, A, shaped as shown, with one or more semicircular inverted arch-bars, B, resting on said shoe, constituting bench-knees, with a curved brace, D, fastened to the rear end of said shoe as auxiliary to the rear point of a segment, B, and a brace, C, fastened to the forward end of said shoe, supporting the forward point of an inverted segment, B, all formed of separate pieces of T-iron or steel bars, so placed that the web-flange *c* of the respective pieces will lie inward and bear against each other at the several connecting-points, with plates *r* placed on each side of the flanges *c* and riveted to both the shoe A and segments B, and the knee-caps *e*, in pairs, having laterally-projecting flanges extending in opposite directions, being firmly riveted to opposite sides at the meeting-points of the segments B and those also of the braces C and D, with said segments serving as bench-supports, all substantially as shown and described.

2. In combination with a sled or sleigh runner constructed of T or other transverse forms of metal bars, the combination of the bar or shoe A and sole A', both being curved transversely to fit each other, so as to form a longitudinal inverted gutter underneath them, substantially as shown, for the purpose specified.

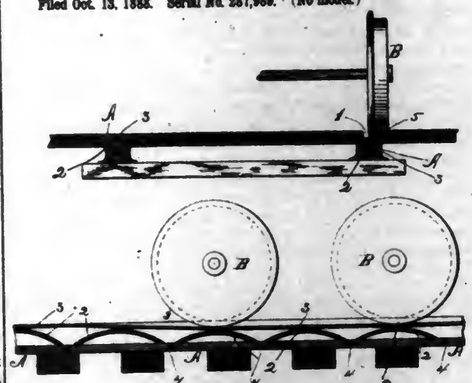


402,020. TWO-WHEELED VEHICLE. SETH L. KIMBEY, Graceton, Md. Filed July 30, 1888. Serial No. 281,357. (No model.)

Claim.—1. The combination, in a two-wheeled vehicle, of the thills secured to the axle, the corrugated brace extending from the axle to said thills, the hangers having their upper ends adjustably and loosely connected to said brace-rods, and their lower ends having eyes, the spring secured at the center of the bed and provided with loops on its ends, and said loops being connected with said eyes, whereby the bed may have a back-and-forth and sidewise movement, substantially as described.

2. The combination, in a two-wheeled vehicle, of the thills secured to the axle, the bed or body, the spring centrally secured to the bottom of the body and having the loops on its ends, the brace-rods, the hangers having their hook ends loosely connected to said brace-rods and their eye ends loosely connected with the loops, the blocks having grooves secured to said thills, the slotted slides working in said grooves, the bolts limiting the movement of said slides, set-screws engaging said slides, and the rocker-arms pivotally attached to said slides, substantially as described.

402,021. CAR-COUPLING. EDWARD J. KNAPP, Syracuse, N. Y. Filed June 23, 1888. Serial No. 277,989. (No model.)



Claim.—1. A coupling-pin connected directly to a piston-head and operated vertically through the draw-bar, and a link inserted horizontally into the draw-bar by the introduction or withdrawal of air behind the piston-head, substantially as described.

2. In a car-coupling, a coupling-pin directly connected to a piston-head mounted in a cylinder secured to the draw-bar or bumper, and a pipe connected to an air compressor or exhauster, in combination, substantially as described.

3. In a car-coupling, a cylinder secured to the bumper, a piston-head within the cylinder, a coupling-pin connected directly to a piston-head, and means for forcing air into the cylinder or exhausting it therefrom, and a spring around the coupling-pin between the piston-head and bumper, substantially as described.

402,022. RAILWAY-RAIL. EDWARD J. KNAPP, Syracuse, N. Y. Filed Oct. 13, 1888. Serial No. 287,989. (No model.)

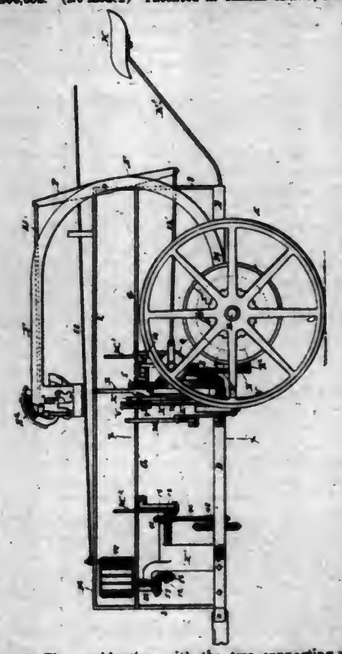
Claim.—A railway-rail grooved longitudinally and provided with a yielding filler, and drainage-perforations through the bottom of the groove, substantially as described.

402,023. NUT-LOCK. ISAAC F. LEIBY, Baird, Tex. Filed Sept. 17, 1888. Serial No. 285,667. (Model.)

Claim.—1. The combination, with the loop-formed nut-locking device and the plate to which it is hinged, of the supplementary locking device, consisting of a wire or rod having one end bent at right angles and embracing the hinge of the main device and its other end provided with a hook to receive the side bar of the main device, as shown.

2. The combination, with the foundation-plate and the loop-formed nut-locking device 1, having the cross-piece 5 and hinged to said plate, as specified, of the supplementary locking device 1', having one end bent laterally to adapt it to bear against a nut and its other end bent downward and abutting the said cross-piece, as shown and described.

402,024. NEWSPAPER-FILE. THOMAS LOMAS, Bridgeport, Conn. Filed Jan. 14, 1889. Serial No. 296,231. (No model.)



Claim.—1. The herein-described newspaper-file, consisting of a metal tube constructed with a longitudinal slot less in width than the internal diameter of the tube, combined with a rod of less diameter than the internal diameter of the tube, but greater in diameter than the width of the slot of the tube, substantially as described, the said rod being adapted to be placed in the fold of papers and with that folded portion of the papers introduced into the tube, the leaves of the paper extending through the slot, substantially as described.

2. The tube A, made from sheet metal, the edges of the metal brought near together so as to form a longitudinal slot, *a*, in the tube, the edges of the slot diverging at the end, so as to form a flaring mouth, *b*, combined with a rod, B, less in diameter than the internal diameter of the tube A, but larger in diameter than the width of the slot *a*, substantially as described.

3. The combination of the tube A, constructed with a longitudinal slot, *a*, one end fixed in a handle, C, the slot *a*, open at the opposite end, combined with a rod, B, less in diameter than the internal diameter of the tube A, but larger in diameter than the width of the slot *a*, substantially as and for the purpose described.

4. The longitudinally-slotted metal tube A, provided with a handle, C, at one end and with a removable cap, D, at the opposite end, combined with the rod B, of less diameter than the internal diameter of the tube A, but larger in diameter than the width of the slot *a* substantially as and for the purpose described.

402,025. HARVESTER. SAMUEL D. MADDIN, Sarnia, Ontario, Canada, assignor to Mary Maddin, same place. Filed May 2, 1887. Serial No. 236,852. (No model.) Patented in Canada Mar. 3, 1888, No. 28,617.

Claim.—1. The combination, with the two supporting-wheels and axle of a grain-binder, of a sleeve on the axle, a frame supported on the sleeve, a platform supported by the frame, and a U-shaped bar, F, supported by the frame below the platform and extending above the same, and a knotter supported by the bar F above the platform, substantially as described.

2. A binder-frame supported upon two wheels and an axle, and consisting of a sleeve, C, mounted on the axle, a bar, D, arranged transversely across the sleeve to which it is secured, a grain platform supported upon brackets rising from said bar and sleeve, and a U-shaped bar or plate supported at one end upon the frame below the platform, and having the other end extending above the same where it carries a support for the knotter, substantially as described.

3. A binder-frame provided with a longitudinal bar, D, brackets rising from said bar, a binder-platform supported on said brackets, and a strip or bar, E, extending above the platform and having downwardly-extending arms secured to the frame and supporting the platform at the ends, substantially as described.

4. The combination, with a continuously-rotating wheel, S, and the needle, of an intermittently-rotated wheel mounted below the binder-platform in a plane beside the needle and actuated from the wheel S, and provided with a crank-pin, and a link mounted on the said pin and connected directly with the needle, substantially as described.

5. The combination, with the knotter devices, the compressor, the ejector, and the needle, of the intermittently-rotated wheel N, mounted below the binder-platform in a plane beside the needle, and having a crank-pin connected by a link directly with the needle, and provided with separate racks, and mutilated pinions driven by the racks and driving, respectively, the knotter devices and the compressor and ejector, substantially as described.

6. The combination, with the compressor, the ejector, the needle, and the knotter, of an intermittently-rotated wheel, N, adjacent to the needle and connected directly therewith, gears between the compressor and the ejector and the wheel N, a bevel-wheel, Q, gearing with wheel N, and link-and-lever connections between the wheel Q and the knotter, substantially as described.

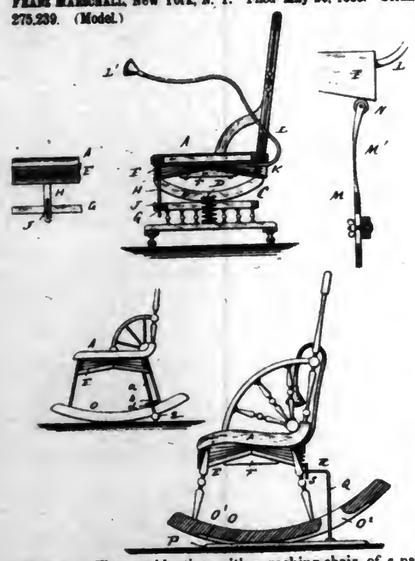
7. In a grain-binder, the combination, with the needle and the ejector supported upon the needle-shaft, of an intermittently-moving wheel, N, which drives the needle, mounted below the binder-platform in a plane beside the needle, and a gear-wheel, 5, connected with the ejector and driven directly by said wheel N, substantially as described.

8. In a grain-binder, the combination, with the needle and the compressor and ejector, both mounted upon the needle-shaft, of a wheel, N, arranged below the binder-platform in a plane beside the needle, but below the needle-shaft, and connected to drive the same, and a wheel, 5, to which the compressor and ejector are secured, driven directly by the wheel N, substantially as described.

9. In a grain-binder, a frame supporting the binder devices, located between two drive-wheels of equal size, which are both connected to drive the operative parts of the binder, a binder platform or table mounted on said frame extending over the said wheels, and an elevator supported by pivoted links from the said frame and resting loosely at its upper end upon a bar at the grain or receiving end of the binder-platform, substantially as described.

10. The combination of the packers M M', projecting through the binder-platform near the central portion thereof, cranked shaft 6, driving the same, a supplemental packer, M^3, projecting through the platform near the front edge thereof, a shaft, 43, parallel with the main packer's shaft, and a short shaft, 12, parallel thereto connected to drive the supplemental packer and driven from shaft 43, substantially as described.

11. The combination, with the platform, sleeve C, packers, needle, compressor and ejector arms, and knotting mechanism, of a bracket, J, carried by the sleeve and supporting the devices connected to drive the needle, compressor and ejector arms, packers, and knotting devices, substantially as described.



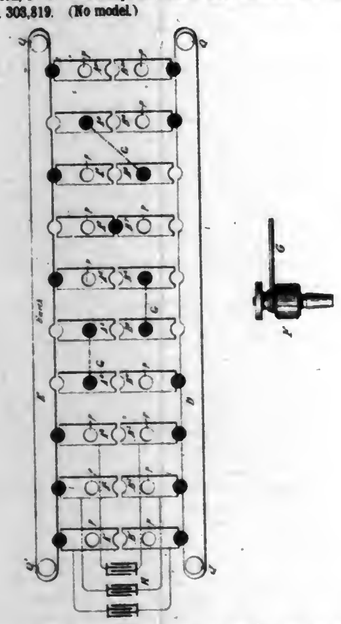
12. The combination, with two supporting-wheels, of the binder and the intermediate sleeve rocking upon the axle, of the packer, binder, discharge and knotter operating devices arranged above, close to, and forward of the sleeve, and the driver's seat in rear of said sleeve, substantially as described.

13. The combination of the frame of the binder supported upon two wheels, the platform-frame B^3, rocking together with the binder-frame on a line in rear of its center, arms connecting said frame to the binder, a shaft, 64, bearing against the under side of the platform-frame, near its front edge, having arms at the ends, one having an axle for the grain-wheel in line with the axes of the wheels of the binder, and means for rocking the shaft 64, substantially as described.

14. The combination, with the harvester-frame rocking with the binder-frame on a fulcrum in rear of its central line and flexibly connected to the binder-frame and traveling therewith, of a longitudinal bar located near the forward part of said harvester-frame and having a rearwardly-extending arm and axle for a grain-wheel with its journal about in line with the journals of the binder-wheels, substantially as described.

402,026. BELLOWS ATTACHMENT FOR ROCKING-CHAIRS.

FRANK MARSCHALL, New York, N. Y. Filed May 26, 1888. Serial No. 275,239. (Model.)



Claim.—1. The combination, with a rocking-chair, of a pair of bellows secured to the under side of the seat, a rigid piece connecting them, an air-conducting tube connected with the bellows, and a rod for operating the bellows, substantially as herein shown and described.

2. The combination, with a rocking-chair, of a bellows secured to the under side of the seat, a rod for operating the bellows by the rocking of the chair, and an air-conducting tube connected with the bellows, substantially as herein shown and described.

402,027. CONDENSER SWITCH-BOARD.

WILLIAM MARSHALL, New York, N. Y. Filed Sept. 29, 1887. Renewed Mar. 15, 1889. Serial No. 303,819. (No model.)

Claim.—1. The combination, with the positive leaf or leaves of each one of a series of condensers, of a series of contact-plates connected thereto, respectively, a corresponding series of contact-plates connected to the alternate or negative leaves, respectively, a strip adjacent to each series of plates, and a switch for connecting each plate with its corresponding strip.

2. The combination, in a condenser switch-board, of the positive series of plates A' A^2, &c., the corresponding series of negative plates, each plate of both series being provided with an independent plug-hole, and plugs adapted to the said holes provided with binding-screws at their upper ends, whereby a wire connection can be made between any two plates.

3. The combination, in a condenser switch-board, of the series of positive plates A' A^2, &c., the corresponding series of negative plates B' B^2, &c., the strips D and E, adjacent to the two series, respectively, a plug-connection between each plate and its adjacent strip, and plugs having binding-screws at their upper ends adapted to independent holes in the plates, whereby additional wire connections between the plates may be made.

402,028. LETTER-BOX FOR STREET-CARS.

GEORGE B. McALLISTER, Baltimore, Md. Filed Nov. 24, 1888. Serial No. 291,752. (No model.)

Claim.—1. The combination, with a letter receptacle or box arranged in the car with its receiving-opening in the opening of the car, of a guide plate or rib secured to the side of the car and arranged parallel therewith, and provided with a guide-bar on its outer edge, substantially as described.

2. The combination, with a letter-receptacle arranged in the car with its receiving-opening in said opening of the car, of a guide plate or rib secured horizontally on the side of the car, and provided with guides to direct the packages in the opening of the car, substantially as described.

3. The combination, in a letter-receptacle formed with an inclined chute opening therein, of the false bottoms arranged at different angles of incline and consisting of thin strips having their meeting ends intersecting, substantially as described, and for the purpose specified.

4. The combination, in a letter-receptacle, of false bottoms arranged at different angles of incline and consisting of thin strips having their meeting ends intersecting and supported on a common bearing, substantially as described.

5. The letter-receptacle herein described, composed of the receptacle A, inclined chute 1, mouth-piece 2, partially covered by the pieces 4, and the false bottoms arranged in said chute on different inclines and consisting of strips having beveled upper edges, substantially as described.

6. In a letter-receptacle, the inclined false bottoms composed of thin strips formed with beveled upper edges, substantially as described.

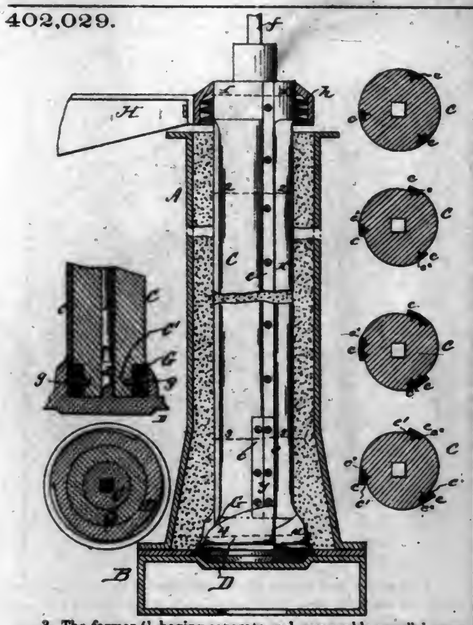
7. A letter-receptacle formed with a chute, constructed as described, leading into the main receptacle, and provided with vertical stop-pieces on the inner surface of the sides of the chute, whereby rain-drip is prevented from entering the receptacle.

8. The combination, with a letter box or receptacle, A, of a letter-chute, 1 2 3, constructed as herein described, that is of two sections arranged at different angles of inclination, and inclined bottom arranged to stop short of the receptacle, substantially as set forth.

9. The combination, with the receptacle A, constructed as described, having an inclined bottom, 18, of a series of beveled slats arranged on the bottom of the receptacle, as herein shown and specified.

10. The herein-described device, composed of a receptacle, A, a chute leading therein, and a mouth-piece opening into the chute, false bottom in the chute arranged at different angles of inclination, and a bottom in the receptacle composed of strips, all as specified.

11. In a letter-receptacle, the combination of the false bottom 5 6, composed of strips having beveled upper edges formed with notches, substantially as described, and for the purpose specified.

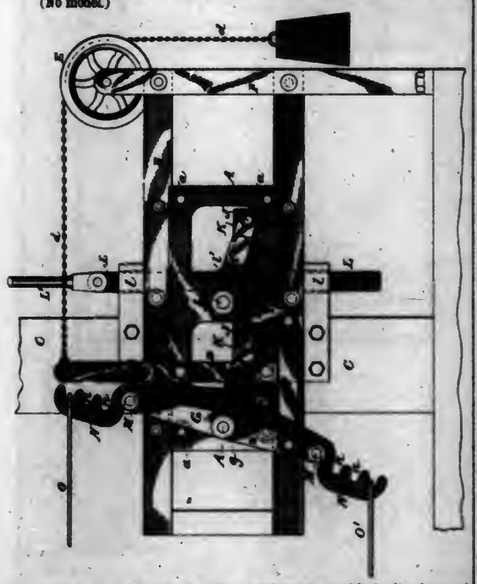


402,029. FORMER FOR PIPE-MOLDING APPARATUS.

ANDREW H. McNEAL and WILLIAM A. STINEBUCK, Burlington, N. J. Filed Apr. 23, 1887. Serial No. 235,856. (Model.)

Claim.—1. A vertically-arranged pipe-former having removable pressing-faces parallel with the axis, and the advance faces flush with the surface of the former.

2. A vertically-arranged pipe-former having removable pressing-faces, the advance edges of which are flush with the surface and the lower part provided with two faces contiguous to each other, for the purpose set forth.



402,029.

3. The former C, having separate and removable parallel pressing-faces *c c*, extending from top to bottom of the former, and packing, *c'*, between the faces and former, substantially as and for the purpose set forth.

402,030. COMPENSATOR FOR RAILWAY SIGNAL AND SWITCH CONNECTIONS.

ALBERT R. MITCHELL, Paterson, N. J., and WILLIAM N. STEVENS, Brooklyn, N. Y. Filed Nov. 27, 1888. Serial No. 291,985 (No model.)

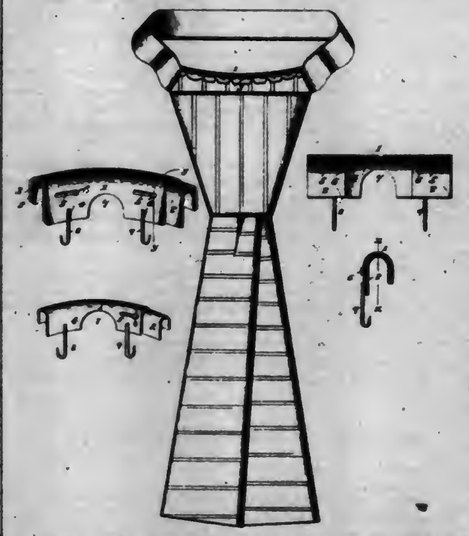
Claim.—1. The combination, with two movable bodies located at a distance from each other and wires for transmitting motion from one to the other, of a plate sliding on ways, mechanism mounted on said plate and to which the wires are connected so as to move simultaneously therewith, a weight attached to the sliding plate, and a horizontal bar connecting the mechanism on the plate with one of the movable bodies and adapted to have a movement in a direction at a right angle to and simultaneously with the movement of the wires, substantially as specified.

2. In a compensator, a bar, L, capable only of end reciprocating movement, and a plate having end reciprocating movement in a plane at a right angle to the movement of the bar L, combined with connected cranks pivoted in said plate, to one of which cranks the operating-wires are attached, and a bar, K, carried by said cranks and engaging with the bar L, substantially as set forth.

3. In a compensator, a bar, L, capable only of end reciprocating movement, a plate having end reciprocating movement in a plane at a right angle to that of the bar L, a bar, K, carried by said plate and engaging said bar L by a sliding connection, and means, also carried by said plate, for giving movement to said bar K, substantially as set forth.

4. In a compensator, a bar, L, capable only of vertical reciprocal movement, and a plate, A, sliding on ways and capable only of horizontal reciprocating movement, combined with the connected cranks G and H, pivoted to said plate, a bar, K, carried by said cranks and engaging the bar L by a sliding connection, and the safety attachment N, mounted on one of the cranks and to which the operating-wires are attached, substantially as set forth.

5. The plate A, having end reciprocating movement in tracks B and carrying the connected cranks G and H, bar K, and safety attachment N, combined with the wires O O', bar D, chain *d*, pulley E, and weight X, substantially as set forth.



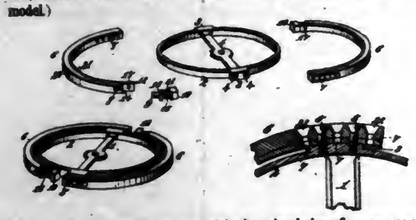
6. In a compensator, the plate A and crank G, having the grooved posts M, combined with the safety attachment N, substantially as set forth.

7. In a compensator, the crank G and grooved posts M, combined with the safety attachment N, having the notches *n* in front of the center of the said posts M, substantially as set forth.

8. In a compensator, a sliding plate, a T-crank pivoted on said plate, and posts attached to the ends of said T-crank, said posts having grooves, combined with a safety attachment which rests in said grooves and to which the operating-wires are attached, and a weight connected to said sliding plate, substantially as set forth.

402,031. SCARF-PROTECTOR.

JESSE H. MOYER, Temple, Tex. Filed Jan. 4, 1889. Serial No. 295,430. (No model.)



Claim.—1. A scarf-protector consisting of two members U-shaped in cross-section, fitted one within the other and having a pin-and-slot connection at the rear thereof, as and for the purpose described.

2. As a new article of manufacture, a scarf-protector consisting of a central member substantially U-shaped in cross-section, and two extensible members fitted within the central member at the ends thereof and connected thereto by a pin-and-slot connection, substantially as described.

3. As a new article of manufacture, a scarf-protector consisting of a longitudinally-curved central member substantially U-shaped in cross-section and having a transverse recess in its rear arm, and two extensible members fitted within and connected to the central member at the ends thereof and curved to correspond with the same, substantially as described.

4. As a new article of manufacture, a scarf-protector consisting of two extensible members connected to each other, and fastening hooks or claws permanently connected to one of the members, substantially as described.

402,032. COMPENSATION WATCH-BALANCE. AUGUSTUS F. PICKETT, Atlanta, Ga. Filed June 28, 1888. Serial No. 278,440. (No model.)

Claim.—1. The combination, with the wheel-rim of a compensating balance, of lengthwise movable and adjustable segments arranged upon and secured to the exterior of the wheel-rim, substantially as described.

2. The combination, with the wheel-rim of a compensating balance having screw-holes, of lengthwise-adjustable segments located outside the wheel-rim and provided with a longitudinal line of perforations, and screws passing through the segments into the holes of the wheel-rim, substantially as described.

3. The combination, with the wheel-rim of a balance having screw-holes, of segments on the exterior thereof having countersunk screw-holes, and screws attaching the segments and fitting the countersinks with their heads flush with the surface of the segments, substantially as described.

4. The combination, with the wheel-rim of a balance having screw-holes, of segments on the exterior thereof having countersunk screw-holes, screws attaching the segments and fitting the countersinks with their heads flush with the surface of the segments, and weights slidable lengthwise on the segments and having their sides and edges flush with or within the sides and edges of the segments to remove resistance to the air in the movement of the balance, substantially as described.

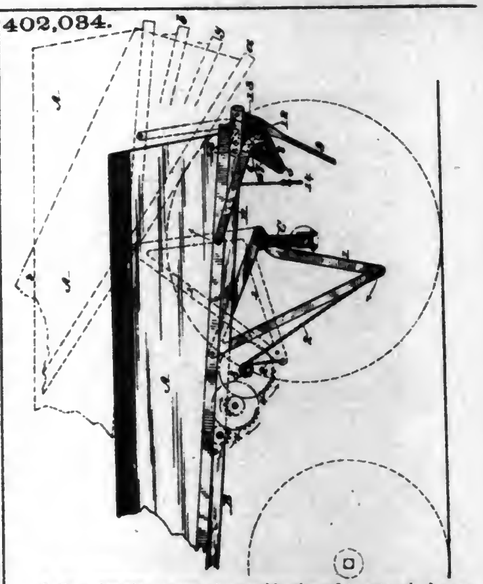
5. The combination, with the segments having rabbeted or recessed free extremities, of sliding weights having slotted shanks fitting the rabbets or recesses, and set-screws for holding the weights in their adjusted position, substantially as described.

6. The combination, with the wheel-rim having screw-holes, of lengthwise-adjustable segments, each having at one end more than two screw-holes, and screws adapted to pass through any of the holes into the wheel-rim to hold the segments when moved lengthwise, substantially as described.

7. The combination, with the wheel-rim having the thickened portions or projections provided with screw-holes, of lengthwise-adjustable segments, each having one end setting on the washer and provided with more than two screw-holes, and screws for holding the segments on the washers when adjusted lengthwise, substantially as described.

8. The combination, with a balance having a sectional wheel-rim thickened at points opposite the end of the cross-bar, substantially as described, of the segments and screws attaching the segments to said thickened portions of the sectional rim.

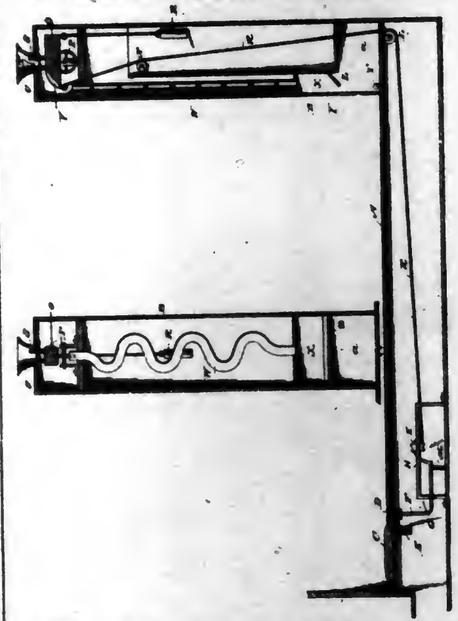
402,033. FLEXIBLE RAZOR-STROP. JEROME L. POMEROY, New Haven, Conn. Filed Oct. 29, 1888. Serial No. 289,627. (No model.)



Claim.—A razor-strop consisting of a flat elastic metallic blade, A, combined with a handle attached at one end, a non-metallic jacket, *a*, around the blade, and a non-metallic surface applied to the said covering and attached thereto throughout its length, substantially as and for the purpose described.

402,034. DUMPING-WAGON. LEONHARD RODENHAUSEN, Philadelphia, Pa. Filed Feb. 1, 1889. Serial No. 298,220. (No model.)

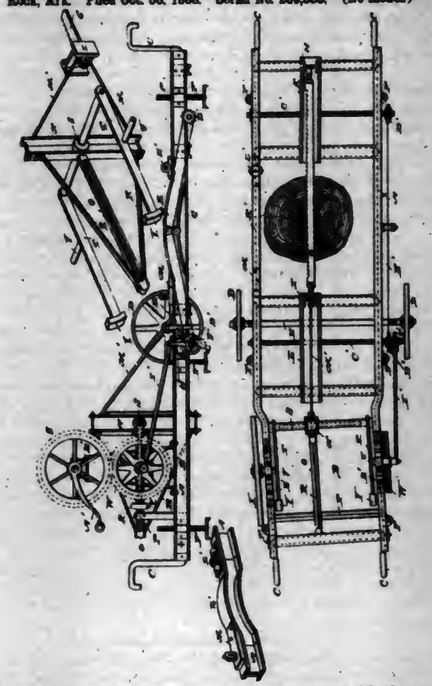
Claim.—1. The body of a dumping-wagon and the sills of the running-gear thereof, in combination with the system of levers 5 and 6, the latter being connected with each other and with said body and sills, substantially as described.



2. A dumping-wagon having the toggle-levers 5 and 6, said levers 5 consisting of levers 7 and 8, pivoted together, the lever 7 having openings or recesses in one end, and the levers 6 consisting of the levers 10 and 11, pivoted together, the lever 10 pivoted to the axis of the lever 7 and the lever 11 pivoted to the body of the wagon, and an operating-lever pivoted to the sill and to the end of lever 8, said parts being combined substantially as and for the purpose set forth.

402,084.

3. In a dumping-wagon, the combination of two toggle-levers connected together, one of said toggle-levers being secured to the sill and the other to the body of the wagon, and an operating-lever secured to said toggle-levers, substantially as and for the purpose set forth.

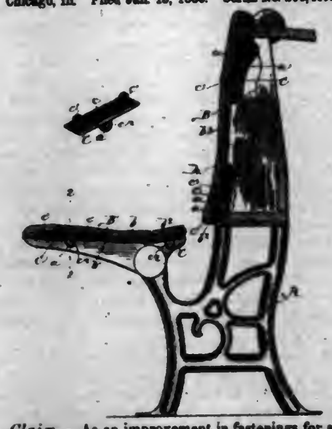


402,085. PASSENGER-REGISTER. ARNOLD ROMAIN, New Orleans, La. Filed Apr. 9, 1888. Serial No. 270,117. (No model.)

Claim.—1. An automatic register consisting of a box or case, B, the weighted tilting table O, the receptacle and chute leading from the table to the receptacle, the trap C, lever F, wheel I and its shaft, and the cord connecting the shaft and table O, substantially as and for the purpose specified.

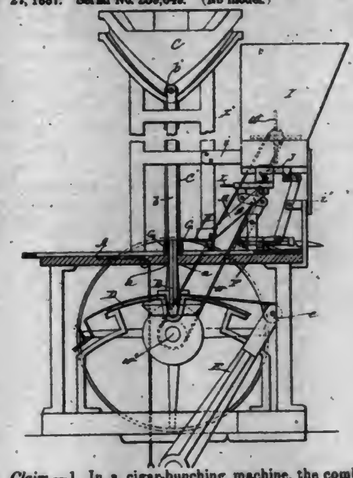
2. An automatic register consisting of the box B, grooved and weighted tilting table O, zigzag chute W under one end of the table, the cord K, connected to the table, the wheel I and its shaft, to which the cord is attached, the bent lever F, acting on the wheel, and the trap C, all constructed substantially as specified.

402,086. TREE-SAWING MACHINE. JOHN C. SCHULTE, Little Rock, Ark. Filed Oct. 30, 1888. Serial No. 289,553. (No model.)



Claim.—1. In a sawing-machine, the combination, with the saw and supporting-frame, of the approximately U-shaped frame having side arms provided with short lateral shafts, the said arms also having counterbalance-weights at their rear ends, the frame N, the slotted rearwardly-extending branch O, and the pitman connecting the frame with the saw, substantially as specified.

2. In a sawing-machine, the combination, with the frame A, having the pivoted part K′ and angle portion B, of a reciprocating saw, guiding-ways for the saw arranged out of line, and a driving-gear mounted on the angle portion of the frame, substantially as specified.



3. In a sawing-machine, the combination of the frame A, saw G, ways K L, out of line one with the other, screw feed-rods C′, frame N, connected to the saw, crank-shaft S T, shafts U V, for said crank-shaft, pitman I′, connected to the shaft U, pawl G′, and ratchet F′, and means, substantially as described, for imparting motion to the several parts, as set forth.

402,087. FASTENING FOR SCHOOL-DESKS. JOHN B. SHERWOOD, Chicago, Ill. Filed Jan. 15, 1889. Serial No. 296,419. (No model.)

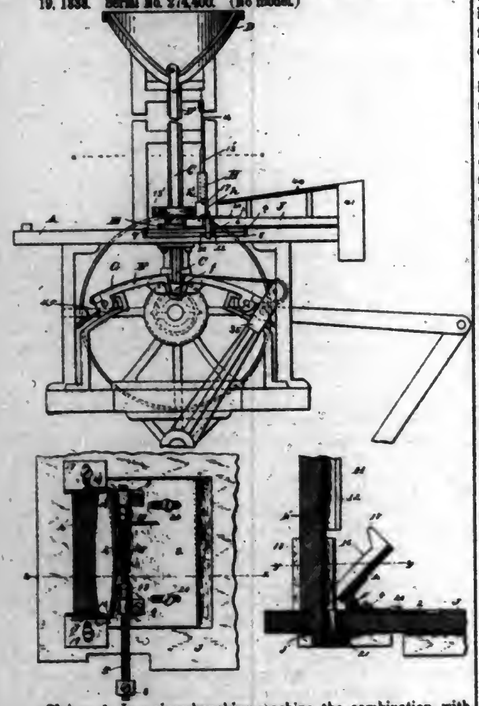
Claim.—As an improvement in fastenings for school-desks, the combination, with clamp-plates C, provided with a broad corrugated bearing-surface and two perforated lugs projecting perpendicularly therefrom, and a perforated lug projecting perpendicularly from the under side of said clamp-plates, substantially as shown, of the bored slats, the rods for connecting said slats and clamp-plates, and the desk-frame provided with bolt-holes adapted to register with the perforations of the lugs projecting from the under side of said clamp-plates, and bolts *a*, for connecting the same with the frame, as specified.

402,088. CIGAR-BUNCHING MACHINE. JAMES R. SMITH, New York, N. Y., assignor, by direct and mesne assignments, of two-thirds to Adolph Moonelis and Benjamin Lichtenstein, same place. Filed Dec. 27, 1887. Serial No. 259,049. (No model.)

Claim.—1. In a cigar-bunching machine, the combination of a hopper having a receptacle of less area or size arranged below the same and communicating therewith, a valve operating in the hopper to cut off communication between the same and the receptacle, another valve operating in the receptacle to open the same and permit its contents to escape when the first-mentioned valve cuts off communication from the hopper and receptacle, a reciprocating carriage having an open mold and a cut-off, and mechanism for moving said valves, substantially as described.

2. In a cigar-bunching machine, the combination of an elevated hopper, a receptacle of less area arranged below said hopper, a valve operating in the hopper above the receptacle, another valve operating across the lower open end of the receptacle, a reciprocating carriage having an open mold, a fixed chute having its upper end arranged in proximity to the receptacle and its lower end terminating a suitable distance above said mold and carriage, and a cut-off operating to close the chute when the mold is moved by the carriage out of line with the chute, substantially as described.

3. In a cigar-bunching machine, the combination of a hopper having a lower receptacle communicating with the discharge-orifice thereof, a reciprocating carriage having an open mold into which the contents of the receptacle are discharged, a valve operating across the discharge-orifice of the hopper, another valve located in the lower open end of the receptacle, a link-connection between the carriage and the first-mentioned valve for reciprocating the latter at suitable regular intervals, and another independent connection, substantially as described, intermediate of the carriage and the last-mentioned valve, for moving said valve to open the receptacle for a limited time and while the first-mentioned valve cuts off communication between the hopper and receptacle, substantially as described.



4. In a cigar-bunching machine, the combination of a carriage having an open mold and a valve-plate fixed thereto, an elevated hopper having a supplemental receptacle arranged below the discharge-orifice thereof, the independent valves K L, operating in the bottom of the hopper and its supplemental receptacle, link-connections, as described, between the carriage and each of the valves for alternately operating the latter, and an inclined chute below the hopper to convey the filler from the same to the mold, substantially as described, for the purpose set forth.

5. In a cigar-bunching machine, the combination of a carriage having an open mold and a rearward extension, H, a hopper having a supplemental receptacle below its discharge-orifice, the valve N, movable endwise in the box or receptacle to vary the area of the discharge-orifice in the hopper and receptacle, the independent valves K L, and connections, as described, between said valves and the carriage for alternately opening and closing the same, substantially as described.

6. In a cigar-bunching machine, the combination of a carriage having an open mold and a rearward extension, H, an elevated hopper having a discharge-orifice and a supplemental receptacle below said orifice, a reciprocating valve for opening and closing the orifice in said hopper, another valve in the supplemental receptacle for opening and closing the discharge-opening therein, link-connections between each valve and the carriage, an inclined chute below the supplemental receptacle, and the partitions in the chute, one or both of which are adjustable laterally therein, substantially as described, for the purpose set forth.

7. In a cigar-bunching machine, the combination of a carriage having an open mold, an elevated hopper provided with a supplemental receptacle below its discharge-orifice, the independent valves operating in the hopper and the receptacle thereof to alternately close the same, the vertical levers pivoted at intermediate points of their length and connected to the valves, a link connecting the lower end of one lever with the carriage by a pin-and-slot connection, and the connected arm and link S T, pivotally connected to the lower end of the other lever and the carriage, substantially as and for the purpose described.

402,039. CIGAR-BUNCHING MACHINE. JAMES E. SMITH, New York, N. Y., assignor, by direct and mesne assignments, of two-thirds to Adolph Moonelis and Benjamin Lichtenstein, same place. Filed May 19, 1888. Serial No. 274,400. (No model.)

Claim.—1. In a cigar-bunching machine, the combination, with a reciprocating carriage having an open mold and a cut-off, of a hopper having a shaper at its lower end for feeding tobacco directly to said mold, and a compressor for positively forcing the tobacco from said hopper and shaper into said mold, substantially as and for the purpose described.

2. In a cigar-bunching machine, the combination of a combined hopper and shaper having its walls constructed and arranged for primarily shaping the tobacco therein to the desired contour of a cigar-bunch, a reciprocating carriage adapted to slide beneath said hopper and shaper and having a cut-off, and an open mold carried by the carriage, substantially as described, for the purpose set forth.

3. In a cigar-bunching machine, the combination of a hopper having a shaper arranged in its lower part below the receiving-orifice for primarily forming the tobacco to the desired contour of a bunch before it is discharged from said hopper, a reciprocating carriage having a cut-off, and an open mold fixed to the carriage, substantially as described.

4. In a cigar-bunching machine, the combination of a combined hopper and shaper, a reciprocating carriage having an open shallow mold adapted to align with said hopper and shaper to receive a specified quantity of tobacco directly therefrom, a cut-off fixed to the carriage at one side of the mold and having a knife-edge to sever the tobacco when the mold is carried away from the hopper and shaper, and a reciprocating compressor operating in the hopper and shaper, substantially as and for the purpose described.

5. In a cigar-bunching machine, the combination of a combined hopper and shaper, a reciprocating carriage having an open mold and a cut-off, a vertically-reciprocating compressor operating in the hopper and shaper above the contents thereof, a power-shaft carrying two cams, one of which draws the carriage and mold away from the hopper and shaper, and mechanism, substantially as described, operated by the other cam of the power-shaft to permit the compressor to act on the contents of the hopper and shaper when the mold aligns with the latter, as and for the purpose described.

6. In a cigar-bunching machine, the combination of a primary shaping-hopper, a reciprocating carriage having an open mold and a cut-off, a gravity-compressor for positively expelling the contents of the hopper, and mechanism for automatically releasing the compressor to cause it to exert downward pressure on the contents of the hopper simultaneously with the arrival of the open mold beneath the hopper to receive tobacco therefrom, substantially as described.

7. In a cigar-bunching machine, the combination of a primary shaping-hopper, a reciprocating carriage having an open mold and a cut-off, a compressor operating in the hopper to force the tobacco into the open mold, a lever connected to said compressor, and a cam fixed to a rotary power-shaft and arranged to act against the free end of the lever, substantially as described, for the purpose set forth.

8. In a cigar-bunching machine, the combination of a combined hopper and shaper having the walls thereof constructed and arranged to shape the contents thereof to the desired contour of a bunch, one of the side walls of said hopper being adapted to swing back and forth with respect to the other wall thereof, a reciprocating carriage, an open mold on the carriage adapted to align with the hopper and shaper, and a cut-off fixed to the carriage at one side of the mold to close the hopper and shaper when the mold is forced away from the same, substantially as described.

9. In a cigar-bunching machine, the combination of a combined hopper and shaper having the walls thereof constructed and arranged to shape the contents of the same to the desired contour of a bunch, and having one of its walls arranged to swing back and forth, a reciprocating carriage having an open mold adapted to align with the hopper and shaper, connections intermediate of the carriage and swinging wall of the hopper and shaper for automatically closing said wall when the mold aligns with said hopper and shaper, and a cut-off, substantially as described.

10. In a cigar-bunching machine, the combination of a combined hopper and shaper having the walls thereof constructed and arranged to shape the contents to the desired contour of a bunch, and having one of its walls pivotally supported to swing laterally, a reciprocating carriage having an open mold, connections intermediate of the carriage and swinging wall of the hopper for automatically closing the latter when the mold aligns therewith, a cut-off, and a vertically-reciprocating compressor operating in the hopper and shaper to descend upon the contents of the same when the swinging wall is closed and force the tobacco into said mold, substantially as described.

11. In a cigar-bunching machine, the combination of a combined hopper and shaper having its walls constructed and arranged to shape the contents thereof to the desired contour of a bunch, and one of said walls movable away from the other, a reciprocating carriage having an open mold and a cut-off and adapted to slide beneath the hopper, and devices connected to the carriage and movable wall of said hopper and shaper for holding said wall open when the carriage is moved away from the hopper, substantially as described.

12. In a cigar-bunching machine, the combination of a hopper, a rock-shaft carrying one of the walls of said hopper and having a depending arm, a reciprocating carriage arranged to slide beneath said hopper and carrying an open mold and a cut-off, and fixed studs or projections on the carriage for alternately striking the depending arm, and thereby rocking the shaft, substantially as described.

13. In a cigar-bunching machine, the combination of a hopper, a rock-shaft to which one of the walls of said hopper is secured and having a depending arm at one end, a reciprocating carriage arranged to slide beneath the hopper and having an open mold and a cut-off, and a bar or rod arranged at one side of and secured to the carriage and having studs in the path of which the depending arm is arranged, substantially as described.

14. In a cigar-bunching machine, the combination of a hopper, a rock-shaft to which one of the walls of said hopper is secured, an arm depending from said rock-shaft, a reciprocating carriage having an open mold and a cut-off, a fixed stud on the carriage for striking the depending arm, and a spring for closing said movable wall of the hopper when the depending arm is released from the stud, substantially as described.

15. In a cigar-bunching machine, a hopper having a movable wall carrying knives or cutters for severing the protruding ends of tobacco, substantially as described, for the purpose set forth.

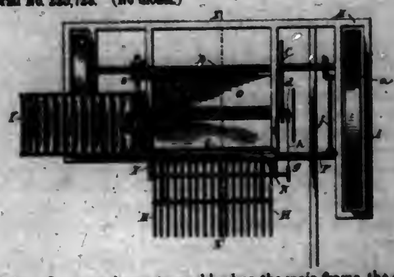
16. In a cigar-bunching machine, a hopper having a movable wall and knives or cutters adjustably connected to said wall, substantially as described.

17. In a cigar-bunching machine, a hopper having a movable wall and cutters or knives carried by the wall at the ends of the hopper and adjustable in the direction of the length of the hopper, substantially as described.

18. In a cigar-bunching machine, the combination of a hopper having a swinging side wall, end walls adjustable in the direction of the length of the hopper and having the cutting-edges, and knives or cutters carried by the swinging wall and adjustable thereon in the same direction as the end walls, substantially as described.

19. A hopper having one of its side walls adjustable laterally at either end of the opposite side wall, substantially as described, for the purpose set forth.

20. A hopper having a base-plate and a movable wall mounted on said plate, the plate being adjustable laterally at either end of the hopper, all combined substantially as described.



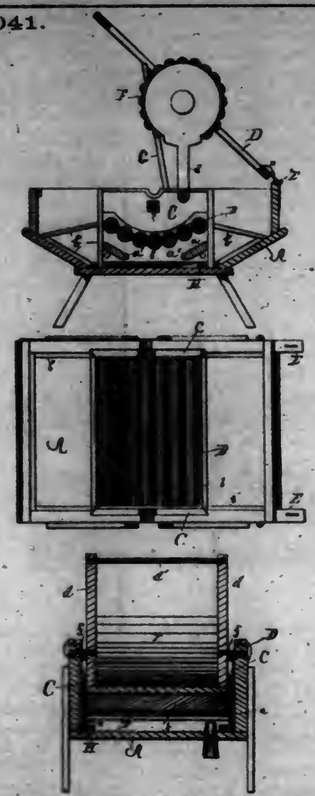
21. In a cigar-bunching machine, a hopper having an adjustable base-plate carrying one of the walls of the hopper, and a vertical shaper-plate, 21, secured to said base-plate and arranged in the lower end of the hopper below the movable wall of the same, all combined substantially as and for the purpose described.

22. In a cigar-bunching machine, the combination of a hopper, a reciprocating carriage having an open mold, and a cut-off plate fixed to the carriage at one side of the mold and having its edge adjoining the mold curved transversely and beveled to a cutting-edge, substantially as described.

23. In a cigar-bunching machine, the combination of a cigar-rolling table, an apron connected directly at one end thereto and having its opposite end cut or divided longitudinally for a suitable distance toward the middle thereof, and plates for independently fastening each of the pieces formed by the cuts to the opposite end of the rolling-table, substantially as described.

24. In a cigar-bunching machine, the combination of a cigar-rolling table, an apron, a rocking arm, the adjustable bearings or plates connected to the rocking arm and each adjustable independently thereon in the direction of its length, and a pair of spaced bunching-rollers journaled in said bearings or plates, substantially as described.

402,040. CORN-HARVESTER. WILLIAM D. STEELE, Huron, Dak., assignor of one-half to John R. Ward, same place. Filed Jan. 27, 1887. Serial No. 225,723. (No model.)



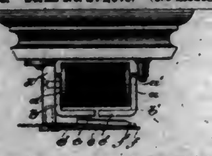
Claim.—In a corn harvester and husker, the main frame, the cutting apparatus on the front side thereof, the hopper in the main frame having the downward converging front and rear sides, the inclined husking-rollers journaled at the lower edges of the converging sides of the hopper, one of said rollers being in a slightly higher plane than the other, the driving-wheel journaled in one side of the main frame, the shaft B, geared to the said wheel, gears connecting said shaft to the husking-rollers, the sweep-reel mounted on the front of the frame and connections between the same and one of the husking-rollers, whereby said reel is rotated, and the inclined elevator projecting from the side of the frame opposite the driving-wheel, the lower roller of said elevator being in proximity to the lower ends of the husking-rollers and geared to the shaft B, all in combination, substantially as described.

402,041. WASHING-MACHINE. JACOB STINE, Martinsburg, W. Va. Filed Aug. 4, 1888. Serial No. 281,940. (Model.)

Claim.—1. In a washing-machine, the combination of a suds-box provided with central vertical dovetailed or undercut ways in two sides, braces or strengthening-strips for the ways, a removable roller-bed comprising end pieces and rollers extending between the same, the end pieces resting in the ways and adapted to slide in the same when being removed from or placed in the suds-box, auxiliary end pieces removably resting in said ways upon the upper edges of and

402,041.

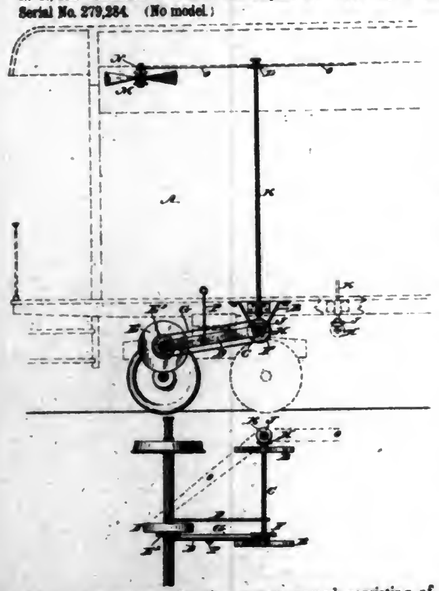
closing the ways above said roller-bed end pieces, and a rubber to operate in conjunction with the roller-bed, substantially as described.



2. A washing-machine comprising a suds-box having central vertical ways in two sides, a removable rectangular frame resting on the bottom of the suds-box between the ways, a roller-bed resting on said frame and provided with end pieces, in which the rollers are journaled, removably resting in said ways, removable auxiliary end pieces filling the ways above the roller-bed end pieces, and a rubbing-cylinder to act in conjunction with the roller-bed.

402,042. BOTTLE. JOSEPH STONE, Boston, assignor to the Nelson Chemical Company, Newton, Mass. Filed July 16, 1888. Serial No. 280,242. (No model.)

Claim.—As an improvement in bottles, the herein-described bottle having a thickened portion at one side of its top, the mouth or discharge-orifice extending through said thickened portion and a circular recess in the thickened portion around and larger than the mouth, and the inclined spout opening from one side of said recess, substantially as described.



402,043. ANNUNCIATOR-DROP. JOHN M. STUART, Boston, Mass. Filed May 22, 1888. Serial No. 274,673. (No model.)

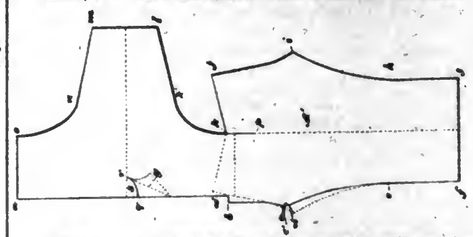
Claim.—The annunciator-drop herein described, comprising the core *a*, coil *a'*, metallic pieces *b b'*, bent to present large flat-surfaced

pole-pieces *c c'*, the armature *c*, attached to a spring, *d'*, the target or disk *f*, pivoted to move in a plane parallel with the flat-surfaced pole-pieces, and the support *d*, substantially as described.

402,044. CAR-VENTILATOR. LEOPOLD C. TAPPEY, Jr., New York, N. Y., and CLARENCE A. EVANS, Philadelphia, Pa. Filed July 7, 1888. Serial No. 279,284. (No model.)

Claim.—An apparatus for the purpose named, consisting of a vertical shaft suitably journaled in the car-body and having a pulley on its upper end and a gearing-wheel on its lower end, a shaft carrying a fan and pulley, the latter connected by a belt with said pulley on the vertical shaft, a horizontal shaft journaled in hangers on the car-body and having a gear-wheel meshing with the gear-wheel on the vertical shaft, an arm pivoted to said shaft, and having at its free end a friction-wheel adapted to contact with one of the axles of the car-truck, pulleys on said horizontal shaft and on the journal of friction-wheel, a belt connecting said last-mentioned pulley, and a lever connected to said pivoted arm and passing into the car, said parts being combined substantially as and for the purpose set forth.

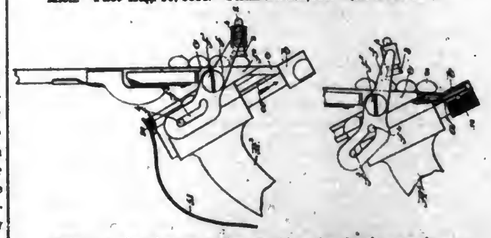
402,045. SWAGING DEVICE. JOSEPH TAYLOR, Shingle Springs Cal. Filed Aug. 30, 1888. Serial No. 284,138. (No model.)



Claim.—1. In combination with an anvil, a bed-piece, B, having a downward projection, *b*, on its under side, the upper face of said bed-piece being provided with transverse grooves, the portion D, of less width than the bed-piece, said portion being pivoted to the bed-piece, the end opposite the pivot being inclined outwardly and upwardly, substantially as shown, and for the purpose set forth.

2. The attachments for anvils herein described, consisting of a bed-piece, B, having transverse semicircular grooves, and portion D, pivoted thereto and provided with corresponding grooves, for the purpose set forth.

3. The improved swaging-block herein described, consisting of a bed-piece, B, having downward projection *b*, for securing the same to an anvil, link C, having slotted portions, through which the pivot-pins pass, and portion D, pivotally secured to the bed-piece, so as to be capable of a vertical movement therein when in a horizontal position, substantially as and for the purpose set forth.

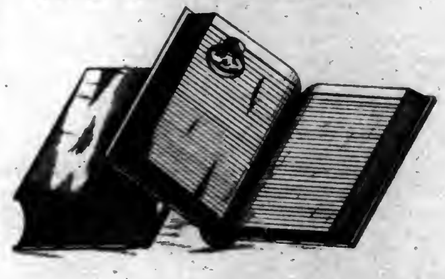


402,046. COMBINATION GARMENT-PATTERN. MORRIS TUCK, Elmira, N. Y. Filed Jan. 24, 1889. Serial No. 297,349. (No model.)

Claim.—1. A combination garment-pattern consisting of a trousers-pattern and formed in one piece therewith, a waist-pattern having a straight edge to form one edge of the back seam and open front of the waist, a straight edge to form the bottom of one-half of the back of the waist, corresponding curved edges to form a sleeve from the end of a sleeve to the bottom of the waist at the side, a straight edge to form the end of a sleeve, and a curved slit (about midway of the length of the first-named straight edge) to form the lapel of the collar, substantially as described.

2. A combination garment-pattern having a straight edge from *a* to *a'*, a right-angled jog from *a'* to *b*, an outcurved edge from *b* to *c*, corresponding incurved and straight edges from points *d* to *f* and *i* to *g* on opposite sides of the pattern, a straight edge from *f* to *g*, corresponding curved and straight edges between points *k* and *l* and *m* and *o*, straight edges between points *a* and *o* and *l* and *m*, a straight edge between points *k* and *j*, and an outcurved edge from *j* to *i*, substantially as described.

402,047. BUTTON-SETTING MACHINE. JOHN H. VINTON, Boston, Mass., assignor to the Peninsular Novelty Company, Grand Rapids, Mich. Filed Aug. 16, 1888. Serial No. 282,900. (No model.)



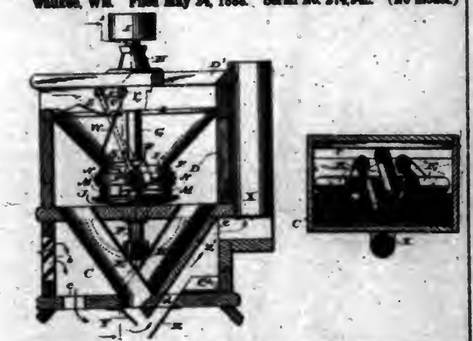
Claim.—1. In a button-setting machine, the simultaneously movable carrier and raceway constructed and arranged to receive and hold button-fastenings and attached buttons, and a spring-controlled pin, 12, within said carrier, combined with the driver adapted to obstruct the passage connecting the raceway and carrier, and to remove from the carrier the fastening contained and held therein by the said pin as the said raceway and carrier ascend, substantially as described.

2. In a button-setting machine, the staple-receiving raceway, combined with the movable feed and a retaining-lever having the yielding pin or presser to act upon the button, substantially as described.

3. In a button-setting machine, the raceway to receive button-fastenings and connected buttons, combined with the movable button-retaining lever *f*, formed at one end to co-operate with a fixed pin or stud, f^8, and having a spring-pin at its other end, substantially as described.

4. In a button-setting machine, the arm A' and the carrier *b*, combined with the spring 51, attached to the arm A', acting on the carrier, substantially as described.

402,048. PAPER-WEIGHT. FRANK R. WHIPPLE, Erie, Pa. Filed Jan. 21, 1888. Serial No. 261,495. (No model.)



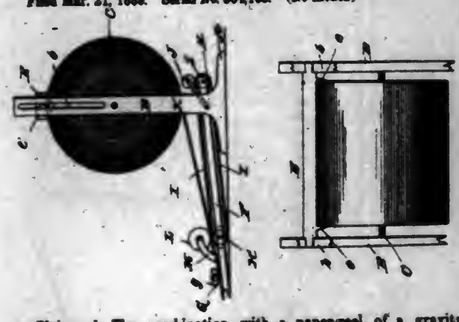
Claim.—1. As a new article of manufacture, a paper-weight having a soft india-rubber bearing-surface which is in the form of a ring which is held in place by its own elasticity.

2. As a new article of manufacture, a paper-weight having a soft india-rubber bearing-surface which is in the form of a ring, which is secured to the bottom of the weight by being set in a grooved or rabbeted space which conforms to the form of the ring.

3. As a new article of manufacture, a paper-weight having a soft india-rubber bearing-surface which is in the form of a flanged ring.

402,049. FEEDER FOR ROLLER-MILLS. RALPH WILCOX, Milwaukee, Wis. Filed May 24, 1888. Serial No. 274,942. (No model.)

Claim.—1. A feeder for roller-mills, &c., that comprises a hopper, a rotating disk arranged beneath the hopper, and a series of flues arranged to have their upper ends in a circle adjacent to the disk and their lower ends in a straight line immediately over the device to which the material is fed, substantially as set forth.

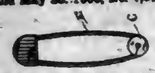


2. A feeder for roller-mills, &c., that comprises a hopper, a rotating disk arranged beneath the hopper, a series of flues arranged to have their upper ends in a circle adjacent to the disk and their lower ends in a straight line immediately over the device to which the material is fed, and deflector-plates located below said lower ends of the flues, substantially as set forth.

3. A feeder for roller-mills, &c., that comprises a hopper, a rotating disk arranged beneath the hopper, a series of flues arranged to have their upper ends in a circle adjacent to the disk and their lower ends in a straight line immediately over the device to which the material is fed, and means, substantially as described, for regulating the flow of stock from the hopper to said disk, as set forth.

4. A feeder for roller-mills, &c., that comprises a hopper, a rotating disk arranged beneath the hopper, a series of flues arranged to have their upper ends in a circle adjacent to the disk and their lower ends in a straight line immediately over the device to which the material is fed, a casing surrounding the flues and having its bottom provided with longitudinal air-passages, an air-inlet in one side of the casing, and an outlet in the opposite side of said casing arranged to communicate with a source of draft, substantially as set forth.

5. A feeder for roller-mills, &c., having a hopper, a ring surrounding the hopper-outlet, a lever connected to the ring, a crank-shaft provided with a wing that depends into said hopper, and a rod connecting said lever and crank-shaft, substantially as set forth.



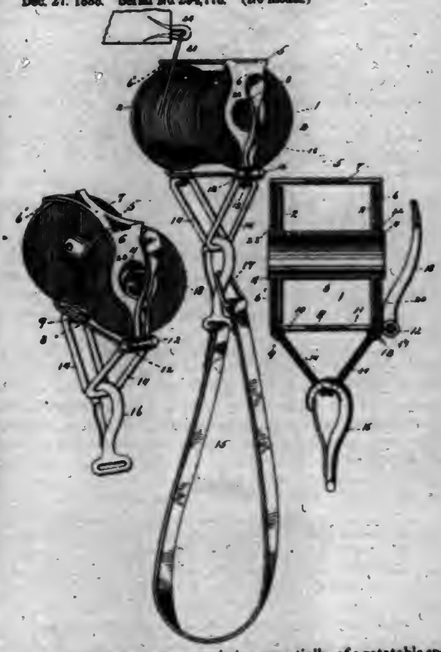
402,050. PAPER-REEL. HOMER T. WILSON, Harrodsburg, Ky. Filed Mar. 21, 1889. Serial No. 304,163. (No model.)

Claim.—1. The combination, with a paper-reel, of a gravity pressure-bar resting upon the roll of paper and provided with ear-guides, whereby the roll will be prevented from moving endwise, as set forth.

2. The combination, with a paper-reel, of means, substantially as shown and described, whereby the paper will be printed as it is unwound from the roll, and a pressure-bar resting upon said roll and provided with ear-guides which prevent a side or end motion of the roll, and thereby insuring the true and uniform delivery of the web of paper to the printing mechanism, as set forth.

402,051. SAFETY-PIN. JOHN ALCOCK, Cheadle, County of Stafford, England. Filed Nov. 15, 1888. Serial No. 290,893. (No model.) Patented in England May 23, 1888, No. 7,611.

Claim.—1. A safety-pin provided in the eye or coil of its spring with a plug or core, which prevents the pin from becoming entangled with the fabric, and at the same time furnishes an internal support for the coil, as and for the purposes hereinbefore set forth.



2. The safety-pin having inserted in the eye or loop of its spring a piece of correspondingly-shaped material provided at its ends with plates or shields, substantially as and for the purposes set forth.

402,052. CRANK FOR MOTORS. SAMUEL F. ARMSTRONG, Adamsville, assignor to Charles Rogers, Edwardsburg, Mich. Filed Oct. 9, 1888. Serial No. 287,902. (No model.)

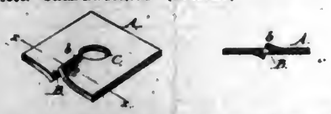
Claim.—The combination of the driving-shaft provided with an annular series of ratchet-teeth and having its end reduced beyond said teeth, the handle provided with a barrel fitting over the reduced end of the driving-shaft and having an enlarged portion projecting over the ratchet-teeth, the said enlarged portion having a notch in its edge, the pawl mounted on the barrel and projecting through the notch to engage the ratchet-teeth, and the spring secured to the handle and bearing upon the pawl, as set forth.

402,053. FIRE-ESCAPE. ISAAC H. ATHEY, Marion, Ark. Filed Dec. 27, 1888. Serial No. 294,778. (No model.)

Claim.—1. A fire-escape consisting, essentially, of a rotatable spool or drum, a supporting-frame having the compressible sides or jaws in which said drum is journaled, a continuous wire compactly coiled around said drum, and a brake-lever fulcrumed on one of the sides of

the frame at or near the free end of the same for simultaneously compressing the jaws to bind on said drum, substantially as and for the purpose described.

2. A fire-escape consisting of a supporting-frame having the compressible jaws, a rotatable spool or drum journaled in said jaws between the latter, the wire coiled around the drum, the depending converging links pivotally connected to the lower ends of the jaws, and a body-strap adapted to be connected to the meeting ends of said converging links, substantially as and for the purpose described.



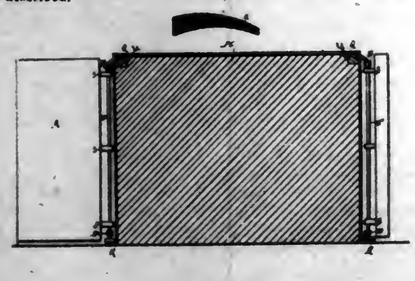
3. A fire-escape consisting of a supporting-frame having the compressible jaws, a rotatable spool or drum journaled therein between the same, the wire coiled around the drum, the depending links connected to said jaws, a body-strap connected to the meeting ends of said links, and a brake-lever fulcrumed on the frame in opposite position with relation to one of said jaws to positively bear against the latter and draw upon the other jaw to thereby compress both jaws on the spool or drum, substantially as and for the purpose described.

4. A fire-escape consisting of a frame having the compressible jaws or sides, a rotatable spool or drum journaled therein, a wire, and a brake-lever fulcrumed on said frame at a point at one side of the drum and having a cam-face arranged to bear directly against one of said sides or jaws, substantially as and for the purpose described.

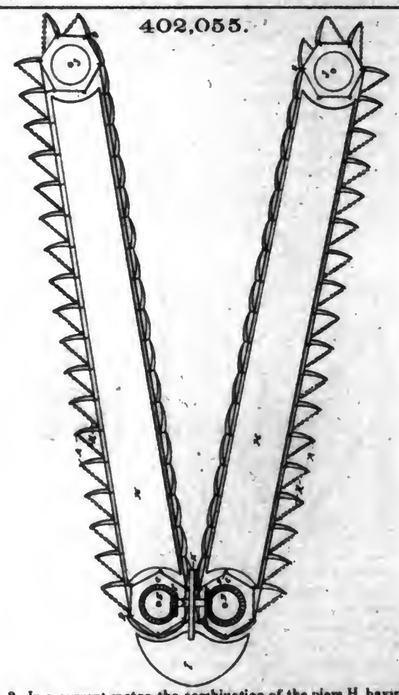
5. In a fire-escape, supporting-frame consisting of the compressible jaws connected at one end by a rigid transverse piece and at their other end by a movable cross-piece, said jaws having depending eyes and the movable cross-piece having an eye at one end which is extended beyond the one of said sides, in combination with a spool or drum journaled in said sides between the same, the depending links connected to the eyes of said jaws, a body-strap connected to the links, and a brake-lever fulcrumed in the eye of the movable cross-piece, substantially as described.

6. A fire-escape, substantially as described, consisting of the compressible connected jaws having the transverse aligned slots or openings at intermediate points of their length, a rotatable spool or drum having its shaft journaled in said aligned slots, a wire coiled around said drum, and a brake-lever fulcrumed on one of the jaws for compressing the same on the heads of the drum, substantially as described.

402,054. NUT-LOCK. JOSEPH L. BAY, Little Rock, Ark. Filed Feb. 14, 1889. Serial No. 299,904. (No model.)



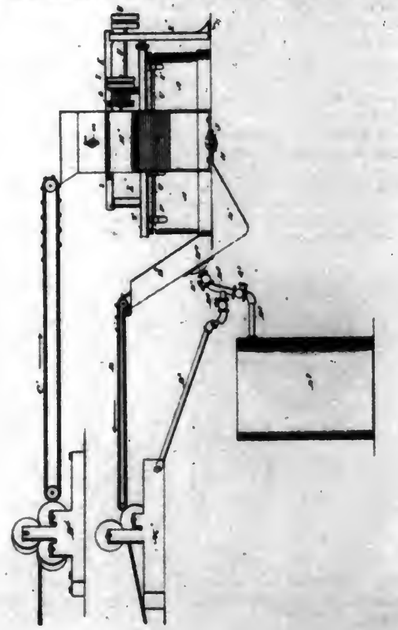
Claim.—An improved nut-lock consisting of a bolt, a washer split from its bolt-hole to one side and having the split portions curved in opposite directions from points near the outer edge to the slit, one of said parts being rounded on its edge to form a pawl and the other portion having a squared edge, and a nut having its face formed with curved depressions, as shown, to engage the rounded edge of the split portion of the washer, as herein described.



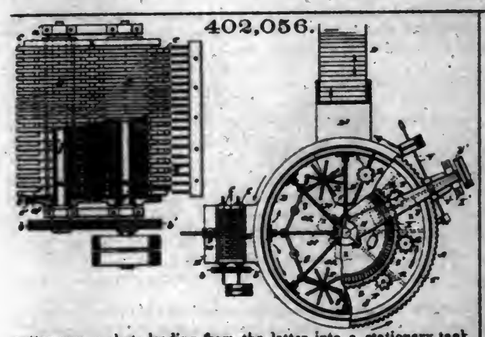
402,055. WATER-MOTOR. ANDREW A. BUSHNELL, Tecumseh, Mich. Filed Feb. 25, 1888. Serial No. 265,251. (No model.)

Claim.—1. A current-motor consisting of a protecting-pier, a submerged pier below the protecting-pier, sprocket-wheels journaled at the ends of said submerged pier and submerged therewith, endless chains connecting said sprocket-wheels, and a series of pivoted hollow buckets carried on said endless chains, substantially as shown and described.

2. A current-motor consisting of a protecting-pier, two submerged piers below said protecting-pier and diverging from each other, sprocket-wheels carried on upright shafts at the ends of said submerged piers, two endless chains connecting the sprocket-wheels at the respective ends of each submerged pier, and a series of pivoted hollow buckets carried on said endless chains, substantially as shown and described.



402,055.



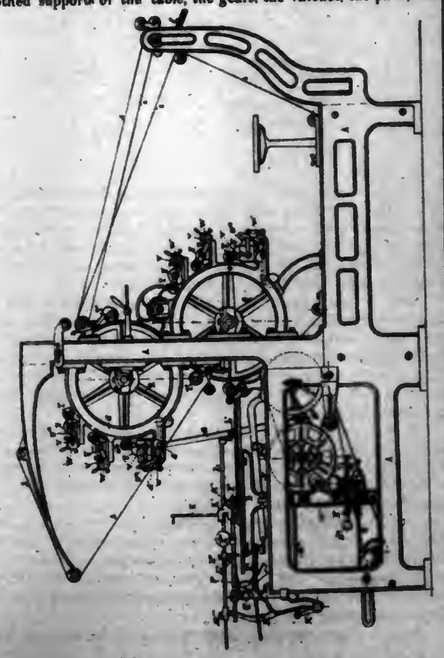
3. In a current-motor, the combination of the piers H, having the channels V therein, the endless chains B, and the rods T, carrying thereon the friction-rollers Q, moving in said channels at such an angle as to normally prevent their being withdrawn, substantially as described.

402,056. DIFFUSION APPARATUS. FRANCIS BIANCHI, New Orleans, La., assignor of one-half to Leon Boyer, same place. Filed June 25, 1887. Serial No. 242,561. (No model.)

Claim.—1. The combination, with a cane-crushing mill, of rotary cutters inclosed in a suitable case for finely dividing the crushed cane, an endless conveyer for moving the cane from said mill to said

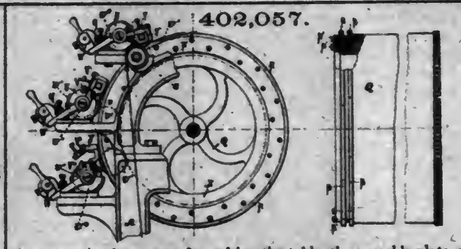
402,056.

cutter-case, a chute leading from the latter into a stationary tank, and a revolving drum subdivided into compartments and provided with rotary agitators, all constructed and adapted to operate substantially as and for the purposes described.



2. The combination of the cane-crushing mill with the endless carrier C, the cutter-case and its rotary cutters, the feed-water-supply pipe w, the stationary tank provided with a subdivided revolving drum having agitators therein and a surrounding strainer-band, a discharge-trunk for the saturated cane, an endless conveyer leading to an expressing-mill, a receiving-tank for the juice, and pipes provided with cocks and communicating with the said stationary tank, the receiving-tank, and the expressing-mill, all substantially as and for the purposes described.

3. The combination, with the stationary tank, a rotary drum therein subdivided into compartments, and an agitator in each of said compartments for stirring the same, of a mill adapted to express the juice from the saturated cane, and an endless carrier for conveying the saturated cane from the bottom of the tank to said mill, substantially as specified.



402,057. PAPER-RULING MACHINE. HENRI A. BERNARD, Paris, France. Filed Oct. 11, 1888. Serial No. 287,872. (No model.)

Claim.—1. The combination, with the vertically-movable table for supporting the pile of paper to be ruled, and the feeding mechanism or pusher, of means whereby the level of the top of the pile is kept constant, said means consisting of a system of gearing which operates to raise the table progressively, a presser which rests on the pile of paper, and a disconnecting mechanism controlled by said presser and operating to arrest the upward motion of the table when said presser is lifted above the normal, substantially as described.

2. The combination, with the vertically-movable table, of the toothed supports of the table, the gears, the ratchet, the pawl, and

402,057.

the eccentric pin or cam for raising the table, the movable plate or guard adapted to be interposed between the pawl and ratchet to prevent the operation of the latter by the former, the presser which rests on the pile of paper on the said table, and the lever and jointed rod connecting the said presser with the said guard, substantially as described.

3. The combination, with the carrying-drum, the series of tracing and inking rollers, and the lever-supports for the rollers, of the means for interrupting the operation of the lower roller of the upper drum, said means comprising a cam on a shaft of the machine, a lever-arm operated by said cam, a rock-shaft to which the arm is fixed, and additional lever-arms connected by links with the lever-supports of said tracing-rollers, substantially as described.

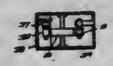
4. The combination, with an ink-roller and ink-well, of an adjustable scraper, of felt or like material, and a support for said scraper embracing the edge of the said well, and having the inside arm hollowed out next the wall of the well to prevent the ink from mounting by capillarity, substantially as described.

5. The combination, with a supporting-table and pusher, of a mechanically-operated straightening-stop arranged in front of a pile of paper on the table at a distance in excess of the stroke of the pusher, so that each sheet is fed against the stop to straighten the same by the pusher acting upon an underlying sheet, substantially as described.

6. The combination, with the ruling machinery proper, of the supporting-table, pusher, mechanically-operated straightening-stop, and feed-rollers or disks, substantially as described.

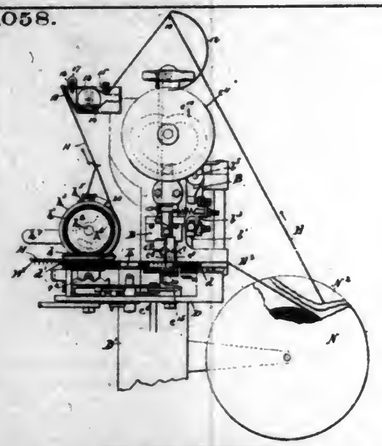
7. The combination, with the ruling machinery proper, of the supporting-table, pusher, mechanically-operating straightening-stop, feed-roller, series of springs, and vertically-movable pressure-disks set opposite the spaces between the springs, substantially as described.

8. A carrying-drum provided with a cam and holding-tapes, in combination with tracing-rollers rolling on said cam, and the means for inking said tracing-rollers, substantially as described.



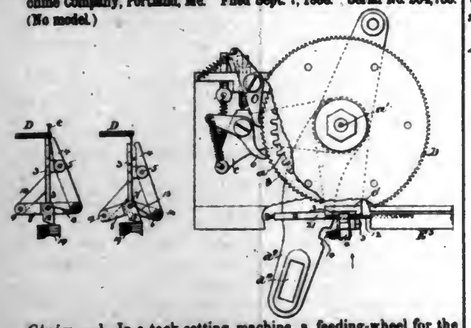
9. A drum provided with a cam formed by two rows of segmented pieces set in grooves in the periphery of the drum, the inner set of pieces and the grooves therefor being deepest, and the two sets of pieces being held by independent set-screws tapped in from the end of the drum, in combination with tracing-rollers running on said cam, and means for inking said rollers, substantially as described.

10. In combination with the carrying-drum, the cam thereon, and the tracing-rollers rolling on said cam, the forked supports for the journals of the said tracing-rollers, provided with removable covers for confining the journals in the forks, substantially as described.



11. The ruling-machine comprising a machine-frame, a carrying drum or drums thereon, the tapes for said drums, the vertically-movable table, the gearing for lifting it, the guard or plate for interrupting the transmission of the movement to said table, the presser, the connections between the said presser and the said guide or plate, the pusher and its operating mechanism, the tracing-rollers, the inking-rollers, the ink-wells, and the gearing for rotating the inking-rollers in said wells, substantially as described.

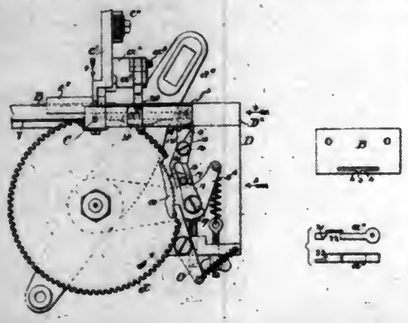
402,058. MACHINE FOR MAKING TACK-STRIPS. MATTHIAS BROOX, Boston, Mass., assignor to The McKay & Copeland Lasting Machine Company, Portland, Me. Filed Sept. 7, 1888. Serial No. 284,782. (No model.)



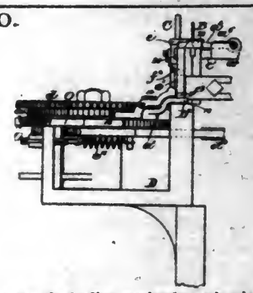
Claim.—In a machine for making tack-strips substantially such as described, the combination, with means for supporting and feeding a foundation-strip, and a tack-driver, of pasting or gumming mechanism by which to apply paste to unite the covering-strip to the foundation-strip, and with a presser to press the covering-strip to the foundation-strip after the same has been provided with tacks, thus securing the covering and foundation strips together, substantially as described.

402,058.

402,059. MACHINE FOR SETTING TACK-STRIPS. MATTHIAS BROCK, Boston, Mass., assignor to The McKay & Copeland Lasting Machine Company, Portland, Me. Filed Sept. 7, 1888. Serial No. 284,753. (No model.)



Claim.—1. In a tack-setting machine, a feeding-wheel for the strip and actuating devices to move the said feeding-wheel, combined with jaws between which to force the body of a tack, as described, the presence of the body of a tack between the faces of the said jaws insuring the action of the said actuating mechanism to move the feed-wheel, substantially as described.

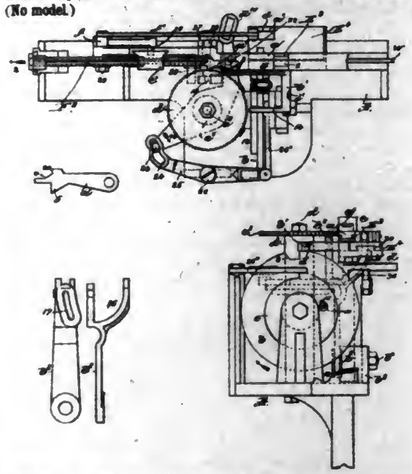


2. The feed-wheel and the vertically-movable jaws and their connecting spring-actuated toggle-links, combined with a stop to spring the said links and open the said jaws for the passage laterally from between them of the body of a driven tack, substantially as described.

402,060. MACHINE FOR MAKING TACK-STRIPS. MATTHIAS BROCK, Boston, Mass., assignor to The McKay & Copeland Lasting Machine Company, Portland, Me. Filed Oct. 29, 1888. Serial No. 289,390. (No model.)

Claim.—1. In a machine for driving tacks into a strip, the throat, the driver to drive a tack into the strip, feeding mechanism to act against the driven tack to feed the tack-strip, and a pawl and intermediate devices to engage and move the said feeding mechanism, and a gate, combined with a transferring-plate, to push a tack against the said gate, and with means between the said gate and pawl to cause

402,060.



the latter to actuate the feeding mechanism only when the said gate is moved by the action of a tack against it, substantially as described.

2. In a machine for driving tacks into a strip, the feed-wheel, the pawl having a projection and intermediate ratchet to actuate the feed-wheel, and the double lever having a spring to control one of its arms, combined with the sliding beveled gate engaging one member of the said double lever, and with a throat, a driver, and a transferring-plate to push a tack against and move the said gate, substantially as described.

3. In a machine for driving tacks into a strip, the transferring-plate, the throat, the driver, and the gate having a stud, 20, combined with the pivoted finger having a notch, as 22, and beveled at 21 and and 23, to operate substantially as described.

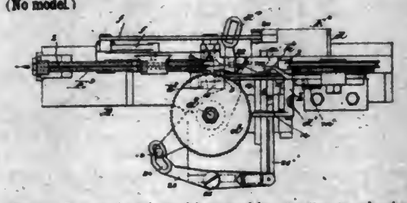
402,061. MACHINE FOR MAKING TACK-STRIPS. MATTHIAS BROCK, Boston, Mass., assignor to The McKay & Copeland Lasting Machine Company, Portland, Me. Filed Dec. 18, 1888. Serial No. 293,943. (No model.)

Claim.—1. In a tack-strip-making machine, a slotted roadway to receive the shanks of the tacks driven into the strip, the driveway or throat, and a driver, combined with a reciprocating slide having a finger provided with a shoulder to act against a tack after the same has been driven into the said strip, thereby feeding the same along the said roadway, substantially as described.

2. In a tack-strip-making machine, a ratchet-wheel, a slide, a finger mounted thereon having a projection, an inclined surface, and a shoulder, combined with means to move the said slide and finger toward the tack last driven into the strip, the presence of a tack in the strip acting against the beveled face of the finger and causing the projection of the finger to engage and move the said ratchet-wheel, substantially as described.

3. In a tack-strip-making machine, the combination, with the slide and its finger having a projection and an inclined surface and a shoulder and the ratchet-wheel, of a spacing mechanism, substantially as described, whereby the strip is moved for a greater distance at stated intervals, substantially as described.

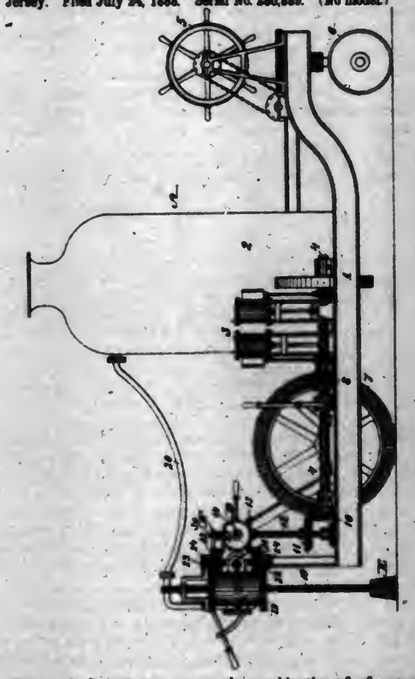
4. In a tack-strip-making machine, the combination, with the slide and its finger having a projection, an inclined surface and a shoulder, and the ratchet-wheel, of a spacing mechanism, substantially as described, whereby the strip is moved for a greater distance at stated intervals, and with cutting mechanism to sever the strip at intervals, substantially as described.



5. In a tack-strip-making machine, the slide having upon it a

feeding-finger, the lever b', having arms 14 15, and a pin, 16, combined with a slotted lever, b^3, and a cam to control the movement of the lever b', as and for the purposes set forth.

6. In a tack-strip-making machine, the lever d^{10}, provided with a projection, 23, and a lever, 24, and its attached pawl 26*, combined with the spacing mechanism and with a lever, b', and the slotted lever b^3, to operate substantially as described.



7. In a tack-strip-making machine, the reciprocating slide, and a finger thereon to be moved aside by contact with a tack already driven into the strip and having a toe to engage a notch in the strip substantially as described.

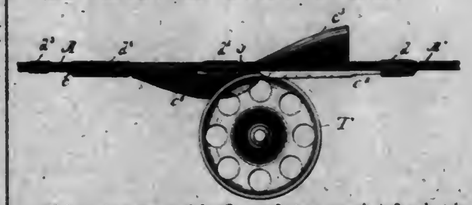
402,062. MACHINE FOR MAKING TACK-STRIPS. MATTHIAS BROCK, Boston, Mass., assignor to The McKay & Copeland Lasting Machine Company, Portland, Me. Filed Dec. 18, 1888. Serial No. 293,944. (No model.)

Claim.—In a tack-strip-making machine, feeding mechanism to engage and feed the tack-strip, a guideway for the tacks, a driver to drive the tacks, and a roadway for the tacks driven into the strip, combined with a slide and a finger therein having a beveled face and a projection, whereby the finger moved by a tack, as the slide is moved toward a driven tack, is made to effect the movement of the feeding mechanism to feed the strip, substantially as described.

402,063. STEAM ROAD-RAMMER. FREDERIC W. CARTER, Camden, N. J., assignor to the American Steam Paving Company, of New Jersey. Filed July 24, 1888. Serial No. 280,889. (No model.)

Claim.—1. In a steam-rammer, the combination of a frame with a rotary longitudinal shaft journaled therein, a vertical shaft connected by gearing with said longitudinal shaft, a cylinder with steam-hammer, and an internally-screw-threaded ear, a screw connected by gearing with said vertical shaft and carrying said ear of cylinder, and a lateral guideway for said cylinder, substantially as described.

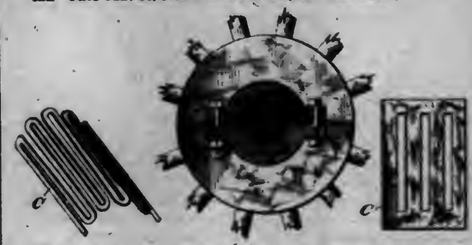
2. In a steam-rammer, the vertical rotary shaft 12, with bevel gear-wheel on its upper end, the horizontal shaft B, with bevel-wheels 14 and 15, gearing with bevel-wheel on upper end of vertical shaft 12, the clutch 16 on said shaft B, the screw C, carrying pinion 18, gearing with a pinion, 17, on shaft B, and a cylinder with steam-hammer and the ear 21, the latter internally screw-threaded and working on the screw C, said parts being combined substantially as described.



3. In a steam-rammer, the beams 22, in combination with a cylinder having a steam-hammer and the ear 21 internally screw-threaded, and plate guided on said beams, and a rotary screw on which said ear works, substantially as and for the purpose set forth.

4. In a steam-rammer, a cylinder with a steam-hammer, and the plates 23, the transverse beams 22, the rollers 24, the ear 21, internally screw-threaded, and the rotary screw C, said parts being combined substantially as and for the purpose set forth.

5. In a steam-rammer, the combination, with a frame, of a rotary shaft journaled therein, an upright shaft connected by gearing to said longitudinal shaft and carrying a bevel-wheel, the shaft B, with bevel-wheels 14 and 15 loosely mounted thereon and gearing with the bevel-wheel on the upright shaft, and the pinion 17, a clutch adapted to connect either of said wheels 14 and 15 rotatably with said shaft B, an operating-rod for said clutch having the lugs 29 and 30, the screw C, carrying pinion 18, meshing with the pinion 17, a cylinder with hammer, the said cylinder having an ear internally screw-threaded and working on said screw, and a plate connected to the cylinder and guided on cross-beams secured to the frame of the machine, and having the finger F, substantially as described.



6. In a steam-rammer, the vertical shaft 12, with bevel-gear thereon, the shaft B, with bevel-gears 14 and 15 and pinion 17, the clutch 16 on said shaft B, the screw C, with pinion 18 meshing with said pinion 17, a cylinder with ear 21 internally screw-threaded, and the plate 23, having the finger F, and the clutch-operating rod 27, with studs 29 and 30, said parts being combined substantially as described.

402,064. SWITCH FOR ELECTRIC-MOTOR TROLLEYS. WILL CHRISTY, Akron, Ohio, assignor of one-half to James Christy, Jr., same place. Filed Dec. 27, 1888. Serial No. 294,762. (No model.)

Claim.—As a new article of manufacture, a switch for electric-motor trolleys, consisting of a stem and divergent arms, a concavo-convex web extending from the point of junction of the stem and arms, and a rib or flange extending longitudinally of the switch and serving to divert the trolley upon and off of the branch wires, substantially as described.

402,065. KEY FOR PULLEYS. CHESTER W. CLARK, Mishawaka, Ind. Filed June 11, 1888. Serial No. 276,683. (No model.)

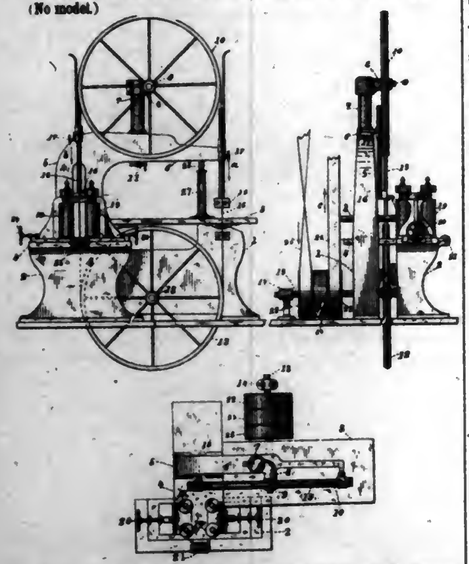
Claim.—1. A pulley-key formed of a single strip of metal bent to form parallel ribs connected at their ends, substantially as set forth.

2. A pulley-key having a series of ribs arranged in parallel rows, connected to each other at their ends and provided upon their outer and inner corners with cutting-edges, substantially as set forth.

3. The combination, with a pulley-hub and a shaft of less diameter arranged to have an annular space surrounding the shaft, of keys, each having a series of ribs connected with each other at their ends and arranged upon opposite sides of the shaft.

402,066. DYNAMO-ELECTRIC MACHINE. CARL COERPER, Mirenfeld, near Cologne-on-the-Rhine, Prussia, Germany, assignor to the Helios Actien-Gesellschaft für Elektrisches Licht und Telegraphenbau, same place. Filed July 12, 1887. Serial No. 244,717. (No model.) Patented in France June 22, 1887, No. 184,384; in England June 24, 1887, No. 9,013; in Belgium June 28, 1887, No. 77,962, and in Italy Aug. 31, 1887. XXI, 21,906, XLIII, 352.

402,066.



Claim.—1. In a dynamo-electric machine, an armature-core provided with notches for receiving the wires, tongues projecting toward each other at the open ends of said notches, and cross-pieces supported by said tongues, substantially as shown and described.

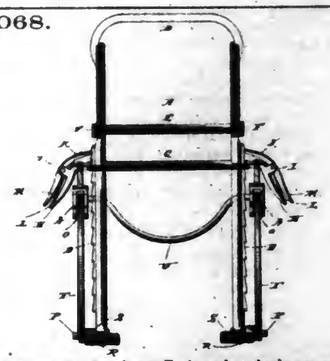
2. In a dynamo-electric machine, an armature-core having notches in its rim, which notches have their width increased a short distance from their outer ends, and insulating-pieces in said notches, which insulating-pieces serve for receiving the wires, substantially as shown and described.

3. In a dynamo-electric machine, the combination, with an armature-core provided with notches, of insulating-pieces in said notches, tongues at the open ends of said notches, and cross-pieces for retaining the wires in place in the insulating-pieces, substantially as shown and described.

4. In a dynamo-electric machine, the combination, with an armature-core having notches and tongues at the outer ends of said notches, of insulating-pieces in said notches, and cross-pieces at the open ends of the notches for retaining the wires in place in the notches, said cross-pieces resting on the inner edges of the tongues, substantially as shown and described.

402,067. COMBINED SCROLL AND RESAWING MACHINE. FRANCIS H. CRAFTS, Buffalo, N. Y. Filed Jan. 3, 1888. Serial No. 259,719. (No model.)

Claim.—1. The combination, with a band-saw, of the driving-pulleys mounted in bearings on the machine for carrying the saw, a table at the front of the machine for the scroll-cutting side of the saw, a table provided with a feeding mechanism facing the saw at the rear of the machine for feeding material to be resawed, and a means for reversing the motion of the saw, for the purposes described.



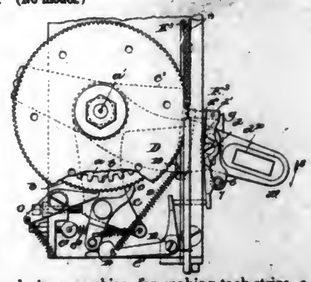
2. In a band sawing-machine, the combination of the overhanging arm having an opening through the vertical portion of the same and opposite the saw at the rear of the machine, a feeding mechanism for carrying the material to be resawed against the saw through said opening, and a reversing-gear for reversing the motion of the saw, substantially as described.

402,068. DRENCHING-BIT. CHARLES W. CRANNELL, Oberlin, Kans., assignor of one-half to Tully Scott, same place. Filed Nov. 27, 1888. Serial No. 291,988. (No model.)

Claim.—1. The combination of the frame having the rigid bar E, the adjustable bar G, movable on the frame, the detents to lock the same to the frame, and the cam-levers T, pivoted to the frame and connected to the bar G to operate the latter, substantially as described.

2. The combination of the frame A, having the cross-bar E and the arms C, with ratchet-teeth D, the bar G, movable on the arms C and having the detents to engage the ratchet-teeth, the links swiveled

402,068.



to the bar G, and the cam-levers T, pivoted at the lower ends of arms C and engaging the links, substantially as described.

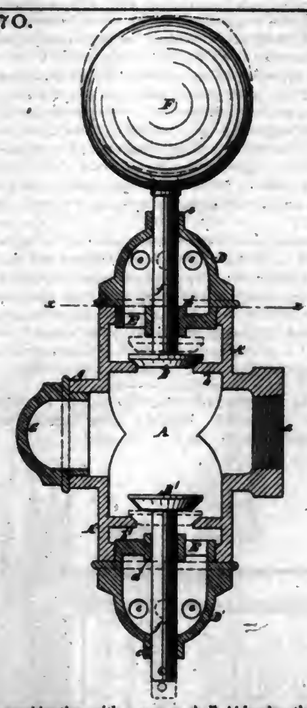
3. The combination of the frame having the cross-bar E and the arms C, the cross-bar G, movable vertically on said arms, the links swiveled to the cross-bar, the cam-levers pivoted to the lower ends of arms C and operating in the links, and the yoke U, connecting the free ends of the cam-levers, substantially as described.

4. In a mouth-expander, the frame A, having the arched portion B to pass across the horse's nose, and having the side arms, C, and the cross-bar E, to enter the horse's mouth, combined with the adjusting-bar G, sliding on the arms C, and also adapted to enter the horse's mouth, the detents carried by the sliding bar G to engage the side arms, and the mechanism, substantially as described, to lower the bar G, as set forth.

5. In a mouth-expander, the frame A, having the arched portion to pass over the horse's nose, and the rigid bar E, to enter the mouth of the horse, combined with the bar G, sliding on the frame A, and also entering the horse's mouth, the yoke O, bearing under the jaw of the horse, and connecting devices between the yoke U and the bar G to raise and lower said bar G, and the detents for said bar G, as set forth.

402,069. MACHINE FOR MAKING TACK-STRIPS. JOHN A. CROSBY, Methuen, Mass., assignor to The McKay & Copeland Lasting Machine Company, Portland, Me. Filed Oct. 15, 1888. Serial No. 288,484. (No model.)

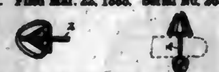
Claim.—1. In a machine for making tack-strips, a feed-wheel and a pawl to move it, combined with a feeler to contact with the side of a tack driven into the strip and enable the said pawl to act and move the said feed-wheel, substantially as described.



2. In a machine for making tack-strips, a feed-wheel, a pawl to move it, and a pawl-controller, combined with a feeler to contact with the side of a tack driven into the strip and keep the pawl-controller in position to enable the said pawl to act and move the said feed-wheel, substantially as described.

3. A feed-wheel, a pawl to rotate it, a support for one side of the body of a tack driven into a tack-strip, and a pawl-controller, combined with a feeler adapted to contact with the body of a driven tack between the said support and the said feed-wheel, to operate substantially as described.

402,070. SAFETY-VALVE. WILLIAM P. CUNNINGHAM, Brooklyn, N. Y., assignor of one-half to Enoch Rutzler, same place. Filed Jan. 23, 1889. Serial No. 297,316. (No model.)



Claim.—1. In a safety-valve, the combination, with a case or shell forming a chamber and provided with a normally-open outlet-port, of two separate valves arranged at different parts of said chamber, one of which is adapted to open into said chamber and the other of which opens outwardly from said chamber, separate communications with the external atmosphere being established when either of said valves is raised from its seat, substantially as specified.

402,070.

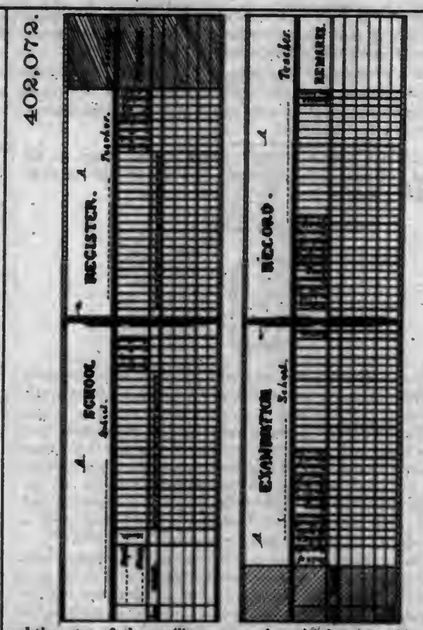
2. The combination, with a case or shell, A', having the normally-open outlet-port *a*, of the valve B', the weighted valve B, seats for said valves within the case or shell, and caps or plugs for the said shell affording separate communications with the external atmosphere when either of the valves is raised from its seat, substantially as specified.

402,071. LOBE EAR-RING. JAMES C. DORAN and HORACE A. HALL, Pawtucket, R. I. Filed Mar. 22, 1888. Serial No. 268,158. (No model.)

Claim.—1. A catch for ear-rings struck up from sheet metal having the central aperture and the extended spring-tongue covering said aperture and adapted to engage the pin projected through the same, substantially as described.

2. A catch for ear-rings struck up from sheet metal having the central aperture and the extended spring-tongue, with the aperture in the same registering with the central aperture and engaging the pin projected through said apertures, substantially as described.

3. A catch for ear-rings struck up from sheet metal having the central aperture, the points *a* swaged up into juxtaposition, with the opening between them for the passage of the pin, and the spring-tongue having the aperture in its end and adapted to engage the pin projected through said central aperture and between the points, substantially as described.



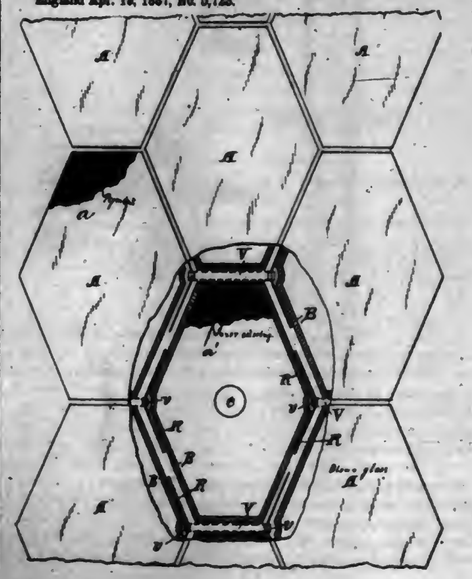
4. In an ear-ring, the combination, with the pin and the catch having the central aperture, of the points *a*, with the opening between their ends, and the extended spring-tongue passing over said opening to form a guard for the end of the pin passing between said points, its end extending between the points and engaging the pin to retain the same in position, substantially as described.

5. In an ear-ring, the combination, with the threaded pin and the catch having the central aperture, of the points *a*, with the opening between their ends, and the extended spring-tongue passing over said opening to form a guard for the end of the pin passing between said points, its end extending between the points and having the screw-threaded aperture therein engaging the pin to retain the same in position, substantially as described.

402,072. SCHOOL-RECORD BOOK. JAMES DU SHANE, South Bend, Ind. Filed July 11, 1888. Serial No. 279,682. (No model.)

Claim.—1. A record-book composed of a series of sheets having the school-register on one side and the examination-record on the other side, the sheets being folded in unequal lengths and bound at the folds, whereby alternate pages of different lengths are produced

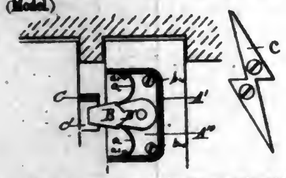
402,072.



and the entry of the pupil's name on the school-register side of the sheet is seen when the examination-record is opened, substantially as described.

2. A record-book composed of a series of alternate long and short pages bound together, the adjoining faces of one long and one short page showing a school-record, and their opposite faces showing an examination-record, whereby, when the examination-record is opened, the name on the school-record on the preceding page will be disclosed, substantially as set forth.

3. A record-book composed of a series of alternate short and long sheets, A A, so bound that when the short sheet is turned down a margin on a preceding long sheet is disclosed, so that the record on the margin of the front sheet can be read with both sides of the short sheet, substantially as specified.

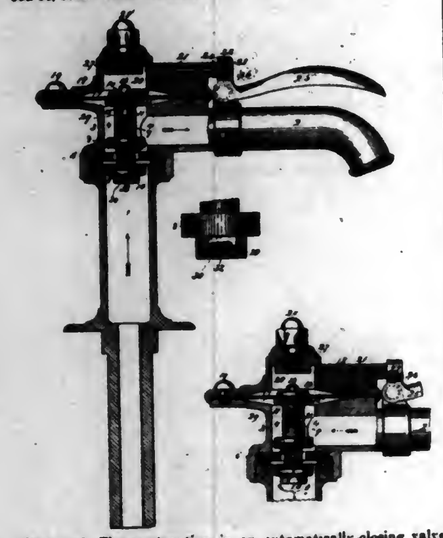


402,073. GLASS BUILDING-BLOCK. GUSTAVE FALCONNIER, Nyon, Vaud, Switzerland. Filed June 26, 1887. Serial No. 243,532. (No model.) Patented in France Nov. 11, 1886, No. 179,585; in Germany Mar. 14, 1887, No. 41,773; in Belgium Apr. 18, 1887, No. 77,079, and in England Apr. 19, 1887, No. 5,723.

Claim.—1. As a new article of manufacture, a blown-glass building-block having an air-chamber substantially entirely closed by the walls thereof, substantially as set forth.

2. As a new article of manufacture, a blown-glass building-block having an air-chamber substantially entirely closed by the walls thereof and provided with a coloring material within the inclosed air-chamber, substantially as set forth.

402,074. SASH-FASTENER. HENRY C. TROST, Chicago, Ill., and FRANK A. WESTON, Dodge City, Kans. Filed Mar. 30, 1888. Serial No. 269,025. (Model.)

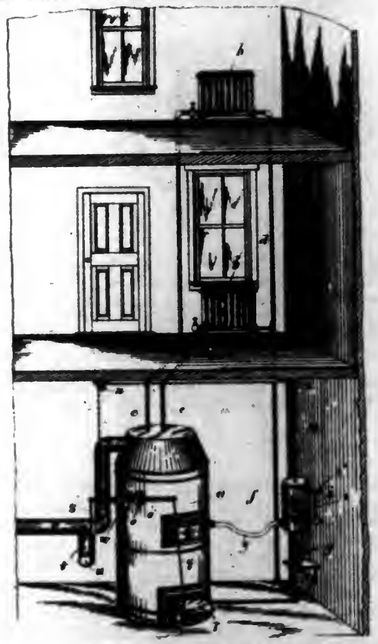


Claim.—1. The bolt-case comprising two parts, one of said parts forming the bottom and rim, and the other the top and side plate, substantially as set forth.

2. The combination of the trip-plate secured to the upper sash, its lateral edges each comprising two portions beveled in the same direction, and having between said portions an indentation with the bolt-case secured to the lower sash, the bolt located therein and projecting therefrom into the path of the trip-plate, and springs which resist but permit the movement of the bolt in a horizontal plane in both directions from the said plate, substantially as set forth.

3. The combination of the trip-plate secured to the upper sash, its lateral edges each comprising two portions beveled in the same direction, and having between said portions an indentation with the bolt-case secured to the lower sash, the bolt pivotally mounted therein and projecting therefrom into the path of the trip-plate, and springs which resist but permit the swinging of the bolt in a horizontal plane upon its pivot, said pivot having its axis fixed in location with respect both to the bolt and to the case, substantially as set forth.

402,075. AUTOMATICALLY-CLOSING FAUCET. ELLIOTT R. FURNEY, St. Louis, Mo., assignor to Nellie C. Furney, same place. Filed Oct. 31, 1888. Serial No. 289,601. (No model.)



Claim.—1. The combination, in an automatically-closing valve of two valves upon a stem, said valves closing, respectively, in opposite directions upon seats between them, a flexible diaphragm secured at the center to the valve-stem, a chamber on the opposite side of the diaphragm from the valves communicating through a bore in the valve-stem with the source of supply, and a discharge-passage from the chamber controlled by a valve or cock, for the purpose set forth.

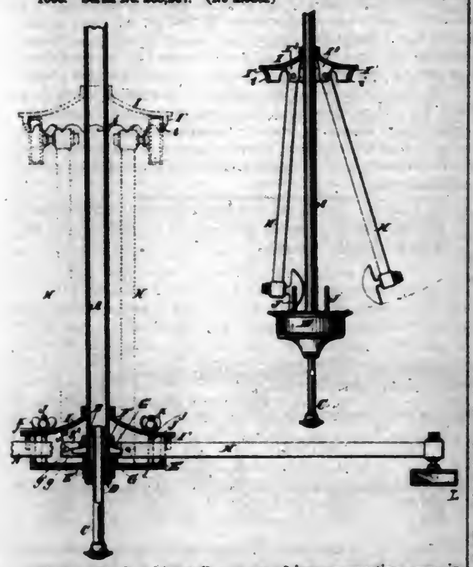
2. The combination, in an automatically-closing valve, of two valves upon a stem, a flexible diaphragm giving support to the stem, valve-seats between the valves against which they close, respectively, by an opposite movement of the valve-stem, an induction and eduction pipe on opposite sides of the valve-port, which is common to both valve-seats, a chamber separated from the valve-chamber 4 by the diaphragm and communicating with the induction pipe or chamber by a small passage, and having a discharge-passage governed by a valve, substantially as and for the purpose set forth.

3. The combinat on of the induction and eduction pipes, a valve-stem carrying two valves closing against the opposite sides of a plate having a valve-port through which the stem passes, through a flexible diaphragm supporting the valve and forming the separation between the valve-chamber 4 and the chamber 20, a small passage forming communication between the chamber 20 and the induction pipe or chamber, a valve, as 13, governing said passage, and a discharge-passage from chamber 20, governed by a valve or cock, for the purpose set forth.

4. The combination of induction and eduction pipes, the two valves 7 and 8, governing a valve-port, 5, between said pipes, a valve-stem passing through the valve-port and supporting the valves, a diaphragm, 17, separating the valve-chamber 4 from the chamber 20, a small passage between the induction-pipe or chamber, an adjustable valve governing the passage, a plug, 23, giving access to the adjustable valve, and a discharge-passage from the chamber 20, governed by a valve, substantially as and for the purpose set forth.

402,076. AUTOMATIC HEAT-REGULATOR FOR HOT-WATER HEATING APPARATUS. EUGENE H. GATES, Fitchburg, Mass. Filed Nov. 1, 1888. Serial No. 289,741. (No model.)

Claim.—1. The combination, with a water heating and circulating system, of a vertically-movable tank or chamber flexibly connected with said system and partly filled with the water thereof, a body of air which is compressed by the water-pressure, a mobile diaphragm interposed between the air and water in said tank, a damper or dampers controlling the fire, and connections between said damper or dampers and tank, whereby the fire is checked when the weight of the tank is increased, as set forth.



2. The combination, with a water heating and circulating system, of a vertically-movable tank or chamber flexibly connected with said system and partly filled with the water thereof, a body of oil supported by the water in said tank, a damper or dampers controlling the fire, and connections between said damper or dampers and tank, whereby the fire is checked when the weight of the tank is increased, as set forth.

3. The combination, with a water heating and circulating system, of a vertically-movable tank or chamber flexibly connected with said system and partly filled with the water thereof, a body of air which is compressed by the water-pressure, a mobile diaphragm interposed between the air and water in said tank, a damper or dampers controlling the fire, and connections between said damper or dampers and tank, whereby the fire is checked when the weight of the tank is increased, and a yielding check, as *y*, to prevent the abrupt descent of the tank, as set forth.

4. The combination, with a water heating and circulating system, of a vertically-movable tank or chamber flexibly connected with said system and partly filled with the water thereof, a body of air which is compressed by the water-pressure, a mobile diaphragm interposed between the air and water in said tank, a transparent indicator showing the height of water in the tank, a damper or dampers controlling the fire, and connections between said damper or dampers and tank, whereby the fire is checked when the weight of the tank is increased, as set forth.

5. The combination, with a water heating and circulating system, of a vertically-movable tank or chamber flexibly connected with said system and partly filled with the water thereof, a body of air which is compressed by the water-pressure, a mobile diaphragm interposed between the air and water in said tank, a damper or dampers controlling the fire, and connections between said damper or dampers and tank, whereby the fire is checked when the weight of the tank is increased, and means, as the weight *w*, whereby said damper or dampers are normally held in their fire-promoting positions with a yielding pressure, as set forth.

402,077. CHANDELIER. LEWIS F. GRISWOLD, Meriden, Conn., assignor to The Charles Parker Company, same place. Filed Sept. 13 1888. Serial No. 285,267. (No model.)

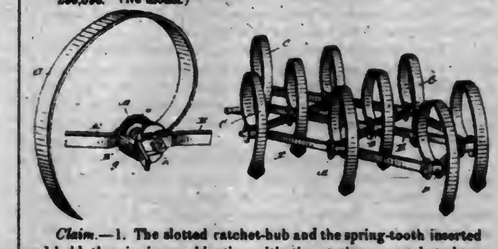
Claim.—1. In a chandelier, a set of lamp-supporting arms, in combination with movable arm-supports between which they are held and pivoted, and clamping devices for holding said arm-supports together, substantially as set forth.

2. A pair of arm-supports and a box detachable therefrom, in combination with a tubular shaft having a fixed internal nut and a fixed external collar, lamp-supporting arms held between said arm-supports and resting on said box, and a hand-piece which enters said tubular shaft and engages said nut, said hand-piece being provided with a shoulder which bears against said box to clamp said box and arm-supports between it and said collar, substantially as set forth.

3. A chandelier-shaft and a box mounted thereon, in combination with a cap vertically movable on said shaft, and clamping devices for holding said cap to said box at will, in order that said cap may be used to secure the lamp-supporting arms either in their horizontal or in their folded position, as set forth.

4. A set of lamp-supporting arms having pieces L attached to their outer ends, as described, in combination with shaft A, a cap, I, movable vertically on said shaft and adapted to fit over said pieces L, and attachments of said shaft to which said arms are pivoted, substantially as set forth.

5. A series of lamp-supporting arms, H, each having lateral gudgeons *h* near its inner end, in combination with a pair of arm-holders, G G', having arms *g g*^{3} and grooves *g' g*^{3} to receive and hold said gudgeons, a box, E, having a raised flange on which said lamp-supporting arms rest, a shaft on which said box and arm-holders are sleeved, and a hand-piece which clamps them in position, for the purpose set forth.

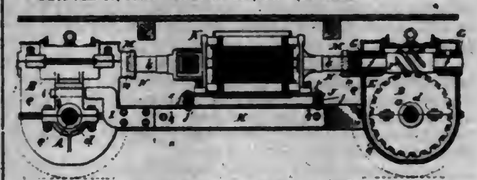


6. A box, E, and cap I, having overlapping peripheral flanges and corresponding recesses, *e i*, in combination with lamp-supporting arms extending through the openings formed by said recesses, a main shaft, to an attachment of which the inner ends of said lamp-supporting arms are pivoted, and clamping devices for holding said cap to said box, substantially as set forth.

402,078. BOTTLE-STOPPER. CHARLES C. HALEY, Newark, N. J., assignor to Henry A. Hausding and Adell A. Haley, same place. Filed Dec. 10, 1888. Serial No. 293,117. (No model.)

Claim.—The improved bottle-stopper herein described, combining with the button having an eye, d^3, a wire bail doubled, as at d^3, to form a finger-loop, and the hooked arms d' d', which extend downwardly and pass in opposite directions through said eye, the extremities of said arms being bent upward at said eye d^3, forming spring-bearings d^4 d^4 to engage the opposite sides of the interior of the neck, substantially as shown and described, for the purposes set forth.

402,079. SPRING-TOOTH HARROW. SAMUEL M. HENCH and WALKER A. DROSCOLD, York, Pa. Filed Feb. 11, 1889. Serial No. 299,396. (No model.)



Claim.—1. The slotted ratchet-hub and the spring-tooth inserted and held therein, in combination with the stationary ratchet-plates and the pivot-bolt, substantially as and for the purposes hereinbefore set forth.

2. The slotted ratchet-hub having lug *e*, in combination with the spring-tooth inserted in the slot and notched to engage lug *e*, the pin or rivet *f*, by which the tooth is secured to the hub, the stationary ratchet-plates, and the pivot-bolt, substantially as and for the purposes hereinbefore set forth.

3. The harrow-frame composed of straps of zigzag form, in combination with individually hinged or pivoted spring-teeth located between the contiguous angles of adjoining straps, and pivot-bolts whereby both the teeth are held in place and the straps between which the teeth come are bound together, substantially as set forth.

4. The combination of the harrow-frame E, composed of straps bent into zigzag form, as described, the stationary ratchet-plates, the ratchet-hubs, the spring-teeth attached to said hubs, and the pivot-bolts by which both the hubs and stationary plates are held in place and the frame-straps are bound together, substantially as and for the purposes hereinbefore set forth.

402,080. ELECTRIC CAR. JOHN W. HENDERSON, Philadelphia, Pa. Filed Jan. 19, 1889. Serial No. 296,797. (No model.)

Claim.—1. In an electrically-propelled vehicle, the combination of two axles, an axle-frame journaled upon each axle, a motor-supporting frame hung from said axle-frames with provision for lateral movement, and an electric motor supported by said motor-supporting frame.

2. In an electrically-propelled vehicle, the combination of two axles, an axle-frame journaled upon each axle, a motor-supporting frame hung from said axle-frames with provision for lateral movement, an electric motor supported by said motor-supporting frame

having a longitudinal shaft, and gearing between the ends of said shaft and axles.

3. In an electrically-propelled vehicle, the combination of two axles, an axle-frame journaled upon each axle, a motor-supporting frame hung from said axle-frames with provision for lateral movement, an electric motor supported by said motor-supporting frame, having a longitudinal shaft, and gearing between the ends of said shaft and axles consisting of worms and worm-wheels, the latter being secured to the axles.

4. In an electrically-propelled vehicle, the combination of two axles, an axle-frame journaled upon each axle having a worm chamber or case, a motor-supporting frame hung from said axle-frames with provision for lateral movement, an electric motor supported by said motor-supporting frame, having a longitudinal shaft, and gearing between the ends of said shaft and axles consisting of worms and worm-wheels, the latter being secured to the axles and arranged within the inclosing chambers or casings of the axle-frames.

5. In an electrically-propelled vehicle, the combination of two axles, a frame supported by said axles between the wheels, an electric motor, elastic supports wholly supporting and arranged below the motor and between the motor and frame, and power-transmitting devices between the motor and axle.

6. In an electrically-propelled vehicle, the combination of two axles, a frame supported by said axles, an electric motor, elastic supports between the motor and frame, worm-wheels on the axles, worms for meshing with the worm-wheels, and flexible couplings between the motor-shaft and worms.

7. In an electrically-propelled vehicle, the combination of two axles, a laterally-swinging frame supported by said axles, an electric motor, elastic supports between the motor and frame, and power-transmitting devices between the motor and axle.

8. In an electrically-propelled vehicle, the combination of two axles, an axle-frame on each axle, a motor-supporting frame hung from said frames, worm-wheels on the axles, worms for said worm-wheels journaled in the axle-frames, a motor supported on motor-supporting frame, and flexible couplings between the motor-shaft and worms.

9. In an electrically-propelled vehicle, the combination of two axles, an axle-frame on each axle, a motor-supporting frame hung from said frames, worm-wheels on the axles, worms for said worm-wheels journaled in the axle-frames, a motor supported on motor-supporting frame by elastic connections, and flexible couplings between the motor-shaft and worms.

10. The combination of two axles, a laterally-movable motor-supporting frame carried by the axles, a motor on said frame, and a power-transmitting connection between one or both axles and motor-shaft.

11. The combination of two axles, an axle-frame journaled upon each axle, and a motor-supporting frame hung upon said axle-frame by longitudinal journals.

12. The combination of two axles, an axle-frame journaled upon each axle and having two holes, and a motor-supporting frame formed of two parallel beams hung upon said axle-frames by longitudinal journals of smaller diameter than the holes of the axle-frames.

13. The combination of two axles, a worm-wheel upon each axle, an axle-frame journaled concentrically with each axle, worms held by said frames, a motor to rotate said worms, and a longitudinal frame structure loosely connecting with each axle-frame to prevent them from rotating with the axles, but allow of movement of one axle-frame independent of the other.

14. The combination of two axles, a worm-wheel upon each axle, an axle-frame journaled concentrically with each axle, worms held by said frames, a motor to rotate said worms, a flexible coupling between the worms and motor-shaft, and a longitudinal frame structure loosely connecting with each axle-frame to prevent them from rotating with the axles, but allow of movement of one axle-frame independent of the other.

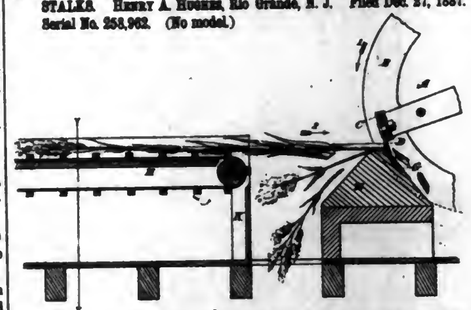
15. The combination of two axles, a worm-wheel on each axle, an inclosing-frame journaled concentric with each axle, a worm journaled in the upper parts of each of said frames and also inclosed thereby and meshing with the worm-wheels, an electric motor having a longitudinal shaft arranged in line with the worms, and flexible connections between the motor-shaft and worms.

16. The combination of two axles, a worm-wheel secured to each axle, a worm meshing with the upper part of each worm-wheel, an inclosing-frame for said worm-wheel, a worm on each axle forming a receptacle for oil and keeping out dust, and a longitudinal motor-shaft extending from worm to worm in a line above both axles.

17. The combination of an axle, a worm-wheel on the axle, a worm meshing with the worm-wheel, a motor, and a flexible coupling between the motor-shaft and worm, consisting of a slotted head, *m*, and pin N, substantially as shown.

18. The combination of two axles, axle-frames on each axle, two longitudinal beams hung from said axle-frame on longitudinals, elastic connections between the beams, and a motor supported on said beams.

19. In an electrically-propelled vehicle, the combination of two axles, an axle-frame journaled upon each axle having a worm chamber or case, a motor-supporting frame hung from said axle-frames with provision for lateral movement, an electric motor supported by said motor-supporting frame having a longitudinal shaft, and gearing between the ends of said shaft and axles, consisting of worms and worm-wheels, the latter being secured to the axles, arranged within the inclosing chambers or casings of the axle-frame, and in which the axle-frame, worm-wheel, and worm on one axle are fixed against lateral movement and the similar parts on the other axle are free to have lateral movement by sliding upon the axle.



20. The combination of two axles, an axle-frame on each axle having a hole, P, and a longitudinal beam having journals *i* at each end loosely fitting said holes P and provided on top with a key or feather or similar projecting part, *p*.

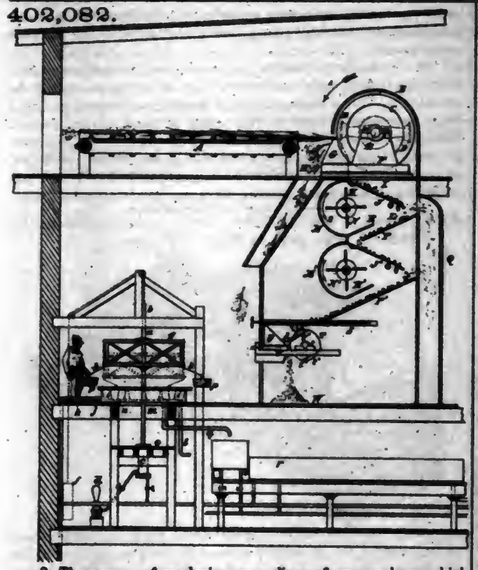
21. The combination of two axles, a worm and worm-wheel and connecting-frame carried upon each axle, an intermediate loosely-connected motor-supporting frame connecting the frames on the two axles, and a motor supported by said motor-supporting frame having its shaft connected with the worms.

22. The combination of two axles, a worm-wheel on each axle, a worm for each worm-wheel, a frame for holding the worm to the worm-wheel, a detachable motor-frame connecting the frames for the worms to hold them in place, and a motor secured to the motor-frame and movable with it and having its shaft connected with the worms.

23. The combination of two axles, a worm-wheel on each axle, a worm for each worm-wheel, a frame for holding the worm to the worm-wheel, a detachable motor-frame connecting the frames for the worms to hold them in place, a motor secured to the motor-frame and movable with it, and a detachable connection between the motor-shaft and worms.

402,081. APPARATUS FOR REMOVING END SECTIONS FROM STALKS. HENRY A. HUGHES, Rio Grande, N. J. Filed Dec. 27, 1887. Serial No. 258,962. (No model.)

Claim.—1. An apparatus for removing and separating end sections from stalks, &c., containing the combination of a descending cutting-blade, a traveling carrier adapted to support said stalks and feed them to said cutting-blade, and a fixed support for said stalks in front of and adjacent to said cutting-blade, the said support and proximate end of the stalk-carrier being separated by a free space or interval greater in width than the length of the end sections to be separated, substantially as described.

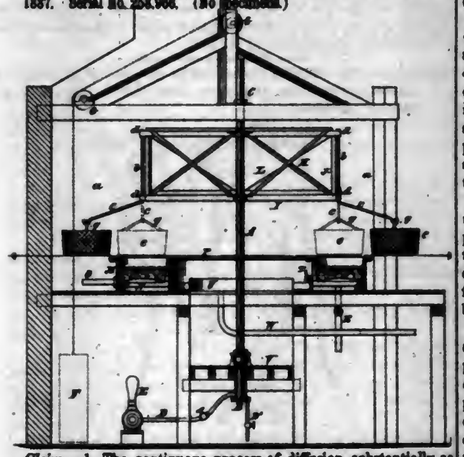


2. An apparatus for removing and separating end sections from stalks, &c., containing the combination of a rotary descending cutting-blade, a continuously-moving carrier adapted to support said stalks and feed them to said cutting-blade, and a fixed support for said stalks in front of and adjacent to said cutting-blade, the said support and proximate end of the stalk-carrier being separated by a free space or interval greater in width than the length of the end sections to be separated, substantially as described.

3. An apparatus for removing and separating end sections from stalks, &c., containing the combination of a rotary intermittently-descending cutting-blade, the endless traveling apron or carrier H and stationary support E, the said fixed support E and proximate end of apron H being separated by a space or interval greater in width than the length of the end sections to be separated, substantially as described.

402,082. PROCESS OF SUGAR PRODUCTION FROM SORGHUM. HENRY A. HUGHES, Rio Grande, N. J. Filed Dec. 27, 1887. Serial No. 258,964. (No specimens.)

Claim.—1. The process of preparing sorghum-cane for diffusion, which consists in first dividing the cane into short lengths and freeing it from seed-heads, leaves, and sheaths; second, separating the leaves, sheaths, &c., from the cane; third, subjecting the cane to shredding or fibrous disintegration, substantially as described.



402,082.

2. The process of producing sugar-liquor from sorghum, which consists in first dividing the cane into short lengths and freeing it from seed-heads, leaves, and sheaths; second, separating the leaves, sheaths, &c., from the cane; third, subjecting the cane to shredding or fibrous disintegration; fourth, subjecting the disintegrated cane to diffusion in hot water until the water dissolves from said cane a given percentage or quantity of sugar, substantially as described.

3. The process of producing concentrated sugar-liquor from sorghum, which consists in first dividing the cane into short lengths and freeing it from seed-heads, leaves, and sheaths; second, separating the leaves, sheaths, &c., from the cane; third, subjecting the cane to shredding or fibrous disintegration; fourth, subjecting the disintegrated cane to diffusion in hot water until the water dissolves from the cane a given percentage or quantity of sugar, and, fifth, subjecting the liquor so obtained directly to evaporation until a concentrated liquor suitable for treatment in the vacuum-pan is produced, substantially as described.

402,083. PROCESS OF EXTRACTING SUGAR FROM SORGHUM BY DIFFUSION. HENRY A. HUGHES, Rio Grande, N. J. Filed Dec. 27, 1887. Serial No. 258,966. (No specimens.)

Claim.—1. The continuous process of diffusion, substantially as herein described, which consists in subjecting successive masses of cane in a disintegrated or shredded condition to the action of stationary bodies of hot water contained in a series of successive independent non-communicating vessels, by immersing each mass of cane successively in each vessel, and thereby bringing the liquor in each vessel to a predetermined density.

2. The continuous process of diffusion, substantially as herein described, which consists in, first, charging a given number of vessels not communicating with one another with hot water; second, immersing in vessel No. 1 a mass of cane, No. 1, in disintegrated or shredded condition; third, removing said mass No. 1 to vessel No. 2, and placing in vessel No 1 a new mass, No. 2, of shredded cane; fourth, removing masses Nos. 1 and 2, respectively, from vessels 1 and 2 to vessels 2 and 3, and placing a new mass of cane, No. 3, in vessel No. 1, and so continuing immersing successive masses of cane in each vessel until the liquor in each vessel shall attain a predetermined density.

402,084. INCLINE ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa. Filed Jan. 5, 1888. Serial No. 295,534. (No model.)

Claim.—1. In an electric railway having an upgrade, the combination of a source of electric supply, line working-conductors, a short switching turn-out or siding at the top of the grade provided with working-conductors for the traction-dummy, and electrical connections between said working-conductors for the dummy and line-conductors or their source of electrical supply.

2. In an electric railway having an upgrade, the combination of a source of electric supply, main-line working-conductors, a short switching turn-out or siding at the top of the grade provided with working-conductors for the traction-dummy, electrical connections between said working-conductors for the dummy and line-conductors or their source of electrical supply, and a slotted branched conduit containing said line and traction-dummy working-conductors.

3. In an electric railway having an upgrade, the combination of a source of electric supply, main-line working-conductors, a short switching turn-out or siding at the top of the grade provided with working-conductors for the traction-dummy, electrical connections between said working-conductors for the dummy, and line-conductors or their source of electrical supply, a slotted branched conduit containing said line and traction-dummy working-conductors, and switching devices to switch the dummy onto the siding or turn-out to allow the passage of the passenger-car.

4. In an electric railway having an upgrade, the combination of a source of electric supply, main-line working-conductors, a short switching turn-out or siding at the top of the grade provided with working-conductors for the traction-dummy, electrical connections between said working-conductors for the dummy and line-conductors or their source of electrical supply, a slotted branched conduit containing said line and traction-dummy working-conductors, switching devices to switch the dummy onto the siding or turn-out to allow the passage of the passenger-car, an electrically-propelled passenger-car, a traction dummy or motor to assist said car up the grade, and a disconnectible coupling between said car and traction-dummy.

5. The combination of an electric railway arranged on an incline with a substantially-horizontal part at top and bottom, a dummy-track at one end of said inclined portion of the railway arranged out of line of the main track to support the dummy to one side of the main track, electrical conductors for the dummy on the inclined portion of the railway, an electrically-propelled dummy or traction-vehicle, a passenger-car to run upon the main track, and a coupling between the passenger-car and dummy, whereby the dummy may assist the passenger-car up the grade or incline, and also allow the passenger-car to pass the dummy.

6. The combination of a railway-track having a grade portion, a main-line conductor arranged along the railway, an electrically-propelled passenger-car receiving current from said conductor, a dummy-track, a conductor for said dummy-track, an electrically-propelled dummy for assisting the passenger-car up the grade receiving current from said conductor for the dummy-track, and a detachable coupling between the dummy and passenger-car.

7. The combination of a railway-track having a grade portion, a main-line conductor arranged along the railway, an electrically-propelled passenger-car receiving current from said conductor, a dummy-track, a conductor for said dummy-track, an electrically-propelled dummy for assisting the passenger-car up the grade receiving current from said conductor for the dummy-track, a common source of supply to the main-line and dummy-track conductors, and a detachable coupling between the dummy and passenger-car.

8. The combination of a railway-track having a grade portion, a main-line conductor arranged along the railway, an electrically-propelled passenger-car receiving current from said conductor, a dummy-track, a conductor for said dummy-track, an electrically-propelled dummy for assisting the passenger-car up the grade receiving current from said conductor for the dummy-track, a common source of supply to the main-line and dummy-track conductors, a regulator to regu-

late the current supplied to the dummy-track conductor, and a detachable coupling between the dummy and passenger-car.

9. The combination, in a railway, of a main track having a grade, an auxiliary track at the grade, a passenger-car adapted to run on the main track, an electrically-propelled dummy-car to run upon the auxiliary track, a coupling between the passenger-car and dummy, and a source of electric supply to the motor on the dummy.

10. The combination, in a railway, of a main track having a grade, an auxiliary track at the grade, an electrically-propelled passenger-car adapted to run on the main track, an electrically-propelled dummy-car to run upon the auxiliary track, a coupling between the passenger-car and dummy, and a source of electric supply to the motor on the dummy and passenger-car.

11. The combination, in a railway, of a main track having a grade, an auxiliary track at the grade, a passenger-car adapted to run on the main track, an electrically-propelled dummy-car to run upon the auxiliary track, a coupling between the passenger-car and dummy, separate conductors for the main track and auxiliary track, and electrical connections between the motors on the passenger-car and dummy.

12. The combination, in a railway, of a main track having a grade, an auxiliary track at the grade, a passenger-car adapted to run on the main track, an electrically-propelled dummy-car to run upon the auxiliary track, a coupling between the passenger-car and dummy, separate conductors for the man track and auxiliary track, electrical connections between the motors on the passenger-car and dummy, and a common source of electric energy for both conductors.

13. The combination, in an electric railway having a grade, of the main track and line-conductor, with an auxiliary parallel track at the grade portion, an electrically-propelled passenger-car for the main track, a traction electrically-propelled dummy for the auxiliary track, a common source of electric energy, and a detachable coupling between the passenger-car and dummy.

14. The combination, in an electric railway having a grade, of the main track and line-conductor, with an auxiliary parallel track of different gage at the grade portion, an electrically-propelled passenger-car for the main track, a traction electrically-propelled dummy for the auxiliary track, a common source of electric energy, and a detachable coupling between the passenger-car and dummy.

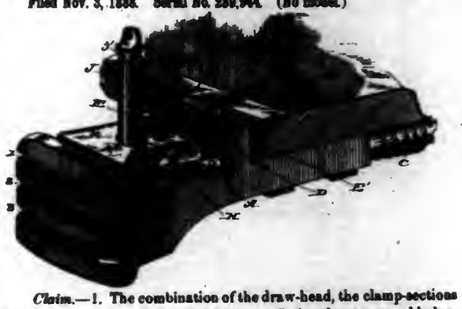
15. The combination, in an electric railway having a grade, of the main track and line-conductor, with an auxiliary parallel track at the grade portion, an electrically-propelled passenger-car for the main track, a traction electrically-propelled dummy for the auxiliary track, and a conductor for the auxiliary track, and electrical connection between the conductors for the respective tracks and the car and dummy.

16. The combination, in an electric railway having a grade, of the main track with a dummy turn-out track at one end of the grade, an electrically-propelled passenger-car, an electrically-propelled dummy for assisting the car up the grade, a detachable coupling between the car and dummy, and a common source of electric energy for the motors of both the passenger-car and dummy.

17. The combination of a main track having a line-conductor, a parallel auxiliary track having a longitudinal conductor, a source of electric supply for said conductors, and a regulator to control the current passing to the conductor of the auxiliary track.

18. The combination of two electrically-propelled vehicles coupled together, a common source of electric energy for the motors of both vehicles, and a regulator independent of the two vehicles to control the relative supply of electricity to the motors.

19. The combination of a main track and line-conductor, a source of electric energy, an auxiliary track and conductor at a distance from the source of supply, and a connection between the two track-conductors, whereby the auxiliary track-conductor receives current from the source of supply through the line-conductor of the main track.



20. In an electric railway, line working-conductors from which a traveling motor derives its current, having an upgrade, in combination with a short section of working-conductors having a length substantially equal to said grade and arranged parallel to said line-conductors and on the grade, a passenger electrically-propelled vehicle receiving current from the line-conductors, a traction-motor or dummy receiving current from the short-grade sections of working-conductors, and a disconnectible coupling between the passenger-vehicle and dummy.

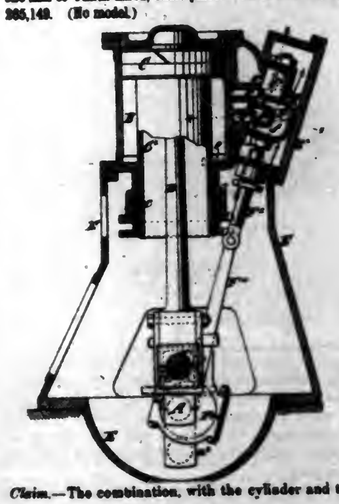
21. In an electric railway, line working-conductors from which a traveling motor derives its current, having an upgrade, in combination with a short section of working-conductors having a length substantially equal to said grade, and arranged parallel to said line-conductors and on the grade, and a common source of electric supply for both the line-conductors and upgrade-motor conductors.

22. In an electric railway, a line of working-conductors from which a traveling motor derives its current, having an upgrade, in combination with a short section of working-conductors having a length substantially equal to said grade, and arranged parallel to said line-conductors on the grade, an electric generator to supply electricity to said line-conductors, and branch conductors connecting the line-conductors with the corresponding conductors of the upgrade-motor circuit.

23. In an electric railway, a line of working-conductors from which a traveling motor derives its current, having an upgrade, in combination with a short section of working-conductors having a length substantially equal to said grade, arranged parallel to said line-conductors and on the grade, and an electrically-propelled passenger-vehicle receiving electricity from the line-conductors, an electric motor receiving electricity from the upgrade-motor conductors, and a disconnectible coupling between the motor and passenger-vehicle.

402,085. CAR-COUPLING. JOHN J. JETER, Campbellsville, Ky. Filed Nov. 3, 1888. Serial No. 289,944. (No model.)

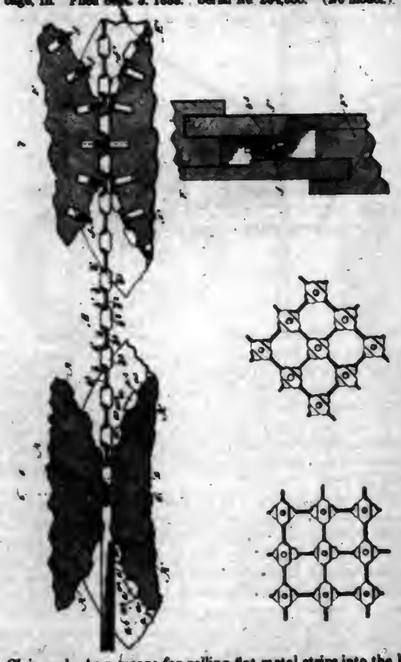
Claim.—1. The combination of the draw-head, the clamp-sections having recesses f^3 and beveled surfaces f'; the plunger movable longitudinally and having its head e beveled and arranged to engage beveled surfaces f' of the clamp-sections, substantially as set forth.



2. In a car-coupling, the combination of a longitudinally-movable draw-head, a plunger movable longitudinally independent of the draw-head, a bearing arranged for engagement by such plunger, whereby a rearward movement of the draw-head will effect a forward movement of the plunger, and the clamp-sections adapted to engage and hold the pin and arranged for actuation by the plunger, substantially as set forth.

3. In a car-coupling, the combination of the draw-head, the clamp-sections, and the plunger adapted to operate the clamp-sections, and a bearing by engagement with which the plunger is moved forward on the meeting of two draw-heads, substantially as set forth.

4. In a car-coupling, the combination of the draw-head movable longitudinally and having a lug, D, arranged to limit such movement, such lug D being provided with an opening, d, forming a guide for the plunger, the clamp-sections and the plunger movable in guide d and arranged to engage the clamp-sections, all substantially as and for the purposes specified.



5. The combination of the draw-head, the clamp-sections, the plunger, and the pins i, operating in grooves I, and adapted to form a guide whereby to direct the movement of the forward ends of the clamp-sections, substantially as set forth.

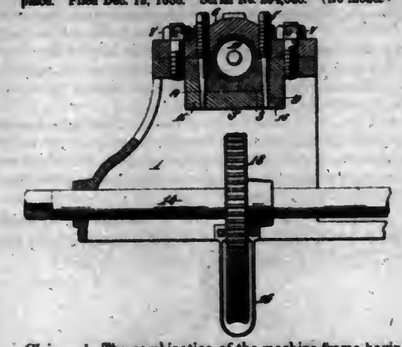
402,086. ENGINE. JULIUS JOHNSON, New York, N. Y., assignor of one-half to Julius Elsen, same place. Filed Feb. 24, 1888. Serial No. 265,149. (No model.)

Claim.—The combination, with the cylinder and trunk-piston of a compound engine, the cylinder having a valve-seat in which are the supply-ports e e', adjacent to each other, and the exhaust-port e^2 beyond said supply-ports, of a valve having the passage f, whereby the two supply-ports may be placed in communication, and having between the ends of said passage a supply-cove, f', opening at the side of the valve, and also having beyond said passage the separate exhaust-cove f^2, substantially as herein described.

402,087. MACHINE FOR SHAPING METAL STRIPS FOR ORNAMENTAL METAL LATTICE OR FENCE WORK. FRED H. KINDL, Chicago, Ill. Filed Sept. 5, 1888. Serial No. 284,655. (No model.)

Claim.—1. As a means for rolling flat metal strips into the hereinbefore-described reversely-twisted strips having two portions which are intermediate of the twists alternately in different planes, a pair of dies, each having a series of substantially flat die-face portions alternately in different planes in correspondence with said portions of the strips that are intermediate of the twists, and a series of curved-face portions intervening between said flat die-face portions and alternately curved in reverse directions in correspondence with and to form the reverse twists in the strips, substantially as set forth.

2. In a machine for forming the within-described reversely-twisted metal strips, a pair of opposing rotary dies, each having die-face portions a, alternating with die-face portions a', and reversely-curved face portions a^2 and a^3, alternating with one another and formed at the points of junction between the die-faces a and a', substantially as described.



3. In a machine for forming the within-described reversely-twisted metal strips, the flanged dies, each provided with a die-face comprising the portions a, a', a^2, and a^3, for the purpose described.

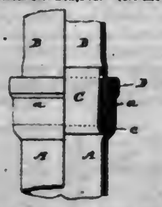
4. In a machine for forming the within-described reversely-twisted metal strips, a pair of dies, each provided with a die-face comprising the alternately-arranged flat and curved portions, as set forth, for forming the reversely-twisted strips B, one of said die-holders being provided with a flange which works within a groove in the opposing die-holder, for the purpose described.

5. The combination, with the rolls provided with dies, each having the herein-described alternately-arranged flat and curved die-face portions for forming the reversely-twisted strips B, of a punching device arranged for punching rivet-holes in said strip, for the purpose described.

6. In a machine for forming strips B, the roll A, provided with the within-described die-face having the alternately-arranged flat and curved die-face portions, forming a die-face which is shaped in conformity to said strip, said roll being journaled eccentrically in rotary adjustable bearings, in combination with a separate movable die having alternately-arranged flat and curved die-face portions corresponding to and matching the said die-face portions of the die on roll A, substantially as and for the purpose described.

402,088. TOBACCO-CUTTING MACHINE. WILLIAM KRUTSCH, Dayton, Ohio, assignor to the Buckeye Iron and Brass Works, same place. Filed Dec. 19, 1888. Serial No. 294,065. (No model.)

Claim.—1. The combination of the machine-frame having a pillow-block, the feed-chain-operating shaft carrying a worm-wheel, the cutter-shaft, the worm detachably mounted on the end portion of the cutter-shaft, and a journal-box removably mounted on the pillow-block, supporting the ends of the cutter-shaft outside the worm and having a detachable cap for replacing the worm by another to change the speed of the feed-chain-operating shaft, substantially as described.



2. The combination of the machine-frame having a pillow-block provided with two stationary jaws, the feed-chain-operating shaft having a worm-wheel, the cutter-shaft, the worm detachably mounted on the cutter-shaft, and the removable journal-box supporting the end of the cutter-shaft outside the worm, and comprising a lower section detachably held between the jaws of the pillow-block, and the top cap detachably bolted to the pillow-block for replacing the worm by another to change the speed of the feed-chain-operating shaft, substantially as described.

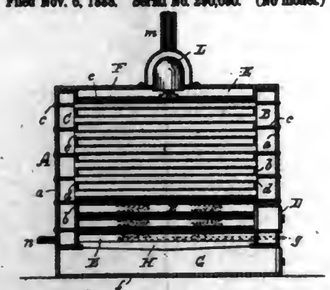
3. The combination of the machine-frame having a pillow-block provided with two jaws, a feed-chain-operating shaft having a worm-wheel, a cutter-shaft having a detachable worm, a journal-box comprising a lower section removably located between the jaws of the pillow-block, and a top cap detachably secured to the pillow-block, and screws having tapering portions located between the said jaws and the lower section of the journal-box, substantially as described.

4. The combination of the machine-frame having a pillow-block provided with two jaws, the journal-box comprising the lower section removably located between the jaws, and a top cap detachably bolted to the pillow-block, the screws having tapering portions extending between the said jaws and the lower section of the journal-box, and the shaft having a removable worm, substantially as described.

5. The combination of the machine-frame having a pillow-block provided with two jaws, a journal box composed of a lower section removably located between the jaws, and a cap removably secured to the pillow-block, and screws having tapering portions arranged between the jaws and the lower section of the journal-box, substantially as described.

402,089. PIPE-JOINT. FRANK A. LANE, Manchester, N. H. Filed Apr. 30, 1888. Serial No. 272,375. (No model.)

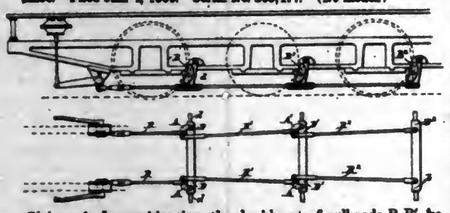
Claim.—1. The herein-described ferrule, tapering toward one end and provided at the other end with the laterally-extending flange adapted to form a seat for the calking, and convex and tapering on its end face, and thereby adapted to center the ferrule within the bell, in combination with the bell having a tapering or rounded seat adapted to co-operate with said ferrule to bring both parts in line, substantially as set forth.



2. The herein-described ferrule C for pipe-joints, provided at one end with a convex or tapering end face, and having at the same end the laterally-extending flange or shoulder c, adapted to form a seat for the calking, said ferrule being tapered or flared on its inner surface toward the end opposite said flange, whereby obstruction of the pipe in which it may be inserted is avoided, substantially as set forth.

402,090. MANUFACTURE OF GLASSWARE. GEORGE W. LEIGHTON, Findlay, Ohio, assignor to the Dalzell Gilmore & Leighton Company, same place. Filed Feb. 1, 1889. Serial No. 298,393. (Specimens.)

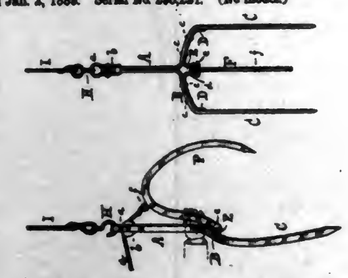
Claim.—1. As a step in the manufacture of glassware, the method herein described of producing a metallic luster on the surface of the glassware, which consists in reheating a wholly or partially shaped article formed of glass having a metallic constituent and while hot subjecting the article to the action of sulphurous fumes or vapors, substantially as set forth.



2. As a step in the manufacture of glassware, the method herein described of developing a metallic luster and a color on the surface of the glassware, which consists in heating a wholly or partially shaped article having its surface formed of glass having a metallic constituent in a sulphurous flame, substantially as set forth.

402,091. STEAM-BOILER. LEVI W. LOMBARD and NATHANIEL LOMBARD, Boston, Mass., assignors of one-half to Orlando E. Lewis, same place. Filed Nov. 6, 1888. Serial No. 290,096. (No model.)

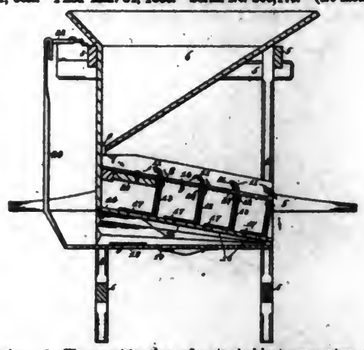
Claim.—A steam-boiler composed of two hollow chambers having metallic walls which form the end heads, a series of pipes connecting said chambers, an exterior shell inclosing said tubes to form a combustion-chamber, a fluid-supply pipe, a steam-drum, L, above the steam-pipes *e* and connected directly to the middle thereof, and a smoke-stack inclosing the steam-drum, substantially as set forth.



402,092. BRAKE. ALBERT P. MASSEY and ELIE NORMAND, Watertown, N. Y., assignors to the Eames Vacuum Brake Company, same place. Filed Jan. 4, 1889. Serial No. 295,417. (No model.)

Claim.—1. In combination, the double set of pull-rods R R', &c., the double set of levers A A', &c., the beams D D', &c., and the brake-heads B B', &c., all arranged and operating substantially as described.

2. In combination, the double set of pull-rods, the double set of levers, the beams, and the brake-heads, with the terminal beam D^2, and brake-heads B^2, that terminal beam being connected directly with the pull-rods, while the other beams in the system are connected with the pull-rods through the levers, all substantially as shown.

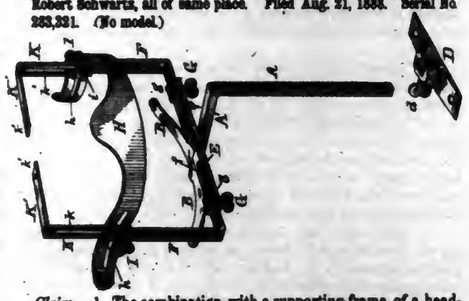


402,093. HAY-FORK. NATHAN F. MATHEWSON, Providence, R. I. Filed Jan. 2, 1889. Serial No. 295,231. (No model.)

Claim.—1. The combination of the handle A, having an eye, *a*, the top piece, B, the stiffening-pieces D, having the hangers E, the fixed tines C, the pivotally-mounted hooked tine F, and the rope G, fastened to the tine F and passing through the eye *a*, substantially as specified.

2. The improved hay-fork herein described, consisting of the handle A, having the eye *a* and sheave *b*, the top piece, B, the fixed tines C, the stiffening-pieces D, having the hangers E, the pivotally-mounted hooked tine F, having the stop-pins *e* and the eye *f*, and the rope G, substantially as specified.

402,094. ORE-CONCENTRATOR. WILLIAM H. MESSENGER, Denver, Colo. Filed Mar. 31, 1888. Serial No. 269,178. (No model.)



Claim.—1. The combination of a single-blast apparatus, a series of transverse walls directly upon the stationary side thereof, forming with side walls a series of chambers directly upon the blast apparatus, a series of outlet-valves for the blast apparatus, one for and opening into each chamber, the valve in any one chamber being weighted to require a different degree of pressure to raise it from that required by the valves in adjacent chambers, an inclined riddle lying directly over the chambers, and means for operating the blast apparatus, substantially as set forth.

2. The combination of a single-blast apparatus, a series of transverse walls projecting from the stationary side thereof and forming with side walls a series of chambers directly upon the blast apparatus, a series of outlet-valves for the blast apparatus, one for and opening into each chamber, an ordinary inlet-valve for such apparatus, an extra outlet-valve therefor having means for adjusting it to any desired pressure, an inclined screen lying directly over the chambers, and means for operating the blast apparatus, substantially as set forth.

3. The combination, in an ore-concentrator, of a screen having transverse riffle-bars, a perforated or reticulated metal base secured to a frame, transverse clamping-bars beneath such base, a bellows having walls or partitions upon its upper side coinciding with the riffle and clamping bars, forming chambers between the bellows and the riddle, and a valve in each chamber, the valve in any one chamber being weighted or constructed to require a different degree of force to raise it from that required by the other valves, substantially as set forth.

402,095. COMBINED HEAD-REST, CHIN-SUPPORT, AND EYE-CLOSER FOR CORPSES. FRANK MOHARTER, Nanticoke, Pa., assignor of four-fifths to Frank P. Grotzer, John J. Ditty, George W. Gruver, and Robert Schwartz, all of same place. Filed Aug. 21, 1888. Serial No. 283,231. (No model.)

Claim.—1. The combination, with a supporting-frame, of a head-rest, a chin-support, and an eye-closer, the latter consisting of a bar adapted to rest over the eye of a cadaver, substantially as described.

2. The combination, with a supporting-frame, of a head-rest and bars adapted to rest over the eyes of a cadaver, substantially as described.

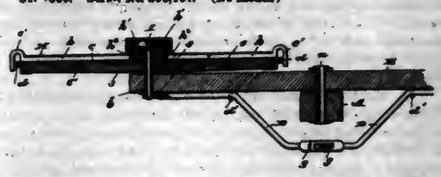
3. The combination, with a supporting-frame, of adjustable bars adapted to rest over the eyes of a cadaver, substantially as described.

4. The combination, with a head-rest, of a cross-bar, side bars adjustably fastened to said cross-bar, and a chin-support attached to said side bars, substantially as set forth.

5. The combination, with a head-rest, of a cross-bar, side bars adjustably fastened to said cross-bar, and eye-closers secured to said side bars, substantially as set forth.

6. The combination, with a shank, A, having an arm, A', of a cross-bar, E, slotted side bars, F, sliding on said cross-bar, thumb-screws G and I, and slotted eye-closers K, having holes *k'* and sliding on said side bars, substantially as set forth.

402,096. RATCHET-DRILL. WILLIAM G. MORGAN, St. Louis, Mo. Filed June 11, 1888. Serial No. 276,753. (No model.)



Claim.—1. A ratchet-drill composed of an outside casing, A, provided with a fulcrum-rest in its interior portion to engage the arm B, the arm B, having pawls *d d*, engaging ratchet-wheels *c c*, two ratchet-wheels, *c c*, handles $H' H^2$, shaft N, adapted to hold the drill at one end and containing a thread at the other, shank M, and band *b*.

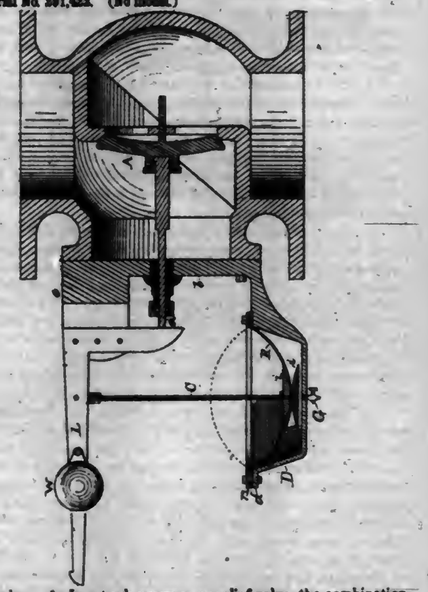
2. In a ratchet-drill, an arm, B, fulcrumed in a casing, A, and having a circular recess on each side of said fulcrum for the reception and retention of pawls *d d*, in combination with a ratchet-wheel and casing, substantially as described.

3. In a ratchet-drill, the combination of two ratchet-wheels, one larger than the other, fixed to a drill-shank, an arm fulcrumed between two pawls held and operated by said arm and engaging the ratchet-wheels, and a casing inclosing said ratchet-wheels, pawls, and arm, substantially as described.

402,097. HORSE-DETACHER. WHEELER M. MORRISON, Tower Hill, Ill., assignor of one-half to David O. Miller, same place. Filed Jan. 31, 1889. Serial No. 298,167. (No model.)

Claim.—1. In a horse-detacher, the combination, substantially as described, of the whiffletrees and singletree connected by hollow bolts, hooked bars A, mounted to slide on the whiffletrees and provided at their inner ends with inclines, rods I, seated loosely in the hollow bolts and engaging directly with the inclines of the hooked bars, levers D, fulcrumed on the singletree and connected at their outer ends with the rods I, and a device connected with the inner ends of the levers to operate them simultaneously.

2. In a horse-detacher, the combination, substantially as described, of the whiffletrees and singletree connected by hollow bolts, hooked bars A, mounted to slide on the whiffletrees and provided at their inner ends with inclines, rods I, seated loosely in the hollow bolts and engaging directly with the inclines of the hooked bars, levers D, fulcrumed on the singletree and connected at their outer ends to the rods I, and a lever connected at one end to the slotted inner ends of levers D.

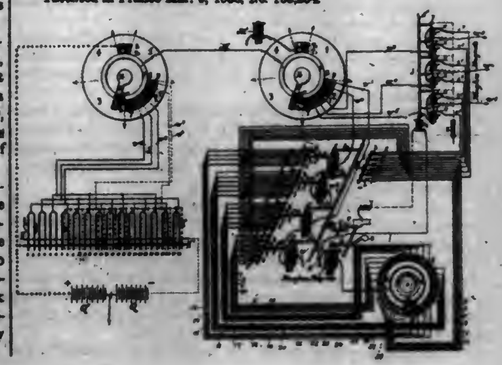


3. The combination, with the singletree and whiffletrees constructed and arranged as described, of hooked bars mounted to slide in the grooves of the whiffletrees and having at their inner ends upwardly-projecting inclined or beveled webs, rods I, seated between the inner ends of said hooked bars and provided with T-heads beveled to correspond to the bevel of the webs, levers D, fulcrumed on the singletree and connected at their outer ends to the rods I, and a bell-crank lever fulcrumed on the tongue and having its forward end in engagement with the slots at the inner ends of said levers D, substantially as set forth.

4. The combination, with a singletree constructed substantially as shown and provided with a longitudinal recess, of the sliding bars A, having upwardly-projecting inner ends which are beveled, notches A^3, which engage with the covering-plates H, and springs *s*, substantially as shown, and for the purpose set forth.

5. The combination, with a singletree, of the T-headed rod I, sliding bars A, said bars having their inner ends inclined and extended upwardly, plates *i i*, attached to the upwardly-extended portions of the bars A, so as to lie over the upper portion of the T-headed rod, substantially as shown.

6. The combination, with the singletree provided with a longitudinal recess and sliding bars A, of covering-plates H and a box, G, having downwardly-extended members A^2 A^3, which are adapted to embrace the singletree to retain said box in position, substantially as shown.



402,098. RELIEF-VALVE. FREDERICK T. MUELLER, New York, N. Y., assignor to Timothy Kisley, same place. Filed Nov. 21, 1888. Serial No. 291,422. (No model.)

Claim.—1. In a back-pressure or relief valve, the combination of the valve-lever with a dish-shaped vessel closed at the bottom and having its top hermetically covered by a flexible diaphragm of rubber or other suitable material, said diaphragm being connected with the lever by a rod one end of which is attached to the center of the diaphragm and the other to the lever, substantially as described.

2. In combination with the valve A and its lever L, the vessel D, covered by a flexible diaphragm, R, the rod C, connecting the diaphragm with the lever, and the cock G, substantially as and for the purpose set forth.

402,099. PRINTING-TELEGRAPH SYSTEM. CLAUDE J. A. MUSIER, Paris, France. Filed Oct. 27, 1888. Serial No. 289,352. (No model.) Patented in France Mar. 9, 1888, No. 189,254.

Claim.—1. The system of transmitting messages by telegraphic printers, characterized by the combination, with an electro-magnetic printer, of a collector having contacts corresponding to the different characters, and a traveling contact-maker for completing the circuit from the different contacts to the printer-maguet, a printing-battery or electrical generator, a series of branches and sub-branches over which the current to operate said printer-maguet is sent, the sub-branches being connected with the respective contacts of said collector, and electro-magnetic circuit-changers in the branches and sub-branches for establishing the connection of said branches collectively with individual groups of said sub-branches and of the individual branches with the printing-battery, so that the printing of a character is effected over a selected group of sub-branches and a selected branch and sub-branch in the selected group, substantially as described.

2. The combination of electro-magnetic multiple-circuit controllers, relays, branches connected with the circuit-changers of said relays, and groups of sub-branches connected with the said branches and with the circuit-changers of the multiple circuit-controllers, so that by operation of said circuit-controllers the branches are completed through a set of sub-branches, and by the operation of the relays a circuit is established through an individual branch and sub-branch in the selected group, substantially as described.

3. The combination of the line-wire, a distributer having two sets of contacts, the electro-magnetic multiple-circuit controllers having their magnets electrically connected with one set of said contacts, the relays having their magnets electrically connected with the other set of contacts, the branches connected with the circuit-changers of said relays, and the sub-branches connected with the said branches and with the circuit-changers of the said multiple-circuit controllers, substantially as described.

4. The combination of a line-wire, a distributer electrically connected with the line-wire and having two sets of contacts, the electro-magnetic multiple-circuit controllers having their magnets electrically connected with one set of distributing-contacts, the relays having their magnets electrically connected with another set of distributing-contacts, the branches connected with the circuit-changers of said relays, the sub-branches connected with the said branches and with the circuit-changers of said circuit-controllers, the collector having its contacts connected with the sub-branches, and the printing-magnet in circuit with said collector, substantially as described.

5. The combination, with the line-wire, the distributers connected therewith at a transmitting and a receiving station and having two sets of contacts, and a battery or electrical generator and circuit-closers for sending currents to line through the distributer at the transmitting-station, of the following apparatus at the receiving-station, namely: electro-magnetic multiple-circuit controllers having their magnets electrically connected with one set of contacts of the distributer, relays having their magnets electrically connected with another set of contacts, branches connected with the circuit-changers of the relays, and sub-branches connected with the branches and by groups with the multiple-circuit changers of the multiple-controllers, substantially as described.

6. The combination, with the line-wire, the distributers connected therewith at transmitting and receiving stations and having two sets of contacts, and a battery or electrical generator and circuit-closers for sending currents to line through the distributer at the transmitting-station, of the following apparatus at the receiving-station, namely: electro-magnetic multiple-circuit controllers having their electro-magnets connected with one set of the distributer-contacts, relays having their magnets electrically connected with another set of contacts, branches connected with circuit-changers of the relays, sub-branches connected by groups with the circuit-changers of the multiple-circuit controllers, the collector having contacts connected with the sub-branches, and the printer-magnet in circuit with said collector, substantially as described.

7. The combination, with the relays, multiple-circuit controller, branches, sub-branches, collector, and printing-magnet, of the replacers for the relay-armatures and for the multiple-circuit controllers, substantially as described.

8. The combination, with the branches and sub-branches, of a normally-closed multiple-circuit controller in one group of sub-branches, a normally-open circuit-controller in another, and an electro-magnet which opens the first when it closes the second of said multiple-circuit controllers, substantially as described.

9. The collector turning synchronously with a type-wheel and composed of, first, a solid contact-ring which is electrically connected with the electro-magnet of a Hughes printer; second, a ring divided into separate contacts corresponding to the characters on the type-wheel, which contacts are connected in circuit with circuit-changers; third, two brushes passing over the rings for successively connecting each contact in the divided ring with the printer-magnet, and, fourth, a carrier for said brushes, substantially as described.

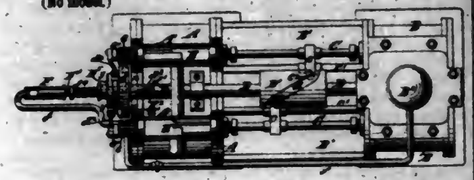
10. The distributer divided into sectors equal in number to the transmitting key-boards which it is desired to employ at one time on same line-wire, and composed of a solid ring connected with the line, two others similarly divided into separate contacts and provided for each sector with seven divisions, the first two divisions of the outside sector being electrically connected with the electro-magnets of the multiple-circuit controllers, the next division with the earth, the next three divisions with the electro-magnets of the relays, and the last of the seven divisions with the earth, so that an earth-contact is interposed between the contacts for the multiple-circuit controllers and the relay-contacts, and the interior divided sector having its first two divisions connected with the circuit-closers of the transmitting key-board for operating the multiple-circuit controllers, and three succeeding divisions connected with the circuit-closers of the transmitting key-board for operating the relays, substantially as described.

11. The relays formed by six polarized magnets connected in pairs, of opposite polarity, with different contacts of the distributer and having their armatures arranged to close a local circuit when they move away from their magnets, in combination with the replacer, its magnets included in circuit with a local battery, and the printing-lever, the branches controlled by said relays being connected each with one of the circuit-changers in each of the multiple-circuit controllers, substantially as described.

12. The electro-magnetic multiple-circuit controllers composed of, first, four polarized electro-magnets connected in pairs of opposite polarity; second, an armature-lever for each magnet; third, a bar carried by each of said levers, and, fourth, a series of six circuit-changers operated simultaneously by the respective bars of the first three electro-magnets and four circuit-changers by that of the fourth; fifth, the rock-shaft having arms above other armatures of said magnets and on the opposite side two arms; sixth, a bar carried by one of the last-mentioned arms, the other arm being acted on by the printing mechanism, and, seventh, six circuit-changers operated simultaneously by the last-mentioned bar to open their circuits when any of the other groups of circuit-changers are operated by their magnets to close their said circuits, the said circuit-changers being connected with the contacts of the collector, substantially as described.

13. In combination with the distributer and line-batteries, the key-board provided with two strips and two series of circuit-closers, one strip being connected with the positive pole of one line-battery and the other strip with the negative pole of another line-battery, and half the circuit-closers in each series making contact with one of said strips and the other half said circuit-closers making contact with the other strip, and wires extending from the distributer-contacts and each connected with a number of positive and a number of negative circuit-closers, substantially as described.

14. The combination, with a distributer having two sets of contacts and a traveling contact-maker, of a series of circuit-closers arranged in groups and having one circuit-closer in each group connected with a contact of one set, and a second series of circuit-closers associated each with a circuit-controller of the first series and connected in groups with the contacts of the other set, substantially as described.

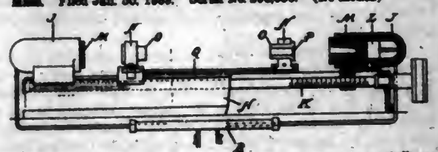


15. The combination, with a line and distributers on said line at transmitting and receiving stations, said distributers having synchronously-traveling contact-makers and being each provided with two sets of contacts, of a key-board provided with a series of circuit-closers arranged in groups and having one circuit-closer in each group connected on the transmitting-distributer with a contact of one set, and a second series of circuit-closers associated each with a circuit-controller of the first-mentioned series and connected on the transmitting-distributer in groups with the contacts of the other set, and the following receiving apparatus, namely: electro-magnetic multiple-circuit controllers having the magnets connected on the receiving-distributer with the contacts of the set corresponding to the last-mentioned series of circuit-closers, relays connected on the receiving-distributer with contacts of the set corresponding to the first-mentioned series of circuit-closers, branches controlled by said relays, sub-branches controlled in groups by the multiple-circuit controllers, the collector having contacts connected with said sub-branches, and the printing-magnet in circuit with collector, substantially as described.

16. The combination of the polarized relays connected in pairs of opposite polarity, the electro-magnetic multiple-circuit controllers having polarized magnets connected in pairs of opposite polarity, the branches connected with the circuit-changers of the relays, and the sub-branches connected with the branches and the circuit-changers of the multiple-circuit controllers, substantially as described.

17. The combination, with the line-wire and the distributer having two sets of contacts, of the polarized relays connected in pairs of opposite polarity with the distributer-contacts of one set, the electro-magnetic multiple-circuit controllers having polarized magnets connected in pairs of opposite polarity with the distributer-contacts of the other set, the branches connected with the circuit-changers of the said relays, the sub-branches connected with the branches and the

circuit-changers of the said multiple-circuit controllers, and the collector having a series of contacts connected with the sub-branches, substantially as described.

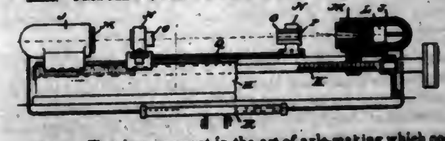


402,100. VALVE-GEAR FOR DUPLEX STEAM-PUMPS. NATHAN E. HAMM, Stonington, Conn. Filed Dec. 1, 1887. Serial No. 256,693. (No model.)

Claim.—1. In a duplex pump, the combination, with the steam-cylinders and rocking valves having their axes lengthwise of the cylinders, of a shaft extending parallel with and between the piston-rods and provided with eccentrics connected with the valve-stems for operating them, a cam upon said shaft having an endless groove formed obliquely or spirally thereon, and arms on the piston-rods having pins or rolls engaging the groove of the cam and imparting rotary motion thereto from the reciprocating movement of the piston-rods, substantially as herein described.

2. The combination, with the steam and water cylinders and steam-valves of a duplex pump, of a rotary shaft receiving motion from the piston-rods of the pump, a head or disk secured to said shaft and carrying a slide movable diametrically across it, eccentrics on the slide and having their straps connected with the steam-valves for operating them, a sleeve turning with the shaft and having a spiral slot, a regulating-cylinder connected by a pipe with a pressure-space of the pump, a plunger or piston fitting the cylinder and having upon its rod a tooth or projection locking the sleeve to the shaft by engaging said spiral slot, and a connection between said slide and sleeve, whereby the lengthwise movement of the regulating-plunger or piston-rod will turn the sleeve relatively to the shaft and shift the slide to vary the throw of the eccentrics, substantially as herein described.

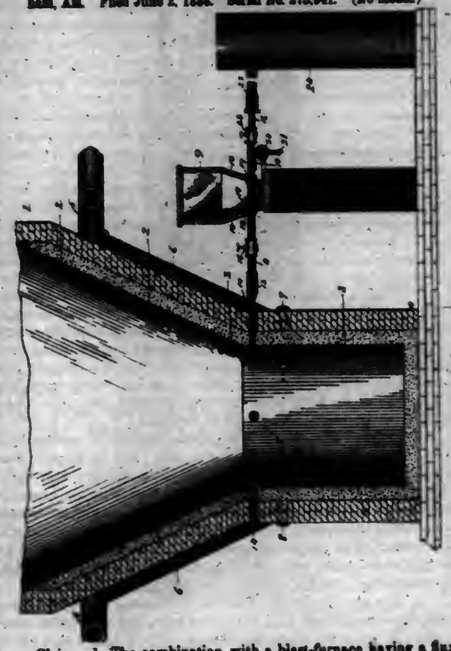
402,101. MACHINE FOR MAKING AXLES. ANDREW PATERSON, McKeesport, Pa., assignor to the National Tube Works Company, Boston, Mass. Filed Jan. 20, 1888. Serial No. 296,056. (No model.)



Claim.—1. In axle machinery, the combination, substantially as set forth, of a press-bed, a pair of chucks adjustable thereon and adapted to closely fit and clamp the body of an axle, a pair of hydraulic-press cylinders fitted for sliding motion on the ends of said bed, mechanism arranged to cause said cylinders to approach or recede from each other and said chucks, and a die in each cylinder having a cavity adapted to fit the spindle of the axle.

2. In axle machinery, the combination, substantially as set forth, of a press-bed, a pair of hydraulic-press cylinders fitted to slide thereon, mechanism for sliding said cylinders, a die in each cylinder, a pair of chucks fitted to slide on the press-bed between the two cylinders and adapted to grasp the body of an axle, and a removable distance-piece supported by the press-bed between the two chucks.

3. In axle machinery, the combination, substantially as set forth, of a pair of heaters, a set of rolls at each heater adapted to support an axle with its ends over the heaters, and a pulley for giving rotary motion to one of said rolls.



4. In axle machinery, the combination, substantially as set forth, of a pair of heaters, a set of axle-supporting rolls at each heater, a press-bed arranged parallel to said pair of heaters, a pair of chucks adapted to grasp the body of an axle, a track leading from said rolls to said chucks, and a press-cylinder at each end of said press-bed.

402,102. METHOD OF MAKING AXLES. ANDREW PATERSON, McKeesport, Pa., assignor to the National Tube Works Company, Boston, Mass. Filed Jan. 20, 1888. Serial No. 296,057. (No model.)

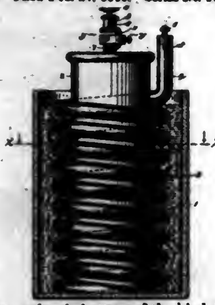
Claim.—That improvement in the art of axle-making which consists of the following steps, viz: forming the axle preliminarily with a surplus of length between the spindles, heating the preliminarily-formed axle at the necessary points, grasping the body of the axle at two points corresponding with the rear of the collars, grasping the entire spindle portions, and forcing the spindle portions toward the body portion, substantially as and for the purpose set forth.

402,103. FLUX-FEEDER FOR BLAST-FURNACES. NATHANIEL A. PRATT, Atlanta, Ga., assignor to the Pratt Steel Company, Birmingham, Ala. Filed June 2, 1888. Serial No. 275,941. (No model.)

Claim.—1. The combination, with a blast-furnace having a flux-nozzle, of a flux-hopper, a discharge-pipe having a sliding coupling thereon adapted to enter said nozzle, an injector-pipe which is movably inserted within said hopper and arranged with its inner end opposite the inner end of said discharge-pipe, and devices for longitudinally adjusting said injector-pipe, substantially as described.

2. The combination, with a blast-furnace having a flux-nozzle, of a flux-hopper, a discharge-pipe having a funnel-shaped inner end within said hopper and a sliding coupling on its outer end, and an injector-pipe having a conical mouth-piece arranged opposite the funnel-shaped inner end of said discharge-pipe, substantially as described.

3. The combination, with a blast-furnace, of a flux-hopper, a discharge-pipe which is adapted to enter said furnace, and which is provided with a funnel-shaped inner end within said hopper, a movable injector-pipe having a conical mouth-piece which is adapted to project into said funnel-shaped end of the discharge-pipe, and provided with a cogged rack, a pinion meshing with said rack, and a handle for revolving said pinion, substantially as described.



4. The combination, with a blast-furnace, of a flux-hopper provided with a stuffing-box on one side, a discharge-pipe which is formed with a funnel-shaped inner end within said hopper diametrically opposite said stuffing-box, an injector-pipe which slides through said stuffing-box, and which is provided with a conical inner end or mouth-piece and with a rack and stop-cock outside of said hopper, a pinion meshing with said rack and provided with a handle for revolving it, and a blast-conveying pipe which has the end of said injector-pipe sliding inside of its packed end, substantially as described.

5. The combination, with a blast-furnace having a flux-nozzle in the wall thereof, of a flux-hopper, a discharge-pipe formed with a funnel-shaped inner end within said hopper, and having a slidable coupling upon its outer end which is adapted to enter said flux-nozzle, and an injector-pipe entering said hopper opposite the funnel-shaped end of said discharge-pipe and adapted to project into the same, substantially as described.

6. The combination, with a blast-furnace, 1, having a flux-nozzle, 14, in the wall thereof, of a flux-hopper, 9, a discharge-pipe, 11, provided with a funnel-shaped inner end, 12, and with a stop-cock, 15, a sliding coupling, 13, upon said pipe, a sliding injector-pipe, 16, pro-

vided with a conical inner end, 18, a rack, 19, and stop-cock 22, a pinion, 20, provided with a handle, 21, and meshing with said rack, a blast-conveying pipe, 23, having the end of said injector-pipe sliding in its packed end, and a suitable compressed-air supply, substantially as described.

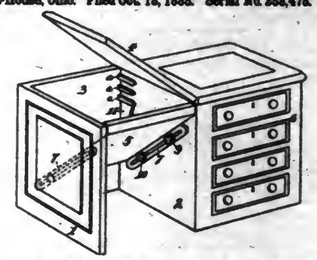
402,104. GALVANIC BATTERY. ROBERT J. PRATT, Greenbush Heights, N. Y., assignor to the Water Primary Battery Company, Jersey City, N. J. Filed Feb. 27, 1889. Serial No. 301,365. (No model.)

Claim.—1. In a galvanic battery of the kind described, the combination, with the compartment 1, of the porous cell 2 and its negative electrode, and a positive electrode consisting of a spirally-wound cylindrical bar of wrought-iron resting upon the bottom of the compartment 1 and encompassing the porous cell, the convolutions of said spiral being separated from each other by an intervening space, and the interior of the spiral being also separated from the porous cell by an intervening space, substantially as described.

2. In a galvanic battery of the kind described, the combination, with the compartment 1, of the porous cell 2 and its negative electrode, and a positive electrode consisting of a spirally-wound cylindrical bar of wrought-iron resting upon the bottom of the compartment 1 and encompassing the porous cell, the convolutions of said spiral being separated from each other by an intervening space, and the interior of the spiral being also separated from the porous cell by an intervening space, said spiral terminating in an upright projection, 4, constituting a binding-post therefor, substantially as described.

3. In a galvanic battery of the kind described, the combination, with the compartment 1, of the porous cell 2 and its negative electrode, and a positive electrode consisting of a spirally-wound bar of wrought-iron encompassing the porous cell, the convolutions of said spiral being separated from each other by an intervening space, and the interior of the spiral being also separated from the porous cell by an intervening space, substantially as described.

4. In a galvanic battery, the combination, with the negative electrode, of a rectangular frame, 12, of conducting material, provided with an offset, 15, faced with platinum, a clamping-screw, 14, and a binding-post, 8, having a leg, 11, faced with platinum, substantially as described.



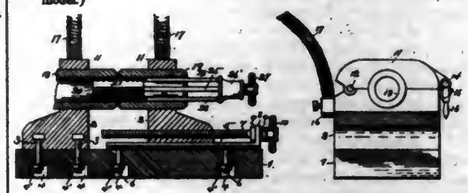
402,105. PITMAN. PHILIP R. PULLIAM, Omaha, Nebr., assignor to Elmer S. Dundy, Jr., same place. Filed Sept. 24, 1888. Serial No. 286,195. (No model.)

Claim.—1. The combination of the bracket having the transverse opening and the openings G H, communicating with opposite sides thereof, the spherical block having the trunnion on one side engaging the opening G and provided on the opposite side with the opening I, registering with opening H, said block being further provided with the transverse tapering opening, the bolt K, screwed in opening H, and having its inner end engaging opening I, for the purpose set forth, and the pitman having the tapered bearing at one end journaled in the tapered opening of the block, substantially as described.

2. The combination of the bracket, the block pivoted therein, the axis of said block being longitudinal in said bracket, the pitman having the tapered bearing at one end fitted in a transverse tapered opening in the block, and the clamping-bolt extending through said bearing having the head bearing against one side of the block and the clamping-nut bearing against the opposite side of the pitman, for the purpose set forth, substantially as described.

402,106. TYPE-WRITER CASE. HARRY D. PURSELL, Washington Court-House, Ohio. Filed Oct. 18, 1888. Serial No. 288,478. (No model.)

Claim.—1. A type-writer case comprising the opposite side walls, the rear wall, an opening and closing lid, the lengthwise-adjustable inclined cleats at the sides below the lid, the type-writer platform adapted to slide up and down on the cleats and to rest upon the upper ends of the latter and be adjusted to different heights thereby, and rear supports for the platform, substantially as described.



2. A type-writer case having at its opposite sides the lengthwise-adjustable inclined cleats, a type-writer platform adapted to slide up and down on the cleats and to be adjusted to different heights by the latter, rear supports for the platform, and a curved guide fixed in the rear of the case, and against which the inner edge of the platform bears to direct the latter in its descending movement, substantially as described.

3. A type-writer case comprising the side and rear walls, the lengthwise-adjustable inclined cleats on the side walls, the series of stationary cleats at the rear of the case, the rear supporting-ledge below the stationary cleats, and the type-writer platform adapted to slide up and down upon the inclined cleats and be adjustably supported in a horizontal position by the stationary cleats and the upper ends of the adjustable cleats, substantially as described.

4. A type-writer case having an opening and closing lid, 4, the lengthwise-adjustable inclined cleats 7 at the opposite sides, the type-writer platform 5, adapted to slide up and down on the cleats, adjustable thereby to different heights and provided at its outer edge with the flange 13, to form a dust-tight bearing for the lid, rear supports for the platform, and the rear ledge, 12, for supporting the inner edge of the platform when depressed within the case, substantially as described.

5. A type-writer case having an opening and closing lid, 4, the lengthwise-adjustable inclined cleats 7 at the opposite sides, the stationary cleats *a* in the rear top portion, the type-writer platform 5, adapted to slide up and down on the inclined cleats and having the flange 13 at its outer edge to form a dust-tight bearing for the lid, the rear guide, 11, against which the inner edge of the platform bears in its descent, and the rear ledge, 12, below the guide, for supporting the inner edge of the platform, substantially as described.

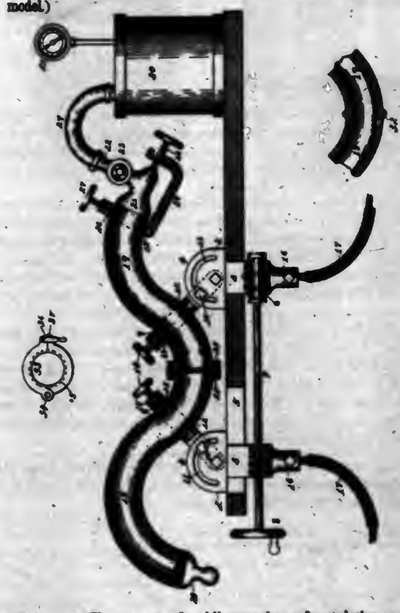
402,107. PROCESS OF WELDING TOGETHER SECTIONS OF PIPE BY ELECTRICITY. ELIAS R. RIES, Baltimore, Md., assignor to Ries & Henderson. Filed Feb. 12, 1889. Serial No. 299,572. (No model.)

Claim.—1. The process of welding together sections of metal pipe or other hollow metallic articles, consisting in backing the interior of the sections about the contiguous ends by means of an unyielding core, and then raising the said ends to a welding heat by means of a current of electricity and upsetting the plastic metal to complete the weld, substantially as described.

2. The process of welding together sections of metal pipe or other hollow metallic articles, consisting in introducing a core within the sections, then raising their contiguous ends to a welding heat by the action of a current of electricity, and then forcing the sections together to complete the weld, substantially as described.

3. The process of welding together sections of metal pipe or other hollow metallic articles, consisting in raising the contiguous ends of the sections to a welding heat by the action of a current of electricity and then upsetting the said ends in the presence of an unyielding internal medium, whereby the upset metal is forced to the exterior of the pipe, substantially as described.

4. The process of welding together sections of metal pipe or other hollow metallic articles, consisting in raising their contiguous ends to a welding heat by the action of a current of electricity and in the presence of an unyielding core, and then upsetting the said ends and circumscribing and limiting the protuberance of the metal on the exterior of the sections, substantially as described.



5. The process of welding together sections of metal pipe or other hollow metallic articles, consisting in reducing the mass or thickness of the edges to be welded to increase their electrical resistance, then placing the sections with the reduced edges in contact, then introducing a removable core of electrically non-conducting material within the sections, and then raising the ends of the sections to a welding heat by a current of electricity and forcing the said ends together to upset the fused metal and complete the weld, substantially as described.

6. The process of welding together sections of metal pipe or other hollow metallic articles, consisting in reducing the mass or thickness of the edges to be welded to increase their electrical resistance, then placing the sections with the reduced ends in contact, then introducing a removable core of electrically non-conducting material within the sections, then raising their contiguous ends to a welding heat by the action of a current of electricity, and upsetting the plastic metal and circumscribing and limiting the protuberance thereof on the exterior of the sections, substantially as described.

7. The process of welding together sections of metal pipe or other hollow metallic articles, consisting in raising their contiguous ends to a welding heat by the action of a current of electricity in the presence of an unyielding core, then upsetting the said ends, whereby the upset metal is forced to the exterior of the pipe, and then condensing the upset portion by external pressure or hammering, substantially as described.

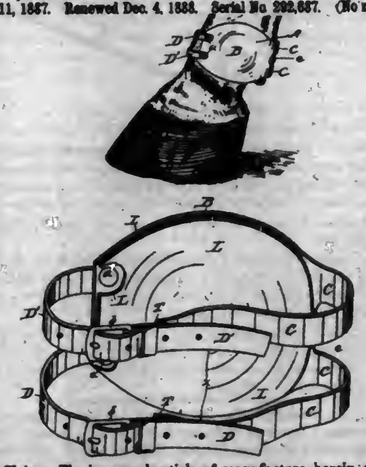
8. The process of forming continuous lines of pipe, consisting in electrically welding together one section after the other of such pipe in the presence of an unyielding removable core at the lines of juncture, whereby the upset metal is forced to the exterior of the pipe, substantially as described.

402,108. PROCESS OF WELDING TOGETHER SECTIONS OF PIPE BY ELECTRICITY. ELIAS R. RIES, Baltimore, Md., assignor to Ries & Henderson. Filed Feb. 12, 1889. Serial No. 299,573. (No model.)

Claim.—1. The process of welding sections of metal pipe or other hollow metallic articles, consisting in heating their contiguous ends to a welding heat by the action of an electric current in the presence of a fluid-pressure within the said sections, substantially as described.

2. The process of welding together sections of metal pipe or other hollow articles, consisting in raising their contiguous ends to a welding heat by the passage through the same of a current of electricity, and then forcing the ends of the sections together and simultaneously therewith applying an internal fluid-pressure, substantially as described.

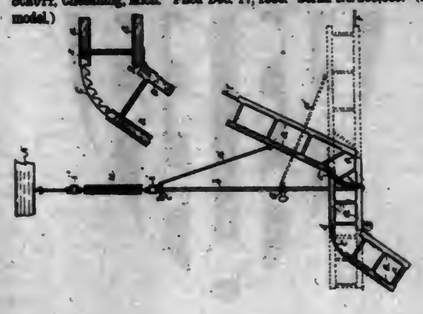
3. The process of welding together sections of metal pipe or other hollow metallic articles, consisting in subjecting their contiguous ends to the action of a heating-current of electricity until an initial fusion or weld hermetically closing the seam is produced, then applying an internal fluid-pressure at the said ends, and simultaneously therewith forcing the sections against each other, whereby the weld is finished and the formation of an internal burr is prevented, substantially as described.



4. The process of welding together sections of metal pipe or other hollow articles, consisting in first reducing the mass or thickness of the ends to be welded, then placing said ends in contact with each other, then subjecting them to the action of a heating-current of electricity until an initial weld hermetically sealing the seam is produced, and finally completing the weld while applying an internal fluid-pressure, substantially as described.

5. The process of welding together sections of metal pipe or other hollow metallic articles, consisting in subjecting the contiguous ends of the sections to the action of a welding current of electricity in the presence of an internal fluid-pressure, and circumscribing or limiting the protuberance of metal thus formed on the exterior of the seam, substantially as described.

6. The process of welding together sections of metal pipe or other hollow metallic articles, consisting in raising the ends of the sections to be joined to a welding heat by the passage of a current of electricity, then upsetting the joined ends by a longitudinal pressure, and simultaneously therewith forcing the upset metal to the exterior of the pipe by internal gas-pressure, substantially as described.

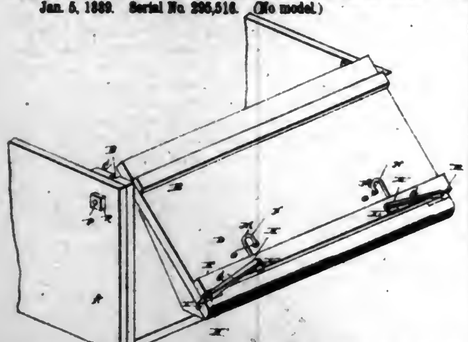


7. The process of welding together sections of metal pipe or other hollow metallic articles, consisting in subjecting their contiguous ends to the action of a welding current of electricity in the presence of a pressure of oxygen gas within the said sections, substantially as described.

402,109. HORSE-BOOT. JOHN J. RYAN, Midland, Mich. Filed Apr. 11, 1887. Renewed Dec. 4, 1888. Serial No. 292,657. (No model.)

Claim.—The improved article of manufacture herein described as an entirety, consisting of a metal plate of concavo-convex form, having formed integral with it the two narrow spring-metal straps, having an opening, *c*, between them to admit the joint of the ankle, the buckles *b* at the ends of said straps, the leather straps D D′, opposite said metal straps, and a suitable lining, L, upon the inner face of the concavo-convex plate, as specified.

402,110. CONVERTIBLE SUSPENDING CHAIR. MARTIN H. SCHUTT, Chesaning, Mich. Filed Dec. 17, 1888. Serial No. 293,885. (No model.)



Claim.—1. The convertible suspending chair comprising the pendent rods, the central section supported by said rods, the front section attached to the center section by hinges at the lower side and the projections and notched bars at the upper side, the rear section hinged to the center section, the collars with set-screws on the vertical rods, and the oblique rods jointedly attached to said collars and the rear section, substantially as set forth.

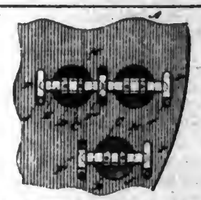
2. The chair-sections hinged together, the pendent rods supporting the center section, the sliding collars on said rods and their set-screws, the rods jointedly attached to said collars and to the rear sections, and springs elastically suspending the whole, substantially as set forth.

3. The combination of the convertible chair-sections hinged together, the upper cross-pieces, the series of vertical springs between the cross-pieces and attached thereto at their ends, the pendent rods attached to the lower cross-piece and suspending the center section, the sliding collars on said rods and their set-screws, and the oblique rods jointedly attached to the collars and to the rear section of the chair, substantially as set forth.

402,111. END-GATE. ABRAHAM H. STARK, Belleville, Kans. Filed Jan. 5, 1889. Serial No. 295,516. (No model.)

Claim.—1. The combination, with the wagon-bed having the vertical slots or grooves B and bolts P at the upper ends thereof, of the end-gate having the hooks G near its lower side to engage the slots B, the frames or castings secured to the upper side of the end-gate, and keepers Y therein adapted to engage the bolts P, substantially as described.

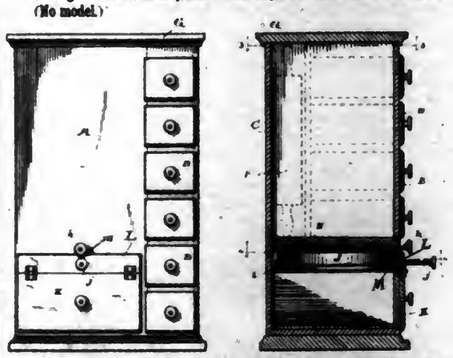
2. The combination, with the end-gate, of the hooks G, pivoted thereto and adapted to engage the wagon-bed, and having the arms K and bent ends or handles L, and the pins or keys N, for the purpose set forth, substantially as described.



3. The frames or castings adapted to be secured to an end-gate and pivot the same to the wagon-bed, and having the ears V, and the keepers Y, with arms A′, adapted to slide in aligned openings in the said ears, substantially as described.

402,112. GAME-BOARD. SYLVESTER T. F. STERRIS, Gaithersburg, Md., assignor of two-thirds to Michael V. Tierney and Leonard C. Wood, Washington, D. C. Filed Sept. 19, 1888. Serial No. 285,798. (No model.)

Claim.—1. A game-board consisting of a board having a series of port-holes therein, a series of detachable ports in said holes, springs attached to said ports, their ends extending beyond the same, and fastenings on the board in which said ends of the springs are placed, substantially as described.

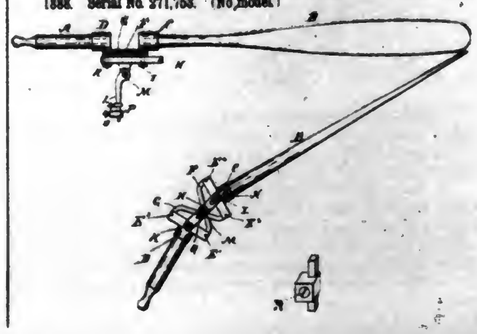


402,112.

2. A game-board consisting of a board having a series of port-holes therein with inclined walls, a series of ports in said holes having oppositely-inclined edges, flat springs on the ports, and fastenings on the board fitting over the projecting ends of said springs for detachably retaining them in place, having their ends projecting beyond the same, substantially as described.

3. A game-board consisting of a board having a series of openings formed therein and ports in the openings, springs secured on the rear sides of the ports and extending beyond the edges of the same on both sides thereof, and cleats and buttons placed, respectively, on opposite sides of the openings, fitting over to detachably retain the springs in place, substantially as described.

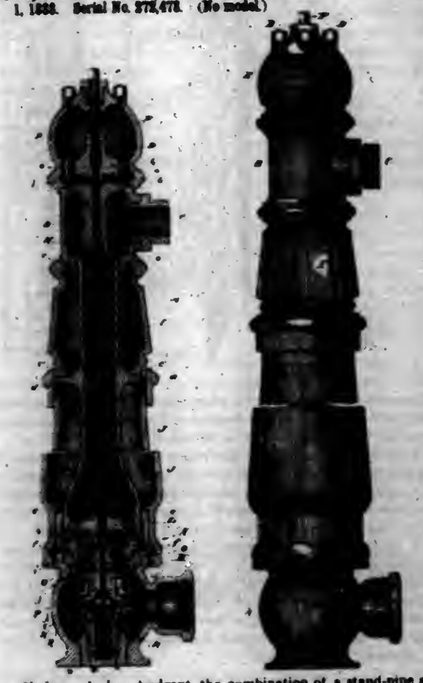
402,113. KITCHEN-CABINET AND FLOUR-CHEST. JOHN W. STOUT and ALBERT COLMAN, St. Lawrence, Dak., assignors of one-third to Eugene Baker, same place. Filed Sept. 22, 1888. Serial No. 286,072. (No model.)



Claim.—1. In a kitchen-cabinet the combination of a flour-chest, a sieve removably supported below the flour-chest, a removable receptacle for the sifted flour located below the sieve, said receptacle having a flap hinged thereto for closing the front portion of the sieve-chamber, substantially as described.

2. In a kitchen-cabinet, the combination of a flour-chest, a movable sieve removably supported below the flour-chest, having a handle attached thereto extending to the outside of the cabinet, a removable receptacle for the sifted flour located below the sieve and having a flap hinged thereto for closing the front portion of the sieve-chamber, said flap being provided with a suitable notch, whereby the flap may be closed around said handle, substantially as described.

3. The herein-described kitchen-cabinet, comprising the following parts: a flour-chest, a series of drawers arranged one above the other beside the flour-chest, a vertical compartment in rear of said drawers for the reception of a rolling-pin, a removable sieve beneath the flour-chest, and a removable receptacle beneath the sieve for the sifted flour, having a hinged flap adapted to close the sieve-chamber, all substantially as shown and described.



402,114. BOW-FACING OAR. STEPHEN R. SWEET, Lima, Ohio, assignor of two-thirds to William Ackerman, same place. Filed Apr. 24, 1888. Serial No. 271,753. (No model.)

Claim.—1. The combination, with an oar made in two parts, of sockets for the reception of the inner ends of said parts, bars rigidly attached to said sockets at right angles to the oar, bent levers pivotally connecting the diagonal ends of said bars, and a pivotal shank connected to said sockets, substantially as described.

2. The combination of two sockets, an oar-handle in one socket, an oar-blade in the other socket, and a cross-bar rigidly attached to each socket, with bent levers pivotally connecting the diagonally-opposite ends of said cross-bars, and a slotted bar connected to said sockets and bearing, the shank or pin pivotally connected thereto, substantially as described.

402,115. HYDRANT. AARON J. TYLER, Albion, N. Y. Filed May 1, 1888. Serial No. 272,478. (No model.)

Claim.—1. In a hydrant, the combination of a stand-pipe and valves, a water-chamber, B, and a valve-rod with a vertically-guided valve, G, attached to the upper end of this valve-rod, so as to move with the same, a packing-ring, *b*, between the valve and head of said water-chamber and surrounding the valve-rod, a cap, E, bolted to the head of the water-chamber, and means for operating the valve-rod and valve, substantially as described.

2. In a hydrant, the combination, with a stand-pipe, water-chamber, valve-rod, cap, and vertical bolts D D for securing this cap to the head of the water-chamber, of a valve, G, attached to the upper end of the valve-rod and provided with lugs *a a*, adapted to embrace the vertical bolts D D, a packing-ring, *b*, and means for raising and lowering the said valve and rod, substantially as described.

3. In a hydrant, the combination of the stand-pipe having cast integral with it an external flange, *d*, a water-chamber screwed upon the upper end of the stand-pipe, and a jacket, I, provided with internal shoulders, *c c′*, formed integral with it, the said jacket forming a dead-air chamber around the stand-pipe above the ground-line and being clamped removably in place by simply screwing the said water-chamber to the stand-pipe, substantially as herein set forth.

4. The combination of the stand-pipe having screwed to its upper end a water-chamber and provided with an integral flange, *d*, a jacket, I, surrounding the stand-pipe above the ground-line and provided with an internal integral flange, *c′*, adapted to abut against the aforesaid flange *d*, the lower end of this jacket extending below the said flange *d* on the stand-pipe, an elbow detachably attached to the lower end of the stand-pipe, the lower end of the stand-pipe setting in the vertical arm of the said elbow, and an upwardly-tapering frost-case, J, provided with an internal shoulder, *e*, adapted to rest upon the upper end of the vertical arm of the elbow, the upper end of the said frost-case being inserted in the lower end of the said jacket I, all arranged as and for the purposes herein set forth.

5. The combination of the stand-pipe enlarged at its lower end, a ring, N, screwed into the lower enlarged end of the stand-pipe, the said ring being provided with a beveled seat for the waste-valve, and a beveled seat, *i*, for the main valve, this seat *i* being smaller than the waste-valve seat and formed on the interior of the said ring N, a valve-rod, a main valve, M, and a beveled waste-valve, L, mounted loosely upon the valve-rod and adapted to automatically close upon its seat when the main valve opens, waste-apertures *h* being formed through the stand-pipe and ring, substantially as herein described.

6. In a hydrant, the combination, with the stand-pipe and elbow, of the vertical valve-rod, an automatically-closing waste-valve mounted upon this valve-rod, a ring screwed into the lower end of the stand-pipe and provided with a seat, *i*, for the main valve, the main valve M, attached to lower end of valve-rod below the waste-valve, and the spider Q, attached to the lower end of valve-rod below the main valve, of the supplemental valve immediately below and larger than the said main valve, the said supplemental valve being provided with a central opening or recess for the reception of the said spider Q and the supplemental valve-seat, substantially as described.

7. In a hydrant, the combination, with the stand-pipe, elbow, and vertical valve-rod, of the automatically-closing waste-valve mounted loosely upon the valve-rod, ring N, screwed into the lower end of the stand-pipe and forming a seat for the waste-valve and main valve, the main valve attached to valve-rod, a spider, Q, attached to valve-rod below the main valve, a removable externally-screw-threaded ring, O, screwed into the elbow and forming a seat for the supplemental valve, and the spring-actuated supplemental valve immediately below the main valve and provided with a central opening or recess for the reception of the spider Q, substantially as described.

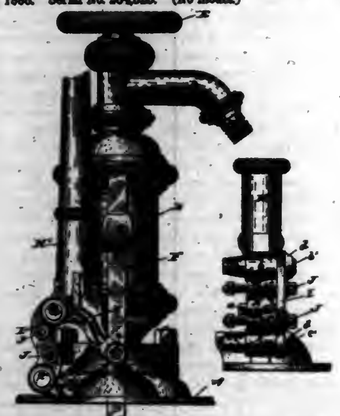
8. The combination of the stand-pipe, a ring, N, screwed into the lower end of the stand-pipe, this ring being externally screw-threaded and provided internally with two beveled seats, one for the waste-valve and the other for the main valve, a valve-rod, beveled waste and main valves on this rod and adapted to close on their respective seats, elbow K, a removable externally-screw-threaded ring, O, screwed into the said elbow, this ring forming a seat for the supplemental valve, and a spring-actuated supplemental valve adapted to close on the seat in the ring O, this supplemental valve being larger than the main valve and located in close proximity to it, substantially as and for the purposes herein set forth.

9. In a hydrant, the combination, with a stand-pipe, elbow, vertical valve-rod provided with a pin, *p*, waste-valve, main valve, seats for these valves, a supplemental valve, P, having a perforated tubular stem and a central opening through it, and a spring-actuated auxiliary valve, R, adapted to automatically close the said central opening in the supplemental valve and be forced open by the said pin *p*, substantially as described.

10. In a hydrant, the combination, with the stand-pipe enlarged at its lower end, of a ring screwed into the lower enlarged end of this stand-pipe, this ring being beveled on its interior to form a waste-valve seat and provided with lateral waste-apertures *h*, a valve-rod provided with a main valve, a seat for this main valve, and an open beveled waste-valve mounted loosely upon the said valve-rod and adapted to automatically seat itself on the said beveled valve-seat formed on the interior of the ring N and close the said waste-apertures, substantially as and for the purpose herein set forth.

11. In a hydrant, the combination, with the stand-pipe provided with a flange, *d*, and a water-chamber screwed to the upper end thereof, of the jacket I, provided with a flange, *c′*, said jacket surrounding the stand-pipe between the said water-chamber and the surface of the ground, substantially as described.

12. In a hydrant, the combination, with the stand-pipe and the jacket I, surrounding the upper portion of the same, of the upwardly-tapering frost-case J, having its upper end inserted in the lower end of the jacket I, and the elbow K, attached to the lower end of the stand-pipe and having its vertical arm inserted in the lower end of the frost-case, substantially as described.



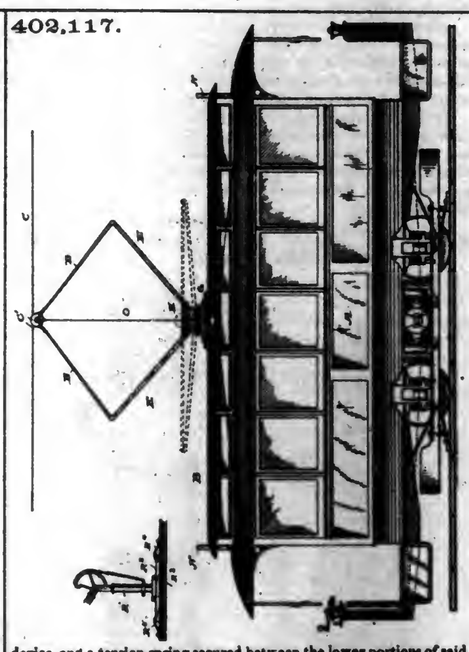
13. In a hydrant, the combination, with the stand-pipe and jacket I, of the elbow K, screwed to the lower end of the said stand-pipe, and the upwardly-tapering frost-case J, having its upper end inserted in the lower end of the said jacket I and its lower end surrounding the vertical arm of the elbow K, the said jacket being provided with an internal shoulder, *e*, which rests upon the upper end of the said vertical arm of the elbow, substantially as described.

14. In a hydrant, the combination, with the stand-pipe, valve-rod, a waste-valve, L, upon the valve-rod, and a main valve attached to the lower end of the said valve-rod, of the ring N, screwed into the lower end of the said stand-pipe and provided with seats for the main and waste valves, waste-apertures *h* being formed through the said seat N, between the two valves, substantially as described.

15. The combination of a stand-pipe, a valve-rod, a main valve upon this valve-rod, a supplemental valve located below the main valve and provided with a central opening, seats for these valves, an auxiliary valve, R, seated over the opening in the said supplemental valve, and a pin for opening the auxiliary valve, substantially as described.

16. The combination of a stand-pipe, a valve-rod, main and supplemental valves, the former being attached to the valve-rod, the said supplemental valve being located immediately below the main valve and provided with a central recess in its upper side, seats for these valves, and a spider or guide, Q, upon the valve-rod below the main valve, this spider being adapted to enter the recess in the upper side of the supplemental valve, as and for the purpose herein set forth.

402,116. PUMP-BRAKE. AARON J. TYLER, Albion, N. Y. Filed Sept. 4, 1888. Serial No. 284,585. (No model.)



Claim.—1. The combination of a pump-rod, a vibrating lever provided with an arm, this arm being pivotally connected to the pump-rod at its forward end and provided at its rear end with an integral enlargement having oppositely-projecting reduced pins, a support or base provided with an integral enlargement having oppositely-projecting reduced pins, the fulcrum-links connecting the pins on these enlargements, and connecting-bolts for holding these links upon the pins, substantially as set forth.

2. The combination of a pump-rod, a vibrating lever provided with an arm at its lower end, this arm being pivotally connected at its forward end to the pump-rod and having formed on its rear end an enlargement provided with oppositely-projecting pins, a support or base provided with an enlargement having oppositely-projecting pins, the fulcrum-links pivotally connecting the pins on the enlargements, these links being provided on their adjacent faces with abutting sleeves, and the connecting-bolts, substantially as described.

3. The combination, with a support or base provided with an enlargement having tapering pins projecting in opposite directions, of a pump-rod, an operating-lever provided with an arm pivotally connected to the pump-rod, an enlargement provided with oppositely-projecting tapering pins being carried by this arm, the fulcrum-links connecting these tapering pins, these links being provided with internally-tapered sleeves adapted to fit the said tapering pins, and the connecting-bolts, substantially as described.

4. The combination of a base provided with an enlargement, this enlargement being provided with oppositely-projecting tapering pins, a pump-rod, an operating-lever provided with an arm on its lower end, the forward end of this arm being pivoted to the pump-rod and its rear end being provided with oppositely-projecting tapering pins, fulcrum-links connecting the tapering pins on the handle with those on the base, these links being provided with internally-tapered sleeves *d d*, adapted to fit over the said tapering pins, and the connecting-bolts passing through the fulcrum-links, substantially as described.

402,117. UNIVERSAL UPWARD-PRESSURE CONTACT-ARM. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Feb. 19, 1889. Serial No. 300,396. (No model.)

Claim.—1. In electric railways, the combination, with the suspended supply-conductor and a moving vehicle, of a contact-carrying device suitably supported upon the vehicle and comprising extensible members pivotally connected at their upper ends and provided with a contact device, substantially as described.

2. In electric railways, the combination, with the suspended supply-conductor and a moving vehicle, of a contact-carrying device suitably supported upon the vehicle and comprising extensible members pivotally connected at their upper ends, and a contact-wheel upon the axis of said pivotal connection, substantially as described.

3. In electric railways, the combination, with the suspended supply-conductor and a moving vehicle, of a contact-carrying device suitably supported upon the vehicle and comprising extensible members pivotally connected at their upper ends and provided with a contact device, and a tension-spring secured between the lower portions of said members for inclining the members toward each other and elevating the contact device, substantially as described.

4. In electric railways, in combination with a suspended supply-conductor and a moving vehicle, a contact-carrying device between the same, comprising extensible members pivotally connected at their upper ends and having a contact-wheel thereon, said members being suitably supported upon the vehicle, substantially as described.

5. In electric railways, in combination with a suspended supply-conductor and a moving vehicle, a contact-carrying device between the same, comprising extensible members supported by the car and pivoted together at their upper ends, and having a contact-wheel thereon and a spring-connection between the lower portions of said members for drawing the members together and elevating the contact, substantially as described.

6. In electric railways, in combination with a suspended supply-conductor and a moving vehicle, a contact-carrying device between the same, comprising upper members pivoted together at one end and sustaining a contact-wheel, lower members supported by the car and pivoted to the upper members, and a spring-connection between the said lower members, substantially as described.

7. In electric railways, in combination with a suspended conductor and a moving vehicle, a contact-carrying device extending between the vehicle and the conductor, and a tilting standard supporting the contact device when in operative relation to the conductor, substantially as described.

8. In electric railways, in combination with a suspended conductor and a moving vehicle, a contact-carrying device extending between the vehicle and the conductor, and a tilting standard upon which the contact device is supported and is laterally movable, substantially as described.

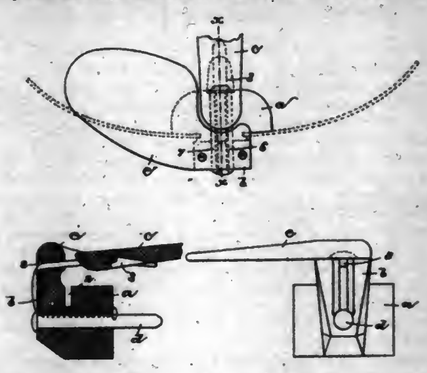
9. In electric railways, in combination with a suspended supply-conductor and a moving vehicle having a standard, a contact-carrying device between the same, comprising extensible members carrying at their upper ends a contact-wheel and at their lower ends being pivoted to swing longitudinally on a suitable support, said support being pivoted to swing laterally on said standard, substantially as described.

10. In electric railways, in combination with a suspended supply-conductor and a moving vehicle, a contact-carrying device carried by the vehicle and comprising extensible members carrying at their upper ends a contact-wheel for engaging the under side of the conductor and pivoted at their lower ends to swing longitudinally on a suitable support, said support being pivoted to swing laterally, substantially as described.

11. In electric railways, in combination with a suspended supply-conductor and a moving vehicle, a contact-carrying device carried by the vehicle and comprising extensible members carrying at their upper ends a contact-wheel for engaging the under side of the conductor and pivoted at their lower ends to swing longitudinally on a suitable support, said support being pivoted to swing laterally, and ropes connected to or near to the axis of the contact device and extending obliquely downward therefrom and passing to the ends of the vehicle, whereby vertical and lateral movement may be imparted to the contact-making device, substantially as described.

12. In combination with a suspended supply-conductor and a moving vehicle having a standard thereon, a contact-carrying device between the same, comprising extensible members carrying a contact-wheel at their upper united ends and pivoted at their lower ends to swing longitudinally on a suitable support, said support being pivoted to swing laterally on the standard, and ropes connected to the pivotal point of the extensible members and passing to the ends of the vehicle, whereby vertical and lateral movement may be imparted to the contact-making device, substantially as described.

13. In electric railways, in combination with a suspended supply-conductor and a moving vehicle, a tilting standard thereon, an extensible contact-carrying frame carrying at its upper end a contact-wheel pivotally connected to said tilting standard at its lower portion, substantially as described.



14. In combination with a suspended supply-conductor and a moving vehicle, a tilting standard thereon, an extensible contact-making device between the same, carrying at its upper end a contact-wheel and at its lower end pivoted to swing longitudinally upon a suitable support, said support being pivoted to swing laterally upon the tilting standard, substantially as described.

15. In combination with a suspended supply-conductor and a moving vehicle, a contact-carrying device comprising upper members pivoted together at their upper ends, and having a contact-wheel thereon, lower members pivoted to said upper members and secured at their lower ends to engaging gears pivoted on a suitable support, whereby movement of one member is imparted to the other, and a spring-connection between said lower members, substantially as described.

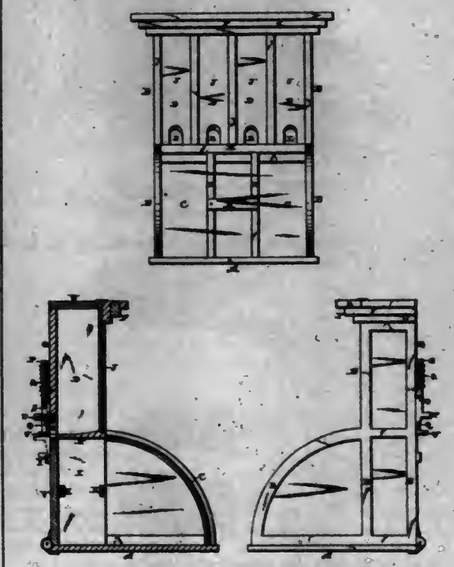
16. In the described contact-making device, having upper and lower members, the spring-connection for said lower members consisting of a plurality of parallel springs attached at opposite ends to pieces pivotally connected to the lower members, substantially as described.

17. The herein-described tilting standard for contact-carrying devices, consisting of eared brackets arranged at a suitable distance apart, links pivoted at one end to one of the brackets, a link pivoted at one end to the free ends of the links and at the other end upon the free end of the link, and a support for the contact device pivoted upon said forked lever, substantially as described.

402,118. TAIL-PIECE FASTENER FOR VIOLINS. MAURICE W. WHITE, Boston, Mass., assignor of one-half to George W. Ross, same place. Filed Sept. 14, 1888. Serial No. 285,201. (No model.)

Claim.—1. The butt-block *a* and block *b*, formed in one piece and having the hole through it, and the grooves, as described, combined with the pin *d* and the tail-piece string or cord, as and for the purpose set forth.

2. The butt-block *a* and chin-rest support or block *b*, said block *b* extending upward above the level of the body of the instrument, combined with the tail-piece string or cord drawing over the top of the said block *b*, free from contact with the body of the instrument, and the fastening for the said tail-piece string or cord, substantially as described.



3. The butt-block *a* and chin-rest support or block *b* and the tail-piece string or cord, combined with the tail-piece having an opening, 3, and two holes through which the tail-piece string or cord passes, substantially as described.

4. The butt-block *a* and block *b* and tail-piece *c*, combined with the tail-piece string or cord, the free ends of which form a connection with the block *b* and the looped end with the tail-piece, substantially as described.

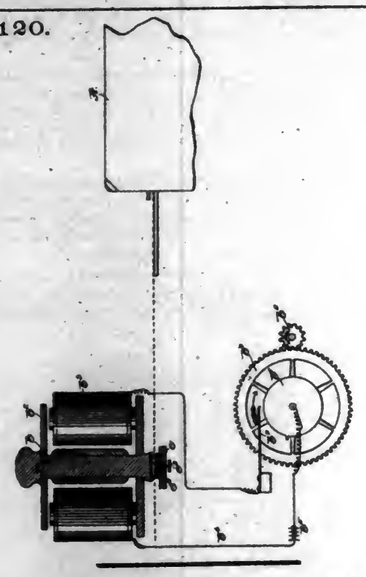
5. The butt-block *a*, the block *b*, extending upward above the level of the body of the instrument and over which the tail-piece string or cord passes, said blocks having a hole formed therethrough, and grooves which receive the ends of the tail-piece string or cord, and the pin *d*, combined with the chin-rest support *c*, all substantially as described.

6. A fastener for the tail-pieces of stringed instruments, it consisting of the butt-block *a*, having a hole through it and grooved, as shown, the string or cord, the looped end of which is connected with the tail-piece and the free ends of which enter the grooves in the butt-block, and the pin *d*, substantially as described.

402,119. COMBINED SHOW AND SHOT CASE. WILLIAM A. WHITEMORE, Hartman, Ark. Filed Aug. 2, 1888. Serial No. 282,304. (Model.)

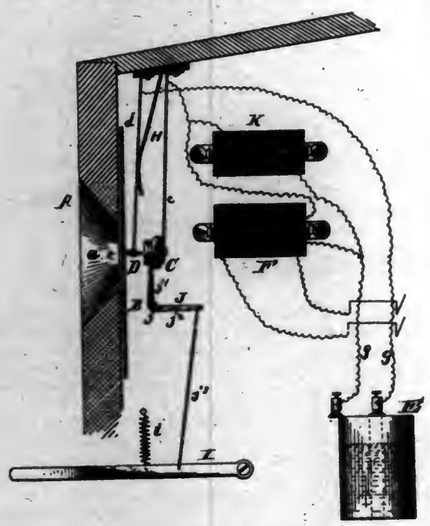
Claim.—1. A combined show and shot case formed together in a single frame, the shot-case being located above and separated from the show-case by the horizontal partition H, in combination with the vertical uprights or supports I, the shot-case being divided by vertical partitions into a number of compartments, which have their fronts covered with glass, substantially as shown.

2. The combination of the shot-case, provided with an opening for the discharge of the shot, with a vertically-moving slide or door, O, provided with an extension, P, and having the opening S, with the guide T below it, the spring *a*, applied to the extension, and the guides between which the slide moves, substantially as set forth.



3. The combination of a show and a shot case formed together in a single frame, and separated from each other by a horizontal partition, H, with a vertically-moving slide for each opening for discharge of shot, each slide being provided with an opening, S, and an extension, P, the springs *a*, and guides Q, substantially as specified.

402,120. MESSAGE AND TIME RECORDER. JOHN C. WILSON, Boston, Mass. Filed Aug. 20, 1888. Serial No. 283,244. (No model.)



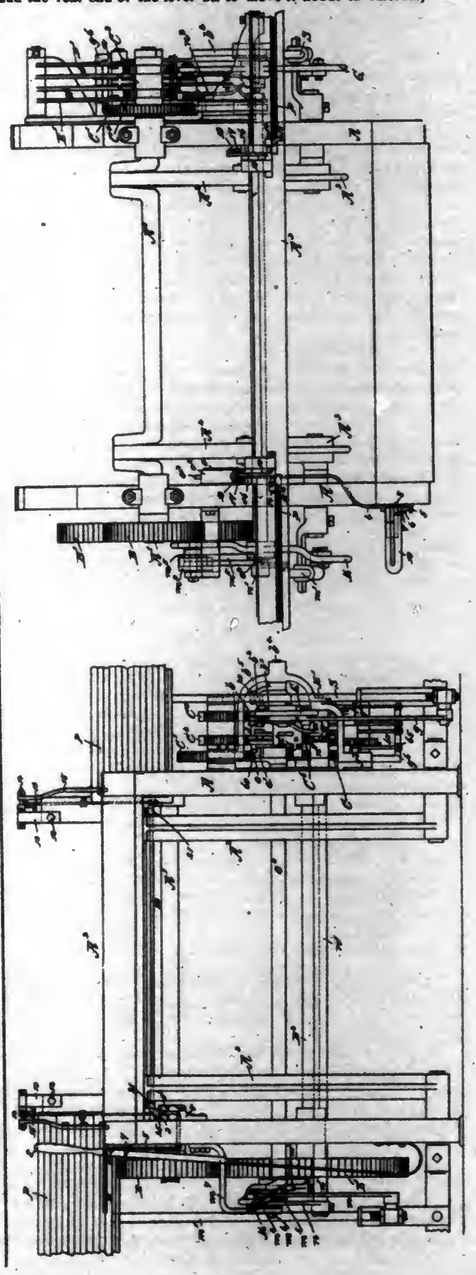
Claim.—1. The signal-receiving instrument and a time-stamp comprising a dial and pointer, one of which is continuously movable with relation to the other, a presser, and an electro-magnet for moving the presser, combined with a circuit-changing device which at regular intervals effects a change in the condition of the circuit of the said electro-magnet, and a motor mechanism for said circuit-changing device, all substantially as and for the purpose set forth.

2. The signal-receiving instrument and a time-stamp comprising time-printing indicators, a presser, and an electro-magnet for moving the presser, combined with a circuit-changing device which at regular intervals effects a change in the condition of the circuit of the said electro-magnet, and a motor mechanism for said circuit-changing device, all substantially as and for the purpose set forth.

402,120.

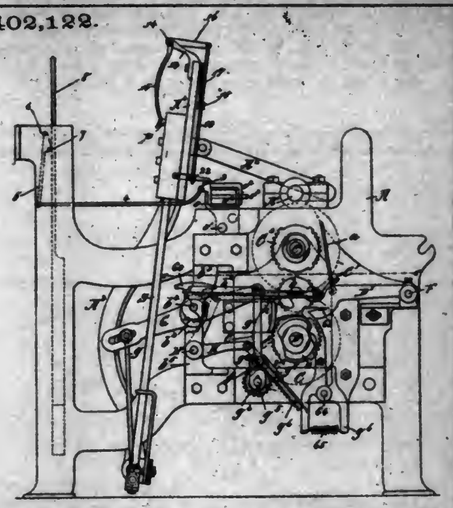
402,121. TELEPHONE. EDWARD A. WORLE, Belleville, Ill. Filed July 7, 1888. Serial No. 279,273. (No model.)

Claim.—1. In a telephone, the combination, with the diaphragm and the two separable contacts supported independently of each other and each movable toward and from the other, of a movable stop for the first of said contacts with which it engages when the contacts are separated, and a stop for the other contact limiting its movement, substantially as set forth.



2. In a telephone, the combination, with the diaphragm, of the two contacts movable independently of each other and of the diaphragm, a stop limiting the movement of one of said contacts toward the other, and a lever connected with the other contact for positively withdrawing it from the first, substantially as set forth.

3. In a telephone, the combination, with the diaphragm and the two contacts movable independently of each other, of a yielding stop for one of said contacts, a spring or elastic support for the other contact, and a stop which holds the last said contact away from the first against the tension of the spring, substantially as set forth.



4. In a telephone, the combination, with the diaphragm and the contacts D and C, of the spring-stop H, adapted to engage with the contact D, and a pivoted lever, J, connected to the other contact, C, for withdrawing it from the contact D, substantially as set forth.

402,122. LOOM. HORACE WYMAN, Worcester, Mass., assignor to the Crompton Loom Works, same place. Filed Mar. 15, 1886. Serial No. 195,673. (No model.)

Claim.—1. The combination, in a loom, of the following instrumentalities, viz: the partial gears C^3 C^4 C^5 C^6, the vibrators, the toothed gears *b c d e*, mounted upon the said vibrators and located all at one side the loom-frame, means to operate the said partial gears to actuate the said toothed gears, the shuttle-box levers G and M, one at each side of the loom, the eccentrics b^3 and e^4, on which the said levers are mounted, connections between the gear *b* and eccentric b^3, the shaft e^4, extended across the loom-frame and carrying the eccentric e^4, the pinion e^3 thereon, the toothed connecting-rod to actuate the said pinion from the said gear *e*, the shaft *n'*, extended across the loom-frame, means, substantially as described, between the said shaft and the rear end of the lever M, to move it about its fulcrum, and

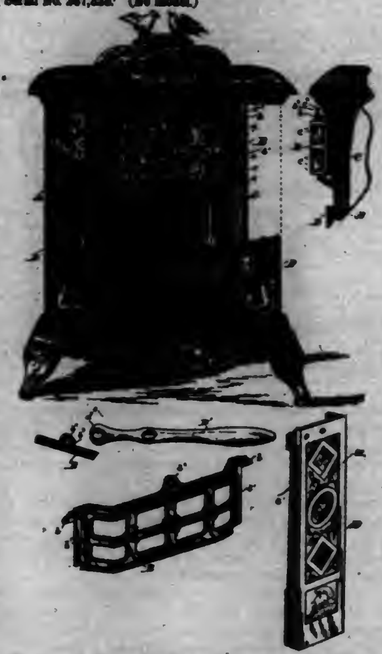
402,122.

means between the said shaft *n'* and the toothed gear *d*, whereby the said gear is enabled to actuate the said shaft, and a crank, as g^6, and means between it and the said gear *e* to actuate the said crank, and connections between the said crank and the said lever G, the combination being and operating substantially as described, whereby both shuttle-box levers at opposite sides of the loom are operated positively.

2. The shuttle-box lever M, the shaft e^4, the eccentric e^4, the pinion e^3 thereon, the toothed gear *e*, means between it and the said pinion to oscillate the said shaft, means to oscillate the said toothed gear, the toothed pinion m^3, and its co-operating crank-pin m^4, combined with the toothed gear *d*, means to oscillate it, and means, substantially as described, actuated by it to operate the said toothed gear m^5, for the purpose set forth.

3. The toothed gears *b e*, means to oscillate them, the gear b^3 and its attached eccentric, the shuttle-box lever G, mounted thereon, the link g', the shuttle-boxes, and means to connect them operatively with the said lever, the gear g^4 and its co-operating crank-pin g^6, and the elbow-lever H, combined with means actuated by the said toothed gears *b e*, to oscillate the pinion b^3 and the lever H, and with means actuated by the lever H to oscillate the gear g^4, substantially as described.

4. The series of shuttle-boxes, their binders, and the shaft 20, provided with arms 22 23, and a dagger, 25, combined with two fingers, 15, actuated by the said binders, and with means, substantially as described, between the said fingers and the said arms 22 23 to move the said shaft 20, to operate substantially as described.



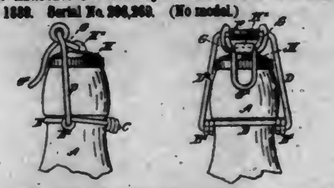
5. The bunter, means to support it, the rod 20, having the dagger and the arm 23, the rod 19, and means to normally elevate it, the arm 16, shaft and finger 15, combined with shuttle-boxes, and binders to operate the said finger, substantially as described.

6. The partial gears C^3 C^4 C^5 C^6, vibrators, and toothed gears mounted thereon, all located at one side of the loom-frame, the shaft e^4, extended across the loom-frame, and means between one of the toothed gears and the said shaft to oscillate the latter, combined with the eccentric e^4, attached to the shaft e^4 at that end of the loom farthest from that at which said vibrators and toothed gears are mounted, the shuttle-box lever M, mounted on the said eccentric, a crank at the same side of the loom as the eccentric and in connection with the said shuttle-box lever, and devices for communicating motion to the said crank from one of the said gears mounted on the vibrators, to operate substantially as described.

7. The shaft *n'*, extended across the loom, its attached arm *n*, the lever M, and connecting mechanism, substantially as described, between the said arm and the end of the said lever M, to move it, combined with the partial gears C^4 C^5 at the opposite side of the loom, a toothed gear, *d*, located between them and having a crank, a vibrator upon which the said gear *d* is mounted to oscillate, and means, substantially as described, between the said gear *d* and the said shaft *n'*, to oscillate said shaft, substantially as described.

8. The lay, two series of shuttle-boxes mounted to slide therein, the binders, shafts 14, the fingers 15 on said shafts actuated by said binders, arms 16 on said shaft, the shaft 20 and its arms 22 and 23, rods 19, and springs 17 to lift the said rods, combined with a dagger on shaft 20 and a bunter, the combination being each, substantially as described, that the outward movement of both of the two fingers resting on the said binders is required to oscillate the shaft 20 and place the dagger in operative position.

402,123. STOVE. BENJAMIN H. GOSMANN, New Albany, Ind., assignor to Tortotge, Gosmann & Co., Louisville, Ky. Filed Oct. 11, 1888. Serial No. 287,823. (No model.)

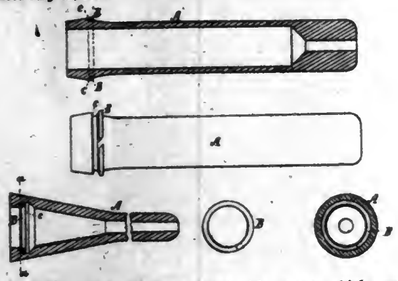


Claim.—1. In a stove or grate, side plates forming the front of the stove provided with a series of catches on their face above the opening for the blower, in combination with a blower having shouldered lugs at its upper corners to engage said catches, and a shoulder or offset at each end to bear against the column and cause the blower to rise uniformly at its ends, with columns at either side of the stove having cut-away portions to confine and guide the ends of the blower, substantially as set forth.

2. In a stove or grate, a front consisting in flat-faced plates at either side, said plates provided with a series of catches on their face near the top, a blower having flat ends, as *b'*, and lateral projections above said portions *b'* to engage the catches on the side plates or front, said blower being constructed to slide over the upper front portion of the stove, in combination with columns cut away along one edge with gradually-decreasing depth from top to bottom and overlapping the ends of the blower, substantially as set forth.

3. In combination with a stove or grate, a blower having a loop or handle to lift the same, formed thinner at its side than at its top, whereby, when the shaker is introduced, it will grip the loop without accidentally slipping its hold, permitting the blower to be moved with ease and comfort, no matter how hot it may be, substantially as set forth.

402,124. BOTTLE-STOPPER. DANIEL J. CONCORAN, Dedham, assignor to Lawrence Michael Aloysius Corcoran, Boston, Mass. Filed Jan. 31, 1888. Serial No. 262,262. (No model.)

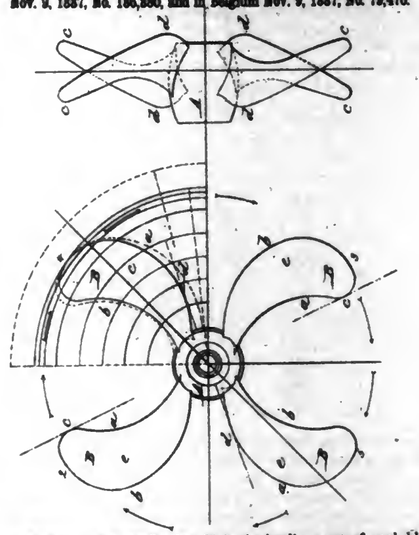


Claim.—1. The combination and arrangement, in connection with a bottle, of the neck-wire B, the bearing-wire D, held to the neck-wire B by coils in said neck-wire, and the stiff latch-wire G, held to the bearing-wire D by a pair of single coils and carrying the latch-loop G^x, with the metal stopple-block H, provided with the boss H^x, the boss holding the two respective ends of the latch-wire G and holding at its lower portion the hollowed rubber stopple J, all constructed and arranged substantially as described and shown.

2. The combination, with a bottle and any stopper, of the wires B, D, and G, the last-named wire, accompanied by the brace F, playing on the horizontal portion of the bearing-wire D, all substantially as described and shown.

REISSUES.

10,996. SPINNING-BOBBIN, &c. LUTHER C. BALDWIN, Manchester, N. H. Filed Nov. 26, 1888. Serial No. 291,915. Original No. 366,196, dated July 12, 1887.



Claim.—1. A solid bobbin provided with a groove which receives and accommodates an elastic ring, in combination with a split elastic ring fitted into said groove, said ring having tapered ends which overlap each other when in position on the bobbin, substantially as described.

2. A solid bobbin provided with a groove, which groove receives and accommodates an elastic ring, in combination with a split elastic ring having overlapping tapered ends and extending in an unbroken curve from end to end, and which ring is sprung into said groove in the bobbin, substantially as described.

3. A solid bobbin provided on its outside with a groove, in combination with a split elastic ring which fits within the groove and extends slightly beyond the plane of the outer surface of the bobbin in a position to receive the wear, substantially as described.

4. The combination of a split elastic ring, and an unsawed or solid bobbin having a groove around it to receive said ring, for the purpose substantially as described.

10,997. SCREW-PROPELLER. ALEXANDER VOGELSANG, Brooklyn, N. Y., assignor to the Vogelsang Screw Propeller Company, same place. Filed Feb. 15, 1889. Serial No. 300,050. Original No. 361,193, dated Apr. 17, 1888. Patented in England Nov. 4, 1887, No. 15,055; in France Nov. 9, 1887, No. 186,880, and in Belgium Nov. 9, 1887, No. 79,470.

Claim.—1. A propeller in which the leading part of each blade rotates in a plane in advance of the part of the next preceding blade in the same radius and in the direction of progression of the screw, substantially as described.

2. A propeller in which the leading parts of two successive blades are situated at different distances from the hub in a plane that is normal to the axis of the propeller-shaft, the blades diametrically opposite each other are alike, and the leading part of each blade rotates in a plane in advance of the part of the next preceding blade in the same radius and in the direction of progression of the screw, substantially as described.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

COLLINS COMPANY *v.* COES *et al.*

Decided March 5, 1889.

JORDAN AND SMITH—WRENCHES.

Reissued Letters Patent No. 5,294, to Lucius Jordan and Leander E. Smith February 25, 1873, for an improvement in wrenches, *Held* to be anticipated by the patent to Loring Coes April 16, 1841, and by the wrenches known as the "Hewitt" wrenches, manufactured in 1851-4, and to be void for want of patentable novelty.

APPEAL from the Circuit Court of the United States for the District of Massachusetts.

STATEMENT OF THE CASE.

The Collins Company of Connecticut, a corporation located at Collinsville, in the county of Hartford and State of Connecticut, brought this suit in equity in the Circuit Court of the United States for the District of Massachusetts, against Loring Coes and Melvin O. Whittier, partners in business at Worcester, in Worcester county, Massachusetts, in the name and style of Loring Coes & Company, for the alleged infringement of Reissued Letters Patent No. 5,294, dated February 25, 1873, for an improvement in wrenches, issued to the Collins Company as assignee of Lucius Jordan and Leander E. Smith, said Reissued Letters Patent being based upon original Letters Patent dated October 10, 1865, No. 50,364. There had also been a reissue February 22, 1870.

The specification and accompanying drawings of the Reissue No. 5,294 are as follows:

The object of this invention is the prevention of end thrust or back pressure on the wooden handle of wrenches, which has heretofore availed to quickly destroy such wooden handles, and, in destroying the handles, has left the working parts of the wrench which depended upon the handles for support without such support, so as to injure and effectually impair their working qualities and efficiency; and is accomplished by so connecting the step which forms a bearing for the lower end of the screw-rod with the bar which forms the main part of the wrench that the back pressure put upon the step by the screw-rod will be directly transmitted to the wrench-bar at the place of connection therewith, and will not be transmitted to and mainly put upon the wooden handle.

Figure 1 is a side view of the whole wrench, the part below the

Fig. 1.

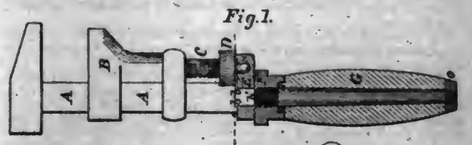

Fig. 2.

dotted line *x x* being in section. Fig. 2 is a top or plan view of the step which forms a bearing for the lower end of the screw-rod.

The letter A indicates the wrench-bar, flat-sided down to the under side of the step E, and from thence downward cylindrical or of other convenient shape, so as to take upon it the wooden handle G. B is the movable jaw. The letter C indicates the screw-rod, and D the rosette by which it is turned. The letter E indicates the step, in which is the bearing *s* for the lower end of the screw-rod, and also the hole *a* to admit the bar A, and fitting up against the shoulder *b*. On the bar A, just below the step E, is cut the screw-thread *t*, on which screws the nut F, forming a projection from the wrench-bar, on which rests the step E, and thus transmits the back pressure put upon the step directly to the wrench-bar at the place of connection therewith, and thus relieves the wooden handle therefrom, the connection of the step with the bar being made in such manner that the step may be removed or taken off the bar without any cutting or abrasion of parts.

The nut not only supports the step, but can be made to rigidly fasten the step to the bar by screwing it firmly up against the step so as to gripe it between itself and the shoulder *b*, thus giving the nut, so to speak, a double office, viz., that of supporting the step, and, also, that of fastening it rigidly to the bar. The nut is interiorly recessed at *d* for the purpose of forming a ferrule for the top of the wooden handle.

Heretofore the part designed to perform the office of the step E has rested directly on the wooden handle, which was secured upon the bar by a light nut, *o*, at the lower extremity of the bar, which is the present method of fastening on the handle.

It is known that, previous to this invention, steps have been forged or otherwise produced solid with the bar, and this became as much a part of it as the solid head at extremity of bar; and also by riveting to reach similar result; but such method, by making a permanent fastening, renders it impossible, or a work of great difficulty, to displace the step in order to remove the sliding jaw for repairs. It will be observed that, while Jordan and Smith's method of fastening is as firm as the permanent fastenings last above referred to, their step can readily be removed and again put in place at pleasure.

It is believed that Smith and Jordan were the first to secure easy divisibility of step and bar, together with a fixed or stationary step when in position, and at the same time supporting the step, when in position, immediately by the bar, and not mediately through the handle, as the manner had been.

As a matter of definition, the Jordan and Smith method of fastening and supporting the step when in position is denominated "removable" hereinafter in contradistinction from a connection and support made by forging or otherwise producing the step in one solid piece with the bar, and, therefore, a part of it; or by riveting it thereto, or the like.

Claims.

1. The step, combined with the wrench-bar and supported by the nut F, or its equivalent, at the place where the step is connected with the bar, in such manner that the step can be removed from the bar without cutting or abrasion of parts.

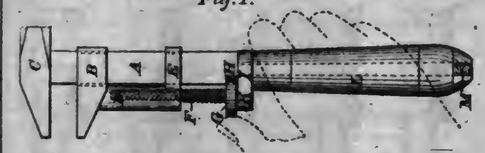
2. The nut F, combined with the wrench-bar, and interiorly recessed at *d*, for the purpose set forth.

3. The nut F, combined with the threaded bar, and performing the office of supporting the step, and also of rigidly fastening it to the bar, for the purpose set forth.

April 16, 1841, a patent issued to Loring Coes for what has since always been known as the Coes wrench, and this was reissued June 26, 1849. The specification and drawings of the reissue are as follows:

Figure 1 is an elevation of my improved wrench, and Fig. 2 an elevation of a wrench previously known but not of my invention.

Fig. 1.



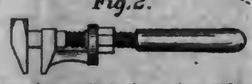


Fig. 2.

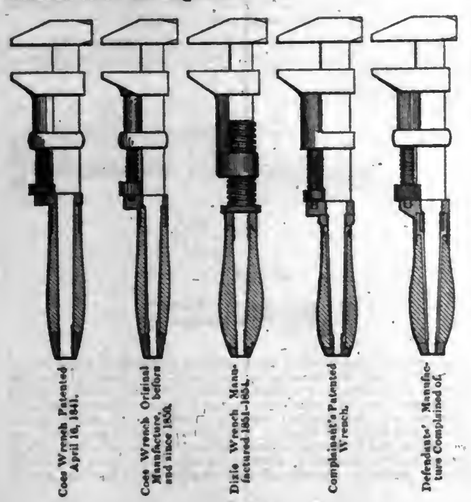
In my improved wrench the inner jaw slides on the bar of the permanent jaw and handle, and is moved by a screw at the side of the bar, operated by a head or rosette, which always remains in the same position relatively to the handle, whereby the movable jaw can be adjusted with the thumb of the hand, which grasps and holds the handle. The principle or character of my invention, and that which distinguishes it from all other things before known, consists in moving the adjustable jaw by means of a screw placed at the side of and parallel with the bar of the

permanent jaw and handle, when the required rotation for sliding the jaw is given by a rosette or head, or the equivalent thereof, which retains the same position relatively to the handle; and my invention also consists in retaining the required position of the rosette, or its equivalent, by which the required motion is given to the sliding jaw, by having its periphery to work in a notch or recess in the bar of the permanent jaw and handle, or vice versa.

In the accompanying drawings, A represents a quadrangular bar of metal with a permanent or hammer jaw, C, at one end, the other end being reduced in size to pass through a handle, L, secured to it by a nut, M. Between the ferrule of the handle and the shoulder of the bar an iron plate, I, is griped by the securing of the handle onto the bar, and this plate extends out sufficiently beyond the bar to receive the journal K (see dotted lines) of a screw, F, which is placed parallel with and by the side of the bar. This screw is tapped into a tubular piece, D, that projects from the back face of the adjustable jaw B, which is fitted to slide on the bar from or toward the permanent jaw C, the rear end of the tubular projection D being provided with and sustained by a bridle, E, which embraces and slides on the bar. At the rear end the screw is provided with a head or rosette, G, the periphery of which turns in a notch or recess, H, made in the edge of the bar, as shown by dotted lines, by which the position of the said rosette is retained relatively to the handle. The hand, represented by dotted lines, indicates the manner in which my improved wrench is operated. The handle is grasped by the fingers, and the rosette is operated by the thumb of the same hand, so that, without any change in the position of the hand, the movable jaw can be moved toward or from the permanent jaw, to set the wrench to any size required, with one hand.

By means of my improvement the bar can be made of any desired form best adapted to the sliding jaw and to strength. The rosette or its equivalent employed for operating the jaw is always retained in the same position relatively to the hand that gripes the handle. At the same time the use of two bearings for the screw is avoided.

The advantages of my improved wrench over other methods of construction will be seen by comparison with the wrench represented by Fig. 2 of the accompanying drawings.



What I claim as my invention, and desire to secure by Letters Patent, is—

Moving the sliding jaw by a screw, combined with and placed by the side of and parallel with the bar of the permanent jaw and handle, substantially as described, when the required rotation for sliding the jaw is given by the head or rosette, or its equivalent, which retains the same position relatively to the handle during the operation, substantially as described.

And I also claim moving the sliding jaw by a screw, combined with and placed by the side of and parallel with the bar of the permanent jaw and handle, substantially as described, in combination with the rosette or its equivalent, retained in its position relatively to the hand in the manner described.

It appears from the evidence that during the years 1851 to 1854, E. F. Dixie was manufacturing, to the extent of from two hundred to four hundred wrenches per week of various sizes, a wrench known as the Hewitt wrench, which wrench contained a recessed nut screwed upon the wrench-bar just above the wooden handle, for the purpose of relieving the handle from back pressure put upon the step, and of serving as a ferrule for the upper end of the wooden handle. It had an adjusting screw-sleeve instead of the adjusting screw-rod of the Coes wrench, but was otherwise substantially the same.

The following diagrams give the various wrenches referred to on the argument:

On the 9th of August, 1880, the Collins Company filed a disclaimer in the Patent Office, stating—

Further, that said The Collins Company has reason to believe that through inadvertence and mistake the second clause of claim made in said last-mentioned Reissued Letters Patent, in the following words, to wit: "2. The nut F, combined with the wrench-bar, and interiorly recessed at *d*, for the purpose set forth," is too broad, including that of which said Jordan and Smith were not the first inventors. Said The Collins Company therefore hereby enters its disclaimer to "the nut F, combined with the wrench-bar, and interiorly recessed at *d*, for the purpose set forth," except when said recessed nut and wrench-bar are in combination with the handle G, the step or step-plate E, the screw-rod C, and the movable jaw B of the wrench, substantially as is shown and described in said last-mentioned Reissued Letters Patent—

being the reissue in question.

The defendants contend that the patent in suit did not disclose a patentable invention in view of the prior state of the art; that the reissue described and claimed a different invention from that for which the original patent was granted; that the reissue was taken too long after the date of the original patent to be permitted upon equitable grounds; and that there was no infringement.

The circuit court originally granted an interlocutory decree in favor of the plaintiff, in accordance with the opinion of Judge Lowell, reported in 5 Banning & Arden, 548, and 3 Fed. Rep., 225. But a rehearing was afterward moved for and granted, the interlocutory decree vacated, and the bill dismissed, for the reasons stated in the opinion of Mr. Justice Gray, presiding in the circuit, in a similar suit by the plaintiff against other defendants, which opinion was as follows:

This is a bill in equity for the infringement of the first claim in the specification of the second reissue to the complainant, dated February 25, 1873, of Letters Patent originally issued to Lucius Jordan and Leander E. Smith, on October 10, 1865, for an improvement in wrenches.

The wrench, as described, both in the original patent and in the reissue, has the following parts: The wrench-bar A, the upper part of which is of the usual shape, and has attached to it the movable jaw B, and the lower part of which is of convenient form to receive upon it the wooden handle; a screw-rod, C, parallel to the main bar; a rosette, D, at the lower end of the screw-rod, by means of which the movable jaw is worked; a ferrule or step, E, having a hole through it for the admission of the bar, and a recess in its upper face as a bearing for the lower end of the screw-rod; a nut, F, screwed on a thread in the bar, under the step, and having a recess in its under face to receive the top of the wooden handle G, and the wooden handle secured at its lower end to the main bar by a nut in the usual way.

Both the original patent and the reissue state that the object of the invention is to make the strain come upon the nut F, instead of coming upon the wooden handle. The original patent states that the nut F is, and the reissue states that it may be, screwed up firmly against the step E. The reissue affirms and repeats that the distinguishing characteristic of the invention is that the step can be readily removed and replaced at pleasure. There is no hint of such a distinction in the original patent.

The first claim of the original patent is for "The step E, made substantially as described, and for the purpose set forth." The corresponding claim in the reissue is for the "The step, combined with the wrench-bar, and supported by the nut F, or its equivalent, at the place where the step is connected with the bar, in such manner that the step can be removed from the bar without cutting or abrasion of parts."

The parallel screw-rod, with a rosette thereon to work the movable jaw, and resting upon a ferrule or step, had been introduced in the original Coes wrench, patented in 1841; and, long before the issue of the patent to Jordan and Smith in 1865, large numbers of the Hewitt or Dixie wrench had been made and sold, in which there was no separate screw-rod, and the screw that worked the movable jaw revolved on the main bar, but that screw rested on a ferrule or step, which was secured sometimes by driving it on under heavy pressure, and sometimes by a nut screwed under it on the bar.

The application to the bar of the Coes wrench, for the purpose of securing and supporting the step, and resisting the strain, of a nut already in use for the same purpose, on the Hewitt or Dixie wrench, lacks the novelty of invention requisite to support a patent, within the decisions of the Supreme Court at the last term, which have, in effect, overruled the earlier decision of this court in the suit of this complainant against Loring Coes and others, reported in 5 Banning & Arden, 548. *Pennsylvania Railroad* v. *Locomotive Engine Safety Truck Co.*, (110 U. S., 490;) *Bussey* v. *Excelsior Manuf. Co.*, (110 U. S., 131;) *Double-Pointed Tack Co.* v. *Two Rivers Manuf. Co.*, (109 U. S., 117;) *Phillips* v. *Detroit*, (111 U. S., 604.)

The complainant's patent being void for want of novelty, it becomes unnecessary to consider the other defenses.

Bill dismissed, with costs.

Mr. W. E. Simonds for the appellant.

Mr. George L. Roberts for the appellee.

Mr. Chief Justice FULLER delivered the opinion of the Court:

We concur with the circuit court in its disposition

of this case and the grounds upon which it rested its decision.

The wrench-bar, the fixed jaw upon its upper end, the movable jaw sliding upon the wrench-bar, the screw-rod parallel with the wrench-bar, the rosette upon the lower end of the screw-rod, the step-plate surrounding the wrench-bar, the wooden handle secured by the nut at its extreme lower end, are all described in the patent to Coes; and the nut screwed upon the wrench-bar just below the step-plate, and provided with a recess for the purpose of forming a ferrule for the step of the wooden handle, which is not in the Coes patent, but is in complainant's reissue, had already been in use in the Hewitt or Dixie wrench for the same purposes. The disclaimer conceded that "the nut F, combined with the wrench-bar, and interiorly recessed at *d*, for the purpose set forth" was an old device; but it is claimed that the device is new when the recessed nut and wrench-bar are in combination with the handle, the step, the screw-rod, and the movable jaw. The handle, the step, the screw-rod, and the jaw are all to be found in the Coes and Dixie wrenches, and the recessed nut of the Dixie wrench constituted, by the shoulder which it made at its upper end, a step upon which the screw rested, and served every purpose designated in the reissued patent in suit as intended to be secured by such recessed nut. This in itself justified the finding that "the application to the bar of the Coes wrench, for the purpose of securing and supporting the step and resisting the strain, of a nut already in use, for the same purpose, on the Hewitt or Dixie wrench, lacks the novelty of invention requisite to support a patent." This conclusion is not affected by the fact that in complainant's wrench the screw-rod of the Coes wrench is availed of instead of the screw-sleeve of the Dixie wrench.

Complainant's first claim is as follows:

1. The step, combined with the wrench-bar and supported by the nut F, or its equivalent, at the place where the step is connected with the bar, in such manner that the step can be removed from the bar without cutting or abrasion of parts.

The specification says:

On the bar A, just below the step E, is cut the screw-thread *f*, on which screws the nut F, forming a projection from the wrench-bar, on which rests the step E, and thus transmits the back pressure put upon the step directly to the wrench-bar at the place of connection therewith, and thus relieves the wooden handle therefrom, the connection of the step with the bar being made in such manner that the step may be removed or taken off the bar without any cutting or abrasion of parts.

The elements of this combination are the support of the step by the nut F, the transmission of back pressure directly to the wrench-bar through that nut, and the removability of the step without cutting or abrasion of parts. Now the Dixie wrench contained the nut F, screwed on the wrench-bar, and transmitting the back pressure directly to it, and removable without cutting or abrasion, by being simply unscrewed.

The second claim is:

2. The nut F, combined with the wrench-bar, and interiorly recessed at *d*, for the purpose set forth.

This, as so stated, was disclaimed, except when said recessed nut and wrench-bar are in combination with the handle, the step, the screw-rod, and the movable jaw.

It was said in *Hailes* v. *Albany Stove Company*, (123 U. S., 582, 587,) the Court speaking through Mr. Justice Bradley:

A disclaimer is usually and properly employed for the surrender of a separate claim in a patent, or some other distinct and separable matter, which can be exscinded without mutilating or changing what is left standing. Perhaps it may be used to limit a claim to a particular class of objects, or even to change the form of a claim which is too broad in its terms; but certainly it cannot be used to change the character of the invention. And if it requires an amended specification or supplemental description to make an altered claim intelligible or relevant, while it may possibly present a case for a surrender and reissue, it is clearly not adapted to a disclaimer.

The complainant's qualified disclaimer is an admission that the second claim of the patent is void for want of novelty, which is true, even if the qualification were effectual, since, as we have seen, the screw-rod and movable jaw of the patent have no different effect from the screw-sleeve and movable jaw of the prior Dixie wrench, upon the other parts of the combination.

The other claim is:

3. The nut F, combined with the threaded bar, and performing the office of supporting the step, and also of rigidly fastening it to the bar, for the purpose set forth.

The specification says:

The nut not only supports the step, but can be made to rigidly fasten the step to the bar by screwing it firmly up against the step, so as to gripe it between itself and the shoulder *b*, thus giving the nut, so to speak, a double office, viz., that of supporting the step, and, also, that of fastening it rigidly to the bar. The nut is interiorly recessed at *d*, for the purpose of forming a ferrule for the top of the wooden handle.

The purpose of supporting the step by the nut F, and fastening the step rigidly to the wrench-bar by means of that nut, is the relief of the wooden handle from the strain of back pressure. In the Dixie wrench the step and nut were made of one and the same piece of metal, thereby fully attaining the object of holding the step-plate rigidly fastened in position. In the Coes wrench the step was rigidly fastened to the bar by being griped between a shoulder above it and upon the bar and the handle below it, which was backed up by the nut screwed upon the lower extremity of the bar. Dispensing with a washer between a nut and that upon which it acts, makes no change in the office of the nut. The action of the nut M of the Coes wrench in griping the step-plate is the same as that of the nut F of the patent. This third claim is also void for want of novelty.

The decree of the circuit court is affirmed.

U. S. Circuit Court—Western District of Pennsylvania.

CARY *et al. v.* THE LOVELL MANUFACTURING COMPANY, (LIMITED.)

Decided January 26, 1889.

MEASURE OF DAMAGES.

It is a general rule in patent causes that established license-fees are the best measure of damages that can be used. In this case the master excluded certain license-fees as the basis of computing damages on the ground that they were practically settlements of pending litigations between the complainants and the parties taking said licenses, made with one exception after the commencement and during the pendency of this suit. *Held* that those licenses were in full operation when the defendants elected to resume their infringing manufacture; that they are competent evidence as bearing upon the fair market value of the privilege which the infringers have wrongfully undertaken to exercise, and that the defendants took the risk of being compelled to pay damages on the basis of the rate of license thus established.

SUR exceptions to the master's report.

Messrs. Witter & Kenyon for the complainants.
Mr. W. C. Witter of counsel.

Mr. William Bakewell and *Mr. J. K. Hallock* for the defendants.

Coram McKENNAN, *Cir. J.*, and ACHESON, *J.*

PER CURIAM:

The master being of opinion that the license for the future use of the patented process, at the rate of 2 cents per pound of springs, granted to R. H. Wolff & Co., (Limited,) on March 2, 1885, and the like license, at the same rate, granted to Gibson, Parish & Co., on November 4, 1885, were inadmissible as evidence, refused to hold the defendants liable for damages upon the basis of an established license-fee. And as he has found that there is no satisfactory evidence disclosing what part, if any, of the defendants' profits was due to the use of the patented process, or to show that the plaintiffs had sustained a loss of trade or any other special damage, the upshot of the matter is that if the master's report stands the plaintiffs will receive nothing but nominal damages for the defendants' infringement. Is this a just conclusion to this litigation?

The only reason assigned by the learned master for his rejection of the licenses as items of proof is that "they were practically settlements of pending litigations between the complainants and the parties taking said licenses," and (unless in the case of the Wolff license) were "made after the commencement and during the pendency" of this suit. But to determine properly the question of the admissibility of these licenses as evidence and the effect to be given to them, it is, we think, necessary not only to consider more closely than the master seems to have done the licenses themselves and the circumstances under which they were executed, but also to take a somewhat broader view of the case as a whole than his report presents. And reversing the above order of procedure, we first remark that his record throughout exhibits proof of the real merit of the Cary invention, and it is clearly shown that the patented process had great money value. For example, in each of the four proved instances in which there were settlements for past infringements substantial damages therefor were paid to the plaintiffs. Again, it appears that the West, Bradley & Cary Manufacturing Company, of which the plaintiff Cary was a member, manufactured springs under a verbal license from him, and that that company, besides discharging large liabilities connected with the litigation touching the patent, in a settlement made with Cary in April, 1876, allowed him for the use of the patent the sum of $14,000, which Mr. Cary testifies was arrived at by computing 2 cents a pound on all springs they had treated by the patented process. Furthermore, it is shown that from June, 1881, to the latter part of 1883 the defendants made large purchases from the plaintiffs of springs tempered by the patented process, and there is evidence that the plaintiffs' profits upon those springs due to said process considerably exceeded 2 cents per pound. We are then of the opinion that, aside from the particular instances of license in question, the proofs tend strongly to the conclusion that a royalty of 2 cents per pound was a reasonable and just rate during the period of the defendants' infringement.

Now, the defendants began their infringing manufacture in March, 1884, and they pursued it until March 28, 1885, when they were restrained by preliminary injunction. But the court, by an order made in February, 1886, having suspended the injunction upon the defendants giving security to pay to the plaintiffs such amount as might be adjudged to them on springs thereafter manufactured by the defendants, the latter resumed their infringing operations and continued the same until the final injunction was granted in July, 1887.

As we have seen, the license to R. H. Wolff & Co., (Limited,) was executed on March 2, 1885, which was 12 days before the bill in this case was filed. Gibson, Parish & Co. were licensed while the preliminary injunction was in force, and about four months before the second period of the defendants' infringement began. Both those licenses, it will be perceived, were in full operation when the defendants elected to resume their infringing manufacture, and they took the risk of being compelled to pay damages on the basis of the rate of license thus established. We have carefully examined the provisions of those instruments and all the evidence on the subject, and we are unable to discover anything which casts the slightest doubt on the good faith of either transaction. They seem to have been fair business arrangements voluntarily entered into by the respective parties. R. H. Wolff & Co., (Limited,) had never been sued at all. That company had infringed to a very limited extent, and at the time it was licensed paid $500 therefor; but it was not bound to take a license for the future. Gibson, Parish & Co., indeed, had been sued and settled for past infringement by paying $1,000; but they were under no sort of coercion to take a future license. Both those licensees regularly paid the stipulated royalty of 2 cents a pound on the springs manufactured by them under the patent from the dates of their respective licenses down to the expiration of the patent in June, 1888. Why then are those licenses not competent evidence as bearing upon the fair market value of a privilege which an infringer has wrongfully undertaken to exercise? We have critically examined the decisions referred to by the master and the other cases cited by the defendants' counsel, but cannot concur in the view that they warrant the exclusion of said licenses from consideration. We think that this case, in its facts, is plainly distinguishable from all the cases relied on to sustain the ruling of the learned master, and we are constrained to hold that he was in error in deciding that said licenses were inadmissible "as evidence showing, or tending to show, an established royalty for the use of the Cary patent." But it is contended that the license granted by the plaintiffs to the Domestic Spring Bed Company on March 19, 1886, for the sum of $2,500, to cover past infringement and future use, shows that there was in fact no uniform or established license-fee. But the right thereby granted to that company was exclusively a shop-right to temper by the patented process only such springs as the company had used or might thereafter use in their own beds. That company was not making springs for the market, and hence the case was exceptional and materially differed from the cases of R. H. Wolff & Co., (Limited,) Gibson, Parish & Co., and the defendants.

In addition to the two instances of licenses at the royalty of 2 cents per pound, we have the settlement already discussed between the patentee and the West, Bradley & Cary Manufacturing Company at the same rate, and also the recited corroborative evidence as to the reasonableness of that rate, and, taking the proofs altogether, we are of the opinion that the defendants are justly answerable to the plaintiffs in damages upon that basis.

In *Clark* v. *Wooster*, (119 U. S., 326,) which, like the present case, was a suit in equity, the Court, speaking of an established license-fee and the sufficiency of the proof thereof, said:

> It is a general rule in patent causes that established license-fees are the best measure of damages that can be used. The complainant proved several instances of licenses given by him to large sewing-machine companies, the fees on which were regularly paid and corresponded with the rate allowed by the master. We think that the defendants have no occasion to complain of the amount awarded.

How many instances of license were there shown does not appear; but we think the language of the Court fully justifies the conclusion we have reached here upon the proofs before us.

The plaintiffs ask the court, under the statutory authority, to increase the damages; but this we must decline to do.

The master reports that the defendants have manufactured by the patented process 437,267 pounds of springs, which, at 2 cents per pound, amount to $8,745.34, and for this sum the plaintiffs are entitled to a decree.

Let a decree be drawn in favor of the plaintiffs in accordance with the foregoing opinion.

U. S. Circuit Court—Southern District of New York.

UNTERMEYER *v.* FREUND *et al.*

Decided January 15, 1889.

1. LETTERS PATENT AS PRIMA-FACIE EVIDENCE.
   The rule is well settled that the production of Letters Patent for a Design establishes a *prima facie* right in the patentee which can only be defeated by proofs which are of convincing force.
2. DESIGN PATENTS AS DISTINGUISHED FROM PATENTS FOR INVENTIONS.
   The validity of a patent for a Design does not depend upon the exercise of the "inventive faculty of the mind" in the sense in which that expression is used in connection with inventions which relate strictly to the useful arts.
3. DESIGNS ANOLOGOUS TO COPYRIGHTS.
   The policy which protects a Design is akin to that which protects the works of an artist by copyright. If the Design produce a different impression upon the eye, even though it be simple, and does not show wide departure from other designs, its use will be protected.

Mr. Rowland Cox for the complainant.
Mr. Frederic H. Betts and *Mr. Samuel R. Betts* for the defendants.

COXE, *J.*:

This is an equity action of infringement founded upon Letters Patent No. 15,121, granted to the complainant July 1, 1884, for a Design for watch-cases. The Design consists of a central conventional star in which any ornament may be set, placed upon a larger star of leaves, both stars being bas-relief. Between the points of the star of leaves are diamond-shaped projections. The Design was the result of considerable effort and industry. It shows some genius, and it soon became popular with the public and a source of profit to those who adopted it.

The claims are as follows:

> 1. A design for watch-cases, consisting of the conventional star A and the larger star, B, the points of which represent leaves, the star A occupying the central field of the star B, all being in relief, substantially as shown and described.
> 2. A design for watch-cases, consisting of the conventional star A and the larger star, B, composed of leaves and having between its points ornamental projections C, the star A occupying the center of the star B, all being in relief, substantially as shown and described.
> 3. A design for watch-cases, consisting of the star A, containing the ornament D, the larger star, B, representing leaves and having between its points the ornamental projections C, and the star A occupying the center of the star B, all being in relief, substantially as shown and described.

The defenses are anticipation, lack of invention, and non-infringement of the second and third claims.

The claims would have to be unreasonably restricted to give the slightest plausibility to the defense of non-infringement. The two Designs look alike, and an ordinary purchaser could not detect the difference. The defendants in their circular of February 10, 1887, admit that they have made the Design of the patent and assert that they have a right to make it and will continue to do so. Infringement is clearly established.

Has novelty been negatived?

The patent is *prima facie* evidence that the complainant was the first inventor. (*Lehnbeuter* v. *Holthaus*, 105 U. S., 94.) He who asserts to the contrary must prove it beyond a reasonable doubt. The onus is upon him. The record discloses the usual conflict upon this subject. The witnesses do not agree. After the testimony has been read and weighed the mind has not a decided impression either way. It is in doubt. This is peculiarly a case where light would be thrown upon the controversy were the court permitted to see the witnesses and observe their manner while testifying. A witness may convince all who hear him testify that he is disingenuous and untruthful, and yet his testimony when read may convey a most favorable impression. To state the proposition as fairly as the defendants can expect, the issue upon this branch of the case is involved in uncertainty.

If the defendants' right to recover a sum of money in an ordinary action at law depended upon their establishing the affirmative of this issue, a verdict in their favor would probably not be disturbed by the court. If, however, the complainant's conviction of a crime depended upon the establishment by the prosecution of the same proposition, a verdict of guilty could hardly be sustained. The jury most certainly would declare that they were not satisfied beyond a reasonable doubt that prior use had been established.

The court had occasion to comment upon this rule in somewhat similar circumstances in the case of *Thayer* v. *Hart*, (20 Fed. Rep., 693; 22 Blatchf., 229.) What was there said need not be repeated.

The question of invention is a perplexing one. It is balanced in well-nigh even scales, and a decision either way would have much in reason and common sense to commend it. The prior art shows badges made with a central raised star of silver placed upon a larger star of similar material, the lower star being

chased into a form somewhat resembling leaves. Badges with a star of tinsel placed upon a larger star of silk were well known, as was a design for the center of a watch-dial resembling the star of leaves and the ornamental projections of the patent, but without the conventional star and the central ornament.

The defendants also introduced a large number of tracings from drawings found in volumes belonging to the Astor library. These show designs for pavements, ceilings, spandrels, panels, railings, pedestals, embroidery, carpets, and marquetry. All these, being drawings, are of course flat, though some show cross-sections, indicating that the originals were in relief. None were designed for watch-cases and none, if put on a watch-case, would be mistaken for the complainant's Design. None, if made now for the first time, would infringe; none can be said to anticipate. It is probably true that an expert, with the patent before him, can select from these drawings every separate feature of the Design, often finding two or more of them in similar juxtaposition. The drawings would not, however, suggest the Design to one who had not seen it before.

A Design requires invention; but a different set of faculties are brought into action from those required to produce a new process or a new machine. In each case there must be novelty; but the Design need not be useful in the popular sense. It must be beautiful. It must appeal to the eye. The distinction is a metaphysical one and difficult to put into words. A flying wheel, a wheel revolving rapidly between two outstretched wings, presents a pleasing object to the eye. A graceful pattern for the handle of a spoon or fork may attract many purchasers, and yet it cannot be said that the embodiment of these Designs requires an exercise of the "intuitive faculty of the mind" in the sense that this faculty is exercised in inventions like the telephone or the safety-lamp. The policy which protects a Design is akin to that which protects the works of an artist, a sculptor, or a photographer by copyright.

It requires but little invention, in the sense above referred to, to paint a pleasing picture, and yet the picture is protected because it presents the personal characteristics of the artist and because *it is his.* So with a Design. If it presents a different impression upon the eye from anything which precedes it; if it proves to be pleasing, attractive, and popular; if it creates a demand for the goods of its originator, even though it be simple and does not show a wide departure from other Designs, its use will be protected.

In the active competition of trade a dealer is fairly entitled to the advantage, slight though it be, which attends such enterprise, and a rival in business should not be permitted thus openly and defiantly to invade the territory of another. It is so easy for every dealer, with the wide universe before him, to select a Design of his own. The appropriation by him of the Design of his neighbor is usually so unnecessary and unwarrantable that the law is seldom relaxed for his advantage.

It is impossible to read the literature upon this subject without being convinced that the courts, though applying the same rules, have looked with greater leniency upon Design patents than patents for other inventions. From the nature of the case it must be so. A Design patent necessarily must relate to subject-matter comparatively trivial. The object of the law is to encourage those who have industry and genius sufficient to originate objects which give pleasure through the sense of sight.

The case of *Miller* v. *Smith* (5 Fed. Rep., 359) is exactly in point. It is rarely that two cases are so nearly parallel upon the facts. There the Design for lockets, sleeve-buttons, &c., consisted of a rustic letter in relief, ornamented with leaves placed on the line of the letter. The patent was upheld, although the prior art disclosed flat drawings of similar letters and also rustic letters having branches and sprays of leaves springing from and around them. If there is any difference in the two Designs, the preponderance of originality would seem to be in favor of the one in hand. There is no room to doubt that the decision would have been the same had Miller's Design been of a rustic letter placed upon a larger letter of leaves instead of leaves placed upon a rustic letter. To adopt the language of Mr. Justice Clifford, when speaking of proofs very similar to those offered by these defendants:

> Nothing of the exact kind is shown in these exhibits, nor is there anything which can be regarded as proof that the thing patented was known to others before the invention patented was made by the patentees. Many attempts are made to prove that fact, but the proofs all fall short of meeting the requirement.

Upon the authority of this decision the doubt which is entertained upon this question must be resolved in favor of the patent. See, also, *Gorham Co.* v. *White*, (14 Wall., 511;) *Simpson* v. *Davis*, (12 Fed. Rep., 144:) *Foster* v. *Crossin*, (23 Fed. Rep., 400;) *Wood* v. *Dolbey*, (19 Blatchf., 214;) *Streat* v. *White*, (O. G., 1291.)

There should be the usual decree for the complainant.

U. S. Circuit Court—Eastern District of New York.

ADEE *et al. v.* THOMAS.

Decided January 23, 1889.

NULLIFICATION OF PATENTS—PATENTEE—ASSIGNEE.

A patentee may not, as against the assignees of his entire interest, so restrict and qualify the claims of his patent as to make them void for want of novelty.

LACOMBE, *J.*:

The article made by the defendant apparently infringes the patent of 1883, (No. 286,746.) That patent was originally granted to the defendant and by him assigned to the complainants. It would be unjust to allow him now, as against his assignees, to so restrict and qualify the claims of the patent as to make them void for want of novelty. (*Curran* v. *Birdsall*, 20 Fed. Rep., 835.) Practically that is what he seeks to do on this motion. Complainants may take an injunction in the first action. The questions raised in the other two may be disposed of on final hearing.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Appendix No. 2 to the index to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1883, has been issued, and is now for sale. These indexes, arranged alphabetically, numerically, and by classes, are completed to June 30, 1883, and comprise the following volumes:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 80 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Notice.

UNITED STATES PATENT OFFICE,
Washington, D. C., April 13, 1888.

To expedite the distribution of the mail in this Office, and to insure the prompt and certain delivery of communications to the divisions and officials having charge of the matters to which they relate, attorneys and correspondents are respectfully requested to enter upon the upper left-hand corner of amendments and other communications, if known to them, the number of the room and the name of the examiner or designation of the division to which the communication should be sent.

BENTON J. HALL,
Commissioner of Patents.

DESIGNS.

19,061.—WATCH-CASE.—*Thomas K. Benton*, Summit, N. J., assignor to *The Courvoisier, Wilcox Manufacturing Company*, New York, N. Y. Application filed March 7, 1889. Serial No. 302,332. Term of patent 7 years.

19,062.—BRUSH OR MIRROR BACK.—*Henry Berry*, Shelton, Conn., assignor to *The Derby Silver Company*, same place. Application filed March 20, 1889. Serial No. 304,047. Term of patent 7 years.

19,063.—KNITTED GARMENT.—*Swits Condé*, Oswego, N. Y. Application filed March 18, 1889. Serial No. 303,780. Term of patent 7 years.

19,064.—BRIDLE-BIT.—*George F. Eberhard*, Cleveland, Ohio. Application filed March 18, 1889. Serial No. 303,778. Term of patent 7 years.

19,065.—CARPET.—*James L. Folsom*, Brooklyn, N. Y., assignor to *The Hartford Carpet Company*, Hartford, Conn. Application filed March 7, 1889. Serial No. 302,347. Term of patent 3½ years.

19,066.—ORNAMENTATION OF DISHES.—*Emile Gérard*, Limoges, France, assignor to *Oliver A. Gager*, Brooklyn, N. Y. Application filed April 20, 1887. Serial No. 235,564. Term of patent 7 years.

19,067.—CARPET.—*Henry Hunt*, Greenville, N. J., assignor to *The Hartford Carpet Company*, Hartford, Conn. Application filed March 7, 1889. Serial No. 302,336. Term of patent 3½ years.

19,068.—ORGAN-CASE TOP.—*Louis H. Marston*, Chicago, Ill. Application filed March 1, 1889. Serial No. 301,705. Term of patent 3½ years.

19,069.—BRETZEL OR CRACKER.—*Eugene H. Sandt*, Allentown, Pa. Application filed April 3, 1889. Serial No. 305,876. Term of patent 7 years.

19,070.—CARPET.—*William E. Sayers*, New York, N. Y., assignor to *The Hartford Carpet Company*, Hartford, Conn. Application filed March 7, 1889. Serial No. 302,331. Term of patent 3½ years.

19,071.—SPOON OR FORK HANDLE.—*Frederick Schmidt*, North Attleborough, Mass., assignor to *F. M. Whiting & Co.*, same place. Application filed March 29, 1889. Serial No. 305,311. Term of patent 3½ years.

19,072.—BOOK-MARK.—*Sarah P. Spencer, Jr.*, Elizabeth, N. J. Application filed March 19, 1889. Serial No. 303,936. Term of patent 7 years.

19,073.—FABRIC FOR CLOAKING, &c.—*Henry Topham*, Philadelphia, Pa., assignor to *Scheppers Brothers*, same place. Application filed March 27, 1889. Serial No. 305,003. Term of patent 3½ years.

19,074.—CURTAIN, DRAPERY, &c.—*Candace Wheeler*, New York, N. Y. Application filed February 20, 1889. Serial No. 300,628. Term of patent 7 years.

19,075.—STOVE-SHELF.—*George E. Wilbur*, Taunton, Mass., assignor to *The Weir Stove Company*, same place. Application filed March 8, 1889. Serial No. 302,534. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,532.—STATUARY.—*Carl Beer*, Chicago, Ill. Application filed March 19, 1889. Used since March 14, 1889.

"An equilateral triangle embracing a star."

16,533.—WATCHES AND WATCH-CASES.—*Crescent Watch Case Company*, Brooklyn, N. Y. Application filed March 9, 1889. Used since September, 1882.

"The representation of a star and crescent combined with the initials 'A. W. W. Co.'"

16,534.—CERTAIN NAMED MEDICINES.—*Forestine Medicine Company, (Limited,)* Gloversville, N. Y. Application filed February 9, 1889. Used since January 8, 1889.

"The word 'FORESTINE.'"

16,535.—CORN-SALVE.—*Giant Chemical Co.*, Philadelphia, Pa. Application filed January 24, 1889. Used since November, 1884.

"The word 'ACORN' and the representation of an acorn, whether the two be used together or separately, and whether a hyphen be used or omitted between the letters 'A' and 'c' of the word."

16,536.—DENIMS.—*Lewis C. Hasell*, New York, N. Y. Application filed March 16, 1889. Used since January 1, 1889.

"The word 'KENWOOD.'"

16,537.—ORANGES AND OTHER CITRUS FRUITS.—*Indian River Orange Growers' Association*, City Point, Fla. Application filed March 16, 1889. Used since February 20, 1889.

"The representation of a star."

16,538.—REFRIGERATORS AND BEER, WATER, AND WINE COOLERS.—*The John C. Jewett Manufacturing Company*, Buffalo, N. Y. Application filed March 25, 1889. Used since January 1, 1885.

"The word 'LABRADOR.'"

16,539.—SWEAT-COLLARS.—*E. L. McClain Manufacturing Co.*, Greenfield, Ohio. Application filed March 18, 1889. Used since February 14, 1889.

"The word 'INVINCIBLE.'"

16,540.—WATCH-CASES.—*H. Muhr's Sons*, Philadelphia, Pa. Application filed March 15, 1889. Used since April 26, 1888.

"'PHOENIX,' whether expressed pictorially or by word."

16,541.—CANNED SALMON.—*Nushagak Canning Company*, San Francisco, Cal. Application filed March 14, 1889. Used since July 1, 1888.

"The words 'MOOSE HEAD' and the pictorial representation of a moose's head."

16,542.—PAINTING AND GRAINING OIL.—*James B. Sipe & Co.*, Allegheny, Pa. Application filed March 13, 1889. Used since August, 1886.

"The words 'JAPAN OIL.'"

16,543.—LAMP-CHIMNEYS.—*Société Anonyme pour la Fubrication D'Apparells D'Eclairage*, Liege, Belgium. Application filed March 15, 1889. Used since November 29, 1883.

"The letters and figure 'L & B.'"

16,544.—SOCIETY BOOKS AND PRINTED MATTER.—*The Supreme Sitting of the Order of the Iron Hall*, Indianapolis, Ind. Application filed April 26, 1888. Used since March or April, 1881.

"The representation of a safe having figures indicating an amount or sum of money above it or on its top."

16,545.—LIQUID AND POWDERED PERFUMERIES AND SOAPS.—*John Wanamaker*, Philadelphia, Pa. Application filed June 25, 1888. Used since January 1, 1883.

"The word 'CARTWRIGHT.'"

16,546.—CHUCKS.—*Westcott Chuck Company*, Oneida, N. Y. Application filed March 14, 1889. Used since January 1, 1875.

"The words 'LITTLE GIANT.'"

LABELS.

5,894.—Title: "SILVER STEEL" (FOR BRASS BAND INSTRUMENTS.)—*Henry J. Distin*, Philadelphia, Pa. Application filed April 1, 1889.

5,895.—Title: "SAXE'S TASTELESS CASTOR OIL."—*A. W. Saxe*, South Omaha, Nebr. Application filed April 5, 1889.

5,896.—Title: "CALCULATION" (FOR CIGARS.)—*Schmidt & Co.*, New York, N. Y. Application filed December 15, 1888.

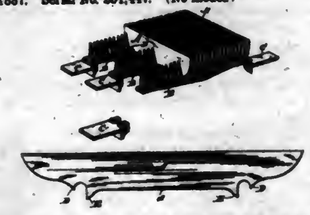
5,897.—Title: "F. M. THOMAS' SURE CURE FOR RHEUMATISM."—*Francis Marion Thomas*, Paris, Tex. Application filed April 4, 1889.

5,898.—Title: "WALKER'S COLD BELT-CEMENT."—*John Walker*, New York, N. Y. Application filed April 2, 1889.

PATENTS

GRANTED APRIL 30, 1889.

402,125. CAR-SEAL. HIRAM ABBOTT, Wakeman, Ohio. Filed Nov. 2, 1888. Serial No. 289,723. (No model.)



Claim.—1. In a car-seal, the combination, with a seal part, of the looped shackle having one arm secured permanently to the seal part and the other arm twisted around the former, substantially as and for the purpose specified.

2. In a car-seal, the combination of the seal part provided with a transverse perforation and a longitudinal perforation intersecting each other, and the looped shackle provided on one of its free ends with an eye which fits in the transverse perforation and is engaged by a pin arranged in the longitudinal perforation, the arms of the shank being twisted together, substantially as specified.

3. In a car-seal, the combination, with a seal part, of the looped shackle having an arm, d, attached to the seal part, and an arm, d^2, twisted around the arm d, the twisted portion of the shackle being provided at intervals with transverse indentations or cuts to partially sever the arms of the shackle, substantially as specified.

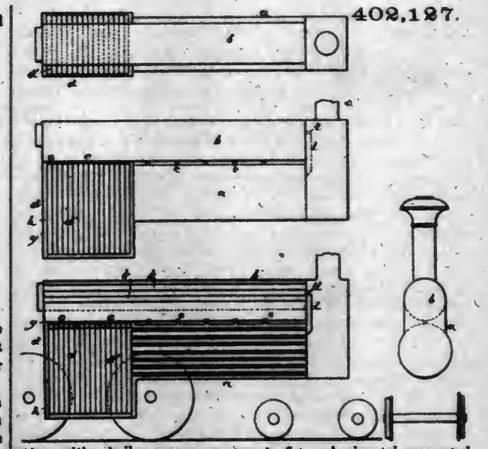
402,126. GRATE-BAR. JAMES A. ALLEN, Adams, Mass. Filed Oct. 4, 1887. Serial No. 251,447. (No model.)

Claim.—1. The combination, with the supporting-bars having the separating and spacing fingers with flat bearing-surfaces between them, of the grate-bars provided with projections on the under side terminating in transverse edges for resting upon the flat bearing-surfaces between the fingers of the supporting-bars, as set forth.

2. The combination, with the supporting-bars having the separating and spacing fingers with flat bearing-surfaces between them, of the grate-bars provided with projections on the under side terminating in transverse edges for resting upon the flat bearing-surfaces between the fingers of the supporting-bars, and other projections on said grate-bars for abutting against the supporting-bars to limit the longitudinal movement of the grate-bars, substantially as described.

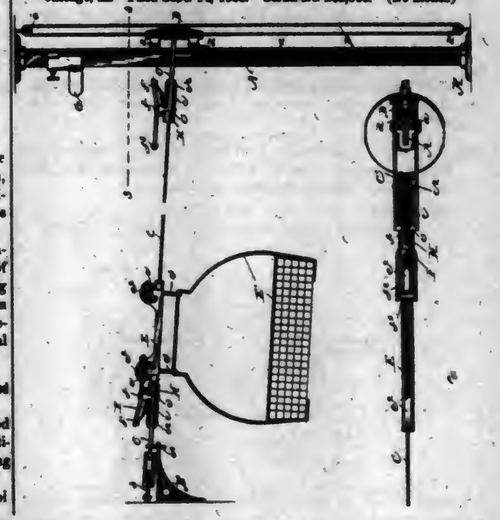
402,127. STEAM-BOILER. JOHN BAIRD, New York, N. Y. Filed Jan. 2, 1888. Serial No. 295,188. (No model.)

Claim.—1. In combination with a fire-box composed of arched tubes, substantially as described, a heating-surface composed of vertical tubes near the rear end of the fire-box, said combination being substantially such as specified.



2. A fire-box composed of arched tubes, as specified, in combination with a boiler proper composed of two horizontal connected shells, the combination being substantially as hereinbefore set forth.

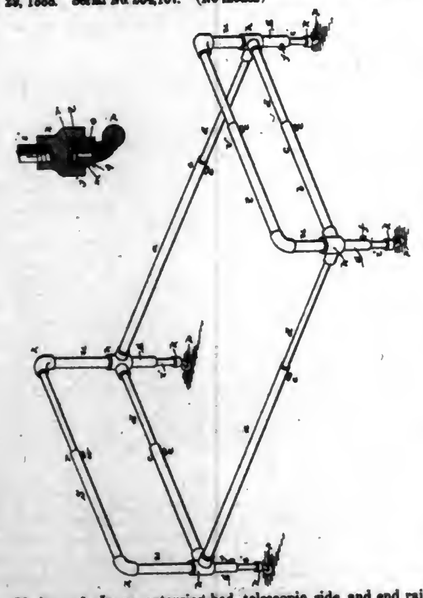
3. A fire-box composed of arched tubes connected at their lower ends with horizontal tubes, substantially as described, in combination with a boiler-iron front, as described.



4. A fire-box composed of arched tubes connected at their lower ends with horizontal tubes, in combination with a tube-sheet and a water-leg to the boiler, as described.

5. A fire-box composed of arched tubes connected at their lower ends with horizontal tubes, in combination with the water-leg and tube-sheet of a boiler, and a boiler-iron front provided with a water-space, all substantially as described.

402,127.



402,128. CASH AND PACKAGE CARRIER. JAMES F. BARTLETT, Chicago, Ill. Filed Sept. 14, 1888. Serial No. 285,269. (No model.)

Claim.—In a cash and package carrier, the combination, with the track-wire C, of links C', for attaching said track-wire to its support, having springs *e* applied between the ends of said links and the ends of the track-wire for permitting the track-wire to yield longitudinally under increasing or decreasing tension, the straight vertical track *a* at one end of said track-wire, a sliding piece, D, pivotally connected to the link C', which is adjacent to the track *a* and adapted to run on said track, and a taut belt, D', supported parallel to said track on a pulley at each end of the belt, said sliding piece being connected in said belt as a part thereof, as and for the purpose specified.

402,129. BED. WILLIAM BECKERT, Allegheny, Pa. Filed Aug. 29, 1888. Serial No. 284,107. (No model.)

Claim.—1. In an extension-bed, telescopic side and end rails, whereby the bed may be extended and contracted longitudinally and laterally, in combination with telescopic legs for adjusting the height of the bed, and devices, substantially as described, for locking said rails and legs in adjustment, in the manner and for the purpose set forth.

2. The combination, in an extension-bed, of the telescopic side and end rails, whereby the bed may be extended and contracted laterally and longitudinally, telescopic legs for adjusting the height of the bed, and four-way couplings for connecting said telescopic sections together, in the manner and for the purpose substantially as described.

3. The combination of the side rails, the end rails, extensible slats having their outer ends bent in the form of an S, the inner curved portion of which is loosely seated upon said side rails, and longitudinal extensible stringers connected to said slats, substantially as described.

402,130. ADJUSTABLE FOOT-REST. GEORGE P. BEDFORD, New York, N. Y., assignor of one-half to Watson L. Savage, same place. Filed Oct. 27, 1888. Serial No. 289,306. (No model.)

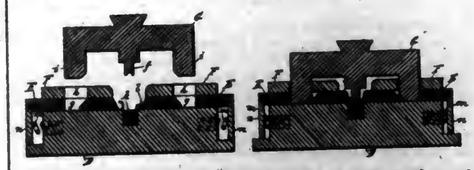
Claim.—1. In an adjustable foot-rest, the combination, with a removable supporting-frame terminating in upwardly-curved hooks *a a'*, which themselves are curved at their lower extremities into retaining-rings *f*, of a flexible suspension-cord, *b*, passing through the retaining-ring *f*, and a stirrup, S, supported at one end thereof, said cord being provided at the other end with a tension-block, *c*, having an eye engaging the suspension-cord *b*, substantially as described.

2. The combination, with a supporting-frame, A, of the foot-piece S', and the continuous suspension-cord *b*, the latter depending from the frame and having attached at one end a tension-block, *c*, provided with an eye engaging the main cord, and having its other end united to the main cord at *e* after passing through the foot-piece S', on each side of which it is knotted to prevent slipping, substantially as described.

402,131. HANDLE FOR SAUCEPANS. WILLIAM H. BERGER, Philadelphia, Pa. Filed May 8, 1886. Serial No. 201,584. (No model.)

Claim.—A handle for saucepans and similar articles, consisting of a main portion having side flanges and projecting lug at the inner end of the handle and perforated between said flanges to prevent accumulation of grease, substantially as and for the purposes specified.

402,132. ROD-COUPLER. ALBERT G. BERRY, Washington, D. C. Filed May 5, 1888. Serial No. 272,936. (Model.)

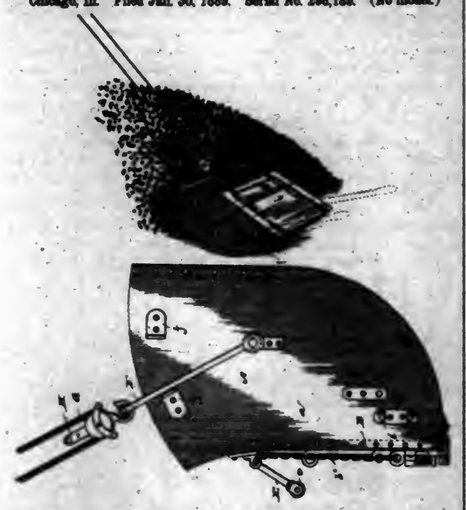


Claim.—1. A coupler having a joint composed of a key upon the male portion, a slot in the female portion for the reception of the key, a recess connected with said slot, and a keeper carried by and adjustable on the female portion to position alongside the recess and within said slot for locking the key within said recess, substantially as and for the purposes set forth.

2. A coupler having a joint composed of a key upon the male portion, a slot in the female portion, a recess in the side of said slot, a removable ring carrying a lug within the slot, a spring to actuate said ring, and a fixed ring to limit the movement of the movable ring, substantially as set forth.

3. A coupler having a joint composed of a key upon the male portion, a slot in the female portion, a recess connected with the slot, and a keeper actuated by a spring to lock the key within said recess, substantially as set forth.

4. A coupler having a joint composed of a key upon the male portion, a slot in the female portion, a recess connected with the slot, a lug within the slot for locking the key within the recess, and a movable ring to which the lug is secured for controlling said lug, substantially as set forth.

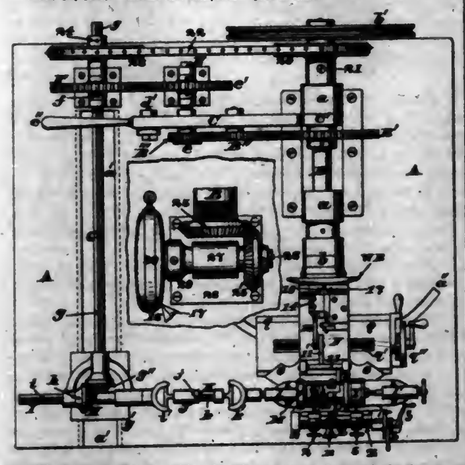


402,133. MACHINE FOR FINISHING METAL TUBES. LEWIS F. BEITS, New York, N. Y. Filed July 27, 1887. Serial No. 245,398. (No model.)

Claim.—1. In a machine for finishing metal tubes, the recessed bed-plate, the bending-plates mounted thereon and having openings with inclined faces, the mandrel, and the closing-die provided with projections arranged to enter the openings in the bending-plates and to move said plates, the parts being combined substantially as shown and described.

2. In a machine for finishing metal tubes, the combination of a recessed bed-plate, bending-plates mounted thereon and having openings with inclined faces, a mandrel, a closing-die provided with projections arranged to enter the openings in the bending-plates, and returning-springs operating in connection with the bending-plates, substantially as shown and described.

402,134. LOADING AND HOISTING BUCKET. WALTER S. BOGLE, Chicago, Ill. Filed Jan. 30, 1889. Serial No. 298,189. (No model.)



Claim.—1. A loading and hoisting bucket having a front wall with a straight portion, a bail pivoted to opposite walls of the bucket at right angles to said front, and a bail-stop located on one of the walls to which the bail is pivoted and in such position as to be above the bail when the bucket is in the act of filling, whereby to limit the movement of the bail and to form a fulcrum therefor, substantially as described.

2. A loading and hoisting bucket having a wall with a straight portion, a bail pivoted to opposite walls of the bucket at right angles to the straight portion, a bail stop located on one of the walls to which the bail is pivoted and between the pivotal point thereof and the mouth, whereby to limit the movement of the bail and to form a fulcrum therefor in filling, and lugs on the walls to which the bail is pivoted to provide bearings for levers, whereby to control the bucket in filling, substantially as described.

3. A loading and hoisting bucket having a front wall with a straight portion, a bail pivoted to opposite walls of the bucket at right angles to the straight portion, a bail-stop located on one of the walls to which the bail is pivoted, and in such position as to be above the bail when the bucket is filling, whereby to limit the movement of the bail and to form a fulcrum therefor, and a hinged door in the rear wall of the bucket and toward the bottom thereof, substantially as described.

402,135. ENGRAVING AND CHASING MACHINE. WILLIAM W BRADLEY, Newport, Ky., assignor to John C. Dueber, same place. Filed Mar. 14, 1888. Serial No. 282,706. (No model.)

Claim.—1. The combination, in an engraving and chasing machine, of a spindle provided with means for holding the blank, a roll having one section that produces the foreground ornament on said blank and another section that produces the background-lining on the same, a pair of tracers operated uniformly by a feed-screw and sliding along a common rocker, so as to traverse these sections, and devices that communicate the motion of said tracers to a single cutter, substantially as herein described.

2. An engraving and chasing roll composed of an ornamented section and another section consisting of a series of notched or fluted disks, said sections being mounted upon a common mandrel and traversed by uniformly-moving tracers that actuate a single cutter, substantially as herein described.

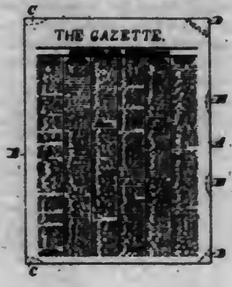
3. The combination, in an engraving and chasing machine, of a roll having foreground and background sections, tracers that traverse said sections and communicate motion to a single cutter, and a feed-screw that uniformly operates said tracers, substantially as herein described.

4. The combination, in an engraving and chasing machine, of a spindle provided with means for holding the blank, a roll having one section that produces the foreground ornament and another section that produces the background-lining, a pair of tracers operated uniformly by a feed-screw and sliding along a common rocker, so as to traverse these sections, and devices that communicate the motion of said tracers to a single cutter mounted in a carrier hinged to the head of a compound slide-rest, substantially as herein described.

5. In an engraving and chasing machine, the ornamented roll S *s* and notched disks V *v*, secured upon a common mandrel, R', having a head, R, in combination with the driving-chuck M, having a chamber, *m*, center *m'*, and screws *m'' m''*, which screws enter the longitudinal slots *r r* of said head R and cause the mandrel, roll, and disks to revolve in unison with said driving-chuck, as herein described.

6. The combination of rocker X, feed-screw Z, standard 6, having slot 6', and set-screw 10, and the divided nut composed of an unthreaded portion, 8, and threaded portion 8', said unthreaded portion being provided with a lug, 7, that engages said slot 6', for the purpose herein described.

7. The combination, in an engraving and chasing machine, of the main spindle B, having a sprocket-wheel, 20, and means for holding the blank, a longitudinally-shiftable shaft, G, having a sprocket-wheel, 23, and universal-joint connections with the slide-rest that carries the ornamental roll, and a perforated belt that communicates motion from wheel 20 to wheel 23, said wheel 20 having means for temporarily locking it to said spindle B, for the purpose described.



8. The combination, in an engraving and chasing machine, of the main spindle B, carrying a bevel-gear, 25, that drives a similar gear, 25', and an auxiliary chuck, 29, which is temporarily attached to the machine, for the purpose described.

9. An auxiliary chuck geared at an angle to the main spindle of an engraving and chasing machine, for the purpose described.

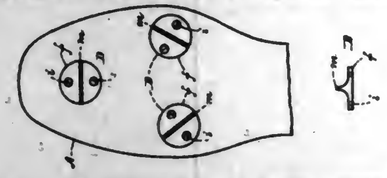
10. The combination, in an engraving and chasing machine, of a roll having foreground and background sections, a pair of tracers operated uniformly by a feed-screw and sliding along a common rocker, and devices for uncoupling the background-tracer from said screw, and means for temporarily locking said tracer to said rocker, for the purpose described.

11. The combination, in an engraving and chasing machine, of mandrel R', having a head, R, screw-threaded shank R'', and longitudinal groove *r''*, the ornamented roll S *s*, secured to said head by the screws *r' r'*, the head T, having a screw, *t*, that enters said groove *r''*, the stop-plate U, having an annular neck, *u'*, surrounding the mandrel R', a series of notched disks, V *v*, mounted upon said annular neck, a cap, W, secured to the stop-plate U by screws *w w*, traversing said disks, and a nut, *w'*, engaged with the screw-threaded shank R'' of the mandrel, which latter is coupled to the driving-chuck M, as herein described.

402,136. METHOD OF PREVENTING THE FRAUDULENT RETURN OF PERIODICALS. ROBERT D. BRAIN, Springfield, Ohio. Filed Oct. 13, 1888. Serial No. 288,018. (No model.)

Claim.—1. The herein-described method of preventing the fraudulent return of newspapers and other periodicals, the same consisting in uniting the sheets thereof at such point or points as will cause a severance by the act of opening the sheets to secure access to the reading-matter therein.

2. The herein-described method of preventing the fraudulent return of newspapers or other periodicals, the same consisting in uniting the sheets thereof at or near their margin, so that by the act of opening the sheets to secure access to the reading-matter therein a change from the normal appearance of the connection will be effected.



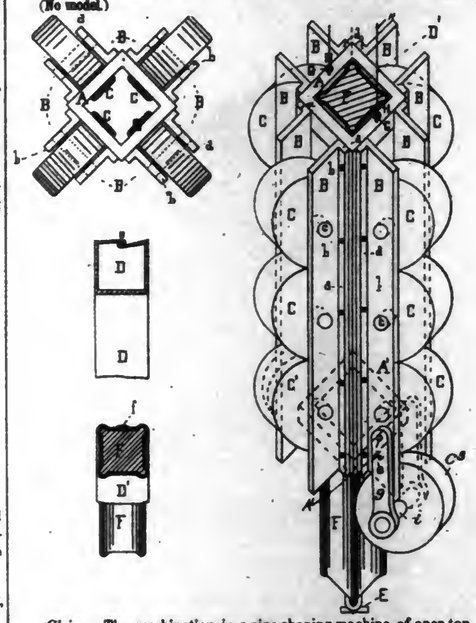
3. The herein-described method of preventing the fraudulent return of newspapers or other periodicals, the same consisting in uniting the margins of sheets at the corners thereof by an adhesive substance, whereby the sheet or sheets will be torn by the act of opening them for reading.

402,137. BOOT-DRIER. EDMUND A. BRYANT, Ellicottsville, N. Y. Filed Oct. 6, 1887. Serial No. 251,647. (No model.)

Claim.—As an improvement in boot-driers, the base A, adapted to be removably placed over a stove-hole, the reversely-inclined tubular standards rising from the base, and reversely-inclined tubes at the upper ends of the standards, as set forth.

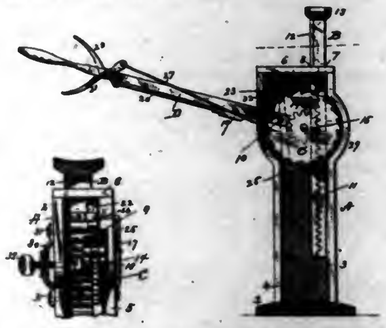
402,138. CALK FOR RUNNING-SHOES. WALTER W. BURNHAM, Boston, Mass. Filed Jan. 25, 1888. Serial No. 297,506. (No model.)

Claim.—The calk D, comprising the bed-plate *f*, provided with holes *i*, and the blade *m*, formed centrally and integral therewith and projecting at right angles therefrom, substantially as described.



402,139. WATER-GATE. JOSEPH R. CAPLINGER, Smithfield, Ky. Filed Dec. 10, 1888. Serial No. 293,207. (No model.)

Claim.—1. The combination, with the posts B, the gate-sections C C, hinged thereto, and springs for normally throwing said sections to a closed position, (the lower inner ends of the sections being provided with projecting studs $c' c'$,) of the gravity-latch E, said latch hinged at its rear end forward of the gate, provided with a water-resistance surface at its rear end, its forward end inclined and provided with a notch adapted to engage the studs $c' c'$ when the latch is dropped, the forward end of said latch adapted to rise from engagement with the studs when increased pressure is applied against the rear end of the latch, substantially as and for the purpose specified.



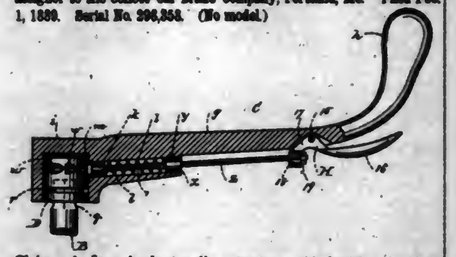
2. The combination, with the posts B B, the gate-sections C C, hinged to said posts, and springs for forcing said sections normally into a closed position, said sections provided with inwardly-projecting studs $c' c'$, of the gravity-latch pivoted forward of the gate and projecting to the rearward thereof, said latch consisting of the body portion e', having an inclined end, e^2, a notch, e^3, adapted to engage the studs $c' c'$, a rearwardly-extending arm, e, pivoted, as shown, and lateral wings or extensions E^4, extending transversely across the rear face of the latch below its pivotal point, said arms forming a resistance-surface for the water-pressure, substantially as and for the purpose set forth.

402,140. MACHINE FOR SHAPING SHEET-METAL PIPES. JAMES A. CARR, Woodbury, N. J. Filed May 17, 1888. Serial No. 274,178. (No model.)

Claim.—The combination, in a pipe-shaping machine, of open top and bottom bolting-pieces, A A', roll-carriers B, shaping-rolls C, stationary mandrel F, and suitable mechanism for operating the same, for the purpose shown and described.

402,141. LIFTING-JACK. HENRY H. CLEVER, Cloversburg, Pa. Filed July 13, 1888. Serial No. 279,892. (No model.)

Claim.—1. The combination, with the casing A, formed with a slot, 7, in its top 6, to receive the lifting-rack B, said slot having a groove, 8, at its edge, of the lifting-rack B, having the teeth united at the edge by a continuous flange, 12, the gear-wheel mounted in the casing, the stop-pawl 22, depending from the roof of the casing, the lever D, fulcrumed on bearings in the casing and formed with an open-end slot, 17, to set about the ratchet-wheel, and provided with a spring-actuated bar, $19^{\times}$, a bell-crank lever, 21, on the lifting-lever D, to operate the spring-actuated bar $19^{\times}$, the latch 25, mounted on the casing and arranged with its free end to bear out on the stop-pawl, and a bell-crank lever, 28, mounted on the lifting-lever to operate said latch, substantially as described.



2. In a lifting-jack, the combination, with the reciprocable lifting-rack B, a gear and ratchet wheel, 14, mounted in the casing, and a pawl, 22, to hold the gear and ratchet against reversing, of a lifting-lever, D, fulcrumed on bearings in the casing, and formed with an open-end slot, 17, to set about the ratchet-wheel, a spring-actuated pawl-bar, $19^{\times}$, mounted on the lifting-lever, and a bell-crank lever, 21, on the lifting-lever to operate the stop-bar.

3. The casing A, having an enlarged upper portion to hold the operating mechanism, the lifting-rack B, arranged in the casing with its rack against the wall thereof, and formed with a side flange, 12, to

connect the teeth and guide the bar, combined gear and ratchet wheels 14, mounted on bearings in the casing, a spring-actuated pawl, 22, to stop the gears against reversal, a lever, D, to give intermittent motion to the gear and ratchet, and having a spring-pawl, $19^{\times}$, to engage the ratchets, and two levers, 21, 28, mounted on the lifting-lever D to release the pawls of the lever and casing, all substantially as described.

4. In combination with the casing, the reciprocable rack B, and gears, the spring-bar 30, secured to the side of the casing, and the set-screw 32, projected through the spring-bar with its end to bear on the end of the journal of the gears, substantially as and for the purpose specified.

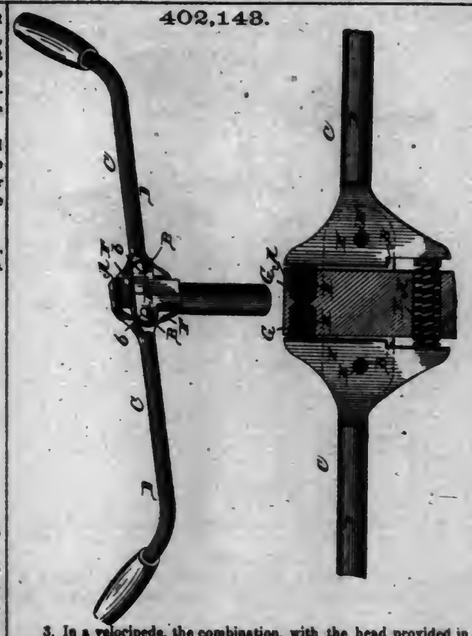
402,142. BRAKE-HANDLE. AUSTIN B. COLLETT, Chelsea, Mass., assignor to the Collett Car Brake Company, Portland, Me. Filed Feb. 1, 1889. Serial No. 298,358. (No model.)

Claim.—1. In a brake-handle, a body provided with a head at one end and a vertical chamber in its opposite end, a ratchet-block fitted to revolve in said chamber and provided with a socket for the brake-rod, a horizontal chamber in said body opening into the vertical chamber, a spring-actuated pallet fitted to slide in said horizontal chamber, a lever pivoted to said handle, and a rod connecting one arm of said lever with the pallet, substantially as and for the purpose set forth.

2. In a brake-handle, a combination of a body having a vertical chamber, a ratchet-block fitted to revolve therein and provided with an annular groove, a retaining-pin projecting from the handle into said groove, a horizontal chamber opening into said vertical chamber, a pallet fitted to slide therein, a sleeve in the outer end thereof, a spring between said sleeve and pallet for holding it in engagement with said ratchet, a rod secured to said pallet and sliding in said sleeve, and a lever on said handle, one arm of which is secured to the outer end of said rod, substantially as described.

3. In a device of the character described, the combination of a brake-rod provided with a ratchet-wheel, a click for said wheel, a handle provided with a vertical chamber, a ratchet-block fitted to revolve therein and provided with a socket for the brake-rod, a horizontal chamber, a spring-actuated pallet therein in engagement with said ratchet-block, and a rod fastened by one end to said pallet, its opposite end being movably secured in an arm of a lever pivoted to said handle, substantially as described.

4. The brake-handle C, comprising the body *g*, provided with the head *h* and chamber *m v*, the ratchet-block D, fitted to revolve in the chamber *m* and provided with the socket *p*, the rod *x*, provided with the pallet *k*, disposed in the chamber *v*, the spring *l*, for actuating said pallet, and the lever H, pivoted to said body and provided with the opening 18, in which the outer end of said rod is secured, substantially as described.



5. The brake-rod B, provided with the wheel *b* and head *g*, in combination with the click *f*, the handle C, comprising the body *g*, having the head *h* and chambers *m v*, the ratchet-block D, fitted to revolve in the chamber *m* and provided with the socket *p*, the pallet *k*, disposed in the chamber *v*, the sleeve *x*, the lever H, pivoted to said body and provided with the opening 18, the rod *x*, fitted to slide in said sleeve and secured to said pallet, and the spring *l*, disposed in the chamber *v*, substantially as described.

402,143. HANDLE-BAR FOR BICYCLES. CHARLES J. COLLINS, Cincinnati, Ohio. Filed Feb. 13, 1889. Serial No. 299,773. (No model.)

Claim.—1. In a velocipede, the combination, with the head, of the handle-bar formed in independent arms or sections, which are pivoted to the head and are provided with cross-heads at their adjacent ends, and the cushions arranged between the ends of the cross-heads and the head of the machine, substantially as specified.

2. In a velocipede, the combination, with a head provided with lateral parallel ears B B, of the handle-bar formed in independent arms or sections which are pivoted between the said ears and are provided with cross-heads F F, the rubber cushions bearing against the upper ends of the said cross-heads, and the coiled spring-cushion bearing against the lower ends of the said cross-head, substantially as specified.

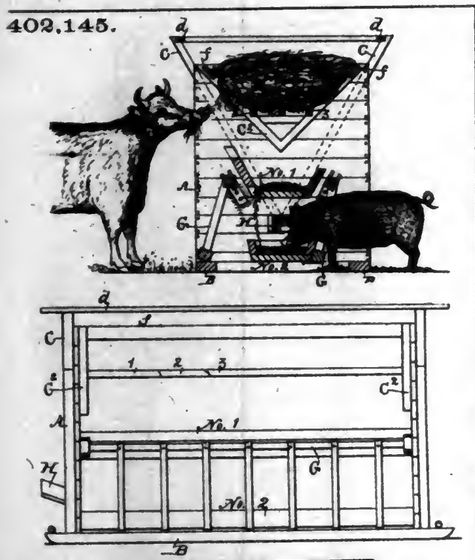
402,148.

3. In a velocipede, the combination, with the head provided in its opposite sides with the recesses G G, and having a transverse perforation, I, of the rubber cushions fitting in the said recesses, the coiled spring-cushion arranged in the transverse perforation, and the handle-bar comprising the independent arms or sections D D, which are pivoted to the head, and are provided with cross-heads which bear at their upper and lower ends, respectively, against the rubber and the spring-cushions, substantially as specified.

4. In a velocipede, the head, the handle-bar formed in independent arms or sections which are pivoted to the head, the rubber cushions H, bearing above the pivot-point of the arms or sections, and the coiled spring K, bearing below the said pivot-point, as set forth.

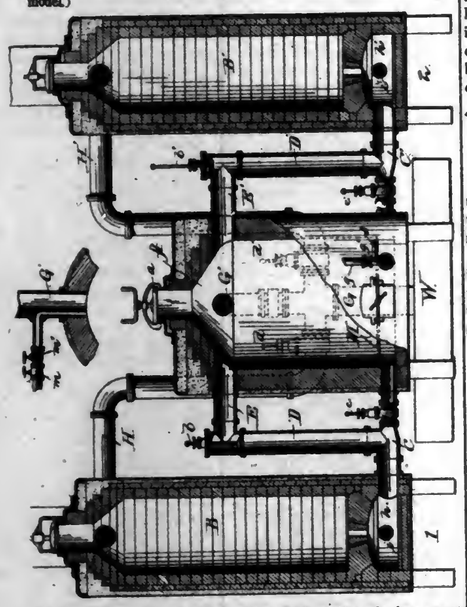
5. In a velocipede, the head, the handle-bar formed in two independent sections pivoted to the head and held out of contact therewith by means of separate and independent cushions which bear against the said sections, respectively, above and below the pivot point thereof, as set forth.

402,144. ADJUSTABLE BARREL-COVER. SAMUEL R. CRAGER, Wichita, Kans. Filed Feb. 19, 1889. Serial No. 300,427. (No model.)



Claim.—1. The barrel-cover consisting of the combination of the screen-cover R S, the coil-spring band D, and the chains C, connecting said cover and band, substantially as and for the purpose set forth.

2. The combination, with a barrel-cover consisting of a screen or netting, of the adjustable spring-band D, and flexible connections connecting said cover with said band, substantially as and for the purpose specified.

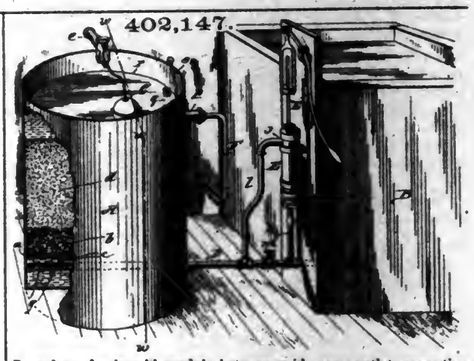


402,145. COMBINED TROUGH AND RACK. WILLIAM H. CRITCHFIELD and ROSS J. RENNER, Wirt, Iowa. Filed July 30, 1888. Serial No. 280,856. (No model.)

Claim.—The device for feeding animals, consisting of the frame A B, the triangular frames C and C^1, having fixed horizontal bars to produce a feed-rack, the trough No. 1, having an adjustable side or section, the trough No. 2, and the adjustable guards G, constructed and combined substantially as shown and described, for the purposes stated.

402,145.

402,146. PROCESS OF MANUFACTURING GAS. WILLIAM M. COSH, Baltimore, Md. Filed Oct. 19, 1888. Serial No. 288,603. (No model.)



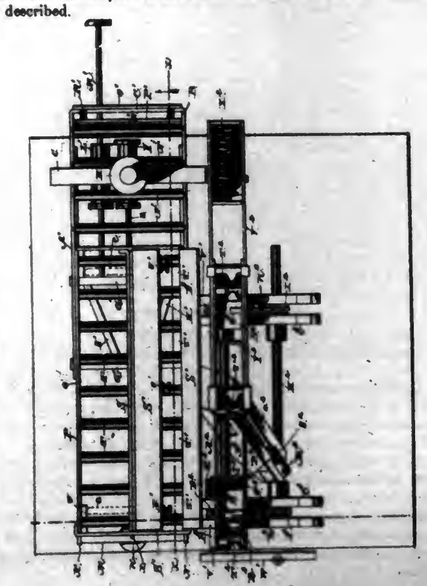
Claim.—The hereinbefore-described method of producing gas at a single heat, consisting in first passing steam through a superheater, and thence directly through an incandescent mass of coal, then causing the resultant gases to take up hydrocarbon vapor, and subsequently passing the gases and vapor through a fixing-chamber, then reversing the current of steam and passing it through the chamber first used as a fixing-chamber, then through the incandescent coal in a direction opposite to that first mentioned, then causing it to take up hydrocarbon, and, finally, passing the gases and vapor through the chamber first used as a superheater, all as set forth.

402,147. FILTERING APPARATUS. CHARLES H. DENISON, Springfield, Mass. Filed Jan. 14, 1889. Serial No. 296,230. (No model.)

Claim.—1. The combination, with a filter-tank, a cistern, and a conduit, D, leading thereto from the lower portion of the filter-tank, of a pump having its inlet in communication with said cistern, and having its outlet connected to an intermediate portion of said conduit

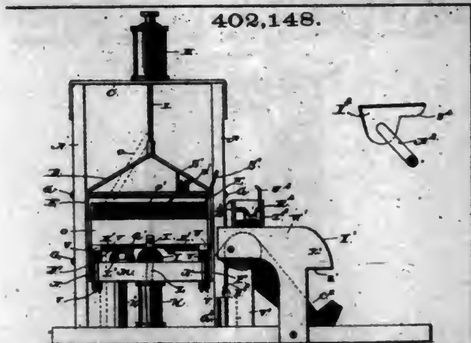
402,147.

D, and a valve in said conduit between said pump-outlet connection and the said cistern, substantially as described.



2. The combination, with a filter-tank provided with a perforated false bottom and a superposed filtering material, and an angular pipe rotatably mounted in said tank and having as a continuation thereof a waste-pipe, a cistern, and a conduit leading thereto from the tank-space below said false bottom, provided with a valve, of a pump by its inlet in communication with said cistern and by its outlet in communication with said lower tank-space, substantially as and for the purpose described.

3. In a filtering apparatus, in combination, a filter-tank provided with a perforated false bottom and a superposed filtering material, an angular pipe rotatably mounted in said tank, and having as a continuation thereof a waste-pipe, F, a supply-pipe, *e*, and a ball-cock, C, a cistern, B, and a pipe, D, leading thereto from the tank-space below said false bottom, provided with a valve, and a pump by its inlet in communication with said pipe D between the said valve and the cistern, and having a pipe, *l*, leading from its outlet to said pipe D between its valve and the filter-tank, all substantially as shown and described, and for the purpose set forth.



402,148. FEED AND TRANSFER MECHANISM FOR ROLLING-MILL PLANTS. ROBERT P. DOLAN, Steelton, Pa., assignor of one-half to A. R. Dunkle, same place. Filed Jan. 13, 1888. Serial No. 260,635. (No model.)

Claim.—1. The combination of the supporting-frame and the table arranged on the said frame and means for raising and lowering the opposite ends of the frame independently, whereby the frame may be tilted or inclined longitudinally, substantially as described.

2. The combination of the frame, means for raising and lowering the opposite ends of the same independently, whereby the frame may be tilted or inclined longitudinally, and the table supported on the frame and adapted to move back and forth thereon, substantially as described.

402,148.

3. The combination of the supporting-frame having its opposite ends independently movable in a vertical direction, the table movable longitudinally on the said frame, and means, substantially as set forth, for operating the said table, substantially as described.

4. The vertically-movable table having the rollers T, and the guide S', having the rollers U' on one side supported at an elevation above the rollers T, substantially as described.

5. The combination of the vertical standards A, the frame D, vertically movable on the said standards, the vertically-movable cross-head M, at a distance from the standards, the track-bars pivotally connected at opposite ends to the said cross-heads and to the frame D, and the table movable longitudinally on the said track-bars, substantially as described.

6. The table having the extension provided with the springs at its outer end, substantially as described.

7. The table having the rollers T, journaled permanently therein, and provided with the longitudinally-adjustable extension having the removable rollers N', substantially as described.

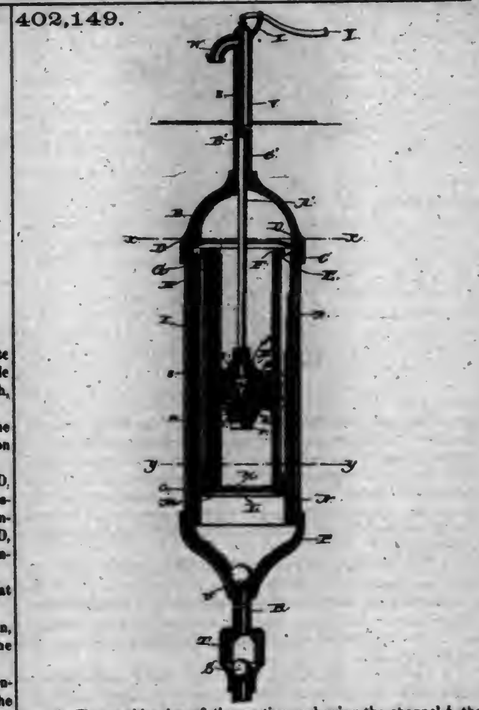
8. The combination of the supporting-frame, the hydraulic engines to raise and lower the opposite ends thereof independently, the table arranged on the frame, the hydraulic engine to move the said table in a longitudinal direction, the extension, and the hydraulic engine to operate the said extension, substantially as described.

9. The combination of the guide-arm W', the inclined guideways C^3, the endless carriers, the guide R^3, arranged on the said guideways and secured to the said carrier, means to normally elevate the guide the inclined cam P^3, and the extension movable longitudinally on the outer end of the guide and having the spring, said extension being further provided with the roller engaging the cam P^3, substantially as described.

10. The combination of the standards V', the shaft A^3, journaled therein, the guideways C^3, the shaft H^3, journaled in the lower ends of the said guideways, the sprocket-wheels on said shafts, the endless sprocket-chains connecting said sprocket-wheels, the drum secured to shaft A^3 and having the chain and counterweight G', and the guide secured to the endless chain and movable laterally on the guideways, substantially as described.

11. The table, in combination with the longitudinally-adjustable extension having the rollers N', as set forth.

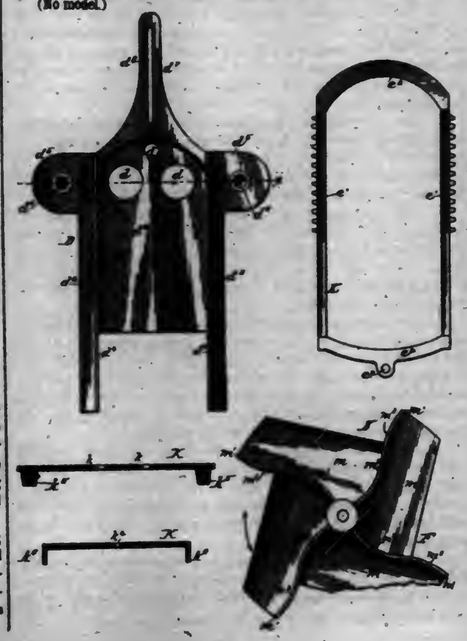
12. The combination, with the guide R^3, means to elevate the same, and the extension V^3, of the guide having the roller W^3, and the inclined cam P^3, to be engaged by the roller when the guide is elevated and lowered, as set forth.



13. The guide R, having the longitudinally-movable extension V^3, in combination with the inclined arms supporting the guides, the carriers to move the same thereon, and the cam engaging the extension, whereby the latter is moved longitudinally by the ascent and descent of the guide, substantially as described.

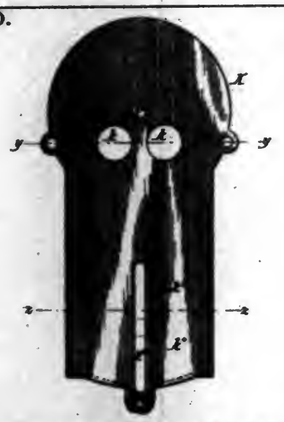
402,149. PUMP. JOSEPH P. M. RAREY, Polk, Ohio. Filed Mar. 3, 1888. Serial No. 266,090. (No model.)

Claim.—1. In a pump, the combination of the outer cylinder, the cap secured to the upper end of the same, the ring E, and the valve-ring D, clamped between the cap and the outer cylinder, the inner cylinder secured to the ring E, the valve-ring K at the lower end of the inner cylinder, the plate L, the collar N, secured to the lower end of the inner cylinder and clamping the plate L and ring K against the inner cylinder, and the plunger reciprocating in said inner cylinder, as specified.



2. The plunger having the sections *a* and *m*, said section *a* having the channel *b*, the recess *f*, communicating with the said channel, said section *m* having the channel *o*, also communicating with the said recess, and the valve arranged in the said recess and adapted to alternately cut off communication between the same and the channels *b* and *o*, substantially as described.

402,149.



3. The combination of the section *a*, having the channel *b*, the depending stud *e*, the recess *f*, formed in said stud and communicating with channel *b*, the section *m*, fitted on the stud and having the channel *o*, communicating with recess *f*, the valve *i*, arranged in the said recess, the nut *r*, screwed to the lower end of the stud, and the packing-rings *s*, clamped between the sections *a* and *m*, substantially as described.

402,150. BROADCAST SEED-SOWER. LLOYD EBERHART and IRVING D. STEVENS, Joliet, Ill. Filed Oct. 24, 1887. Serial No. 253,213. (No model.)

402,150.

Claim.—1. The combination, substantially as hereinbefore set forth, with the hopper having its bottom apertured to discharge at separate points, of the two rotary adjustable valve-plates each provided with a graduated series of openings and arranged to bring its openings into register with one of the discharge-apertures of the hopper-bottom, whereby the discharge from the hopper at separate points may be governed by valve-apertures of different areas, for the purpose described.

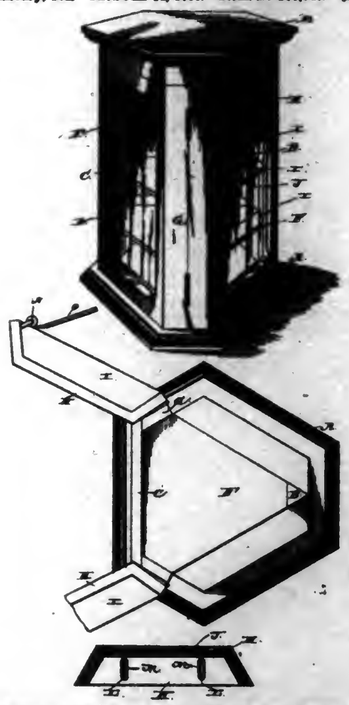
2. The combination, substantially as hereinbefore set forth, with the hopper having an apertured bottom, of a rotary valve-plate, H, provided with a toothed hub or pinion and having a graduated series of openings for the purpose set forth, and a sliding rack engaging said toothed hub or pinion of the rotary valve-plate as a means for operating the same.

3. The rotary valve-plates each provided with a toothed hub or pinion and an annular line of graduated apertures, combined with the sliding double rack engaging the pinions of the rotary valve-plates, whereby the said valve-plates may be rotated either way by operating the double rack, substantially as described.

4. The apertured hopper-bottom provided with a slotted extension, in combination with the apertured rotary valve-plates each having a toothed hub or pinion, and the sliding double rack engaging the toothed hubs or pinions of the rotary valve-plates and having a handle extending up through the slot of the hopper-bottom extension, whereby the rack can be operated and the position of the apertures of the said valve-plates determined, substantially as described.

5. The combination, substantially as hereinbefore set forth, with the rotary adjustable apertured valve-plates, each provided with a toothed hub or pinion, of the sliding double rack engaging the pinions of said valve-plates, and an apertured bottom plate arranged below the rotary adjustable valve-plates and adapted as a guide for the sliding double rack.

6. The combination, substantially as hereinbefore set forth, with the rotary adjustable apertured valve-plates H, arranged below the apertured hopper-bottom, of a plate arranged below the rotary adjustable valves and provided with ribs d^6 and the cut-off slides G, supported to slide upon said plate between its said ribs.



7. The combination, substantially as hereinbefore set forth, with the rotary adjustable apertured valves H, each provided with a toothed hub or pinion, of the double rack engaging said pinions, a plate arranged below said valves and provided with an end extension, d^7, having a slot in which a stud carried by the double rack is received, for the purpose described.

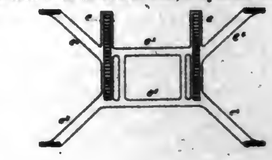
8. The combination, with the hopper and the rotary distributer, of the double-apertured bottom plate, D, having substantially the distinctive features of construction herein set forth, the double-rack frame E, fitted to slide on said bottom plate, the valve-plates H, each provided with a toothed hub, the hopper-bottom K, apertured and slotted, substantially as set forth, and the base-plate B, supporting the hopper and placed over the foregoing stated members.

9. In a broadcast seed-sower, the rotary distributer provided with a series of upturned wings or flanges having their outer end portions formed on the curves m^5, whereof the curvature is arranged in the direction of the length of the wing and substantially as set forth with relation to the direction of rotation of the distributer, for the purpose described.

10. In a broadcast seed-sower, the rotary distributer provided with a series of upturned wings or flanges, m', which are reversely curved in the direction of their length, substantially as and for the purpose described.

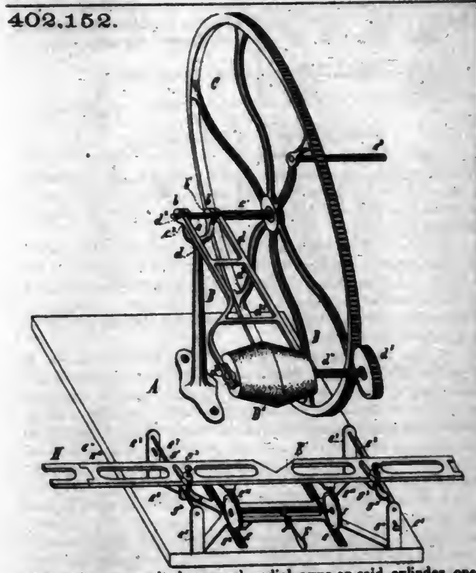
402,151. SHOW-CASE. ERNEST C. FAIN and GEORGE C. POSTON, Granbury, Tex. Filed Jan. 11, 1889. Serial No. 296,046. (No model.)

Claim.—1. The combination, with the case, of the doors, the shelves secured to the doors, the supplemental shelves arranged beneath the same and having transverse slots, and the headed pins or bolts inserted through said slots into the shelves secured to the doors, as set forth.



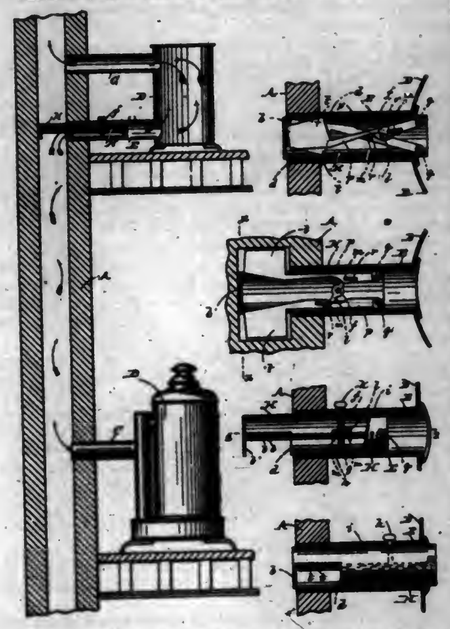
2. A show-case consisting of a casing having a base, a rigid side on the base, and a standard opposite the said side, doors hinged to the rigid side and adapted to close around the standard, the shelves secured between the side and the standard, and the shelves secured to the doors, as set forth.

3. The combination of the frame having one closed side and two open sides and being substantially triangular in horizontal section, the doors hinged to the closed side and adapted to swing over the open sides, the said doors being trapezoidal in horizontal section, the shelves secured in the frame, and the shelves secured to the doors, as set forth.



402,152. GRINDING-MACHINE FOR MOWER AND REAPER KNIVES. EPHRAIM H. FENTON, Kansas City, Mo. Filed Feb. 21, 1888. Serial No. 264,865. (No model.)

Claim.—1. In a grinding-machine, the combination, with the base having a suitable standard, of a driving-wheel, a vibrating tool-holder pivotally attached at one end to said standard and having a rotary grinding-tool at its opposite end in power connection with said driving-wheel, a reciprocating table having a suitable support opposite parallel racks upon said base of the machine and upon the under portion of said table, and cog-gear meshing with said racks, means for rotating said cog-gear, and adjustable stops in the path of said table, as described.



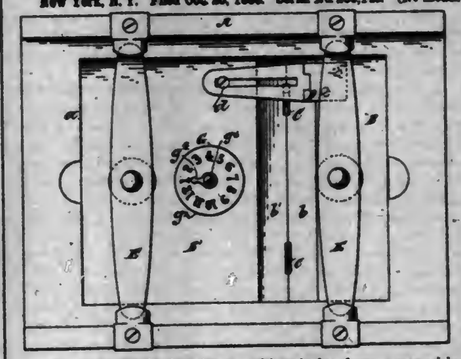
2. In a grinding-machine, the combination, with the base having a suitable standard, of a driving-wheel, a vibrating tool-holder attached at one end to said standard and having a rotary grinding-tool at its opposite end in power connection with said driving-wheel, a table adapted to support the knives to be ground in the path of said grinding-tool provided with a vertical bolt, a cylinder on said bolt provided with a cam at its lower end, radial arms on said cylinder, one of which extends in the plane of and across said table, and a spring on said bolt having one portion connected with the bolt and the opposite portion resting upon said cylinder, for the purpose described.

402,152.

402,153. HEATING APPARATUS. HENRY R. FLINT, Bethel, Me. Filed Feb. 4, 1888. Serial No. 263,545. (No model.)

Claim.—1. In a heating apparatus, the combination of a drum provided with an upper and lower funnel opening into the chimney, a pipe fitted to slide in the lower funnel and be projected into the chimney, and pivoted bars in said pipe having head-plates adapted to be projected into the chimney, whereby the heated air in said chimney may be directed into said drum, substantially as described.

2. In a heating apparatus, the combination of a drum provided with funnels opening into the chimney, a sliding pipe in one funnel adapted to be projected into the chimney and provided with a mouth, pivoted bars in said pipe provided with horizontal head-plates, and a rotating rod in said pipe having arms working in slots in said bars, whereby they may be moved to project their heads laterally into said chimney, substantially as and for the purpose set forth.



3. In a heating apparatus, the combination of a drum provided with funnels opening into a chimney, a pipe fitted to slide in one funnel and be projected into said chimney, a mouth in said pipe, two bars pivoted within the pipe and provided with head-plates adapted to be projected laterally through said mouth, a rotating rod in said pipe, and a bar on said rod provided with arms working in said pivoted bars, whereby they may be actuated as said rod is revolved, substantially as described.

4. In a heating apparatus, the combination of the drum D, provided with the funnels E G, the pipe H, fitted to slide in the funnel E, and provided with the mouth d', the bars p, pivoted in said pipe and provided with heads t, and means, substantially as described, for actuating said bars to project their heads through the mouth of said pipe.

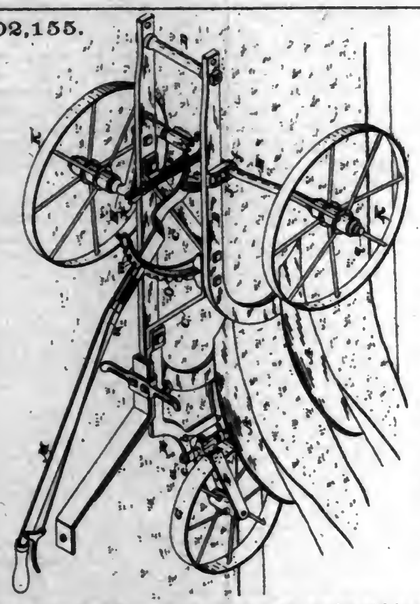
5. In a heating apparatus, the combination of the drum D, provided with the funnels E G, the pipe H, fitted to slide in the funnel E and having the mouth d' and plate b, the bars p, pivoted in said pipe and provided with the heads t, the rod f, fitted to rotate in said pipe and projecting through the funnel-slot i, and the bar l on said rod provided with the arms m, working in slots r in said pivoted bars, all being arranged to operate substantially as described.

6. In a device of the character described, a tube fitted to slide in a drum-funnel and be projected into a chimney, said tube being provided with pivoted bars having head-plates adapted to be projected through the mouth of the tube and block the chimney, whereby the heated air arising therein may be directed into said drum, substantially as described.

402,154. PHOTOGRAPHIC-PRINTING FRAME. WILLARD H. FULLER, Passaic, N. J., assignor to The Scovill Manufacturing Company, New York, N. Y. Filed Oct. 25, 1888. Serial No. 289,140. (No model.)

Claim.—1. A tally for photographic-printing frames, comprising a cup-shaped piece having a screw-threaded hub and the ratchet-teeth turned up from the cup-shaped piece, a disk having figures thereon, a finger, a screw passing through the finger and the disk and engaging with the hub, and a resilient piece secured to the back of the disk and engaging with the ratchet, substantially as specified.

2. The combination, with the printing-frame, of a tally or record consisting of a part provided with ratchet-teeth g and an outer part marked with figures and provided with a spring pawl or detent, g^3, substantially as specified.

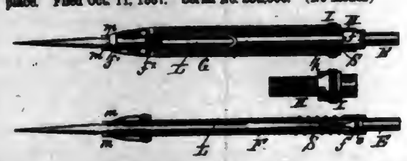


402,155. GANG-PLOW. LEWIS GIBBS, Canton, Ohio. Filed Aug 9, 1888. Serial No. 282,348. (No model.)

Claim.—1. The combination, with a plow-frame consisting of the suitably-connected beams B B', of a two-part axle, H H', journaled in bearings pivotally secured to said frame, a coupling-sleeve, L, in which the two-part axle is secured, one of the parts of the said two-part axle being free to turn in said sleeve, while the other part of the two-part axle is fixed to said sleeve, a segmental rack, k, secured to said sleeve, and a locking-lever, N, to engage the said segmental rack and lock the parts of the two-part axle to each other, substantially as set forth.

2. The coupling-sleeve L, having a segmental rack portion, g, and a laterally-extending arm, J, provided with a vertical aperture and rows of serrations arranged at the sides of said aperture, substantially as set forth.

3. The combination, with a plow-supporting frame, of a supporting axle-shaft composed of two sections, as B and B', secured to said frame in journal-boxes and adapted to be rocked in said journals simultaneously or separately, said axles having cranked portions p and guide-wheel spindles g, a coupling-sleeve secured to axle H', said sleeve having an outwardly-projected arm, j, to which a hand-lever, M, is secured, by which the axle-shaft H' may be rocked in its pivotal con-

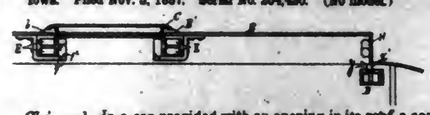


402,155.

nections to the beam B', a rack, O, and means for securing said lever and axle in desired adjustment, substantially as described, and for the purpose set forth.

4. The combination, with a plow-supporting frame composed, essentially, of the beams B B', spaced apart and secured in parallel relation, of a supporting axle-shaft composed of two portions, as H and H', pivotally secured to said frame, said axle portion having crank-portions, as *p* and spindles *q*, a coupling-sleeve, L, secured to the inner end of said portion H', said sleeve having a rack portion, *k*, and an outwardly-projected arm, *j*, a hand-lever, M, secured thereto, a rack, O, and means of adjustably securing said lever to said rack, and a hand-lever, N, secured to axle portion H, the end of said axle loosely secured in sleeve L, and means for locking said lever in engagement with said coupling-sleeve, the lever M, to rock the axles H and H' simultaneously when said axles are locked in rigid relation to raise and lower the plow-supporting frame, and the lever N, to rock the axle portion H independently of the axle H', to adjust the wheel K to the furrow, substantially as described, and for the purpose set forth.

402,156. DENTAL PLUGGER. JOHN W. GILBERT, Philadelphia, Pa., assignor to the S. S. White Dental Manufacturing Company, same place. Filed Oct. 11, 1887. Serial No. 252,006. (No model.)



Claim.—1. The combination of the casing, the tool-carrying spindle fitted to be moved endwise in said casing, the tool-retaining device of said spindle, and the independent striking-plunger carried by said spindle and fitted to reciprocate independently of the reciprocation of said spindle, so as to impart the blows received from the hammer directly to an operating-tool inserted in said spindle, substantially as described.

2. The combination of the casing, the tool-carrying spindle fitted to be moved endwise in said casing, the retracting-spring between said spindle and casing, the tool-retaining device of said spindle, and the independent striking-plunger carried by said spindle and fitted to reciprocate independently of the reciprocation of said spindle, so as to impart the blows received from the hammer directly to an operating-tool inserted in said spindle, substantially as described.

3. The combination of the casing, the tubular spindle movable endwise in said casing, the tool-retaining device of said spindle, the independent striking-plunger carried by said spindle at its rear end, and the adjusting device to limit the inward thrust of said spindle, and thereby the relation of the striking-plunger to its hammer, substantially as described.

402,157. SAFETY RAILWAY-CAR. CHARLES C. GILMAN, Hilton, Iowa. Filed Nov. 5, 1887. Serial No. 254,420. (No model.)

Claim.—1. In a car provided with an opening in its roof, a cover for said opening, and catches arranged for engaging and disengaging with said cover, in combination with an electric battery and connections for operating said catches, substantially as and for the purpose described.

2. In a car provided with an opening in its roof, a cover for the opening, a catch or grapple device to catch and hold the cover and adapted also to be released therefrom, an armature, an electro-magnet, an electric battery, and a wire circuit, in combination with a circuit-breaker and means for operating the latter, substantially as and for the purpose described.

3. In a car having an opening in its top or roof, a cover to fit and close said opening, a catch device adapted to engage and hold said cover, an armature for operating the catch device to cause it to engage the cover, and means tending to move the armature in an opposite direction to disengage the catch device from the cover, in combination with an electric battery, an electro-magnet, an electric-circuit connection, and means for breaking the circuit, substantially as and for the purpose described.

4. A car having an opening in its roof, a cover adapted to close the opening, and a catch mechanism to engage and hold the cover and also adapted to be disengaged therefrom to release the same, in combination with electro-magnetic mechanism for operating the same, substantially as and for the purpose described.

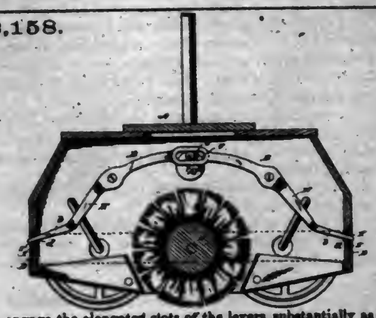
5. A car provided with an opening of a size adapted for the escape of its occupants or passengers when unobstructed, a cover fitting said opening, and a catch device adapted to engage and hold said cover when the car is in its upright or normal position and to release the cover when the car is overturned, in combination with an electric battery, an electro-magnet, electric-circuit connections, and an armature connected with said catch device, substantially as and for the purpose described.

6. A car provided with an opening for the escape of passengers therethrough when unobstructed, a cover loosely fitting and closing said opening, and a catch device for fastening the cover in place, in combination with electro-magnetic mechanism arranged to release the catch device from the cover upon the overturning of the car, substantially as and for the purpose described.

7. In a car having an opening in its roof and a cover fitting to close the same, the combination of pivoted armatures provided with catches for engaging the cover, electro-magnets for operating the armatures in one direction, springs to operate them in the opposite direction, an electric battery, circuit-breakers, and an electric-circuit wire, substantially as and for the purpose described.

8. In a car having an opening in its roof and a cover, C c^3, to loosely fit within and close said opening, the electro-magnets E and spring-actuated pivoted armatures F, supported in bracket-frames G, in combination with an electric battery, D, an electric wire, and circuit-breakers, substantially as and for the purpose described.

9. In a car provided with a bushing, B', fitting in its roof and affording through its central part an opening for the escape of passengers, a cover, C c^3, fitting said opening, electro-magnets E, and pivoted armatures F, carried in brackets G, in combination with a battery, D, the electric-circuit wire formed of the parts *x*, *x'*, and *y*, and the circuit-breakers, substantially as and for the purpose described.



10. A car provided with an opening and a cover fitting loosely and closing the same, electro-magnets E, pivoted armatures F, brackets G, circuit-breaker c^3 L l^3, and circuit-breaker H I K *k' i'*, in combination with the battery D and the electric-circuit-wire connections, substantially as and for the purpose described.

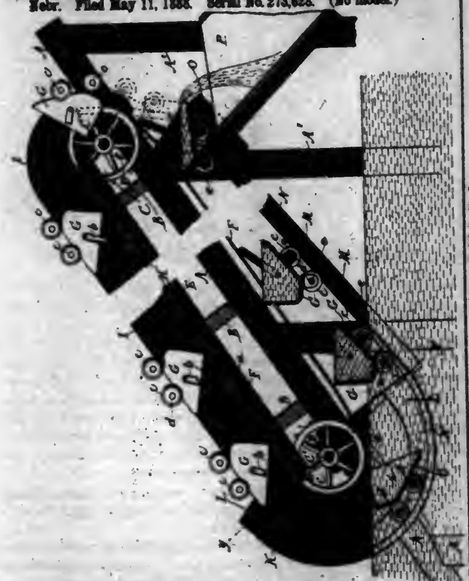
402,158. CARPET-SWEEPER. HENRY A. GORE and HIRAM W. RUTTER, Goshen, Ind. Filed Sept. 12, 1888. Serial No. 285,239. (No model.)

Claim.—1. The combination, in a carpet-sweeper, of the case having its front and rear walls provided with apertures, the metallic bands supporting the brush-shaft, the said bands being pivoted to the case, and levers for moving the said bands on their pivoted bearings, substantially as specified.

2. The combination, with the main case having its front and rear walls provided with apertures, of the bands supporting the brush-shaft pivoted to the said case and having apertures coinciding with those of the case, levers journaled in the end walls of the case with their outer ends engaging the pivoted bands and their inner ends having elongated slots, and a cam or eccentric journaled in the side walls of the case to receive the handle-bail and having an eccentric stud or

402,158.

lug to engage the elongated slots of the levers, substantially as specified.

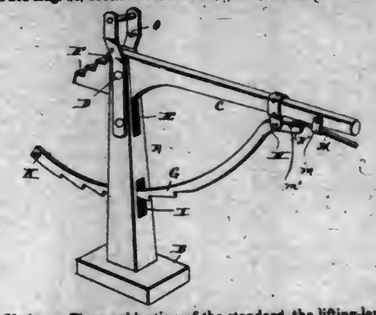


3. In a carpet-sweeper, the combination, with the main case, of metallic bands for supporting the brush-shaft pivoted to the said case, so that it may be allowed to move vertically, and levers connecting the handle-bail with the said bands, whereby the brush may be raised and lowered by the movements of the said bail, substantially as specified.

402,159. CUTTER-BAR. CALEB HANE, Jackson, Ohio. Filed Nov 10, 1887. Serial No. 254,773. (No model.)

Claim.—The combination, with the cutter-bar provided with studs extending at right angles thereto a distance greater than the thickness of the cutters, two studs for each cutter, of the cutters provided with two holes, each adapted to be slid over the studs, and the herein-described locking-bar provided with a series of holes corresponding to the holes in the cutters and to the studs projecting through the cutters, and fastening-screws for securing the locking-bar to the cutter-bar in engagement with the cutters, substantially as set forth.

402,160. WATER-ELEVATOR. ALEXANDER HOGELAND, Lincoln, Nebr. Filed May 11, 1888. Serial No. 273,623. (No model.)

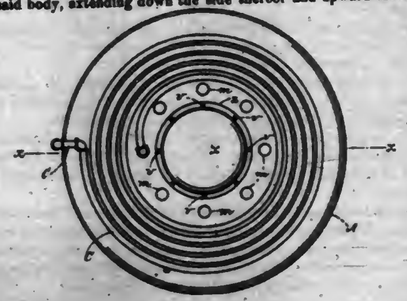


Claim.—1. In combination with the side girders, A, the sprocket-shafts C, having their bearings therein, the sprocket-wheels C, fastened upon said shafts, and the open-linked chains F, adapted to be set in motion by said sprocket-wheels, the buckets G, hinged to said chains, having their rear sides perpendicular to their bottoms, while their front sides incline outwardly from a vertical line, each bucket being provided with two pairs of truck-wheels, c, and their shafts c, one of which has its bearings in flanges rigidly attached to the bottom of the bucket, while the other shaft has its bearings fastened in like manner upon the forward or sloping side of the bucket, the whole adapted, when power is applied to one of the shafts C, to move the chains with their buckets, force in the forward edges of the buckets, and fill them automatically, and upon reaching a higher level dump their contents, substantially as described.

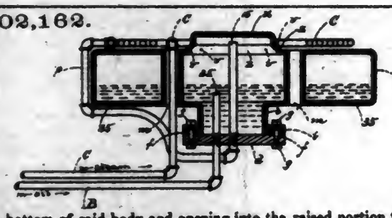
2. In combination with the inclined girders A, the sprocket-shafts C, having their bearing therein, the sprocket-wheels C, fastened upon said shafts, the open-linked endless chains F, the buckets G, hinged to said chains and provided with truck-wheels and shafts, substantially as specified, the two walls I, the cam-plates L, having flanges K, and the stringers N, adapted to furnish rolling supports to the buckets while empty, guide and support them down and around the lower shaft C, to fill and move them up the incline of the stringers N to the point of dumping them, substantially as set forth.

3. In combination with the side girders, A, the sprocket-shafts C, having their sprocket-wheels C, the open-linked chains F, the buckets G, hinged to said chains and provided with truck-wheels and shafts, substantially as specified, the walls I, plates L, having flanges K, and the stringers N, with curved depressions at O, to enable the buckets to fall down upon their front sides and dump their contents, substantially as described.

4. In combination with the sprocket-wheels and their shafts, the endless chains, the walls for the support of the buckets when empty, the flanged plates L, and the stringers N, constructed and arranged as hereinbefore specified, the buckets G, hinged to said chains and provided with sloping front sides, each bucket having truck-wheels and axles, one of which axles is fastened rigidly to the bottom of the bucket, while the other is in like manner fastened to the forward or sloping side of the same, adapted to scoop up the material and convey the same up the incline of the stringers N to a higher level and there dump the same, substantially as set forth.



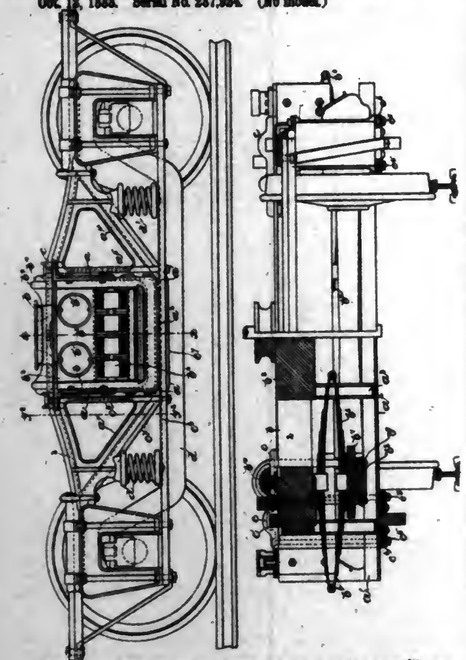
402,161. LIFTING-JACK. WILLIAM H. HOLMES, Charlotte, Vt. Filed Aug. 23, 1888. Serial No. 283,056. (No model.)



Claim.—The combination of the standard, the lifting-lever pivoted thereto, the ears H H, depending from the lifting-lever, the ratchet-arm pivoted to said ears and engaging a transverse pin secured to the standard, and the operating-lever pivoted to the under side of the lifting-lever and having one end provided with a notch, *n'*, engaging the end of the ratchet-arm, as specified.

402,162. HEATER. EDWIN H. JEWETT, Medford, assignor to himself, and George F. Jewett, Boston, Mass. Filed July 7, 1888. Serial No. 279,263. (No model.)

Claim.—1. In a heater of the character described, the combination of a hollow body adapted to contain oil and provided in its top with a raised central portion having an inclined wall provided with a series of burner-holes, a series of vertical tubes extending through said body around said central portion, an oil-pipe opening into said body from the bottom thereof, and a steam-pipe passing upward through one of said vertical tubes, said pipe being coiled on the top of said body, extending down the side thereof and upward through



402,162.

the bottom of said body and opening into the raised portion thereof above the burner-openings, substantially as set forth.

2. In a heater of the character described, the combination of the body A, provided with the tubes *m* and raised portion *x*, having the inclined wall *z*, the burner-holes *v* in said wall, the oil-pipe B, opening into said body through the bottom thereof, and the steam-pipe C, passing through one of said tubes *m* and coiled on the top of said body, said pipe opening into the raised portion of said body above the burner-openings thereof, substantially as specified.

402,163. CAR-TRUCK. LUTHER K. JEWETT, Boston, Mass. Filed Oct. 12, 1888. Serial No. 287,924. (No model.)

Claim.—1. In a car-truck, the combination, with a metallic transom composed of independent pieces of castings or braces to unite the said pieces to form the transom, of sustaining-blocks provided with shoulders to co-operate with the said pieces, substantially as described.

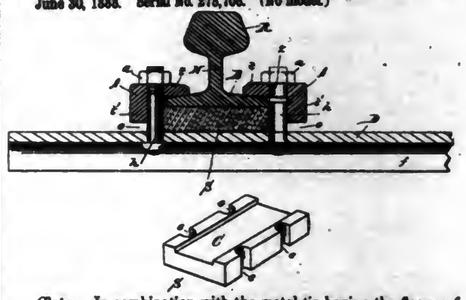
2. In a car-truck, a metallic transom composed of independent side and corner pieces, combined with sustaining-blocks provided with shoulders to co-operate with the said pieces, and with braces or castings to unite the said pieces to form the transom, substantially as described.

3. In a car-truck, the combination, with a metallic transom, of a curve-plate-sustaining frame secured at or near the ends of the said transom, substantially as described.

4. In a car-truck, the combination, with a transom, of a bolster vertically movable therein and composed of independent tubes, and sustaining-blocks for said tubes, substantially as described.

5. In a car-truck, the combination, with a transom composed of independent pieces, of a bolster vertically movable therein and composed of tubes, and sustaining-blocks for said tubes, substantially as described.

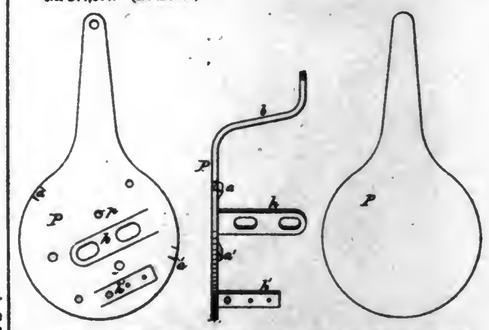
6. In a car-truck, the combination, with a transom composed of independent pieces, and castings or braces to unite said pieces together, of a bolster composed of independent tubes and vertically movable in said transom, sustaining-blocks for said tubes, and chafe-irons to prevent wear of the bolster-tubes, substantially as described.



7. In a car-truck, the combination, with a transom composed of independent pieces, and castings or braces to unite said pieces together, of a bolster composed of tubes and vertically movable in said transom; sustaining-blocks for said tubes, and chafe-irons secured to said bolster-sustaining blocks, substantially as described.

8. In a car-truck, the combination, with a transom, of arch-bar-sustaining blocks having their upper or top sides concaved downward, and arch-bars shaped or bent to fit said concaved sides, as and for the purposes specified.

9. In a car-truck, the pedestal strap composed of a single corrugated bar, substantially as described.

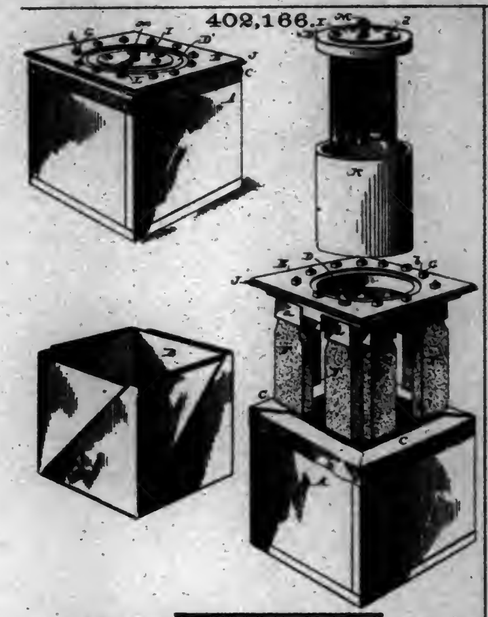


10. In a car-truck, the combination, with an arch-bar-sustaining block, of a metallic transom having its upper end resting upon and supported by the top of the said sustaining-block, substantially as described.

402,164. RAILWAY. WILLIAM J. KENNEY, Chicago, Ill. Filed June 30, 1888. Serial No. 278,708. (No model.)

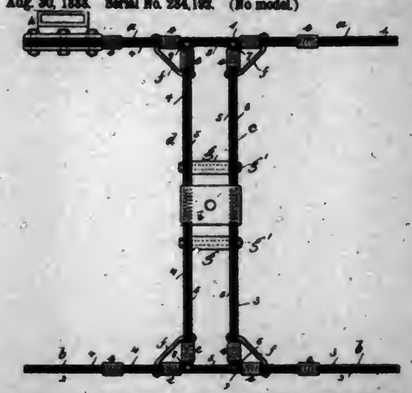
Claim.—In combination with the metal tie having the flanges *f*, the rail, the interposed wooden block having the channel in its upper face, the angle-irons L-shaped in cross-section, the bolts passing through the tie, the wooden agent, and angle-irons having nuts on their upper ends for binding said parts together, substantially as and for the purposes specified.

402,165. BELL. ISAAC KENNEY, Cincinnati, Ohio, assignor to the Standard Electrical Works, same place. Filed June 14, 1888. Serial No. 277,077. (No model.)



Claim.—As an article of manufacture, a metallic bell-plate formed integral with the bell-post *b* and having perforated tongues *h h'* struck out of the interior thereof and bent upward from said plate to form the helix and armature supports, respectively, and tongues *a a'*, formed in the edge of said plate and bent upward therefrom to form lugs for holding a cover, substantially as and for the purpose set forth.

402,166. GALVANIC BATTERY. WILLIAM P. KOOKOGEY, Brooklyn, N. Y., assignor to the Kookogey Electric Company. Filed June 13, 1887. Serial No. 241,181. (No model.)



Claim.—1. In combination with box or shell A, the lining B, formed of a single piece of sheet metal folded together, substantially as shown, to fit the bottom and walls of the outer shell, and forming a water-tight lining without seam or joint.

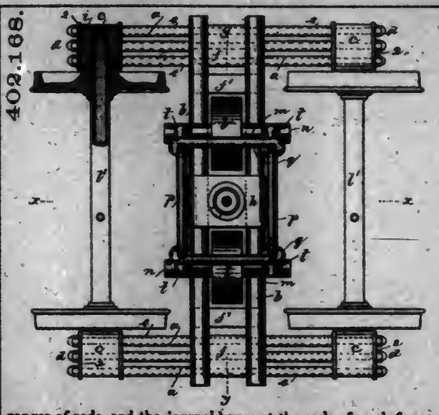
2. In combination with box A, provided with metallic lining, the rubber packing, C, applied to the upper edge of said box or shell, top or cover D, provided with metal plates E and I, carbon element sections F, each having a threaded stem extending through the brass plate E, nuts B, applied to said stems and bearing upon the plate E, zinc element sections H, likewise provided with threaded stems extending through plate I, and nuts applied to said stems and bearing upon the plate, substantially as set forth.

402,166.

402,167. CAR-TRUCK. BERNARD J. LA MOTHE, New York, N. Y., assignor to the United States Rolling Stock Company, same place. Filed Aug. 30, 1888. Serial No. 284,192. (No model.)

Claim.—1. A truck for cars, composed of longitudinal frames or wheel-pieces *a b* and cross or transom frames *c d*, placed edgewise and connected, each of said frames being composed of several plates of metal laid flatwise and touching and connected rigidly together, substantially as specified.

2. A truck for cars, composed of longitudinal frames or wheel-pieces and cross or transom frames, said frames being composed of plates of metal laid flatwise together and placed edgewise, and straps for connecting said plates together at the intersections of the frames and near their ends, substantially as specified.



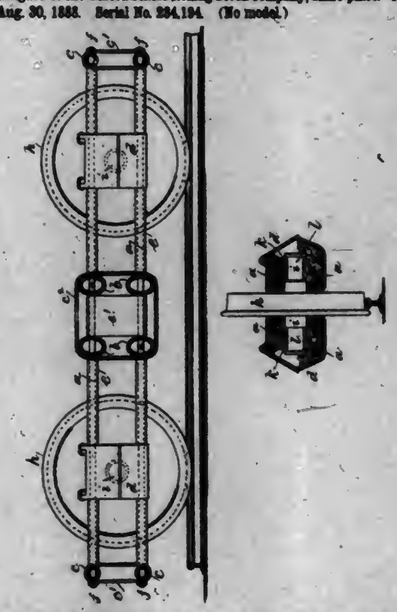
3. A truck for cars, composed of longitudinal frames or wheel-pieces and cross or transom frames, said frames being composed of plates of metal laid flatwise together and placed edgewise, straps for connecting said plates together, stiffening bars or rods *f*, tubes *g*, bolts *g'*, case *i*, and pedestals *h*, substantially as and for the purposes set forth.

402,168. RAILWAY-CAR TRUCK. BERNARD J. LA MOTHE, New York, N. Y., assignor to the United States Rolling Stock Company, same place. Filed Aug. 30, 1888. Serial No. 284,193. (No model.)

Claim.—1. The combination, with the side frames, each composed of the two ranges of rods, of the transom composed of two ranges of tubes, the rods of the side frames passing transversely through the tubes of the transom and supporting them, substantially as specified.

2. The combination, with the side frames, each composed of two

402,168.

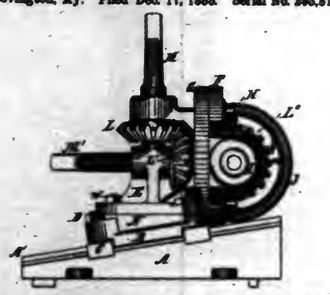


ranges of rods, and the journal-boxes at the ends of each frame and through which journal-boxes said rods pass, of the transom composed of two ranges of tubes through which pass transversely the rods of the side frames, substantially as specified.

3. The combination, with the side frames, each composed of two ranges of rods, the journal-boxes at the ends of the side frames, and the transom composed of two ranges of tubes through which pass transversely the rods of the side frames, of the tubes and bands around said rods, and nuts upon the ends of said rods for keeping the journal-boxes and transom-tubes in position upon said rods, substantially as specified.

4. The combination, with the truck-frame composed of the side frames and transom, consisting of rods and tubes, respectively, of the bearers *m m*, supported by the transom, the springs *l l*, bearers *n n*, frames *p p*, rods *q q*, and center plate, *s*, substantially as and for the purposes specified.

5. The combination, with the side frames composed of metal rods and the transom composed of tubes supported by the rods of the side frames passing transversely through said tubes, of the plates *h* at the center of the transom and the stays *f'* between said plates and the side frames, substantially as and for the purposes specified.



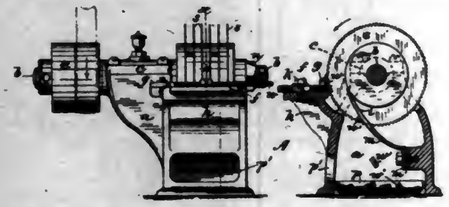
402,169. CAR-TRUCK. BERNARD J. LA MOTHE, New York, N. Y., assignor to the United States Rolling Stock Company, same place. Filed Aug. 30, 1888. Serial No. 284,194. (No model.)

Claim.—The combination with the car-wheels and their axles and journal-boxes, of the four groups of longitudinal rods *a a*, passing through and supporting said journal-boxes, the rods being arranged in two groups at each side of the truck, with the wheels between the

respective groups of rods, the transom-tubes *b*, supported by said rods of the side frames, the end frames, *c*, and the tubes *e* and bands *d* around said rods for keeping the parts of the truck-frame in their proper positions, substantially as and for the purposes specified.

402,170. DRILL. PULASKI LEEDS, Louisville, assignor to R. T. Miller, Covington, Ky. Filed Dec. 17, 1888. Serial No. 293,817. (No model.)

Claim.—1. A universal radial drill having horizontal and vertical angular adjustments, consisting of supporting-frame F, carrying the drill-stock I and the bevel-wheel L', the bearings of the shaft, which are secured by the ring G to the supporting-frame E, said frame carrying the bevel-wheel L, the double bevel-wheel L', and the driving-spindles M and M', and being pivoted to a slotted base-plate, as shown and described.



2. In a universal drill, the combination of the horizontally-rotatable frame E, carrying suitable driving-shaft, and the vertically-rotatable frame F, supported on the frame E and carrying suitable drill-shaft, said shafts having suitable connecting-gearing, for the purposes explained.

3. In a universal drill, the combination, with a suitable drill and its movable support or supports, of two driving-shafts gearing with said drill and projecting in different directions for convenience in driving the drill when in its different positions, as fully explained.

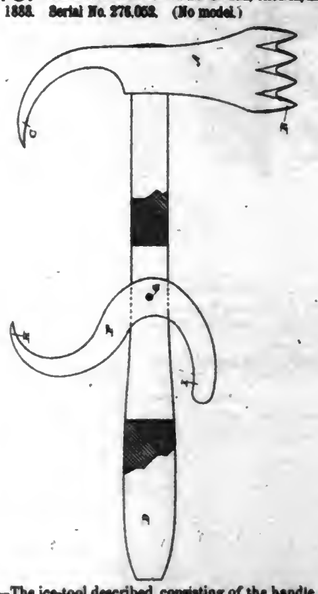
4. In a universal drill, the combination, with the horizontal rotatable frame and the drill and drill-shaft carried thereby, of additional drive-shaft gearing with the first and extending at right angles therefrom for convenience in driving when the first shaft is out of reach, as explained.

5. In a universal drill, the combination of a suitable base, a horizontally-rotatable supporting-frame mounted on the base, a horizontal driving-shaft, a vertical driving-shaft, a vertically-rotatable supporting-frame mounted on the horizontal frame, and a suitable drill mounted on the vertical frame and gearing with the said driving-shafts, said frames being also provided with suitable clamping devices, all substantially as set forth.

402,171. CUTTING-OFF MACHINE FOR JEWELERS' STOCK. FRANK L. LEWIS, Providence, R. I. Filed Jan. 10, 1889. Serial No. 295,918. (No model.)

Claim.—1. The combination, with a series of suitably-mounted cutting-off saws, *s*, of stationary guards or clearers *i*, arranged to intercept the severed blanks, substantially as shown and described, and for the purpose set forth.

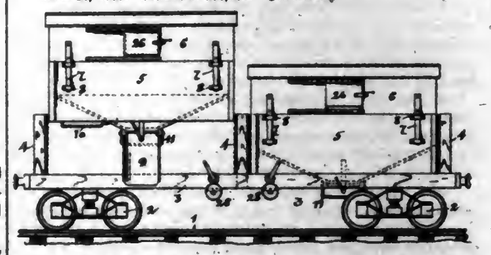
2. The combination, with a series of mounted cutting-off saws, *s*, of a series of stationary guards or clearers, *i*, arranged to intercept the severed blanks, and a sliding table provided with a stop-gage, substantially as shown and described.



402,172. MOTOR. DE SOTO LOVEJOY, Moscow, Tex., assignor of one-half to Solomon Bergman and William M. Kennedy. Filed Nov. 23, 1888. Serial No. 291,673. (No model.)

Claim.—The combination of the chair, the reciprocating bar, the shaft mounted in the lower portion of the chair, the drum on said shaft, the cord coiled around the drum and connected to the bar, the rest secured to the upper end of the bar, and the spring coiled around the said bar between the chair-seat and the rest, as specified.

402,172.



402,173. ICE-TOOL. SEWELL K. LOVEWELL, Chelsea, Mass. Filed June 4, 1888. Serial No. 276,052. (No model.)

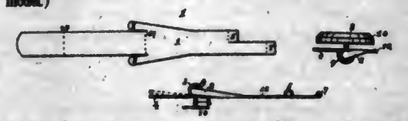
Claim.—The ice-tool described, consisting of the handle, the head formed at one end as an ice cutting or separating implement and at the other as a curved hook or point, and the curved and pointed lever pivoted to the handle, so as to co-operate with the hook as a tongs, or be turned away therefrom, as specified.

402,174. FREIGHT-CAR. CHARLES MACKALL, Baltimore, Md. Filed Feb. 18, 1889. Serial No. 300,313. (No model.)

Claim.—In a freight-car for railroads, the combination of a car having a hopper-bottom and gate at the apex thereof, and provided with a cover, and having a door sufficiently high in the side to permit the car to be loaded by a chute and filled while the door is open, and an independent car-frame provided with trucks, and mechanism connected to the car-body and the car-frame for raising and lowering said car-body, substantially as described.

402,175. ADJUSTABLE TRESTLE. LUDWIG MAURER, Louville, assignor of one-half to Christian Scheer, New York, N. Y. Filed Nov. 28, 1888. Serial No. 292,073. (No model.)

Claim.—1. The combination, with the body, of the cap B, secured

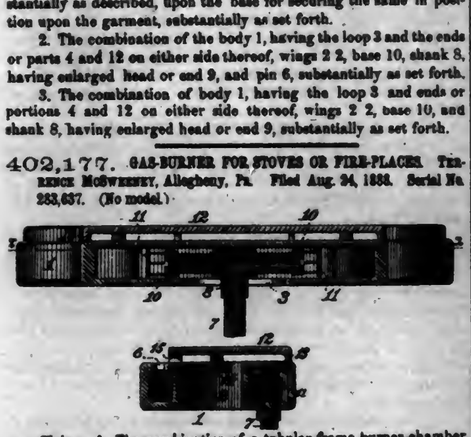


402,175.

to one end thereof and formed with tapered legs b^2, the inner ones of which are connected by the horizontal bar b^3, and the legs fitted in the spaces between each pair of legs and pivoted therein, substantially as described.

2. The combination, with the longitudinally-extensible body and the caps B, secured to the outer ends thereof, of the legs C, pivotally secured between downwardly-extending legs of said caps, and the legs C', adjustable lengthwise on the legs C, and the rack-bars and swinging bails for holding the legs in their adjusted positions, substantially as shown and described.

402,176. CUFF-HOLDER. CHARLES O. MCCASLAND, Denver, Colo. Filed Jan. 4, 1888. Renewed Oct. 13, 1888. Serial No. 288,046. (No model.)



Claim.—1. The combination of the body having or carrying a shank with an enlarged end or head, a base having a spring-loop adapted to open and pass over and receive such head, and to be opened to permit the head to be passed therefrom, and means, substantially as described, upon the base for securing the same in position upon the garment, substantially as set forth.

2. The combination of the body 1, having the loop 3 and the ends or parts 4 and 12 on either side thereof, wings 2 2, base 10, shank 8, having enlarged head or end 9, and pin 6, substantially as set forth.

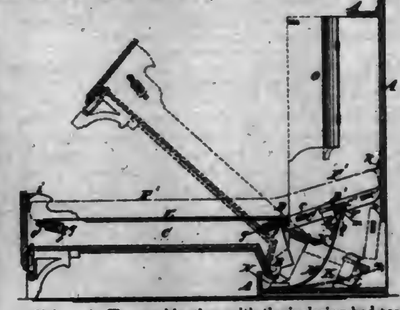
3. The combination of body 1, having the loop 3 and ends or portions 4 and 12 on either side thereof, wings 2 2, base 10, and shank 8, having enlarged head or end 9, substantially as set forth.

402,177. GAS-BURNER FOR STOVES OR FIRE-PLACES. TERRENCE MCSWEENEY, Allegheny, Pa. Filed Aug. 24, 1888. Serial No. 283,637. (No model.)

Claim.—1. The combination of a tubular-frame burner-chamber inclosing a central space and having lateral channels leading from opposite sides of a rear gas and air supply opening to opposite ends of a front passage perforated with burner-openings, and a cover-plate which closes the top of the central space at its rear and sides and presents a front discharge-passage for air adjoining the burner-openings, substantially as set forth.

2. The combination of a tubular-frame burner-chamber inclosing a central space and having lateral channels leading from opposite sides of a rear opening to opposite ends of a front passage perforated with burner-openings, a gas-supply pipe leading into the chamber through its rear opening and having branches provided with perforated end caps and extending in the direction of each of the lateral channels, and perforated diffusing-plates connected to the branches of the gas-supply pipe beyond their ends, substantially as set forth.

402,178. DEVICE FOR SKIMMING MILK. ALBERTUS MILLER, Meadville, Pa. Filed July 12, 1888. Serial No. 279,795. (Model.)



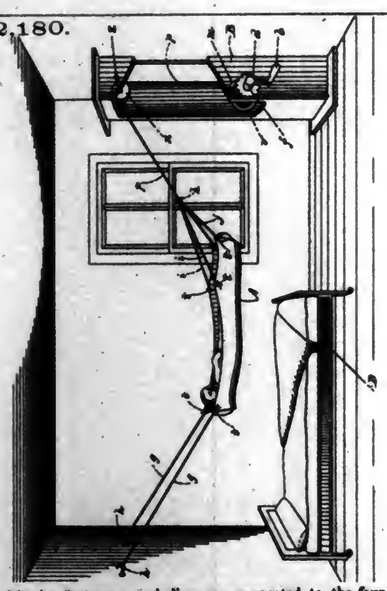
Claim.—The described device for skimming cream from milk, consisting of a pail provided with an air-tight cover, an air-pump, a tube connecting the pail and pump, and a flexible tube connected to

402,178.

said pail and carrying at its outer end a curved skimmer with a long narrow mouth, all constructed and operating substantially as set forth.

402,179. FOLDING BED. FREDERICK R. MILLER, Brooklyn, N. Y., assignor to Andresen, Blatt & Co., same place. Filed Aug. 19, 1886. Serial No. 211,333. (No model.)

Claim.—1. The combination, with the inclosing bed-case, of the main section C and minor sections C' C', hinged as shown, staple or staples G, affixed to one of the minor sections, and bow spring or springs M, fixed at one end to the base of the case and hooked at the other end in said staples, substantially as shown and described.

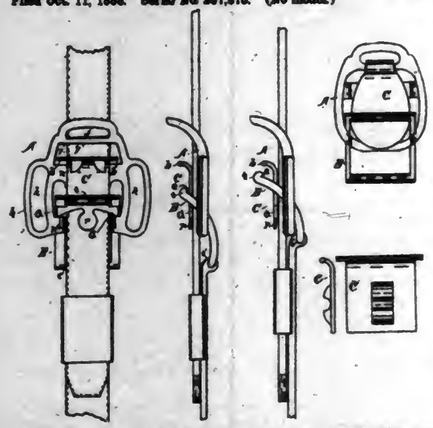


2. The combination, with an inclosing bed-case, of the main swinging section C and minor sections C' C', hinged as shown, with the weight F attached to one of the minor sections, staple or staples G, and spring or springs M, arranged and operating substantially as shown and described.

3. In a folding bed, the combination, with the inclosing-case and a swinging bed-frame pivoted thereto and made of a main section, and two toggle-like sections, of a bow spring or springs arranged in the base of the case parallel with the length of the bed-frame, fixed at one end at or near the joint of the two sections, and connected at the opposite end with the minor section, substantially as shown and described.

402,180. INVALID-LIFTER. JAMES H. MURDOCK, Woodstock, Vt. Filed Sept. 29, 1888. Serial No. 286,768. (No model.)

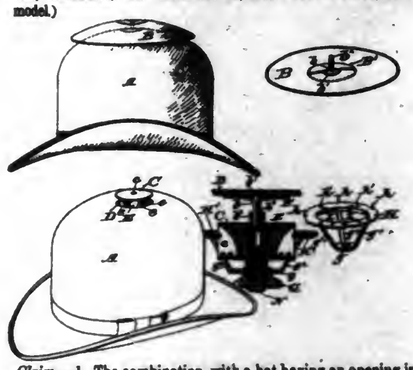
Claim.—1. The combination, with a hammock provided with a set of eyes at its head end, of a set of eyes at its foot end, and an intermediate set of eyes at its opposite edges disposed about a chair height distance from the foot end, supporting-ropes engaging the eyes at the head end, four supporting-ropes united at their outer ends, one pair thereof being connected at their inner ends with said intermediate eyes and the other pair being detachably connected at their inner



402,180.

ends with the foot-eyes, a winding-rope connected to the four supporting-ropes, and a windlass on which the winding-rope is wound for raising or lowering the hammock, substantially as described.

2. In an apparatus of the character described, the combination of the cabinet B, provided with the pulley *x*, the shaft *f*, journaled in said cabinet and provided with the drum *v*, handle *b*, and ratchet *d*, the retaining-pawl *m*, the hammock A, the hooks *h*, the ropes *g*, having the hooks *t*, and adapted to connect the head of said hammock with the hooks *h*, the foot-ropes *i j*, provided with hooks *t*, and knotted at *k*, and the rope *p*, connecting said foot-ropes with the drum *v*, all being arranged to operate substantially as specified.



402,181. TUG-BUCKLE. JAMES H. MYERS, Grand Rapids, Mich. Filed Oct. 11, 1888. Serial No. 287,573. (No model.)

Claim.—1. A tug-buckle having a body, A, in combination with a bail or stirrup, B, provided with a projecting point, *e*, and entirely detached from the balance of the buckle, and a clasp, C, the forward end of which turns outward and is provided with short projections *b*, to prevent the bail from dropping over the end of the clasp, and with a tongue, *d*, and has formed at its back end two outwardly-projecting lugs, *a*, intended to sustain the draft of the tug and to prevent the bail from drawing or dropping from over the clasp, the clasp being entirely detached from the balance of the buckle, substantially as and for the purpose set forth.

2. The combination, in a tug-buckle, of a body, A, provided with bearings *a a'*, opening *h*, for the reception of the bail, opening *i*, for the reception of the tug, bearings *m m*, projecting end P, and loops *j k* and *l*, with a bail, B, of sufficient length, so that when thrown back the clasp may be raised entirely clear of the tug, and provided with a projecting point, *e*, and a clasp, C, having its forward end projected outward from the tug, with small projections *b* formed upon the outer edges, and a tongue, *d*, and provided with lugs *a*, projecting outward from the edges of the back end of the clasp, and a thumb-piece, *r*, at the back end, the bail being entirely separate from the body and attached to the hame-tug, and the clasp being detached from both the body and the bail, substantially as specified, and for the purpose set forth.

402,182. HAT SHIELD AND VENTILATOR. WILLIAM P. O'CONNOR, Milwaukee, Wis. Filed Oct. 23, 1888. Serial No. 288,921. (No model.)

Claim.—1. The combination, with a hat having an opening in the center of the crown, of a ventilator placed in said opening and composed of an inverted cone with laterally-projecting upright wings extending above and below said opening when the ventilator is in working position, substantially as and for the purposes set forth.

2. The combination, with a hat having an opening in the crown, of a vertically-adjustable ventilator placed in said opening and composed of an inverted cone with laterally-projecting upright wings, and means for raising and lowering said ventilator, whereby the size of the aperture around the same is varied or the opening is entirely closed, substantially as and for the purposes set forth.

3. The combination, with a hat having an opening in the crown, of a ventilator placed in said opening and composed of an inverted cone, and laterally-projecting wings having their lower edges slit and bent in opposite directions, substantially as and for the purposes set forth.

4. The combination, with a hat having an opening in the crown, of a ventilator placed therein and composed of an inverted cone with laterally-projecting upright wings, which engage notches in the edge of said opening and serve as guides for the ventilator, and means of adjusting said ventilator vertically, substantially as and for the purposes set forth.

5. The combination, with a hat having an opening formed by the removal of a piece from the top of the crown, of a ventilator placed in said opening and composed of an inverted cone, to the top of which is attached, so as to project over its edges, the piece removed from the hat, and of upright wings projecting laterally from said cone, a ring attached to the inside of the hat and projecting inwardly past the edges of the opening therein, so as to form a seat for the overhanging top of said cone when the ventilator is closed, and means for adjusting said ventilator vertically, substantially as and for the purposes set forth.

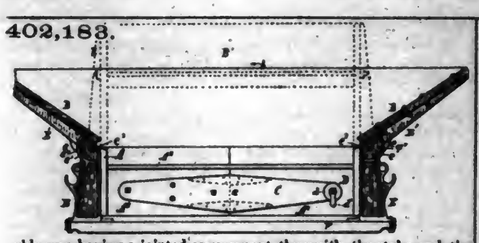
6. The combination, with a hat having an opening in the top of the crown, of a ventilator placed in said opening and serving as a shield-support, and a shield having a central stem on its under side which is removably attached to said ventilator, substantially as and for the purposes set forth.

7. The combination, with a hat having a support carrying a vertical socket in the center of the crown, of a shield shaped to conform to the crown of the hat and provided on the under side with a central vertical stem, which is held adjustably in said socket, whereby the shield may be set at different heights above the crown, brought snugly down against the crown, or removed from the hat, as desired, substantially as and for the purposes set forth.

8. The combination, with a hat having an opening in the crown, of a vertically-adjustable ventilator placed in said opening, and a shield having a telescoping stem by which it is attached to said ventilator over the crown of the hat, so as to be capable of vertical adjustment with and independently of said ventilator, substantially as and for the purposes set forth.

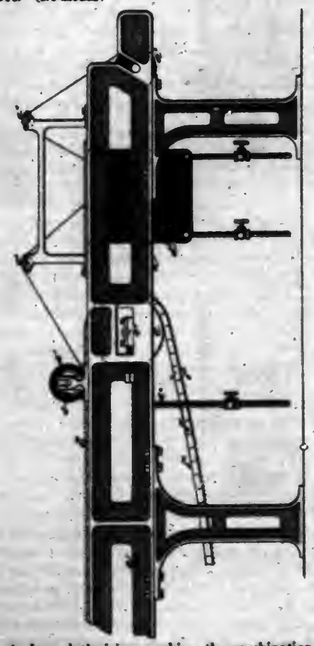
402,183. WAGON-BOX. SOLOMON H. OVIATT, Lansing, Mich., assignor of one-half to Reuben Andrè, Akron, Ohio. Filed June 16, 1888. Serial No. 277,291. (No model.)

Claim.—1. The combination, with a wagon-stake, of an adjustable arm having a jointed engagement therewith, the stake and the arm each constructed with arcs having registering perforations, and a locking device to engage said arcs and hold the arm in any desired position, substantially as described.



2. The combination, with a wagon-box, A, and stake E, of box sides B and removable end-gate B', an arm, E', having a jointed engagement with said stake and united with the side B, said stake and said arm each constructed in a single integral piece, substantially and in the manner described.

3. The combination, with a wagon-box and an end-gate consisting of jointed removable wings, of a cleat having a fixed engagement with one of said wings and a removable engagement with the adjacent wing, a bolt projecting from one of said wings and pushing through the free end of said cleat, and a tightening-nut, substantially as set forth.



4. The combination, with a wagon-box, of an end-gate consisting of flexibly-connected wings, a cleat having a fixed engagement with one of said wings, a bolt, and a washer for holding the bolt in place on one of said wings, the bolt projecting through the free end of said cleat and provided with a tightening-nut, substantially as set forth.

5. The combination, with a wagon-box, of an end-gate consisting of jointly-connected removable wings, and a cleat shorter than the end-gate, having a fixed engagement at one end with one of the wings, the other end of said cleat removably engaged with the adjacent wing between the ends of said wings, substantially as set forth.

402,183.

402,184. MACHINE FOR SIZING AND PAINTING CLOTH. DUNCAN A. PAGE and RICHARD C. BIRD, Chicago, Ill., assignors to the Calumet Shade Cloth Company, same place. Filed Mar. 30, 1888. Serial No. 268,911. (No model.)

Claim.—1. In a cloth-sizing machine, the combination, with the main frame and the sizing apparatus, of the carrier-belts, each consisting of a cable and a series of short spiked sections recessed upon their under sides, in which recesses are secured the cables, and grooved guides in which the said belts run, substantially as described.

2. In a machine for painting or sizing cloth, the combination, with the tank and the positive cloth-feeding devices which engage with the cloth after leaving the tank, of a winding shaft or drum for the finished cloth, provided at its end with a friction-pulley, h^3, a friction driving-wheel, h^2, engaging with the pulley, a hinged arm in which the said pulley is mounted, and a weight adjustable upon the said arm, substantially as described.

3. In a machine for sizing and painting cloth, the combination of the main frame, the size-tank, the positive cloth moving and stretching belts engaging with the cloth after leaving the tank, the paint-tank, the spreading-brushes, the friction driving-wheel, and the friction-driven winding-shaft for receiving the cloth after leaving the painting device, substantially as set forth.

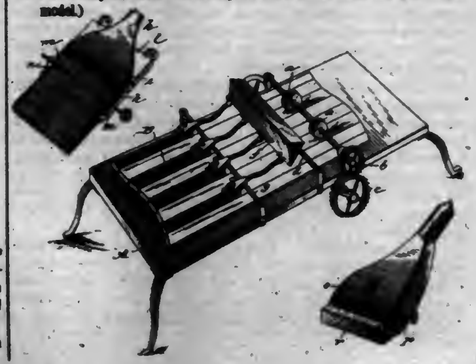
402,185. FINGER-SHIELD AND FOUNTAIN ATTACHMENT. JAMES PATMOR, Pittsburg, Kans. Filed Oct. 6, 1888. Serial No. 287,393. (No model.)

Claim.—1. A combined fountain attachment and finger-shield comprising the coil of wire, and the shield adapted to slide upon a pen and close the base of the coil, substantially as described.

2. A combined fountain attachment and finger-shield comprising the coil of wire, and the shield secured to the coil and closing the base thereof, and provided with a semicircular slot to receive the pen, substantially as described.

3. A combined fountain attachment and finger-shield comprising the wire coil, and the shield having a semicircular pen-slot and provided with a projection fitting within the base of said coil and affording means whereby the coil is secured to the shield, substantially as described.

402,186. WRENCH. IRA F. PECK, Providence, R. I. Filed Dec. 17, 1888. Serial No. 293,907. (No model.)



Claim.—In combination, the stationary jaw C, movable jaw E, the ferrule B, provided with the socket *b*, and the flat inclined face *c*, the operating-screw F, having a milled collar, *g*, and bearing-stem *a*, which enters the socket *b*, and the lever G, provided with a perforation, *d*, to receive the stem *a*, and with opposite flat surfaces inclined to form a wedge which by partial rotation upon the stem *a* will serve to produce the desired powerful forward movement of the jaw E, substantially as described.

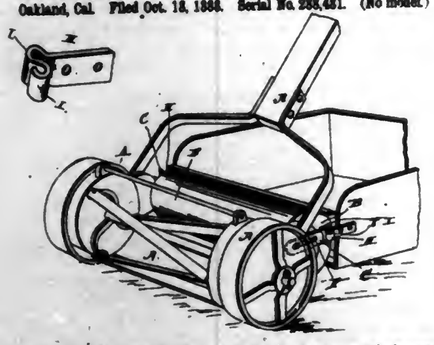
402,187. MOLD FOR CASTING HOLLOW INGOTS. IRA F. PECK, Providence, R. I. Filed Jan. 4, 1889. Serial No. 295,460. (No model.)

Claim.—In an elongated mold for casting hollow metal ingots, the combination, with the outer metallic shell and the hollow metallic core, of the removable plug for heating the hollow core, substantially as described.

402,188. PAINTING APPARATUS. SEYMOUR W. PERREGRINE, Grand Rapids, Mich. Filed Apr. 10, 1888. Serial No. 270,214. (No model.)

Claim.—1. In combination, the table, the brush or stainer consisting of the hollow head with the staining-brush held therein, a reservoir, a connection between said reservoir and the hollow head of the brush, and adjusting-screws for varying the size of the staining-brush.

2. In combination, the table, the reservoir, the bar *g*, and the brush-holders K, pivotally secured to said bar *g*, whereby they may be adjusted in elevation to conform to the surface being painted, substantially as described.



3. In combination, the table, the reservoir, the bar *g*, and the brush-holders K, pivotally secured to said rod to have vertical adjustment, said brushes being adjustable laterally toward and from each other, substantially as described.

4. In a machine for painting slats of school-seats, &c., a table, a reservoir above the same, a supporting-bar, *g*, extending across said table, a series of staining-brushes pivotally supported on said bar at different points to paint the desired slats, feeding-rolls arranged in rear of the brushes, and means for operating said rolls, substantially as described.

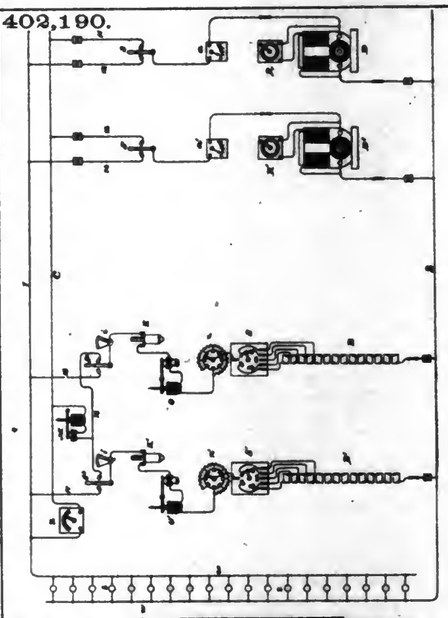
5. In a machine for painting slats of school-seats, a table, a reservoir above and a reservoir below the same, a supporting-bar, *g*, extending across above said table, a series of staining-brushes pivotally supported thereon at different points to paint the desired slats, a shaft beneath the table, painting wheels or rollers supported at different points along said shaft in connection with the lower reservoir, and openings in the table in line with said wheels or rollers, whereby the slats are painted upon both sides at the same time, substantially as described.

402,189. ATTACHMENT FOR LAWN-MOWERS.

HENRY PETERSON, Berkeley, assignor of two-thirds to J. R. Wilson and W. F. Delainey, Oakland, Cal. Filed Oct. 12, 1888. Serial No. 288,481. (No model.)

Claim.—The combination, with the lawn-mower, of the rearwardly-projecting longitudinally-adjustable hooks secured to the sides thereof, the tray or grass-receptacle having the runner on its under side, and a concave front end to fit over the ground-roller of the mower, and forwardly-projecting arms, detachably secured to the sides of the tray and having each two eyes arranged as described and adapted to be engaged by the hooks secured to the mower, as specified.

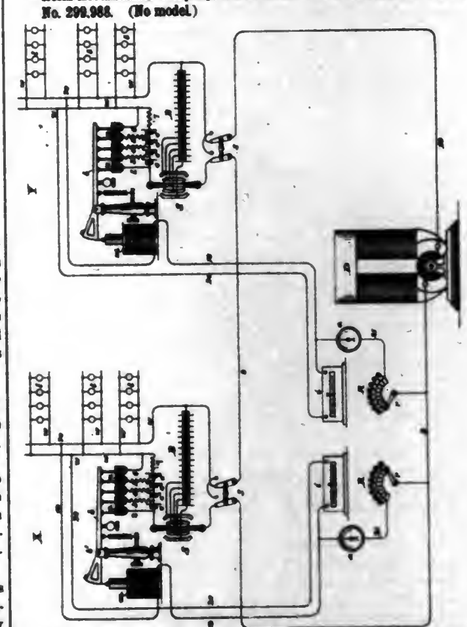
402,190. DISTRIBUTION OF ELECTRICITY BY SECONDARY BATTERIES.



GEORGE B. PRESCOTT, Jr., Newark, N. J., assignor to The Electrical Accumulator Company, of New York. Filed Feb. 7, 1889. Serial No. 298,975. (No model.)

Claim.—1. The combination of a dynamo-electric machine, two main leads therefor, a working-circuit containing lamps, one or more series of cells of secondary battery, an auxiliary lead containing an artificial resistance, and switches for changing the batteries and dynamos from one lead to the other for the purpose of charging and discharging, substantially as described.

2. The combination of two or more dynamo-electric machines connected in multiple arc, main leads therefor, a working-circuit containing lamps in multiple arc, two or more series of cells of secondary battery in parallel circuit, with their opposite terminals connected to the main leads, respectively, whereby both dynamos and batteries supply the working-circuit, a switch in each battery branch for varying the number of cells in circuit, and a switch in each dynamo branch to connect and disconnect either dynamo with respect to the main leads, substantially as described.



3. The combination of a dynamo-electric machine, main leads therefor, two or more series of cells of secondary battery connected in parallel circuit with each other, and an adjustable artificial resistance in circuit with each battery to compensate for fractional differences in the electro-motive force between each series, substantially as described.

402,190.

402,191. SYSTEM OF DISTRIBUTION BY SECONDARY BATTERIES.

GEORGE B. PRESCOTT, Jr., Newark, N. J., assignor to The Electrical Accumulator Company, of New York. Filed Feb. 15, 1889. Serial No. 299,988. (No model.)

Claim.—1. The combination of a primary generator of electricity located at a main station, a charging-circuit, a secondary battery located at a sub-station, a working-circuit therefor, one or more cells yielding a counter electro-motive force to be introduced and withdrawn with respect to the working-circuit, a switch or circuit-changer controlling the position of said cells, an electro-magnet for operating the switch, and a separate circuit connecting the main and sub stations, including the coils of said magnet.

2. The combination of a primary generator of electricity located at one station, a secondary battery located at a second station, a charging-circuit uniting both stations, a working-circuit for the battery, one or more cells yielding a counter electro-motive force to be inserted and withdrawn with respect to the working-circuit, a circuit connecting points in the working-circuit at one station with an indicator at the other station, and an electro-magnetic switch at the sub-station having its coils in an electrical circuit uniting both stations, substantially as described.

3. The combination of a primary generator of electricity located at one station, a secondary battery located at a second station, a charging-circuit uniting said stations, a working-circuit for the battery, one or more cells yielding a counter electro-motive force to be inserted and withdrawn with respect to the working-circuit, a circuit connecting points in the working-circuit at one station with an indicator at the other station, an electro-magnetic switch at the sub-station controlling the counter-electro-motive-force cells, and an electrically-independent circuit uniting both stations and controlling the electro-magnetic switch, substantially as described.

4. The combination of a primary generator of electricity located at one station, a secondary battery located at a second station, a charging-circuit uniting said stations, a working-circuit for the battery at said second station, a series of cells yielding a counter electro-motive force, a switch or circuit-changer for varying the connections of said cells with respect to the working-circuit, an electro-magnet controlling said switch, a separate circuit containing the coils of said magnet, and a third circuit connecting points in the working-circuit with an indicator located at the first station, substantially as described.

5. The combination of a primary generator of electricity located at a main station, a secondary battery located at a sub-station, a charging-circuit uniting both stations, a working-circuit for the secondary battery, a series of artificial resistances and one or more cells yielding a counter electro-motive force to be inserted and withdrawn with respect to the working-circuit, a switch or circuit-changer controlling the position of said cells, an electro-magnet for operating the switch, and a separate circuit connecting the main and sub stations, including the coils of said magnet.

6. The combination of a secondary battery, a working-circuit therefor, a series of cells yielding a counter electro-motive force, and a switch or circuit-changer for introducing one cell after another between the battery and working-circuit, substantially as described.

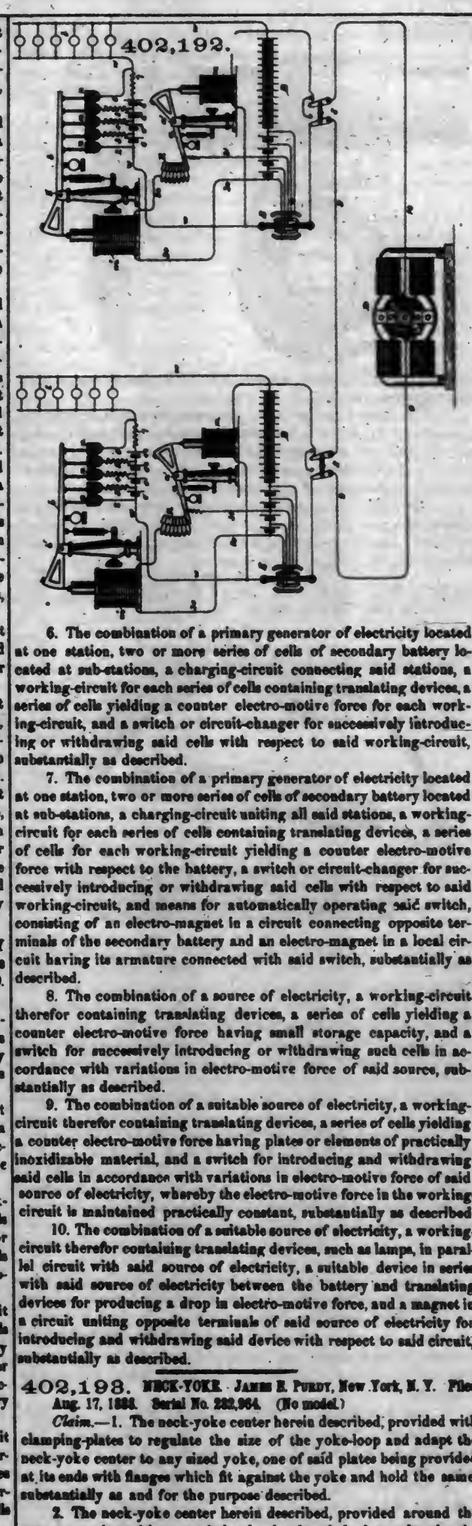
7. The combination of a secondary battery, a working-circuit therefor, a series of cells yielding a counter electro-motive force, located in the working-circuit, a circuit containing an artificial resistance around each cell, and a switch or circuit-changer operating to break the circuit of each cell successively, substantially as described.

8. The combination of a secondary battery, a working-circuit therefor, a series of cells yielding a counter electro-motive force, located in the working-circuit, a sectional artificial resistance for such cells included in circuit therewith, and a switch or circuit-changer normally completing a circuit round each cell, including a resistance and means for breaking such circuits successively to introduce said cells and resistance with respect to the working-circuit, substantially as described.

402,192. DISTRIBUTION OF ELECTRICITY BY SECONDARY BATTERIES.

GEORGE B. PRESCOTT, Jr., Newark, N. J., assignor to The Electrical Accumulator Company, of New York. Filed Feb. 16, 1889. Serial No. 300,261. (No model.)

Claim.—1. The combination of a source of electricity, a working-circuit therefor containing translating devices, a series of cells yielding a counter electro-motive force, and means for successively introducing or withdrawing such cells in accordance with variations in the electro-motive force, substantially as described.



2. The combination of a secondary battery, a working-circuit therefor containing translating devices, a series of cells yielding a counter electro-motive force, and a switch or circuit-changer for successively introducing or withdrawing said cells with respect to the working-circuit, substantially as described.

3. The combination of a suitable source of electricity, a working-circuit therefor containing translating devices, a series of cells yielding a counter electro-motive force, and an automatic switch or circuit-changer for successively introducing or withdrawing said cells with respect to the working-circuit operated by variations in electro-motive force at said source of electricity, substantially as described.

4. The combination of a secondary battery, a working-circuit therefor containing translating devices, such as lamps, a series of cells yielding a counter electro-motive force located between the battery and translating devices, an electro-magnetic switch or circuit-changer for successively introducing and withdrawing said cells, and an electro-magnet in a circuit joining opposite terminals of the secondary battery controlling said switch, substantially as described.

5. The combination of a secondary battery, a charging-circuit therefor containing a primary generator of electricity, a working-circuit for the secondary battery containing translating devices, a series of cells yielding a counter electro-motive force, and a switch or circuit-changer for successively introducing or withdrawing said cells with respect to the working-circuit, substantially as described.

402,192.

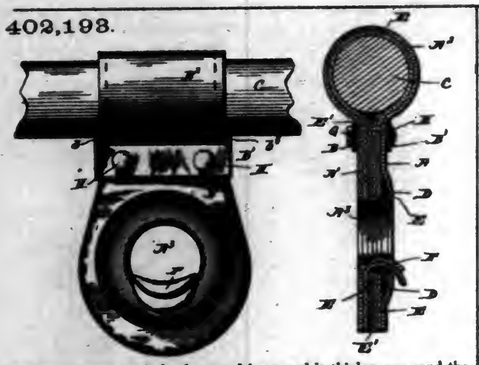
6. The combination of a primary generator of electricity located at one station, two or more series of cells of secondary battery located at sub-stations, a charging-circuit connecting said stations, a working-circuit for each series of cells containing translating devices, a series of cells yielding a counter electro-motive force for each working-circuit, and a switch or circuit-changer for successively introducing or withdrawing said cells with respect to said working-circuit, substantially as described.

7. The combination of a primary generator of electricity located at one station, two or more series of cells of secondary battery located at sub-stations, a charging-circuit uniting all said stations, a working-circuit for each series of cells containing translating devices, a series of cells for each working-circuit yielding a counter electro-motive force with respect to the battery, a switch or circuit-changer for successively introducing or withdrawing said cells with respect to said working-circuit, and means for automatically operating said switch, consisting of an electro-magnet in a circuit connecting opposite terminals of the secondary battery and an electro-magnet in a local circuit having its armature connected with said switch, substantially as described.

8. The combination of a source of electricity, a working-circuit therefor containing translating devices, a series of cells yielding a counter electro-motive force having small storage capacity, and a switch for successively introducing or withdrawing such cells in accordance with variations in electro-motive force of said source, substantially as described.

9. The combination of a suitable source of electricity, a working-circuit therefor containing translating devices, a series of cells yielding a counter electro-motive force having plates or elements of practically inoxidizable material, and a switch for introducing and withdrawing said cells in accordance with variations in electro-motive force of said source of electricity, whereby the electro-motive force in the working-circuit is maintained practically constant, substantially as described.

10. The combination of a suitable source of electricity, a working-circuit therefor containing translating devices, such as lamps, in parallel circuit with said source of electricity, a suitable device in series with said source of electricity between the battery and translating devices for producing a drop in electro-motive force, and a magnet in a circuit uniting opposite terminals of said source of electricity for introducing and withdrawing said device with respect to said circuit, substantially as described.



402,193. NECK-YOKE.

JAMES E. PURDY, New York, N. Y. Filed Aug. 17, 1888. Serial No. 282,964. (No model.)

Claim.—1. The neck-yoke center herein described, provided with clamping-plates to regulate the size of the yoke-loop and adapt the neck-yoke center to any sized yoke, one of said plates being provided at its ends with flanges which fit against the yoke and hold the same, substantially as and for the purpose described.

2. The neck-yoke center herein described, provided around the tongue-opening with a metal ring having beveled edges, whereby the

402,198.

neck-yoke center is bulged out and increased in thickness around the tongue-opening, substantially as described.

3. The herein-described neck-yoke center, having the wear-pieces in the tongue-opening and the beveled ring surrounding said opening, and provided with clamping-plates to regulate the size of the yoke-loop, one of said clamping-plates having at its ends flanges, which fit against the yoke and hold the same, substantially as described.

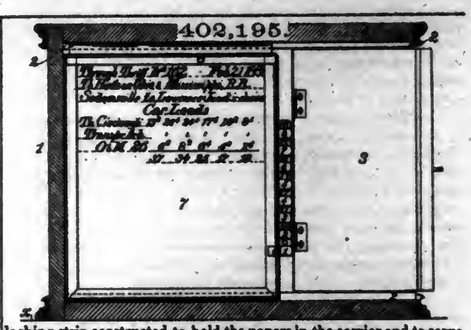
4. The neck-yoke center herein described, provided in the tongue-opening with wear-pieces, formed integral with the leather at the bottom of said opening, and pushed through the same to receive the wear from the tongue, substantially as described.

402,194. STRAP-LOOP. ALVIN C. REEVES, Palouse, Wash. Filed Dec. 13, 1888. Serial No. 293,451. (No model.)

Claim.—1. A keeper for straps, consisting of a loop which is provided at an intermediate point with a stationary tapered or wedge-shaped separator arranged transversely therein, whereby straps extending through the keeper on opposite sides of the separator are held in a divergent position, substantially as specified.

2. As an improved article of manufacture, the keeper for straps, comprising a loop provided with divergent sides, and the stationary tapered or wedge-shaped separator disposed in the loop, with its sides respectively parallel with the sides of the loop, substantially as specified.

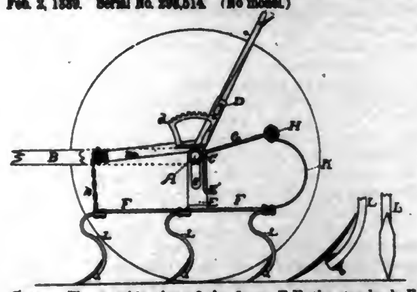
3. The keeper having a base-plate, a loop provided with divergent sides, and a tapered or wedge-shaped separator arranged centrally in the loop, with its sides parallel respectively with the sides of the loop, combined with the back-strap bifurcated at one end to form latches D D, which pass through the loop on opposite sides of the separator, substantially as and for the purpose specified.



402,195. FILE-BOX. JONATHAN A. RHOADS, East Liverpool, Ohio, assignor of one-half to George M. Irwin, Pittsburg, Pa. Filed Aug. 20, 1888. Serial No. 283,252. (No model.)

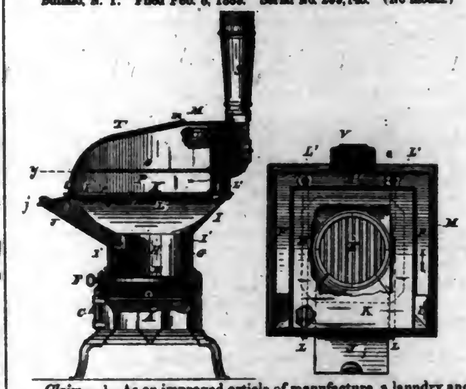
Claim.—1. A file-box having two opposite sides extended beyond the body of the box, the inner surfaces of said sides and extensions being provided with grooves for the reception of papers, substantially as set forth.

2. A file-box having two opposite sides extended beyond the body of the box, the inner surfaces of said sides and extensions being provided with grooves, in combination with a series of two or more carriers arranged in said grooves, substantially as set forth.



3. A file-box having two opposite sides extended beyond the body of the box, the inner surfaces of said sides and extensions being provided with grooves, in combination with a series of two or more carriers, each carrier provided with retaining-grooves, and a keeper or

402,195.



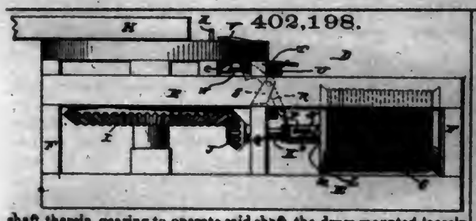
locking-strip constructed to hold the papers in the carrier and to serve as a guide for the carrier, substantially as set forth.

402,196. CULTIVATOR. THOMAS R. RINGWOOD, Solvio, N. Y. Filed Feb. 2, 1889. Serial No. 298,514. (No model.)

Claim.—The combination of the frame F F, the standards E E, provided with racks F' F', the axle A, provided with the actuating-lever D, pinions C C, and bars G G, and the springs K K, connecting said bars with the rear of the frame F F.

402,197. SMOOTHING AND SAD IRON HEATER. ADOLPH SCHMITT, Buffalo, N. Y. Filed Feb. 8, 1888. Serial No. 299,145. (No model.)

Claim.—1. As an improved article of manufacture, a laundry and tailor stove for heating flat and smoothing irons, consisting, essentially, of the base having the grate, the fire-pot, the flaring middle piece having the chute and cover, the plate having the side openings, and the top having the side and back flues, and the hinged cover, as and for the purpose set forth.



2. In heating-stoves, the combination, with the flaring middle piece of the plate and the series of tubes supporting said plate, said tubes having their exit in the back flue, as and for the object set forth.

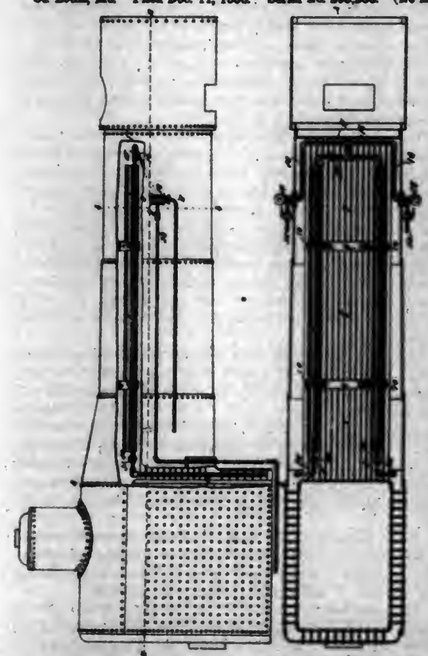
3. In laundry and heating stoves, the combination, with a suitable base and fire-pot, of a flaring middle piece, a plate having tubular supports and provided with passages in its forward corners, and a U-shaped top having double walls provided with ducts and a hinged cover for said top, the whole being constructed and arranged in the manner as and for the purpose set forth.

402,198. HORSE-POWER. JOHN R. SHEAR, Auburn, N. Y. Filed Dec. 28, 1888. Serial No. 294,857. (No model.)

Claim.—1. The combination, with the frame, of the horizontal

402,198.

shaft therein, gearing to operate said shaft, the drum mounted loosely on the shaft and provided with a half-clutch at one end, the half-clutch on the shaft engaging the half-clutch on the drum, the vibrating lever mounted on the frame and engaging said clutch, and a trip-lever mounted above and engaging said vibrating lever, as set forth.



2. The combination, with the frame, of the horizontal shaft mounted therein, the drum mounted loosely on the said shaft and provided with a half-clutch at one end, the half-clutch sliding on the shaft and engaging the half-clutch on the drum, the vibrating lever mounted on the frame and having its lower end engaging said sliding half-clutch, the spring forcing the lower end of the lever outward, and devices for forcing the lower end of the lever inward and thereby disengaging the half-clutches, as set forth.

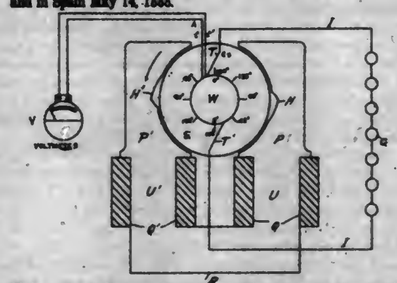
3. The combination of the frame, the horizontal shaft therein, gearing for operating said shaft, the drum mounted loosely on the shaft and provided with the half-clutch at one end, the half-clutch sliding on the shaft and engaging the half-clutch of the drum, the vibrating lever mounted on the frame and having its lower end engaging the clutch, the trip-lever mounted on the frame and engaging the upper end of the vibrating lever, and the pulley having the pin on the upper side engaging the trip-lever and a cam on its lower side engaging the vibrating lever, as specified.

4. In a horse-power, the shaft K, having the drum mounted loosely thereon, the clutch connecting the drum to the shaft, the driving-shaft having the usual sweep, H, the pulley *a*, secured to the driving-shaft below the sweep, a pulley, *b*, connected to pulley *a* by a belt, and tripping devices actuated by the pulley *b* to cause the engagement of the clutch on the drum-shaft, as set forth.

5. In a horse-power, the drum-shaft K, the drum loosely mounted thereon, the clutch connecting the drum to the shaft, the driving-shaft having the sweep, and tripping devices actuated by the movement of the driving-shaft to cause the disengagement and engagement of the clutch on the drum-shaft, as set forth.

402,199. FEED-WATER PURIFIER. WILLIAM J. SMITH, Chicago, Ill., assignor to the Smith Feed Water Heater and Purifier Company, St. Louis, Mo. Filed Dec. 11, 1888. Serial No. 293,288. (No model.)

Claim.—1. The combination, with a feed-water purifier, of a suction-pipe connecting the bottom of the boiler with said feed-water purifier, and a valve in said pipe whereby the feed-water is prevented from passing through said pipe and the sediment is drawn off by said pipe when blowing off the purifier.



2. The combination, with a feed-water purifier located within a boiler, of a pipe, 25, opening into said purifier, and having its other end communicating with the water at or near the bottom of said boiler, and a valve in said pipe whereby the feed-water is prevented from entering the boiler by way of said pipe and circulation is caused in said pipe when blowing off said purifier.

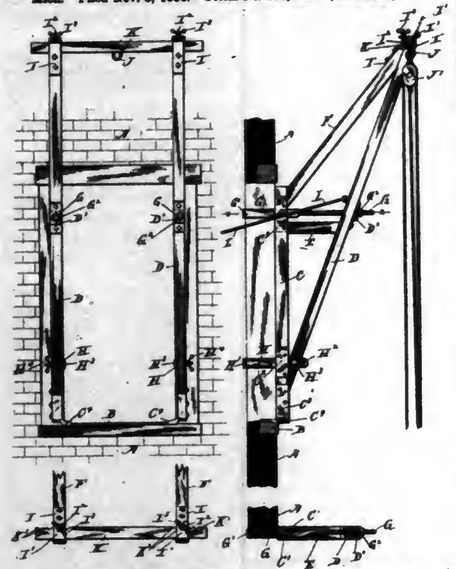
3. The combination, with a feed-water purifier located wholly within the boiler, having a diaphragm intermediate of it provided with holes 13, of a pipe, 25, projecting in said purifier below said diaphragm beyond the holes 13, its other end being open or provided with holes communicating with the water of the boiler, and a valve in said pipe for preventing the feed-water from entering the boiler by way of said pipe.

4. The combination, with a feed-water purifier having one or more apertures through which the feed-water passes to the boiler, said aperture or apertures being arranged at the water-level of said water, of a suction-pipe provided with a valve and connected to said purifier and passing to or near the bottom of the boiler, whereby when the purifier is blown off the surface of the water in the boiler will be skimmed and the sediment deposited in said boiler will be removed.

5. The combination, as hereinbefore set forth, of the tubes 8 8, arranged within and at each side of the boiler, brackets 9 9 for supporting said tubes from the boiler-shell, pipes connecting said tubes with pump and injector connections, the connection between said pipes and said tubes being made inside of the boiler, a diaphragm within said tubes, holes 13 and 14, as described, in the diaphragm and purifier-tubes, respectively, a pipe extending into the lower compartment of said purifier-tubes beyond the holes 13 and connected with the boiler, and a valve, 29, in said pipe, substantially as and for the purpose set forth.

402,200. POLE-PIECE FOR DYNAMO-ELECTRIC MACHINES. JOHN G. STATTER, London, County of Middlesex, England. Filed Feb. 9, 1888. Serial No. 263,453. (No model.) Patented in England Feb. 23, 1887, No. 2,825; in France Feb. 13, 1888; in Belgium Feb. 15, 1888, and in Spain May 14, 1888.

Claim.—1. A dynamo-electric machine or motor having one or more of its pole-pieces cut away or incised at a point, H, intermediate of the extremities of said pole-pieces, to vary the length of the conductor acted upon and keep constant the magnetism generated in the coils passing under the brushes, whereby, when said brushes are shifted, sparking will be obviated, substantially as described.



2. A dynamo-electric machine motor having one or more of its pole-pieces cut away or incised at a point or points, H, intermediate of the extremities of said pole-pieces, to make the inductive effect of the field-magnets equal to the self-induction generated in those coils of the armature passing under the brushes, whereby the inductive effect and the self-inductive effect will neutralize each other and no sparking will occur when the brushes are shifted.

3. A dynamo-electric machine or motor having one or more of its pole-pieces cut away or incised at the point H, intermediate of the extremities of said pole-pieces, to vary the magnetic effect of the field-magnets upon the armature and prevent sparking when the brushes are shifted, substantially as described.

4. A dynamo-electric machine or motor having one or more of its pole-pieces cut away or incised at a point, H, intermediate of the extremities of said pole-pieces, to keep constant the inductive effect of the field-magnets upon the armature-coils passing under the brushes, whereby sparking will not occur when said brushes are shifted.

5. A pole-piece for a dynamo-electric machine or motor cut away or incised at a point, H, intermediate of the extremities of said pole-piece, to vary the magnetic effect of said pole-piece upon the armature and make the resultant of the magnetic effect of the pole-pieces and the self-induction generated in the coils of the armature passing under the brushes zero, the location, size, and form of the cavities H being determined substantially in the manner set forth.

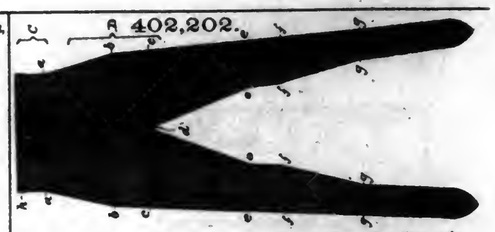
402,201. ADJUSTABLE DERRICK. EDWIN B. STEELE, Adrian, Mich. Filed Nov. 5, 1888. Serial No. 290,060. (No model.)

Claim.—1. The combination of a frame comprising an upright post adapted to rest against the outside of the wall and inclined braces connected at their upper ends to each other and attached at their lower ends to the upper and lower parts, respectively, of said post, horizontal slides adjustable in said frame and provided with hooks at their inner ends for engaging the wall, and bolts having nuts for adjusting said slides.

2. The combination of an upright post provided with a sill-shoe, inclined braces connected at their upper ends to each other and attached at their lower ends to the upper and lower parts, respectively, of said posts, a horizontal slide near the upper end of said post provided with a hook at its inner end for engaging the wall and a bolt-shaped outer end extending through the outer brace, a washer on the outer brace, and a nut on said bolt end for adjusting the slide.

3. The combination of an upright post, inclined braces connected at their upper ends to each other and attached at their lower ends to the upper and lower parts, respectively, of said post, a horizontal slide near the upper end of said post provided with a hook at its inner end for engaging the wall and with a bolt-shaped outer end extending through the outer brace, a washer on the outer brace and a nut on said bolt end for adjusting the slide, and an adjustable horizontal slide near the lower end of said post provided with a hook at its inner end.

4. The combination of an upright post, inclined braces connected at their upper ends to each other and attached at their lower ends to the upper and lower parts, respectively, of said post, a horizontal slide near the upper end of said post provided with a hook at its inner end for engaging the wall and with a bolt-shaped outer end extending through the outer brace, a washer on the outer brace, a nut on said bolt for adjusting the slide, an adjustable horizontal slide near the lower end of said post provided with a hook at its inner end and a slot at its outer end, a bolt extending through said slot and through the lower end of said outer brace, and a thumb-nut on said bolt



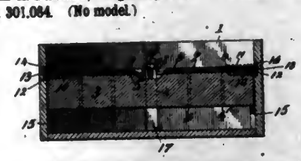
5. The combination of two adjustable window derrick-sections adapted to be secured to the wall of a building, a cross-bar provided with notches near its ends, and bolts in said sections engaging said notches for securing the bar and sections together.

6. The combination of two adjustable window-derrick sections adapted to be secured to the wall of a building and provided with brackets having hinged plates, a bar for connecting said sections resting in said brackets and provided with notches near its opposite ends, and bolts passing through said hinged plates, notches, and brackets, substantially as described.

402,202. FULL TIGHTS. SIMON T. SUTTON, Chicago, Ill. Filed Nov. 8, 1887. Serial No. 254,617. (No model.)

Claim.—1. As an improved manufacture, knitted tights having a seamless waist portion of plain circular work and a seamless hip portion, the latter being widened out from the line *a a* to the line *b b*, or approximately so, substantially as shown and described.

2. As an improved manufacture, knitted tights having a seamless waist portion of plain circular work, and a seamless hip portion which is widened on the two opposite sides of the garment, substantially as shown and described.



3. As an improved manufacture, seamless knitted tights having a waist portion, C, of plain circular work commencing at the top of the garment and extending to the line *a a*, the hip portion D, widened from the line *a a* to the line *b b*, or approximately so, and then knit in plain circular work to the point or line *c c* at the crotch, substantially as shown and described.

4. As an improved manufacture, seamless knitted tights having a waist portion of plain circular work, a hip portion widened from the line *a a* to the line *b b*, or approximately so, and then plain circular work to the line *c c* at the crotch, and the seamless legs narrowed on their insides from the crotch to the ankle portions, excepting at the knee portions between the lines *e e* and *f f*, which are of plain circular work, substantially as shown and described.

5. As an improved manufacture, seamless knitted tights having legs narrowed on their inside lines from the points *d* to the points *e*, and from points *f* to points *g*, and having waist and hip portions formed continuously therewith and of circular knitted work, substantially as shown and described.

402,203. RACK-BOX FOR BOTTLES. THEODORE A. TAYLOR and WILLIAM H. DIAMOND, Poughkeepsie, N. Y. Filed Feb. 25, 1889. Serial No. 301,084. (No model.)

Claim.—1. The combination, with a box, of a rack removably supported therein and provided with locking or latching devices for removably securing the same in said box, substantially as described.

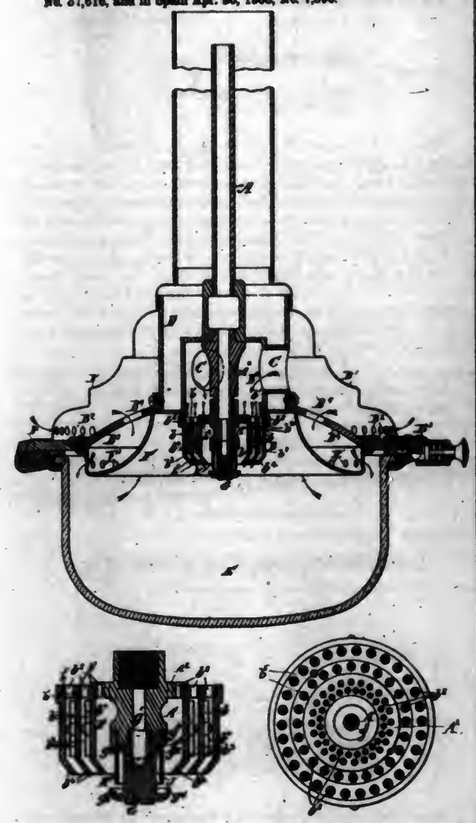
2. The combination, with a box, of a rack removably supported therein and provided with yielding locking or latching devices for removably securing the same in said box, substantially as described.

3. The combination, with a box provided with holes in its sides and ends, of a rack removably supported therein, and spring-actuated rods or bolts secured to said rack for removably securing the same in place in said box, substantially as described.

4. The combination, with a box provided with holes in its sides and ends, of a rack formed with grooves in the upper edges of its central longitudinal and transverse bars or partitions, and spring-actuated rods or bolts, which are adapted to be slid in said grooves, and provided with suitable handles, substantially as described.

5. The combination, with a box provided with holes in its sides and ends, of a rack formed with grooves in the upper edges of its central longitudinal and transverse bars or partitions, rods or bolts placed and adapted to slide in said grooves, and provided with handles at their inner ends, staples fitted over said rods or bolts, and coiled springs surrounding them for forcing their outer ends into said holes, substantially as described.

6. The combination, with a box provided with holes in its sides and ends, a rack formed with grooves in the upper edges of its central longitudinal and transverse bars or partitions, and with enlarged recesses near their outer ends, rods or bolts which are adapted to slide in said grooves, and which are formed with handles at their inner ends and provided with studs or projections near their outer ends, staples for securing said rods or bolts within said grooves, and coiled springs surrounding them and arranged within said enlarged recesses and bearing against said studs or projections, substantially as described.



7. The combination, with a box, of a rack removably secured within said box and provided with locking or latching devices and stop-blocks secured to the sides and bottom of said box for supporting the ends and sides of said rack, substantially as described.

8. The combination, with the box 1, provided with the holes 13 in its sides and ends, of the rack 2, having the central longitudinal and transverse bars 3 and 4, the rods or bolts 7 and 8, the stop-blocks 15

for the ends of said central longitudinal bar, and the stop-blocks 17, formed with the notches 16 for the ends of said central transverse bar, substantially as described.

9. The combination, with the box 1, provided with the stop-blocks 15 and 17 and the plates 14, having the holes 13, of the rack 2, provided with the central longitudinal and transverse bars, 3 and 4, formed with the grooves 5 and 6 and the enlarged recesses 10, and provided with the staples 9, the rods or bolts 7 and 8, having the handles 8' upon their inner ends and the studs 12 near their outer ends, and the springs 11, surrounding said rods or bolts and arranged within said recesses 10, substantially as described.

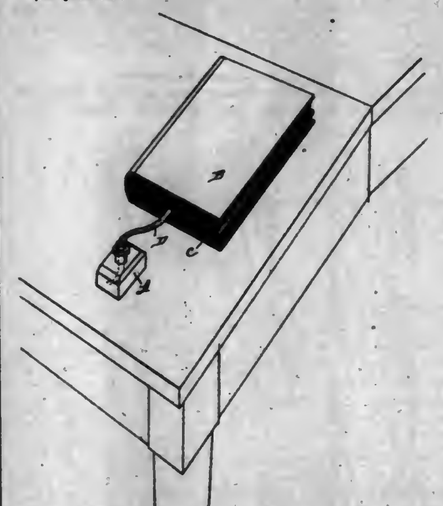
402,204. GAS-LAMP. THOMAS C. J. THOMAS, Finsbury Park, County of Middlesex, England. Filed Mar. 30, 1887. Serial No. 232,974. (No model.) Patented in England Jan. 21, 1885, No. 883, and Jan. 13, 1887, No. 579; in France June 8, 1885, No. 169,417, and Feb. 3, 1887, No. 181,338; in Germany June 10, 1885, No. 35,064; in Belgium Feb. 3, 1887, No. 76,307; in Victoria June 8, 1887, No. 6,116; in South Australia June 9, 1887, No. 319; in New Zealand June 17, 1887, No. 2,383; in New South Wales Aug. 2, 1887, No. 15; in Italy Sept. 23, 1887, XLIV, 134; in India Jan. 10, 1888, No. 190; in Austria-Hungary Feb. 23, 1888, No. 37,616, and in Spain Apr. 20, 1888, No. 7,390.

Claim.—1. In a gas-lamp, the combination, with a gas-supply pipe and a burner, of an air-heating chamber provided with a series of annular divisions placed one within the other and open at both ends for the direct downward passage of air therethrough, said divisions being so arranged that their lower ends form a series of concentric annular openings located above the flame or flames passing laterally from said burner, substantially as described.

2. In a gas-lamp, the combination, with a gas-supply pipe and a burner, of an air-heating chamber provided with a series of annular divisions placed one within the other and open at both ends for the direct downward passage of air therethrough, said divisions being contracted or made of gradually-decreasing diameter at their lower ends and so arranged as to form a series of concentric annular openings located above the flame or flames passing laterally from said burner, substantially as described.

3. In a gas-lamp, the combination, with a gas-supply pipe, a burner, and an air-heating chamber provided with a series of annular divisions open at both ends and so arranged one within the other that their lower ends form a series of concentric annular air-outlet passages located above the flame or flames from said burner, of a perforated cover or plate secured at the upper ends of said divisions, substantially as herein described, for the purpose set forth.

4. In a gas-lamp, the combination, with a gas-supply pipe, of a preliminary air-heating chamber with air-inlet openings, a main air-heating chamber arranged below said preliminary air-heating chamber, and provided with a series of annular divisions placed one within the other and so arranged that their lower ends form a series of concentric annular openings, the spaces between said divisions being in communication at their upper ends with said preliminary air-heating chamber, a burner secured to the under part of said main air-heating chamber, and a nipple or socket carried by the upper part of said main air-heating chamber and adapted to be connected to said gas-supply pipe, substantially as herein described, for the purposes set forth.



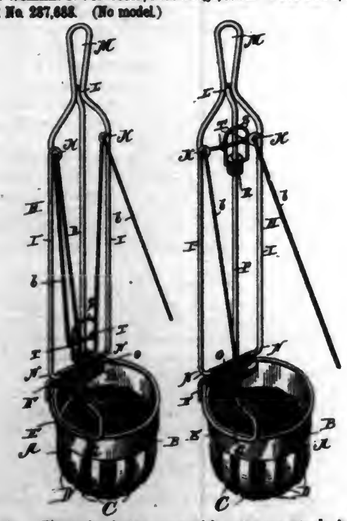
5. In a gas-lamp, the combination, with a gas-supply pipe, of an air-heating chamber provided with annular divisions *b b*, formed at one end with perforated flanges b^2, and a hollow casting, A', with perforated flange A^2, said flanges being adapted to enter the tops of said annular divisions and form a perforated cover or plate, substantially as herein described, for the purpose specified.

6. In a gas-lamp, the combination, with a gas-supply pipe, of an air-heating chamber provided with annular divisions *b b*, formed at one end with perforated flanges b^2 and at the other end with conoidal parts b^4, and a hollow casting, A', with perforated flange A^2, said flanges being adapted to enter the tops of said annular divisions and form a perforated cover or plate, substantially as herein described, for the purpose specified.

7. In a gas-lamp, the combination, with a gas-supply pipe and an air-heating chamber provided with a series of annular divisions open at both ends and so arranged one within the other that their lower ends form a series of concentric annular air-outlet passages, of an inverted burner from which flame passes laterally below said outlet-passages, substantially as herein described.

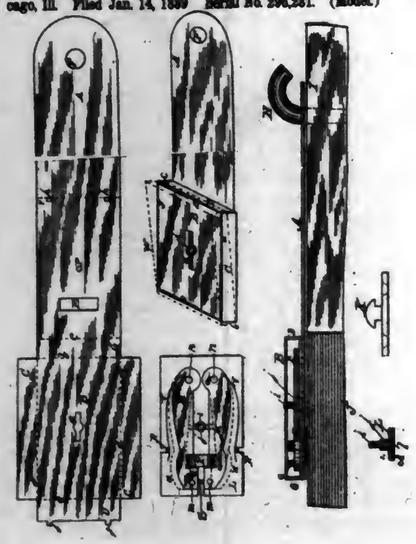
8. In a gas-lamp, the combination, of a gas-supply pipe, A, a preliminary air-heating chamber, B^3, secured to said gas-supply pipe and provided with air-inlets C, a main air-heating chamber, B, arranged below said preliminary air-heating chamber and comprising a hollow casting, A', screwed to said gas-supply pipe A, a perforated top or plate, b^3, carried by said hollow casting, and a series of concentric annular divisions, *b*, depending from said top or cover, contracted at their lower ends and arranged to form a series of concentric annular outlet-passages for air, and a burner secured to said hollow casting A', substantially as described, for the purposes specified.

402,205. METHOD OF MOISTENING PRESS-COPYING LEAVES. HUGO THUN, Grand Rapids, Mich. Filed July 26, 1888. Serial No. 280,904. (No specimens.)



Claim.—1. The method of preparing a quantity of sheets of press-copying paper for use by moistening the same, consisting in placing and supporting one end of a wick in direct connection with the sheets, the other end of said wick extending to and being located and supported in a reservoir, the said wick remaining in permanent contact with the entire number of sheets desired to be prepared to cause complete and proper saturation thereof, substantially as described.

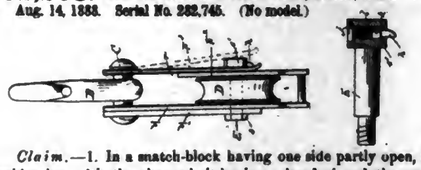
2. The method of preparing sheets of press-copying paper for use by moistening, consisting in separating the desired number of sheets from the entire number by means of oil-boards, then placing and supporting one end of a wick in direct connection with and by said sheets, the other end of which extends into a reservoir, substantially as described.



3. The method of preparing sheets of press-copying paper by moistening the same, consisting in placing and supporting one end of a wick in direct connection with said sheets, the other end of said wick extending into a reservoir containing water having an antiseptic therein, substantially as described.

402,206. TWINE-HOLDER. WILLAR A. TIDBALL, Independence, and WILLIAM B. VON STEIN, Fort Dodge, Iowa. Filed Oct. 9, 1888. Serial No. 287,688. (No model.)

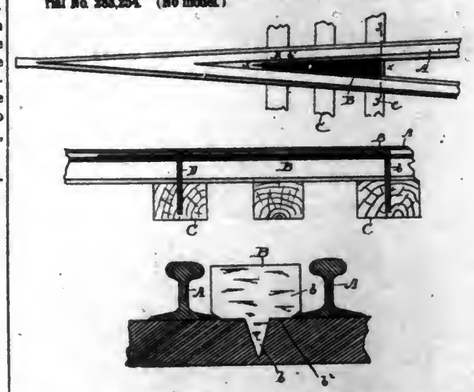
Claim.—The twine-holder comprising the receptacle having the wire E with eyes F G, the keeper O, secured to one edge of the receptacle, the frame H, made of a single piece of wire bent to form the eyes or loops K, and the vertical arms I, the latter having the hooks N at their lower ends inserted in keeper O, the vertical guide P, having its lower end secured to the keeper and its upper end secured between the upper ends of arms I, and the weight R, movable on said vertical guide and having the bail S, with eyes T, adapted to engage a cord or twine strung through the loops or eyes F, G, and K, substantially as described.



402,207. HASP-LOCK. HERMAN TRIPP and LOUIS LATTAN, Chicago, Ill. Filed Jan. 14, 1889. Serial No. 296,261. (Model.)

Claim.—1. In combined hasps and locks, the hasp and lock-case formed of a single piece of metal, as shown, the same being bent at right angles on the lines *b c* to form the outer end, C, of the lock-case, bent on the line *c* to form the inner end, D, of the same, and bent on lines *d g* for the parts C to form the edges of the case, the portion B forming the front and the hasp portion A forming the back thereof, and the inner end portion, D, provided with tenons *f f*, which engage mortises in the hasp portion, the back of the case provided with a slot for the passage of the catch, and the face of the case provided with a key-slot in combination with a lock, the supporting-plate of which is secured to the back of the case by the key-post *i*, and a catch projecting through the back of the case, as specified.

2. In a hasp and lock-case formed of a single plate of metal, a supporting lock-plate placed inside of the case and having an area coinciding to the inside area of the back of the case, in combination with a lock attached to said plate, and the plate attached to the case and the back of the lock-case, and supporting lock-plate provided with coinciding slots, and a catch passing through the slots, as and for the purpose specified.

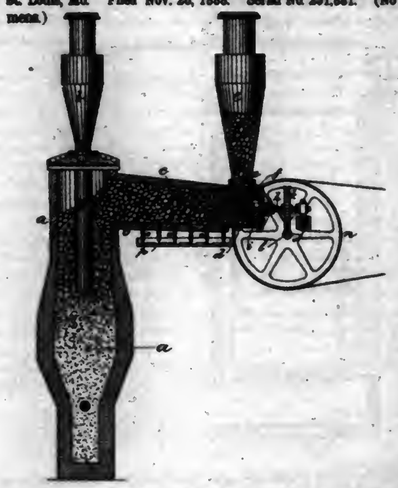


402,208. SNATCH-BLOCK. ANDREW UREN, Seattle, Wash. Filed Aug. 14, 1888. Serial No. 282,745. (No model.)

Claim.—1. In a snatch-block having one side partly open, the combination, with the sheave-bolt having a head, *c*, and the cross-head having one of its rivet ends so extended beyond said open side as to give room for the strap to have lateral and swinging movement, of the said strap pivoted to the cross-head and provided with an opening in its lower end for fitting over said bolt-head, as set forth.

2. In a snatch-block provided with an opening at one side for the insertion of the rope, substantially as shown, the combination, with the said open side and the sheave-bolt provided with a head, of a swinging strap having an opening to fit over said head, the latter being provided with an automatic latch for quickly releasing or locking down said strap, as set forth.

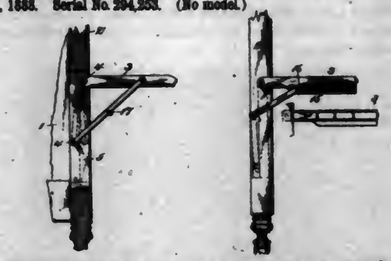
402,209. FOOT-GUARD FOR FROGS, SWITCHES, &c. CHARLES H. WAKEFIELD, Sherbrooke, Quebec, Canada. Filed Aug. 20, 1888. Serial No. 283,254. (No model.)



Claim.—1. The herein-described foot-guard for railway frogs, switches, &c., consisting of a tapering bar having the larger end turned down and formed to adapt it to be driven into the tie, and having one or more holes through it, in combination with a spike having its upper end formed to fit said holes, substantially as described.

2. The herein-described foot-guard for railway frogs, switches, &c., consisting of a tapering bar having the larger end turned down and formed to be driven into the tie, a shoulder on said turned-down end to limit its entrance into said tie, and one or more holes in said bar, in combination with a spike to fit said holes and to support the small end of said bar, substantially as described.

3. The herein-described foot-guard for railway frogs, switches, &c., consisting of a tapering bar having its larger end turned down and formed to be driven into the tie, a shoulder on said turned-down end to limit its entrance into the tie, and a series of holes in said bar, in combination with a spike for supporting the smaller end, having a tongue at its upper end adapted to fit said holes and a shoulder to limit its entrance into the tie, substantially as described.

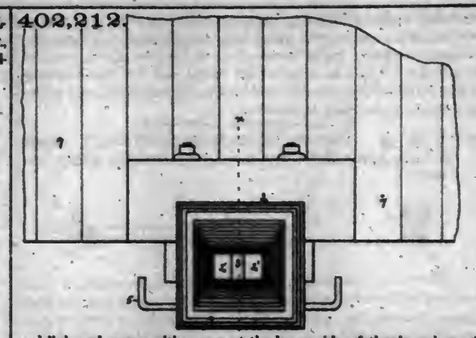


402,210. METHOD OF CONDENSING ZINC VAPORS AND COLLECTING THE METALLIC ZINC THEREFROM. EDWARD WAILES, Jr., St. Louis, Mo. Filed Nov. 26, 1888. Serial No. 291,881. (No specimens.)

Claim.—1. The method herein described for preventing the oxidation of zinc vapors and condensing the same into metallic zinc, which consists in passing the mixed zinc vapors, carbonic-acid gases, &c., through a body of carbon, which at its receiving end is at or above a temperature of fifteen hundred degrees (1,500°) Fahrenheit and at its discharging end, or where the non-condensable gases and molten zinc escape, at a much lower temperature, substantially as and for the purposes specified.

2. As an improvement in the art of condensing metallic zinc from mixed zinc vapors, and oxidizing-gases, subjecting said mixed gases and vapors to a body of carbon which is fed continuously forward through a chamber heated at its discharge end, or where the carbon is discharged, to a temperature of fifteen hundred degrees (1,500°) Fahrenheit, or more, and its carbon-receiving end, or that where the non-condensable gases escape, at or below a temperature at which zinc vapors will condense into liquid molten zinc, the mixed vapors and gases being passed in a reverse direction to the passage or travel of the carbon or condensing medium, substantially as and for the purposes specified

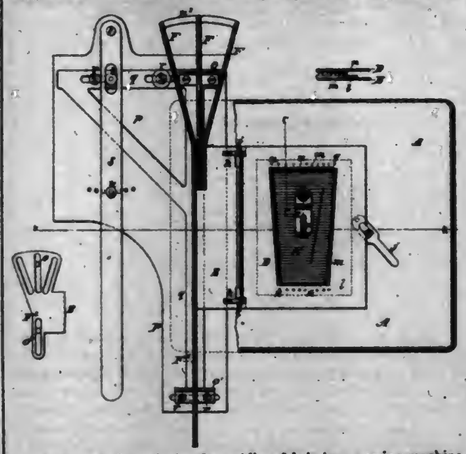
402,211. RACK ATTACHMENT FOR BEDSTEADS. HOWARD M. WARE, Philadelphia, Pa., assignor to I. D. Ware, same place. Filed Dec. 21, 1888. Serial No. 294,253. (No model.)



Claim.—1. The combination, with the upright of a bedstead provided with a vertical slot, of a rack pivoted in the slot and a diagonal brace for supporting the rack, the rack and brace being adapted for folding within the slot, substantially as specified.

2. The combination, with the upright of a bedstead, of a rack formed of angle-iron pivoted thereto and provided with foldable removable hooks, and a pivoted brace for supporting the rack in position, substantially as specified.

3. The upright 2, recessed, as at 5, in combination with the rack 3, adapted to fold therein, having the opposite flanges 7, perforated, as at 8, and the hooks 6, having divergent arms 9 and long and short pins 10 and 11, adapted to take into the openings 8, substantially as specified.



402,212. CAR-COUPLING. CHARLES I. WEBBER, Neenah, Wis. Filed Dec. 18, 1888. Serial No. 293,969. (No model.)

Claim.—In a car-coupling, the combination, with the draw-bar having a link-opening, a cavity for the link leading inward therefrom, and link and cam cavities open at the lower side of the draw-bar, of a hook pivoted therein, said hook having its face or front so formed that it will produce such an angle with the draw-bar when in a closed position that the pressure of the link against it will raise the same, said hook also having a horn extending in a forward direction from below the pivotal point of said hook, a cam pivoted below said pivotal point and adapted in position for raising the hook by its engagement with and its partial revolution toward said horn, and also for retaining the hook in a raised or open position, and the pivot of said cam extended through the cheeks of the draw-bar and adapted for the partial revolution of said cam, all combined and operating substantially as described.

402,213. GLOVE-EMBROIDERING ATTACHMENT FOR SEWING MACHINES. CHARLES E. WEYAND, Brooklyn, N. Y., assignor to A. G. Jennings & Sons, same place. Filed Apr. 30, 1888. Serial No. 272,506. (No model.)

Brief.—The glove-backs are clamped between two plates. The sewing-machine feed acting upon the fabric feeds the same along. The direction is determined by the diverging rods F and shank F^3, which are attached to the plate carrying the fabric and slide in guiding-grooves. Either of the rods F may be placed in the guide-slots.

Claim.—1. In a device for guiding fabric in a sewing-machine, the combination of stitch forming and feeding mechanism with a fabric-clamp having diverging guides F, guide-shank F^3, and bearings for said guides and shank, substantially as described.

2. The fabric-clamp B D, having guide-rods F and shank F^3, combined with the movable bearings *o o'*, whereby by moving said bearings the fabric-clamp will be moved laterally over the bed-plate of a sewing-machine, substantially as described.

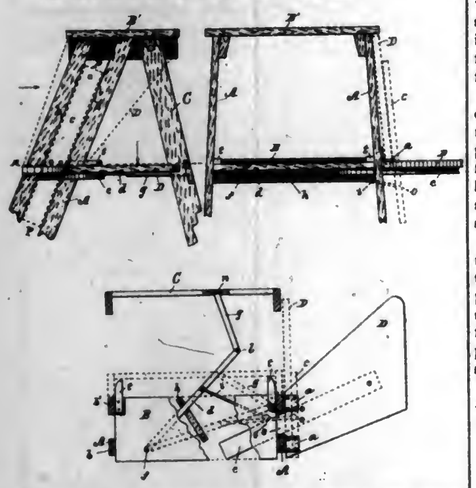
3. The fabric-clamp B D, having an opening for the passage of a needle, and having the diverging guide-rods F and shank F^3, combined with the bearings *o o'*, and the frame *q*, carrying said bearings and guided in the base *p*, substantially as described.

4. The fabric-clamp B D, having the diverging guide-rods F and straight shank F^3, combined with the bearings *o o'* for said guide-rods, and shank-frame *q*, carrying said bearings and guided on the base *p*, and with the lever *s*, for moving said frame, substantially as herein shown and described.

5. The plate B, having an opening, *f*, and pins *n n*, at opposite edges of said opening, upon which pins a tape may be placed and

stretched across said opening, combined with the plate D, having an opening that registers with the opening *f*, said plates B D being constructed to clamp a fabric between them, so that the tape that is held by the pins *n n* may be sewed to the fabric, and with the diverging guides F and straight shank F^2, and bearings for supporting said guides and shank, substantially as described.

402,214. PHOTOGRAPHIC-PLATE-DEVELOPING TRAY. THOMAS S. WILES, Albany, N. Y. Filed Dec. 21, 1888. Serial No. 294,268. (No model.)



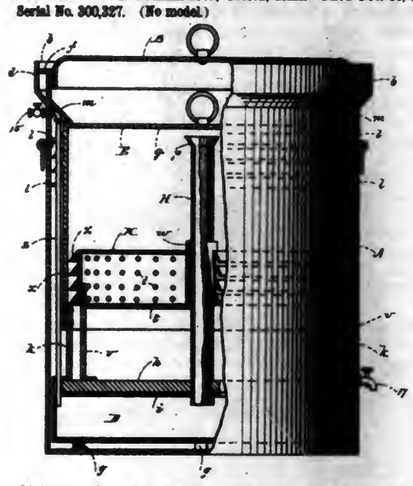
Claim.—1. A bottomless tray adapted to receive within its walls a photographic plate serving as a bottom and provided with swiveled fastening devices for retaining the plate removably in position, substantially as specified.

2. A bottomless tray provided with plate-securing devices having extensions adapted to bear upon the exterior of the walls of the tray, substantially as specified.

3. A bottomless tray provided with corner extensions, in combination with plate-securing devices extended to form spring-tongues, substantially as specified.

4. A bottomless tray provided with plate-retaining devices connected with the tray by headed securing devices, whereby the latter perform the additional function of feet, substantially as specified.

402,215. STEP-LADDER. CHARLES R. WILLIAMS, Newark, N. Y. Filed Dec. 17, 1888. Serial No. 293,896. (No model.)



Claim.—1. A step-ladder having the side A formed with an opening, in combination with a step for the ladder, and a shelf joined to the outer surface of said side A and provided with a supporting-bar held in position to pass through said opening in the side A and to rest against the under surface of the step, substantially as described.

2. A step-ladder having sides A, in combination with a step for the ladder, and a shelf joined by a hinge to a side A and having a supporting-bar held to pass through an opening in the side A and to bear against the step, said shelf being formed with a part extending through said opening in the side A to meet the step, substantially as shown and described.

3. A step-ladder having the side formed with an opening, in combination with a step, rear legs or braces for the ladder, a folding shelf joined to said side by a hinge and provided with a supporting-bar held to pass through said opening in the side, a lever secured to said step, a link connecting said lever and rear braces, and a connecting-rod joining said lever and supporting-bar, substantially as shown and described.

4. A step-ladder having the side formed with an opening, in combination with a step, rear braces for the ladder, a shelf joined to said side by a hinge and provided with a supporting-bar passing through said opening in the side, a lever secured to the step, a link connecting said lever and rear braces, and a rod connecting said lever and supporting-bar, said connecting-rod being detachable from said supporting-bar, substantially as and for the purpose set forth.

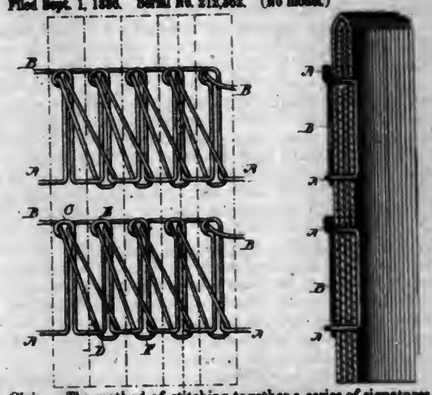
402,216. APPARATUS FOR THE MANUFACTURE OF HYDROGEN GAS. PERRY YARRINGTON, Boston, Mass. Filed Feb. 18, 1889. Serial No. 300,327. (No model.)

Claim.—1. In a hydrogen-gas generator, the combination of a body or tank, a carburetor disposed therein and provided on its top with a guard-plate, a perforated pan for the gas-generating material, supported on said plate and provided with guard-flanges, a bell or inner casing supported on said plate and inclosing said pan, a pipe from the carburetor opening into said bell, and a supply-tube leading from said carburetor through said body, substantially as described.

2. In a gas-generator, the combination of a body, a reservoir for carbureting material so disposed in said body that it may be surrounded by the acid liquid, a wooden guard-plate on said reservoir, a perforated pan supported on said plate and provided with guard-flanges, a bell supported on said plate and inclosing said pan, said bell having guard-flanges, a pipe from the reservoir opening into the bell above said pan, and a supply-tube leading from the reservoir through said body, substantially as described.

3. In a gas-generator, a body provided with a gutter near its mouth, a cover for said body, a carburetor disposed in the bottom of the body, a wooden guard-plate on said carburetor, a perforated pan provided with guard-flanges supported on said plate, a bell inclosing said pan and resting on said plate, guard-flanges on said bell, a pipe from the carburetor opening into the bell above said pan, and a supply-tube leading from said carburetor through the body-wall, substantially as described.

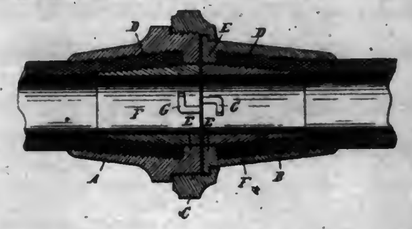
402,217. HEATING AND VENTILATING APPARATUS. WILLIAM S. ZIEGLER, Butler, Pa. Filed Jan. 10, 1889. Serial No. 295,997. (No model.)



Claim.—1. The combination, with receiving and delivery pipes having their opposing ends provided with circumferential flanges, of a removable drum adapted to occupy the space between said ends and having its own ends screw-threaded, and sleeves provided with interior screw-threads, said sleeves being adapted to be disposed upon the ends of the drum and screwed over said pipe ends and against the flanges thereon, substantially as set forth.

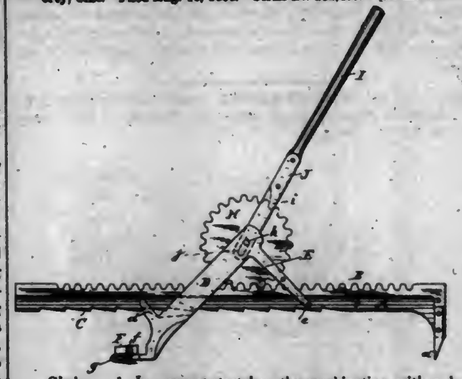
2. The combination, with receiving and delivery pipes provided with smooth opposing ends and with circumferential flanges in rear thereof, of a removable drum adapted to occupy the space between said ends and having its own ends screw-threaded, and cylindrical sleeves provided with interior screw-threads at one end adapted to engage the ends of the drum, the remaining interior surface being smooth and adapted to be screwed over the corresponding smooth ends of said pipes and against the shoulder, substantially as set forth.

3. The combination, with a fire-place, of receiving and delivery pipes having their opposing ends projecting therein at opposite sides and provided with circumferential flanges adapted to fit against the sides of the fire-place, a removable drum adapted to fit the space between said ends and provided at its own ends with exterior screw-threads, and connecting-sleeves provided with interior screw-threads and disposed upon the ends of the drum, said sleeves being adapted to be screwed over the pipe ends and against the flanges thereon, substantially as set forth.



4. The herein-described heating and ventilating apparatus, comprising the receiving and delivery tubes, the former being provided with a damper and the latter with a register or registers, the opposing ends of said pipes being formed with circumferential flanges, a removable drum adapted to occupy the space between said ends and having its own ends screw-threaded, sleeves disposed on the latter having a partially-screw-threaded interior surface for engaging the drum ends, the remainder of said interior surface being smooth and adapted to be adjusted over the corresponding ends of the pipes and against the flanges, substantially as and for the purpose set forth.

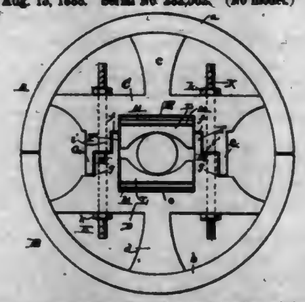
402,218. METHOD OF BOOK-STITCHING. HORACE I. ARNOLD, Hartford, Conn., assignor to Robert S. Woodruff, trustee, Trenton, N. J. Filed Sept. 1, 1886. Serial No. 212,362. (No model.)



Claim.—The method of stitching together a series of signatures, which consists in carrying a loop of one thread through the back of one signature from the outside thereof, and then bringing it out through the same back at another place, and then carrying a loop of another thread through the end of the first loop, outside of the signature, and then carrying another loop of the first thread through the first loop of the second thread, and then through the back of another signature from the outside thereof, and then bringing it out through the same back at another place, and then carrying another loop of the second thread through the end of the second loop of the first thread, and then repeating the operation, if necessary, until all the signatures in the series are stitched together, all substantially as described.

402,219. HOSE-COUPLER. ROBERT A. AUSTIN, Sandusky, Ohio. Filed July 26, 1888. Serial No. 281,079. (No model.)

Claim.—In a pipe or hose coupling, the coupling A, provided with a tapering bore threaded or corrugated, the annular stop E at the inner ends of the tapering bore, the tapering thimble F, exteriorly screw-threaded, and the L-shaped nibs G, formed in the interior of the thimble upon diametrically-opposite sides thereof, substantially as and for the purposes described.



402,220. CARPET-STRETCHER. LEVI G. BALLINGER, East Liberty, Ohio. Filed Aug. 10, 1888. Serial No. 282,405. (No model.)

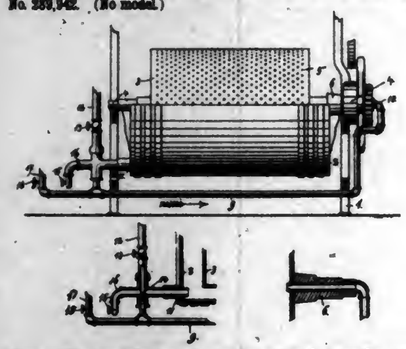
Claim.—1. In a carpet-stretcher, the combination, with a bar provided with a toothed rack, a ratchet, and points for securing the bar to the floor, of an inclined bracket sliding on the bar and having a tooth at its lower end below said bar for engaging with the said ratchet, carpet-hooks connected to the lower part of the bracket, a toothed pinion journaled in the sliding bracket and engaging with the said rack, and a hand-lever for turning the pinion, substantially as set forth.

2. In a carpet-stretcher, the combination, with the bar provided with points for securing it to the floor, a flange upon its upper edge, a toothed rack, and a ratchet, of the inclined sliding bracket provided with a tooth for the ratchet underneath the said bar, and arms projecting downwardly from the bracket and inclined in the opposite direction, said arms having projections engaging with the flange on the said bar, a cross-bar pivoted to the sliding bracket and provided with carpet-hooks, a toothed pinion journaled in the said bracket and engaging with the rack, and a hand-lever for operating the toothed pinion, substantially as set forth.

402,221. SPLIT PULLEY. HENRY BAUTZ, Benton Harbor, Mich. Filed Aug. 13, 1888. Serial No. 282,562. (No model.)

Claim.—1. In a split pulley, the combination of the opposite sections having transverse spoke-bars C D, provided with engaging-shoulders *f* and *g*, and lugs G and F, to prevent displacement of the sections when united, and the uniting-rods and nuts for said sections, substantially as specified.

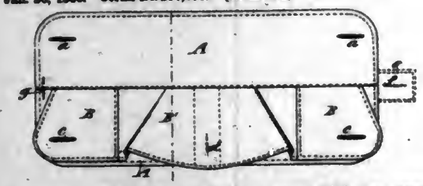
2. In a split pulley, the combination of the opposite sections having transverse spoke-bars C D, united to the rim-sections near the ends thereof and provided on their meeting faces with engaging-lugs G F and shoulders *f g*, and having opposite angular recesses in their meeting faces, with the ovaled faced bushing-blocks L in said recesses, and the uniting-rods, substantially as specified.



3. In a split pulley, the combination of the opposite sections having recesses E *e*, for the passage of the shaft in their meeting faces, with the bushing-blocks L L in said recesses, having oval concaved faces, and the packing-blocks M M, placed in recesses E *e* below blocks L, and uniting-rods and nuts, all substantially as described.

4. The combination of the opposite sections having transverse spoke-bars formed with recesses E *e* in their meeting faces for the passage of the shaft and having engaging-lugs G F and shoulders *f g*, substantially as described, with the uniting-rods and nuts, and the ovaled concaved faced bushing-blocks L in the recesses of the bars, and the packing-blocks M M therein, substantially as set forth.

5. The combination of the opposite pulley-sections having transverse spoke-bars formed with central angular recesses, and with pairs of engaging shoulders and lugs on their meeting faces and widened

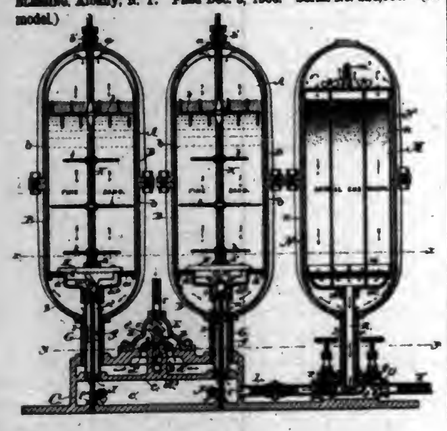


between said shoulders, and lugs on opposite sides of the central recess, with the oval concave-faced bushing-blocks mounted in said recesses, the packing-blocks therefor, and the uniting-rods passing through openings in the widened portions of the spoke-bars, and tightening-nuts thereon, all constructed and arranged substantially as described.

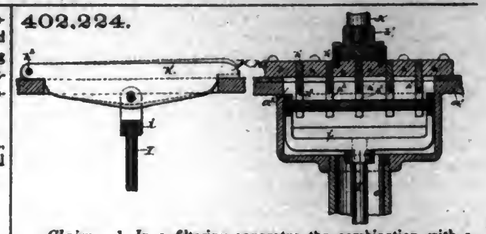
402,222. WASHING-MACHINE. DANA H. BENJAMIN, Utica, N. Y., assignor to Edward Hurlburt, same place. Filed Nov. 3, 1888. Serial No. 289,942. (No model.)

Claim.—The combination of a stationary tank, a perforated rotating cylinder inside of the tank, a hollow bearing, a passage-way connecting with the hollow bearing and the stationary tank, and a steam-pipe entering the connecting passage-way, substantially as set forth, for the purposes stated.

402,223. APPAREL-CUFF. GEORGE BENSON, Belfast, Ireland. Filed Jan. 28, 1889. Serial No. 297,706. (No model.)



Claim.—1. A reversible cup having an attached flap or apron, said flap or apron being provided with a thin flexible central portion and end portions thicker than said central portion, substantially as specified.



2. A reversible cup having an attached flap or apron, said flap or apron being provided with a thin flexible central portion and end portions thicker than said central portion, the central portion being longer upon its outer edge than upon its inner edge, substantially as specified.

3. A reversible cuff having an attached flap or apron, said flap or apron being provided with a thin flexible central portion and end portions thicker than said central portion, said central portion being made in semicircular form, substantially as specified.

402,224. APPARATUS FOR PURIFYING WATER. JAMES H. BLEMING, Albany, N. Y. Filed Dec. 8, 1886. Serial No. 221,007. (No model.)

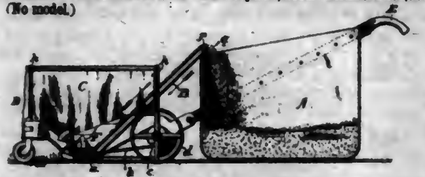
402,224.

Claim.—1. In a filtering apparatus, the combination, with a base provided with a valve-seat having at opposite ends induction-ports and an intermediate eduction-port, and a slide-valve of insufficient length to cover both of said induction-ports at the same time, the said base containing two independent unfiltered-water passages and a waste-water outlet, which are separated from an underlying filtered-water chamber, also contained in said base, of two independent filtering-chambers erected on said base, and each consisting of an inner cylinder for containing the filtering material, and an outer casing which surrounds said inner cylinder, so as to form an annular water-way between said cylinder and casing, each of said inner cylinders being connected by its own outlet water-pipe with the filtered-water chamber of the base, and each of said casings being connected by an independent inlet water-pipe with the unfiltered-water passage of said base, the filtered-water chamber of said base being provided with an outlet-pipe for the filtered water, as and for the purpose specified.

2. In a filtering apparatus, the combination of a filtering-chamber for containing animal charcoal or other purifying material, said chamber consisting of an inner cylinder, M, and an outer casing, N, so as to form an annular water-way, *n*, a base, O, provided with a lower inlet water-passage, *o*, an upper inlet water-passage, o', an upper outlet water-passage, o^2, and a lower outlet water-passage, o^3, said lower inlet water-passage having through its upper side an opening, o^4, which communicates with said upper inlet water-passage, said lower inlet water-passage also having at its lower side an opening, o^5, which leads directly into said outlet water-passage, the openings o' and o^3 being directly opposite each other and having a double-faced valve, P, fitted thereto and arranged to operate so as to reciprocally close one of said openings when the other is opened, the upper outlet water-passage, o^2, being connected to the lower outlet water-passage, o^3, by an opening, o^4, in which a valve, Q, is fitted to close the communication between said outlet water-passages, the inner cylinder, M, being connected by a pipe, R, to the outlet water-passage o^2, and the outer casing, N, being connected by a pipe, S, to the inlet water-passage *o*, as and for the purpose herein specified.

3. In a filtering apparatus, a percolating-bed composed of alternately-arranged reciprocating and stationary bars which are fitted side by side to form leaky joints through which the water will ooze, said reciprocating bars having an endwise movement and being so fitted in respect to said stationary bars as to always form a barrier to the escape of the filtering material, as and for the purpose herein specified.

402,225. MUSICAL NOTATION. BERNARD BOEKELMAN, New York, N. Y. Filed Apr. 4, 1888. Serial No. 269,526. (No model.)



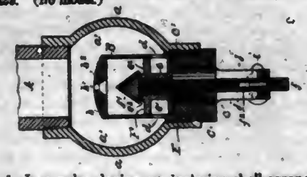
Claim.—1. The herein-described improvement in musical notation, consisting in representing the several constituent or voice parts of musical compositions by notes of such different appearance that such several parts may be distinguished from each other by the appearance of the notes, substantially as described.

2. The improvement in musical notation, consisting in representing the several constituent or voice parts of musical compositions by notes of different colors, whereby such parts may be distinguished from each other by the color of the notes, substantially as described.

402,226. PROCESS OF MANUFACTURING CAUSTIC SODA. JOSEPH A. BRADBURN, Northwich, County of Chester, England. Filed July 24, 1888. Serial No. 280,963. (No specimens.)

Claim.—The process for the manufacture of caustic soda or caustic potash and bleaching-powder, consisting of the following steps, to wit: first, the treatment with nitric acid and peroxide of manganese of common salt or of potassium chloride in a still; second, the treatment of spent liquor with caustic soda or caustic potash and the removal of the peroxide of manganese or its chemical equivalent; third, the evaporation of the nitrate of soda or nitrate of potash mixing it with ferric oxide and furnacing, and, fourth, lixiviating the mass from the furnace.

402,227. GRASS-RECEPTACLE FOR LAWN-MOWERS. CHARLES H. BRAITHWAITE, Ardmore, Pa. Filed Sept. 27, 1888. Serial No. 286,537. (No model.)



Claim.—1. In a lawn-mowar, the combination of the grass-receptacle A, the endless band B, traveling from near the edge of the blades of the mower to the receptacle, and the curtains C D C, surrounding the front and sides of the blades, substantially as set forth.

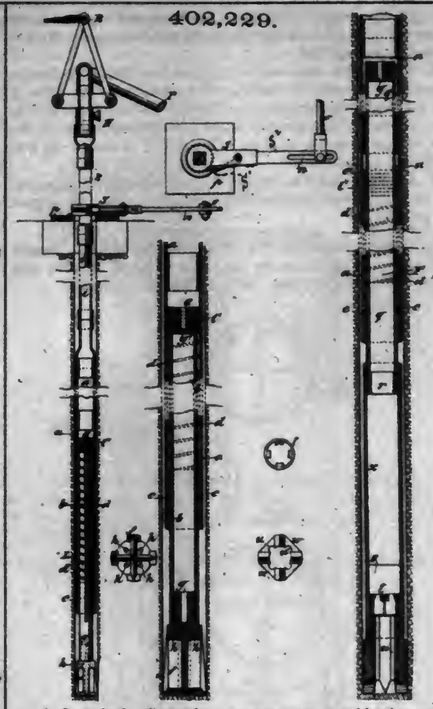
2. In a lawn-mower, the combination of curtains C C, hung on either side of the cutting part thereof, and the curtain D, hung in front of the same, substantially as set forth.

3. A lawn-mower having uprights A A A A at the four corners thereof and curtains C D C upon the uprights and surrounding the front and sides of the blades.

4. In a lawn-mower, the combination of the grass-receptacle A and the handles E E', fastened thereto at the sides, one of which, E, is swiveled at its forward end to the mower-frame, and the other of which, E', is detachably connected at its forward end to the mower-frame, whereby it is capable of being lifted from its fastening to overturn the receptacle on the other handle, substantially as set forth.

402,228. VALVE. JOHN BURKE, Minneapolis, Minn., assignor of one-half to Patrick H. Gunckel, same place. Filed Feb. 2, 1889. Serial No. 298,429. (No model.)

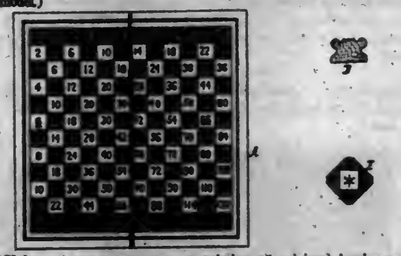
Claim.—1. In a valve device, an inclosing-shell arranged within the fluid and provided at the side and at the inner end with inlet-ports and at the other end with an outlet-opening, a valve for the latter, a piston in the shell, a hollow connection for the valve and piston, and providing an intermediate chamber in communication with the side port, and a sliding stem carrying a valve adapted to close in turn said hollow connection and said end inlet-port, substantially as set forth.



2. In a valve device, an inclosing-shell, a connected piston and valve therein providing an intermediate chamber, inlet-ports at both sides of the piston, a main outlet controlled by said valve, a secondary outlet through said piston and valve, and a stem therein carrying a valve for alternately opening and closing the latter outlet and the inlet in front of the piston, substantially as set forth.

402,229. ROCK-DRILL. FRIEDRICH BUSCHMANN, Heilbronn, Germany, assignor to the Salzwerk Heilbronn, same place. Filed Oct. 26, 1887. Serial No. 253,411. (No model.) Patented in England Aug. 16, 1887, No. 11,210; in Belgium Aug. 31, 1887, No. 73,614; in France Dec. 2, 1887, No. 185,296; in Austria-Hungary Jan. 23, 1888, No. 31,704 and No. 64,920; in Germany June 8, 1888, No. 43,326, and in Spain June 12, 1888, No. 8,005.

Claim.—1. In a hydraulic boring apparatus, the combination, with a pump, of a plunger-cylinder, pipe-connections between the same, a plunger within the said cylinder, and a boring-tool connected with the plunger, all being so arranged and combined that the pump will cause the lifting and forcing downward of water in the bore-hole to elevate or depress the boring-tool, substantially as specified.



2. In a hydraulic boring apparatus, the combination, with a pump, of hollow connecting-rods, a cylinder connected to one of said rods, a plunger within said cylinder, a boring-tool, and a spring for assisting in the elevation of the plunger, substantially as specified.

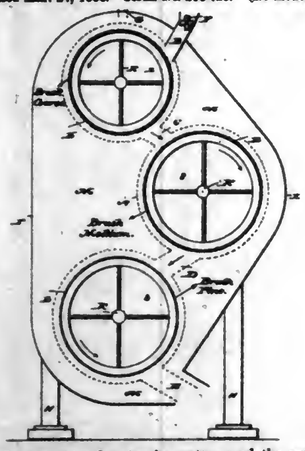
402,229.

3. In a hydraulic boring apparatus, the combination, with a pump, of hollow connecting-rods, a cylinder connected to one of said rods, a hollow plunger within said cylinder, and a boring-tool, said plunger and boring-tool being provided with apertures for the passage of water, substantially as specified.

402,230. GAME APPARATUS. JOHN L. COLES and DAVID H. COLES, Brooklyn, assignors to the Empire State Manufacturing Company, New York, N. Y. Filed Oct. 25, 1888. Serial No. 289,110. (No model.)

Claim.—A game apparatus consisting of a board having on its face a multiplication-table, consisting of a series of numbers arranged in line, and the successively increasing multiples of such numbers arranged in successive lines to form a rectangular board, in combination with various sets of markers, and with polyhedrical numerators, the number of sides of each of which exceeds the square root of the largest figure on the multiplication-table, said sides being marked with figures and signs, substantially as described.

402,231. SINKER FOR FISHING-LINES. JOHN L. COLES and DAVID H. COLES, Brooklyn, assignors to the Empire State Manufacturing Company, New York, N. Y. Filed Oct. 25, 1888. Serial No. 289,111. (No model.)



Claim.—1. A fishing-line sinker consisting of the end parts, A and B, each having a central orifice extending entirely through it for

the lengthwise passage of the line and interposed removable and replaceable sections E, each having a radial slot, F, to receive the line, substantially as described.

2. A fishing-line sinker consisting of the two parts A and B, each having a screw-thread and a central orifice extending entirely through it for the lengthwise passage of the line, and the interposed sections E, screw-threaded together and to the screw-threaded parts of the sinker, and each section having a radial slot, F, to receive the line, substantially as described.

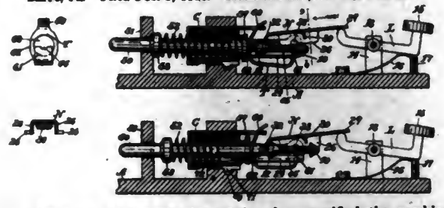
3. A fishing-line sinker containing at one end a cavity having the outer edge of its wall provided with scallops or recesses D, substantially as described.

402,232. MACHINE FOR DELINTING COTTON-SEED. ROBERT H. COLLYER, New Orleans, La., assignor to George M. Harrison, same place. Filed Mar. 27, 1888. Serial No. 268,723. (No model.)

Claim.—In a machine for cleaning cotton-seed, the combination, with the casing I, of a series of cylinders arranged horizontally therein one above another and provided in succession with brushes of increasing degrees of fineness, the wire screen A, concentric with each cylinder, the said screen surrounding the upper cylinder having a conduit, B, and being connected at its bottom by a tangential passage with the top of the screen around the intermediate cylinder, and the said intermediate screen connected in a like manner with the lower cylinder-screen having an outlet, E, the cylinder-shafts, and gearing, substantially as described, for rotating the same at successively-increased speeds.

402,233. CARRIAGE-DRIVING MECHANISM. DARIUS W. DODSON, Wilkes-Barré, Pa. Filed Mar. 30, 1887. Serial No. 232,945. (No model.)

Claim.—1. The combination, with the reciprocatable carriage of a machine, of a driving-gear, a rack carried on said carriage and meshing with said gear and having a lateral movement relative to said gear, a fixed shuttle, a shuttle-guide, and rack-switching apparatus, substantially as described, operating to throw said guide past the ends of said shuttle, and thereby throw the rack into mesh and out of mesh, all substantially as described, and for the purpose specified.



2. The combination, with the reciprocatable carriage of a machine, and with a driving-gear located beside said carriage, of a rack carried on said carriage and meshing with said gear and having a lateral movement relative to said gear, of the fixed stud or shuttle, the guide on said rack, and the yieldingly-held switch-arm carried on said rack and operating to force the guide past the end of said shuttle, all substantially as described, and for the purpose specified.

3. The combination, with the reciprocatable carriage, as C, of a machine, of gear P, rack R, carried by a parallel motion on the carriage, and a shuttle, shuttle-guide, and switch-arm, all substantially as shown and described.

4. The combination, in a mechanism of the class specified, of the gear and rack, a fixed stud or shuttle, 5, guide 7, and an inclined switch-arm having a part, as 14, about parallel to said guide, substantially as described, and for the purpose specified.

5. The combination, with a mechanism of the class specified, having guide 7 and shuttle 5, of the switch-arm having hook 8, substantially as and for the purpose set forth.

402,234. MECHANICAL MOVEMENT. DARIUS W. DODSON, Wilkes-Barré, Pa. Filed Feb. 3, 1888. Serial No. 262,870. (No model.)

Claim.—1. In a mechanism of the class specified, the combination of the reciprocating latch provided with two catches set one in advance of the other, the escapement located at one side of said latch and having two corresponding catches, and a spring-actuated device, substantially as described, pressing said latch against said escapement, substantially as described.

2. In a mechanism of the class specified, the combination of the latch provided with two catches, set one in advance of the other, the escapement having two corresponding catches, the lever pressing said latch against said escapement, and a spring taking its bearings between said latch and lever, all substantially as described.

3. In a mechanism of the class specified, the combination, with a frame-work having a bearing for the latch and a bearing for the latch-case, of the latch, the latch-case having a fulcrum for the lever and carrying the escapement, and the spring-actuated lever fulcrumed in said case and acting on said latch to press the same against said escapement, all substantially as described.

4. In a mechanism of the class specified, the combination consisting of the latch 50, having two catches set one in advance of the other and having a collar or shoulder, 53, the pivoted escapement located at one side of said latch and having two corresponding catches, the bent lever T, pressing said latch against said escapement-catches, and the spiral spring 52, carried on said latch and taking its bearing between said collar 53 and said lever, all substantially as described.

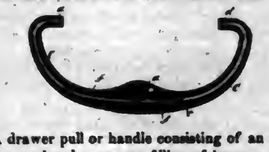
5. In a mechanism of the class specified, the combination, with the latch-case C, having the arms 24 24 perforated at 23, and having a fulcrum for lever T, of the spring-actuated latch having catches 10 and 12, the escapement N, journaled in said case at 23 23, and having catches 30 32, and the bent lever T, fulcrumed in said case and perforated for said latch, and with its point taking its bearing on the side of said latch opposite said escapement, all substantially as described.

6. In a mechanism of the class specified, the combination, with the latch provided with the catches 10 and 12, of the escapement N, pivotally supported on a fixed axis and located at one side of said latch, and having the holding-catch 30 and the detaining-catch 32, the distance between catches 30 and 32 being less than between catches 10 and 12, and the latch having a lateral movement toward and from said escapement, all substantially as described.

7. In a mechanism of the class specified, the combination, with a latch, substantially as described, of the lever T, having the fulcrum-bearing 60 and the latch-bearing 61, and formed at 62 for the passage through said lever of the latch, and to there receive the force of a spring that is carried on said latch, all substantially as described.

8. In a mechanism of the class specified, the combination, with an arm, 26, having two rotary movements, as set forth, of the spring-actuated reciprocating latch interposable into the orbital path of said arm and having two catches, as set forth, the pivoted escapement located at one side of said latch and having two corresponding catches, a key operating said escapement, and a spring-actuated device pressing said latch-catches into engagement with said escapement, the whole being organized and coacting to throw forward the latch on depressing the key and to recatch the latch on its return either before or after the release of the key, all substantially as described, and for the purpose specified.

9. In a mechanism of the class specified, the escapement N, having the holding-catch 30 and detaining-catch 32, and having the depending flanges 26 26, each provided with a trunnion, 25, below the line of said catches, all substantially as described.



10. In a mechanism of the class specified, the combination, with a suitable frame-work and with the latch, of the latch-case removably fixed in said frame-work, the escapement carried by said case and arranged for engagement with the latch-catches, the bent lever bearing against one side of said latch between the latch-catches and fulcrumed in said case on the opposite side of said latch from its said bearing on the latch, and a spring carried on the latch within said case and acting between the latch and said lever, all substantially as described.

11. In a mechanism of the class specified, the combination, with the revolable latch, having catches 10 12, and having the cylindrical portion 65 between said catches, of the latch-case C, the escapement N, pivoted in said case, and the spring-actuated lever T, fulcrumed in said case and having a concave bearing, 66, resting on said part 65, all as set forth.

402,235. FIREPROOFING COMPOUND. CHARLES W. DOUGHTY, Augusta, Ga. Filed July 26, 1888. Serial No. 280,990. (No specimens.)

Claim.—The herein-described composition of matter for protecting cotton-bales against flash of flame and deterioration, consisting of linseed-oil, copperas, water, and kaolin, in substantially the proportions specified.

402,236. DRAWER-PULL. SIGMUND FREUD, New York, N. Y. Filed Dec. 22, 1888. Serial No. 293,406. (No model.)

Claim.—A drawer pull or handle consisting of an outer shell or casing of sheet metal and a core or filling of baser metal than the said shell or casing, the latter being compressed upon and depressed in ornamental or other designs into the core or filling, substantially as specified.

402,237. PAPER-HOLDER. CHARLES H. FISHER, Santa Fé, N. Mex., assignor of one-half to Edward L. Bartlett and L. A. Hughes, same place. Filed Dec. 8, 1888. Serial No. 292,005. (No model.)

Claim.—1. A receptacle for stationery, having a compartment for carbon-paper, provided with a false perforated bottom, and a tray below said bottom, substantially as described.

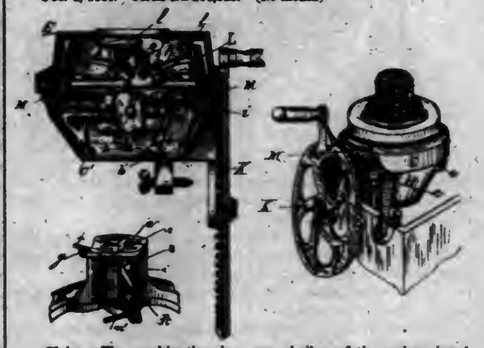
2. A receptacle for stationery, having a compartment for carbon-paper, provided with a lid, a false perforated bottom, and a removable tray below said bottom, substantially as described.

3. A receptacle for stationery, having one or more compartments provided with a removable bottom, as and for the purpose set forth.

4. A receptacle for stationery, having one or more compartments, and provided with a copy-holder, substantially as described.

5. A receptacle for stationery, provided with a copy-holder, and having a compartment for carbon-paper, provided with means for keeping the paper moist, substantially as described.

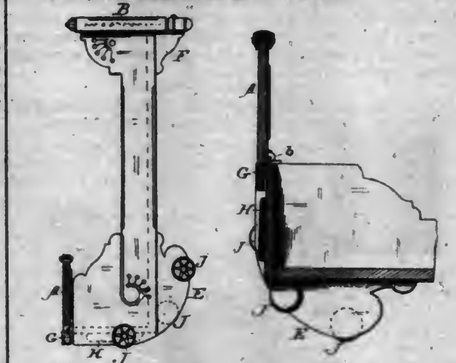
6. The combination, with the base A and standard B, of the receptacle E, adjustable on the standard and having one or more compartments, substantially as described.



7. The combination, with the base A and standard B, of the adjustable collar D, the tube C, resting thereon, and the receptacle E, fastened to the tube and having one or more compartments for stationery, substantially as described.

8. The combination, with the base A and standard B, of the stationery-receptacle E, adjustable on the standard and provided with a copy-holder, F, attached to said receptacle, substantially as described.

9. The stationery-receptacle E, having the slotted block f', and having a copy-holder, F, hinged thereto and provided with an arc, f, adjustable in the slotted block f', substantially as described.

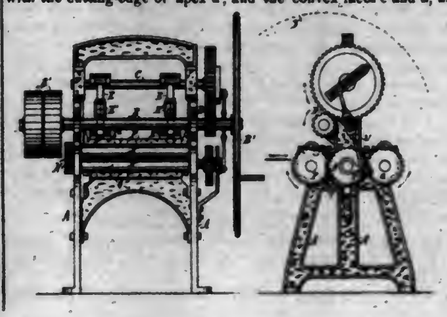


10. The combination, with the base A and standard B, of the tube C, the adjustable collar D, supporting the tube, the receptacle E attached to the tube and provided with the slotted block f', the copy-holder F, hinged to the receptacle and having the arc f sliding through the block f', and the set-screw f^3, for clamping the arc at any desired point, substantially as described.

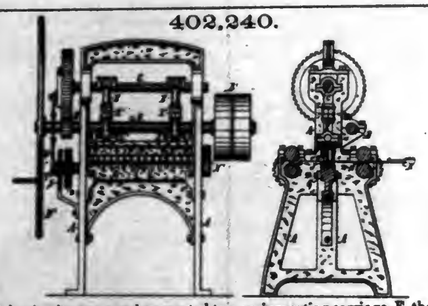
402,238. CORN-SHELLER. CURTIS GODDARD, Alliance, Ohio. Filed Feb. 1, 1888. Serial No. 263,235. (No model.)

Claim.—The combination, in a corn-sheller, of the springs i and the vibrating arms A, with the gear-wheel M, having uprights L, with lateral projections l, provided with a hook, g, substantially as shown and described.

402,239. BEDSTEAD. ROBERT C. GRAHAM, Philadelphia, Pa. Filed Nov. 17, 1887. Serial No. 255,445. (No model.)



Claim.—1. A bedstead having a head-board hinged thereto and provided with a weight, G, attached to said head-board behind and below the hinge, substantially as set forth.



2. A bedstead having rockers at the head end of the frame, and a weight, H, attached to said end beyond the rockers, and further provided with a hinged head-board having a weight attached to it behind and below the hinge to hold said head-board vertical when the bed is turned from a vertical position down into a horizontal position, substantially as set forth.

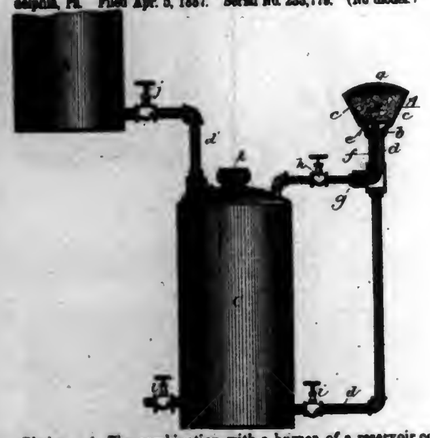
402,240. MACHINE FOR MAKING METALLIC LATHING. GEORGE HAYNS, New York, N. Y. Filed Nov. 26, 1888. Serial No. 291,845. (No model.)

Claim.—1. A machine for the manufacture of sheet-metal lathing, containing cutting-dies H, each die having its lower end formed with the cutting-edge or apex d', and the convex faces c and d, also

402,240.

each having its upper end connected to a reciprocating carriage, F, the said carriage provided with moving mechanism giving it reciprocating motion, essentially as shown and described.

2. The combination of cutting-dies H, each having cutting-edge a', also convex faces c and d, reciprocating carriage F, stripper J, and grooved bed G, essentially as shown and described.



3. The combination of dies M with carriage F and matrix M', as and for the purpose set forth.

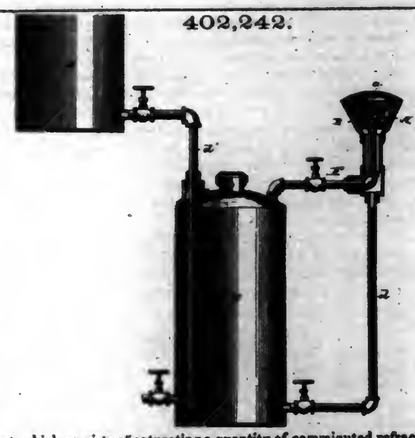
4. Shafts B and C, connected by gearing at D, pitmen E, carriage F, provided with dies H, stripper J, and grooved bed G, arranged and combined essentially as shown and described.

5. The shafts C, connecting-rod U, pawl T, ratchet-wheel S, gear-wheels P, Q, and R, with rollers N and rollers O, the lowermost of the latter being formed to admit free passage of the punctured metal sheet through, all combined essentially as shown and described.

6. A die, H, rectangular in cross-section, having its one end formed with cutting-edge (or apex) a', and the two convex faces c, and the two convex faces d, as a device for puncturing sheet metal and turning outwardly and backwardly the edge metal into form, as tongues and lips, essentially as shown and described.

402,241. HYDROCARBON-BURNER. CHARLES L. HEVERIN, Philadelphia, Pa. Filed Apr. 5, 1887. Serial No. 233,779. (No model.)

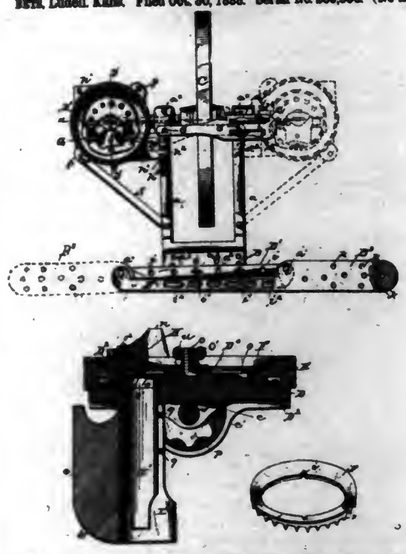
Claim.—1. The combination, with a burner, of a reservoir containing oil and water, pipes leaving said reservoir at different levels and communicating with the burner, and a water supply or reservoir above the burner communicating with said water and oil reservoir, substantially as described.



2. The combination, with the burner, of an oil and water reservoir, a tank or receptacle containing water, a pipe leading from the water-supply to the said reservoir, and separate pipes between the oil and water containing parts of the reservoir and the burner, whereby the water and oil are supplied to the burner under equal pressure, substantially as described.

3. In a hydrocarbon-burner, the combination of a burner, a hydrocarbon-fluid tank, a connecting-tube between the upper part of said tank and the burner, a water-tank, a connecting-tube leading from the water-tank to the lower part of the hydrocarbon-fluid tank, and another tube connecting the lower part of the hydrocarbon-fluid tank with the burner, substantially as set forth.

402,242. PROCESS OF BURNING HYDROCARBON OIL. CHARLES L. HEVERIN, Philadelphia, Pa. Filed Dec. 5, 1887. Serial No. 257,038. (No model.)



Claim.—The herein-described method or process of generating

402,242.

heat, which consists of saturating a quantity of comminuted refractory material with two liquids, one a hydrocarbon and the other a liquid which, when decomposed, will yield oxygen, conducting said liquids intermingled each in a diffused state outward from the body to the surface of the refractory material, and burning the same at the surface of the material, substantially as described.

402,243. SEEDING ATTACHMENT FOR PLOWS. JAMES S. HIBBEN, Ludell, Kans. Filed Oct. 30, 1888. Serial No. 289,533. (No model.)

Claim.—1. A seeding attachment for a walking-plow which may be regulated for depth of seed-planting, and also the spacing apart of individual seed or groups of the grain as it is being planted, substantially as set forth.

2. A seeding attachment for plows, which is adapted to be removed at will and attached to either a left or a right hand plow, substantially as set forth.

3. A seeding attachment for a right or left hand walking-plow, which is removably secured to the plow and adapted to plant seed at different depths by changing its adjustment on the plow, substantially as set forth.

4. A seeding attachment for a right or left hand walking-plow, comprised of a frame, a land-wheel, and seed-dropping mechanism which is actuated by the revolution of the land-wheel, substantially as set forth.

5. A seeding attachment for a left or right hand walking-plow, having a frame which is hinged to the plow, so as to vibrate vertically independent of the plow, a land-wheel supported to rotate on the frame, and a seed-dropping device, which is operated by the revolution of the land-wheel when the plow is in use and turning a furrow-slice, substantially as set forth.

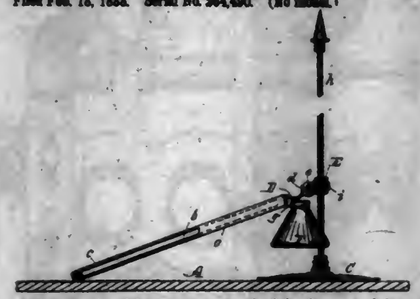
6. A seeding attachment for a right or left hand walking-plow,

which is adapted to drop seed a given depth and be thrown out of use when the plow is in motion, substantially as set forth.

7. A seeding attachment for a right or left hand walking-plow, that is hinged to allow it to conform to the undulations of the ground operated upon and adapted to plant seed at a predetermined depth, space apart individual seeds or groups of seed, and be arrested from dropping seeds while the plow is in motion and turning a furrow-slice, substantially as set forth.

8. The combination, with a plow that turns a furrow to the right or left, of a frame, a driving-shaft, a land-wheel that is adapted to run loose on the shaft or be locked fast to it, and a seeding device which is operated by the land-wheel when the plow is given a forward motion, substantially as set forth.

9. The combination, with a plow, of a reversible bracket-arm, a hinged frame, a driving-shaft, a land-wheel, and seed-dropping mechanism which is adapted to be changed in adjustment for regulating the depth of seed-planting, and also the distance of spaced separation of individual grains or groups of seed, substantially as set forth.



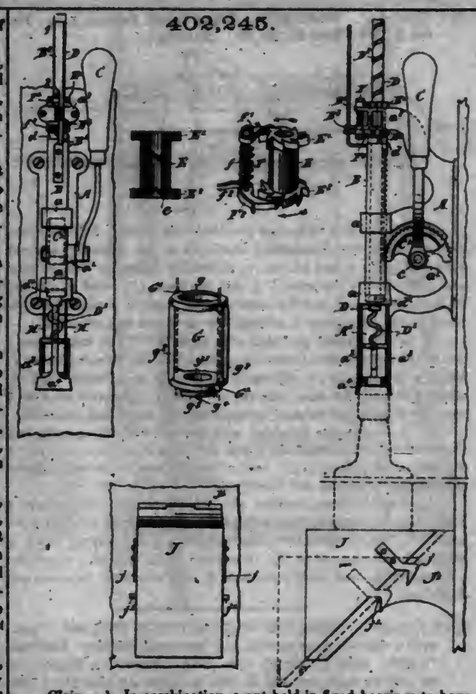
10. In a seeding attachment for right or left hand plows, the combination, with a plow, a bracket-arm removably attached to the plow to operate in advance of or in the rear of the mold-board, and a hinged frame, of a driving-shaft, a land-wheel mounted on the driving-shaft, a device to lock the land-wheel to the shaft or release it, and a seed-dropping device which is supported on the driving-axle, and is adapted to periodically deposit seed in plowed soil which has been turned by the plow, substantially as set forth.

11. In a seeding attachment for walking-plows, the combination, with a plow-beam, a bracket-arm adjustably attached to the beam, and a frame which is hinged to the bracket-arm, of a driving-shaft supported to revolve on the frame, a land-wheel mounted loosely on the driving-shaft, a device to shift the land-wheel on the shaft and lock it thereto, a base-plate, a seed-hopper, and seed-dropping mechanism mounted on the base-plate and adapted to be operated by the revolution of the driving-shaft and land-wheel, substantially as set forth.

12. In a seeding attachment for a walking-plow, the combination, with the handles of a plow, a bracket-arm removably and extensibly secured to these handles, and a frame that is hinged to have vertical vibration on the bracket-arm, of a driving-shaft revolubly secured in the frame, a land-wheel slidingly mounted on the driving-shaft, a shifting-lever to move the land-wheel, and means to lock it to the driving-shaft, substantially as set forth.

13. In a seeding attachment for plows, the combination, with the handles of a right or left hand plow, a bracket-arm, a frame, a driving-shaft, a land-wheel, a lever that is adapted to shift the land-wheel longitudinally of the driving-shaft, and a means to interlock the driving-shaft and land-wheel when it is shifted on the shaft, of a base-plate, a seed-hopper, and dropping mechanism which is supported on the base-plate and actuated by a pinion which is mounted on the driving-shaft and revolves when the plow is moved forwardly to turn a furrow-slice, substantially as set forth.

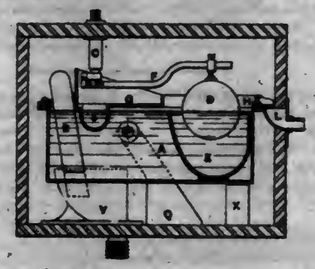
402,244. WRITING-CASE. CHARLES E. HIGGS, Somerville, Mass. Filed Feb. 18, 1888. Serial No. 264,490. (No model.)



Claim.—1. A writing-case composed of the frame or slab a, with a plane writing-surface, c, and a plate, D, combined with the base C, the vertical rod or standard A, and the block E, adapted to slide upon the latter and pivotally united to the writing-case frame a, substantially for purposes described.

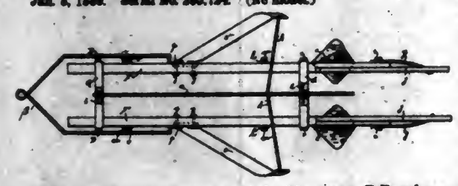
2. The combination, with a table or other support, A, a stand composed of a base, C, and removable rod A, a sliding block, E, with its fastening-screw i, of a writing-case, B, having curved pins d d and pivotally united to said block, whereby the rear part can be raised to change the inclination of said writing-case, substantially as herein specified.

402,245. APPARATUS FOR DRAWING CORKS. WILLIAM J. KIRBY, Montreal, Quebec, Canada. Filed July 9, 1888. Serial No. 279,471. (No model.) Patented in Canada July 17, 1888, No. 29,502.



402,245.

Claim.—1. In combination, a nut held in fixed bearings to have rotary movement therein, a pawl for controlling the movement of said nut, a threaded spindle passing through the nut and adapted to rotate therein and reciprocate through the same, and a releasing-arm moving with the spindle and in line with the pawl, whereby it acts upon the pawl and releases the nut, so that it may revolve, and thus allow the spindle to move longitudinally without rotating, substantially as described.

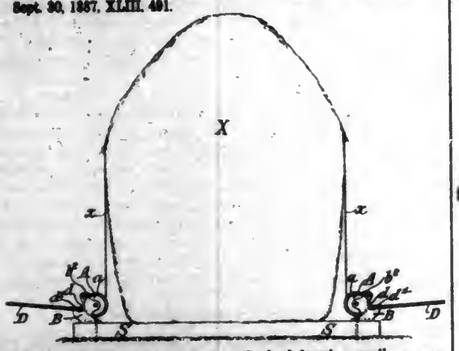


2. In an apparatus for drawing corks, the combination, with a sleeve carried in bearings and movable in either direction vertically, and a spindle within such sleeve and moving vertically with it, having a helical groove cut on a portion of its length, and means for moving the sleeve, of a nut carried loosely in suitable bearings, encircling said spindle, having ratchets formed on it, one at each end, and an interior helical thread corresponding to groove in said spindle, the said ratchets being arranged in opposite or right and left hand order, pawls adapted to engage with said ratchets, and means for operating one of said pawls from the said sliding sleeve, so as to free it from the ratchet during a portion of the ascent of said sleeve, as and for the purpose described.

402,246. FLUSHING-CISTERN FOR WATER-CLOSETS, &c. THOS. HOLT and JAMES HOLT, Liverpool, County of Lancaster, England. Filed Mar. 30, 1888. Serial No. 268,821. (No model.) Patented in England Mar. 21, 1888, No. 4,496.

Claim.—The combination, with the supply-valve of a tilting flushing-cistern, located so as to deliver its water onto the cistern-cover near the falling end, of a cover formed with an opening into the cistern at the rising end, and with its edges extending some distance above the top of the cover, whereby the water of the supply-valve is not allowed to enter the cistern when the cover is in a tilted position.

402,247. CULTIVATOR. ROBERT IMLEY, Bateham, Kans. Filed Jan. 8, 1889. Serial No. 295,734. (No model.)

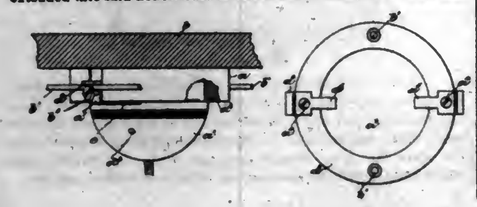


Claim.—1. In a cultivator provided with runners F F and cross-pieces *g* and *d*, the combination therewith of the adjustably-secured colters *l l* and *u u*, and knives *o o*, adjustably hinged to said runners and connected by the arms A A with the lever *a*, pivoted at one end to the cross-piece *g*, and the other playing freely in the bracket C, secured to the cross-piece *d*, substantially as shown and described.

2. In a cultivator provided with runners F F and cross-pieces *g* and *d*, the combination therewith of the adjustably-secured colters *l l* and *u u*, the shovels *s s*, adjustably secured to said runners and extending beneath the same, and the coverers *g g*, adjustably secured to the rear ends of said runners, substantially as shown and described.

3. In a cultivator provided with runners F F, the combination therewith of the cross-pieces *g* and *d*, colters *l l* and *u u*, knives *o o*, shovels *s s*, and coverers *g g*, each adjustably secured to said runners, substantially as shown and described.

4. In a cultivator provided with runners F F and cross-pieces *g* and *d*, the combination therewith of the colters *l l* and *u u*, knives *o o*, arms A A, lever *a*, pivoted to the cross-piece *g* and playing freely in the bracket C, secured to the cross-piece *d*, the shovels *s s*, coverers *g g*, handles *j j*, and draft-connection B, all substantially as shown and described.

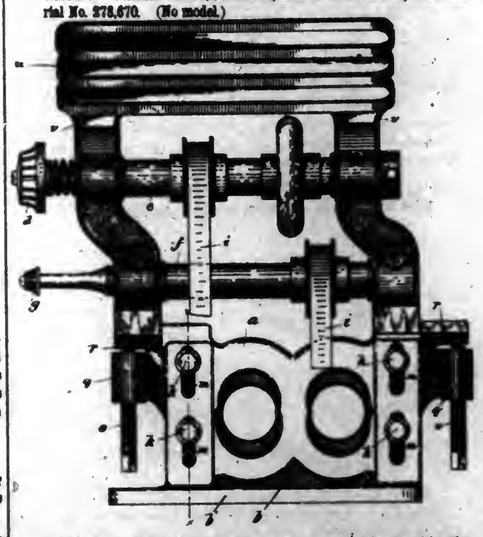


402,248. METHOD OF MANUFACTURING ENSILAGE. CUTHBERT G. JOHNSON, Oakwood Croft, near Darlington, England. Filed June 28, 1887. Serial No. 242,721. (No model.) Patented in England Oct. 26, 1884, No. 14,113, and Mar. 15, 1886, No. 3,659; in France Dec. 7, 1886, No. 180,132; in Belgium Dec. 10, 1886, No. 75,560; in Victoria Mar. 14, 1887, No. 4,961; in Canada Mar. 16, 1887, No. 26,269; in Cape of Good Hope Aug. 17, 1887, No. 6/406; in Natal Aug. 18, 1887, and in Italy Sept. 30, 1887, XLIII. 491.

Claim.—The herein-described method of forming ensilage, consisting in placing the material in a loose stack above the ground and compressing the stack both upon its top and sides in lines at distances apart, said pressure being uniformly distributed over the top and sides at each of the lines of compression, and varying the pressure upon each of the lines of compression at will, substantially as specified.

402,249. ELECTRIC CUT-OUT. JAMES L. KINBALL and HERBERT C. WIRT, Boston, Mass. Filed Jan. 10, 1889. Serial No. 295,975. (No model.)

Claim.—1. The combination, with the hollow base having a rim, metallic strips a^5 a^6, secured to said rim, and having their inner ends extended into said hollow base to form contact-arms, and having their

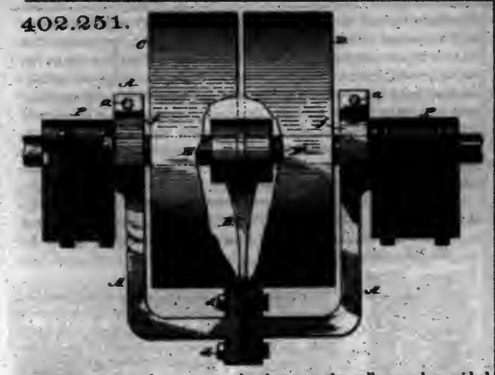


outer ends extended outside of the said rim, and to which the line-wires are secured on the outside of the said base, of the rosette provided on its upper face with contact-pieces b^3 b^4, to engage said contact-arms, terminals secured to the upper face of the said rosette, a fusible strip connecting each terminal with a contact-piece, and branch wires connected to said terminals, and to which an incandescent lamp may be connected, substantially as described.

2. The combination, with the hollow base having an annular rim, metallic strips a^5 a^6, secured to said rim, and having their inner ends extended into said hollow base to form contact-arms, and having their outer ends extended outside of the said rim, and to which the line-wires are secured outside the said base, of the rosette provided on its upper face with contact-pieces b^3 b^4, to engage said contact-arms, and having their ends bent or concaved, as at c^3, to form a lock for said contact-arms, terminals secured to the upper face of the said rosette, a fusible strip, *d*, connecting each terminal with a contact-piece, and branch wires connected to said terminals, and to which an incandescent lamp may be connected, substantially as described.

3. The combination, with the hollow base having an annular rim, and provided with metallic strips secured to said rim, and having their inner ends extended into said hollow base to form contact-arms, and having their outer ends extended outside of the said rim, and to which the line-wires are secured outside the said base, of the rosette provided on its upper face with contact-pieces to engage said contact-arms, terminals secured to the upper face of the said rosette, a fusible strip connecting each terminal with a contact-piece, and branch wires connected to said terminals, and to which an incandescent lamp may be connected to be suspended from the said rosette, and a key to engage and disengage the rosette from its base, whereby the suspended lamp may be removed from the floor of the building, substantially as described.

402,250. BELT-TIGHTENER FOR SOLE-EDGE-TRIMMING MACHINES. WILLIAM LAREY, Stoneham, Mass. Filed June 30, 1888. Serial No. 278,670. (No model.)



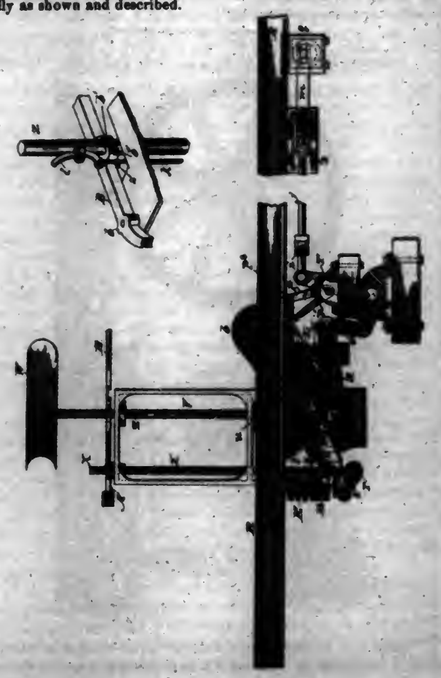
Claim.—As an improvement in belt-tighteners, the combination of the stationary section having tapped sockets, the vertically-disposed adjusting-screws, the adjustable section provided with the end shoulders bearing on said vertical screws, and carrying rotary shafts, and having slots and nutted bolts passed through said slots, substantially as set forth.

402,251. PULLEY-SUPPORT. ADELBERT G. LAWRENCE, Motley, Minn. Filed June 21, 1888. Serial No. 277,266. (No model.)

Claim.—1. In combination with the pulleys C D, the shafts E F, yoke A A, arm B, and the boxes P P, reduced at *f f*, substantially as set forth.

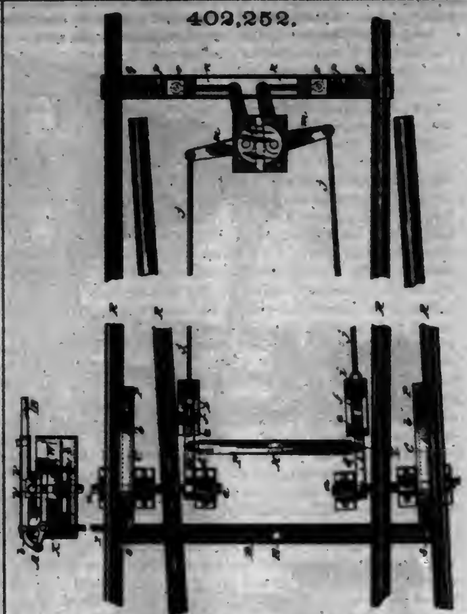
2. In combination with the fast and loose pulleys and the shafts,

402,251.



the yoke A A, and an arm passing between the pulleys and provided with a box at one end for inclosing the meeting ends of the shafts, substantially as set forth.

402,252. AUTOMATIC SWITCH. ADELBERT G. LAWRENCE, Motley, Minn. Filed June 21, 1888. Serial No. 277,259. (No model.)



Claim.—1. In an automatic switch, the combination, with the shaft *a*, the operating-levers C C, said levers connected with each other, means for transmitting reverse motion to said levers, substantially as shown and described, and locking-latches P, the arms P' of which normally look the levers C C, of the shields *b*, pivotally secured normally a slight distance above the levers C, their lower outer ends normally supported on the arms P^2 of the latch P, said shield adapted to automatically unlock the levers C C, substantially as hereinbefore described.

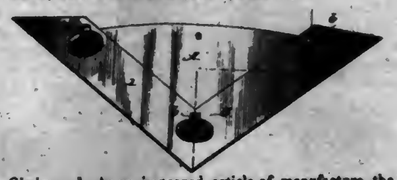
2. In combination with the operating-levers and attachments for throwing the switch, as above set forth, the shield *b*, arranged in connection with the operating-lever, as set forth, eccentric V, locking-dogs P, and springs T, all arranged substantially as and for the purpose described.

3. In an automatic switch, the combination, with the shafts *a*, the levers C C, said levers provided with eccentrics V, having a groove in their upper outer edges at their hub ends, of the swinging shields *b b*, extending over and embracing said levers C C, said shields provided with a small wheel journaled transversely in the lower end thereof, said wheel adapted to normally rest in the groove of the eccentric V, and means for operating the levers and shields, substantially as shown and described.

402,252.

4. The combination, with the shield *b*, of the presser-bar D and spring E, substantially as and for the purpose described.

5. The combination, with crank *d*, of the links L, presser-bar F, and spring H, substantially as and for the purpose described.

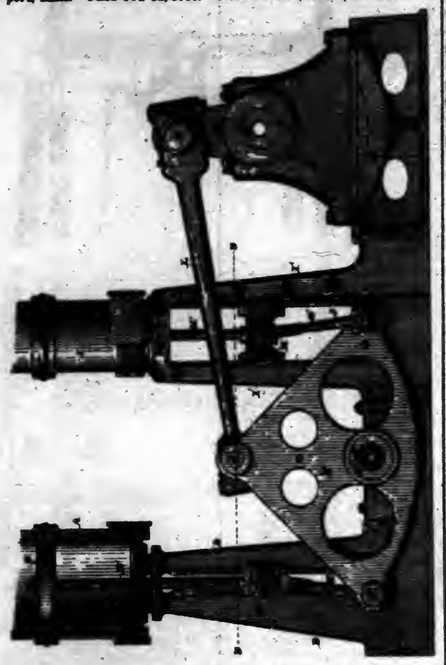


6. In an automatic switch, the combination, with the levers *f* and *m*, the pitman-rods J J, the operating-levers C C, and the throw-bar *q*, of the perpendicular joint *i* and the horizontal joint 3, formed in the said rods J, substantially as and for the purpose specified.

7. In combination with the throw-bar *q*, the sliding block *o* and spring *p*, substantially as and for the purpose specified.

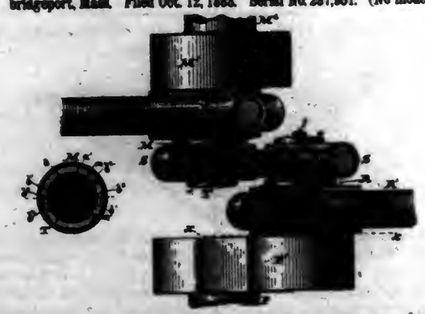
8. In combination with the switch-stand, shields *b*, and operating-levers C C, the shaft *r*, cranks *s*, latch-lever X, link A, and locking-bar B, constituting the device for unlocking the dog P, substantially as and for the purpose hereinbefore specified.

9. The combination, with the shaft *a* under the main track, signal-stand, signal-vane, and the locking-bar B, as set forth, of the lever Z, secured upon the shaft *a*, a toothed disk, Y, mounted on the shaft *a*, a pivoted dog, A, engaging the disk Y, the rod *k*, having a lug, 2, said rod connecting the dog with the hand-lever *l*, said lever Z and rod *k* adapted to be engaged by the locking-bar B, and held from movement when said bar is in a locked position, substantially as and for the purpose set forth.



402,253. PLOW. WILLIAM W. LEAK, Montgomery, Ala. Filed Nov. 30, 1888. Serial No. 292,399. (No model.)

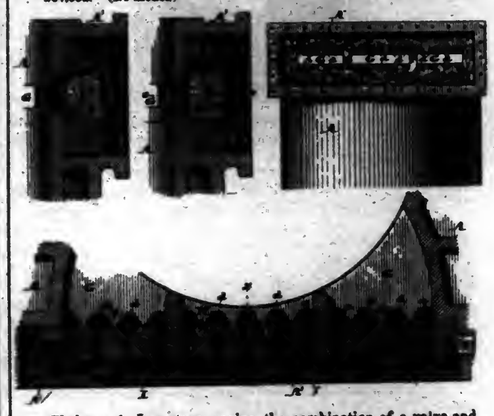
Claim.—1. As an improved article of manufacture, the plow-point B, consisting of a thin plate of metal formed approximately V-shaped, with wings 1 1, such wings being arranged to diverge longitudinally and laterally or transversely, and provided with slots at the juncture of and near the outer ends of wings 1, such slots being arranged parallel with each other and with a line intersecting the angle between the wings, all substantially as and for the purposes set forth.



2. The combination, substantially as herein described, of the sweep A, constructed to incline downward on opposite sides from a central longitudinal line, the point B conformed to such sweep and consisting of a thin V-shaped metal plate having wings 1 1 arranged to diverge longitudinally and laterally or transversely, and provided at its center and near its ends with the slots *b*, and the fastening-bolts passed through such slots and through openings in the point A and secured, all substantially as and for the purposes set forth.

402,254. STEAM-ENGINE. ERASMUS D. LEAVITT, Jr., Cambridgeport, Mass. Filed Oct. 12, 1888. Serial No. 287,960. (No model.)

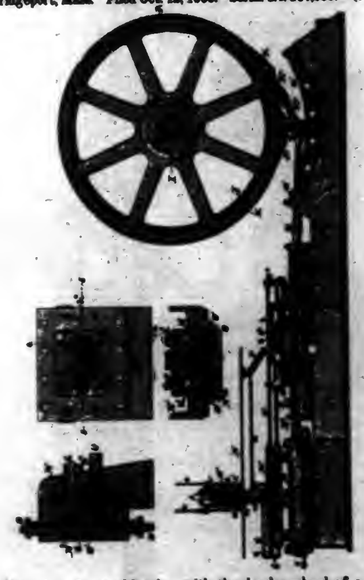
Claim.—In a steam-engine having a plurality of cylinders, the combination, with said cylinders, of a triangular rocker-beam having a plurality of journals or bearings formed on three pins fixed in said beam, one at each angle, a plurality of cross-heads, a plurality of parallel and straight slides, piston-rods connecting said cross-heads with the pistons within said cylinders, links or rods connecting two of said cross-heads to two of said journals or bearings upon one of said beam-pins and the remaining cross-head or cross-heads to another of said beam-pins, a main-shaft crank-pin, and a connecting-rod mounted at one end upon said main-shaft crank-pin and at its other end upon the journal or bearing upon the third beam-pin, said connecting-rod passing and vibrating between two of said cross-heads and piston-rods.



402,255. DEVICE FOR CONNECTING THE CRANKS OF TWO INDEPENDENTLY-ACTING ENGINES. ERASMUS D. LEAVITT, Jr., Cambridgeport, Mass. Filed Oct. 12, 1888. Serial No. 287,961. (No model.)

Claim.—1. Means for connecting and disconnecting two independently-operated engines having their shafts in axial line with each other, so that both shafts may be revolved by either engine, comprising a drag-link and two crank-pins, one of which pins is made in two parts, one tubular and fixed in the crank and provided with a journal to receive the connecting-rod of the engine and the other removably set in said tubular portion in axial line therewith and provided with a journal to receive one end of the drag-link.

2. Means for connecting and disconnecting two independently-operated engines having their shafts in axial line with each other, so that both shafts may be revolved by either engine, comprising a drag-link and two crank-pins, one of which pins is made in two parts, one tubular and fixed in the crank of one of the shafts, and is provided with a journal to receive the connecting-rod of the engine, and the other is removably set in said tubular portion in axial line therewith, and is provided with a journal to receive one end of the drag-link, another crank-pin fixed in the crank of the other shaft and provided with two journals, one to receive the connecting-rod of the engine and the other to receive one end of the drag-link, and a cap secured to the end of the last-mentioned crank-pin to retain said link in position when in use, and which is adapted to be removed when said engines are running independently of each other.



408,256. STEAM-CYLINDER FOR STEAM-ENGINES. ERASMUS D. LEAVITT, Jr., Cambridgeport, Mass. Filed Oct. 12, 1888. Serial No. 287,962. (No model.)

Claim.—1. In a steam-engine, the combination of a valve and valve-seat, each provided with a series of transverse slots or ports, and a cylinder having a port or passage made shallow in the direction of the length of said cylinder for the greater part of the distance from its inner to its outer end, and terminating at its outer end in a series of flaring passages corresponding in number and height in the direction of the length of the cylinder to the length of the slots or ports in the valves.

2. A steam-cylinder provided with a shallow passage extending from each steam-chest to the interior of said cylinder and terminating at its outer end in a series of flaring smaller passages, substantially as and for the purposes described.

402,257. HOISTING-ENGINE. ERASMUS D. LEAVITT, Jr., Cambridgeport, Mass. Filed Oct. 12, 1888. Serial No. 287,963. (No model.)

Claim.—1. In combination with the brake-wheel of a hoisting-drum, a reciprocating cross-head, a lever pivoted to said cross-head,

a strap encircling said wheel and connected at one end to said cross-head and at the other end with one end of said lever, and means for moving said lever in one direction to clamp said strap to said wheel, so that said wheel will move about its axis with said cross-head and in the opposite direction to loosen the grip of said strap upon said wheel.

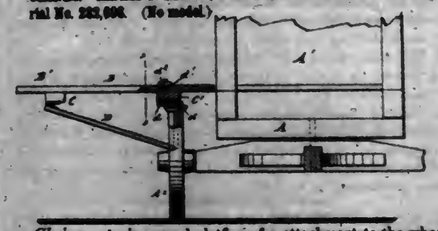
2. In combination with the brake-wheel of a hoisting-drum, a cross-head reciprocating in a path concentric with the axis of said wheel, a fulcrum-pin mounted in said cross-head, a lever mounted upon said pin, a strap encircling said wheel and connected at one end to said cross-head and at the other end with one end of said lever, a reciprocating frame, a lever pivoted to said frame, a rod connecting the lower ends of said levers, another rod connecting said cross-head and said sliding frame, two cylinders secured to said reciprocating frame, and a reciprocating plunger mounted in said cylinders and connected with the upper end of the lever pivoted to said reciprocating frame.

3. In combination with the brake-wheel of a hoisting-drum, a fixed cylinder, a reciprocating piston mounted within said cylinder, a cross-head or frame mounted in suitable guides, a rod connecting said cross-head with said piston, a lever mounted upon said cross-head, an engine-cylinder mounted upon and movable with said cross-head or frame, a piston fitted to said cylinder and arranged to be reciprocated therein and connected to one end of said lever, a second cross-head mounted in guides located beneath said brake-wheel and curved to an arc of a circle concentric to the axis thereof a rod connecting said two cross-heads, a lever pivoted at or near the center of its length to said second cross-head, a brake-strap surrounding said brake-wheel and connected at one end to said second cross-head and at its other end to one end of the lever carried by said cross-head, and a rod connecting the other end of said lever with the lever pivoted to the first-mentioned cross-head or frame.

4. In combination with a fixed cylinder, a piston reciprocating in said cylinder, a frame adapted to slide in suitable guides, a rod connecting said piston with said frame, two cylinders secured to said frame in axial line with each other, a plunger mounted in said cylinders and extending from one to the other, a casting secured to said fixed cylinder and provided with two parallel water-chambers, a pipe secured to one of said sliding cylinders and extending into one of said water-chambers, another pipe secured to the other sliding cylinder and extending into the other water-chamber, and pipes leading to the outer ends of said water-chambers to admit the water thereto or exhaust it therefrom, as the case may be, valves for controlling the flow of water to or from said water-chambers, a two-armed lever pivoted to said reciprocating frame and connected at one end to said plunger, a brake-wheel, a second cross-head located beneath said brake-wheel, curved slides for guiding said second cross-head in a path concentric to the axis of said brake-wheel, a second two-armed lever pivoted to said second cross-head, a brake-strap surrounding said brake-wheel, a rod connecting said reciprocating frame and second cross-head, and a rod connecting the lower ends of the two two-armed levers.

5. In combination with the brake-wheel of a hoisting-drum, a cross-head reciprocating in a path concentric with the axis of said wheel, a fulcrum-pin mounted in said cross-head, a lever mounted upon said pin, a strap encircling said wheel and connected at one end to said cross-head and at the other end with one end of said lever, a reciprocating cross-head or frame, a lever pivoted to said frame, a rod connecting the lower ends of said levers, another rod connecting said cross-head and said reciprocating frame, two cylinders secured to said reciprocating frame in axial line with each other, a reciprocating plunger mounted in said cylinders and extending from one to the other and connected to the upper end of the lever pivoted to said reciprocating frame, a fixed cylinder, a piston mounted in said fixed cylinder and adapted to reciprocate therein, and a rod connecting said piston to said reciprocating frame, so that said frame, said cross-head, and said piston will all move in unison.

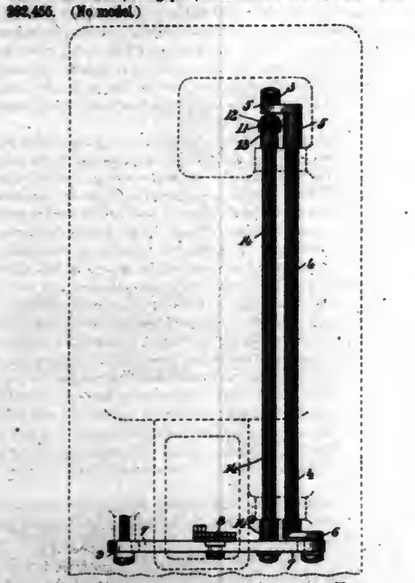
6. In combination with the brake-wheel of a hoisting-drum, a reciprocating frame, two cylinders secured to said frame in axial line with each other, a plunger mounted in said cylinders and extending from one to the other, a lever pivoted to said reciprocating frame and connected at one end to said plunger, and pipes connecting with the outer ends of said cylinders to admit water to reciprocate said plunger, a cross-head located beneath said brake-wheel and arranged to be reciprocated in a path concentric to the axis of said wheel, a two-armed lever pivoted to said cross-head, a brake-strap surrounding said brake-wheel and pivoted at one end to said cross-head and at its other end to one end of the lever carried by said cross-head, and a rod connecting the other end of said lever with the lower end of the two-armed lever carried by said reciprocating frame.



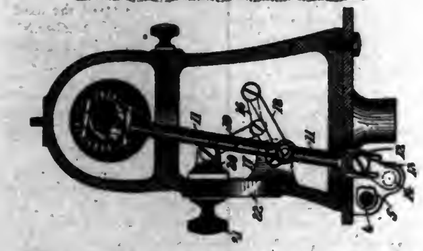
7. In combination with the brake-wheel of a hoisting-drum, a reciprocating frame, a cylinder and piston for transmitting motion to said reciprocating frame, a valve-seat provided with an exhaust-port and another port upon either side of said exhaust-port, pipes connecting said outer ports with the opposite ends of said cylinder, a valve adapted to cover all of said ports or either two of them, as desired, a valve-stem for operating said valve, a lever connected at one end to said valve-stem and at the other end to a fulcrum-pin which is adapted to be raised or lowered at the will of the operator, a sliding cross-head pivoted at one end to said lever, and a series of links and levers interposed between said reciprocating frame and said cross-head, by which, when said frame is moved away from the hoisting-drum, said cross-head will be moved so that all the ports in the valve-seat will be closed by said valve.

8. In combination with the brake-wheel of a hoisting-engine and a gripping or clamping device constructed and arranged to be intermittently clamped to and released from said wheel, a fixed cylinder, a piston working in said cylinder, a reciprocating frame or cross-head connected by a piston-rod to said piston, a pair of differential cylinders mounted upon and movable with said frame, a differential plunger fitted to said cylinders and extending from one to the other, a lever mounted on said frame and connected at one end to said differential plunger and at its other end to the gripping device, a pair of fixed water-chambers, pipes leading from the interior of said water-chambers to the opposite ends of said differential cylinders, a valve-chamber provided with two sets of ports leading therefrom and two valves to cover said ports, pipes leading from the two outer ports of one set to the opposite ends of the fixed cylinder, pipes leading from the two outer ports of the other set to the interior of the water-chambers, a cross-head connected at one end with the stem of the valve that controls the flow of water to the fixed cylinder, and a system of links and rods connecting the other end of said cross-head to one of said differential cylinders or to the frame on which said cylinder is mounted.

9. The combination of the fixed cylinder B, the piston B', the piston-rod B^3, a reciprocating cross-head or frame connected to said piston-rod, the differential cylinders D and D', mounted upon and movable with said reciprocating frame, a differential plunger fitted to said differential cylinders and extending from one to the other, the fixed water-chambers M and M', the pipes L and L', the valve-chamber N^3, the two valves g' g', the ports i, i^2, k^3, k^2, k, and k^4, pipes connecting ports i and i^2 with the opposite ends of the cylinder B, pipes connecting the ports k and k^2 with the water-chambers M' and M, respectively, the valve-rods g g, hand-levers O, means for locking one of said levers in any desired position, links l and l^2, levers I and I^2, the cross-head I^3, the pantograph P, the crank-shaft m^3, lever n, and rod n', all constructed, arranged, and operating substantially as described.



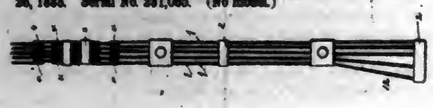
10. In combination with the brake-wheel of a hoisting-drum, a reciprocating cross-head, a strap encircling said wheel and secured at one end to said cross-head, a frame reciprocating in unison with said cross-head, a lever for causing said strap to grip the said wheel when said cross-head is at one end of its movement and to release the same when at the other end of its movement, a pair of differential cylinders mounted upon and movable with said frame, a differential plunger fitted to said cylinders and extending from one to the other, a two-armed lever pivoted to said frame and connected at its upper end to said plunger, a rod connecting the other end of said lever to the strap-clamping lever, a valve-seat provided with three ports in line with each other, a fixed cylinder, a piston adapted to reciprocate within said cylinder and connected with said frame, pipes connecting the ends of said cylinder with two of the ports in said valve-seat, a lever for operating said valve to uncover either of the outer ports and allow water to pass into either end of said cylinder and cause the piston, frame, and cross-head to be moved toward or from said drum, as may be desired, and a system of links and levers connecting said reciprocating frame with the valve, and so arranged that it will cause said valve to cover said ports when said frame has moved a predetermined distance and prevent all further movement in that direction.



402,258. BAND-CUTTER PLATFORM FOR THRASHING-MACHINES. ALFRED B. LESPER, Owasco, Ill. Filed Aug. 14, 1888. Serial No. 282,606. (No model.)

Claim.—An improved platform for attachment to the wheeled truck of a thrashing-machine, the same consisting of the flat body having near one end a concavity adapted to fit the rim of a wheel, the hook-shaped clamping-bolt applied to such recessed end of the body, and a brace-bar hinged to the under side of said body near its outer end, substantially as shown and described.

402,259. FEEDING MECHANISM FOR SEWING-MACHINES. FRANCIS T. LESLIE, Bridgeport, Conn. Filed Dec. 3, 1888. Serial No. 292,455. (No model.)



Claim.—1. The combination, with the main shaft, of the cams arranged thereon, the connections arranged within the arm and operated by said cams, the two rock-shafts actuated by said connections, the feed-bar forked at each end and supported the one end upon a stud and the other on the wrist of the lifting rock-shaft crank, the slotted connection of the feed-bar with the wrist of the other rock-shaft, and the link, arm, and a slide-block held by a thumb-screw binding on the arm connected to the feed-driving connection, and whereby the throw imparted by the latter to the wrist of its rock-shaft is controlled and varied, substantially as set forth.

2. In a feeding mechanism for sewing-machines, the combination, with the feed-bar and the serrated feed-dog mounted thereon, said bar being slotted horizontally and vertically near one end and having its other end forked and supported upon a pin, of the feed-driving rock-shaft having a crank engaging the vertical slot in the bar, a cam-actuated connection engaging said feed-driving rock-shaft, and means for varying the throw of said connection, the feed-lifting rock-shaft having a crank engaging the horizontal slot in the bar and extended beneath the bed parallel to the feed-driving rock-shaft, and a cam-actuated reciprocating connection between the main shaft and the rear end of the feed-lifting rock-shaft, substantially as set forth.

3. The combination, with the feed-bar and the means for imparting thereto its vertical reciprocation, of the main shaft, the rotating cam thereon, the reciprocating connection engaged by said cam and having its lower end forked to embrace the wrist of the feed-driving shaft-crank, a link pivoted to the connection and fulcrumed at its opposite end to one extremity of an adjustable arm fulcrumed to the head, and means for adjusting and securing said arm in various positions, substantially as set forth.

402,260. CORSET-BUSK. ISAAC LEVY, Newport, R. I. Filed July 26, 1888. Serial No. 281,065. (No model.)

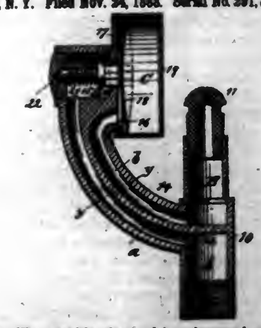
402,260.

Claim.—1. A corset-busk consisting of a series of longitudinal wires connected together at intervals in their length by strips or braces, each wire being formed with spring-coils, substantially as described.

2. A corset-busk consisting of a series of longitudinal wires, 1, formed with spring-coils 4 and secured together by the clips or braces 2, and having a broad lower end, 12, substantially as described.

3. The combination of two corset-busks, each consisting of a series of longitudinal wires formed with spring-coils and secured together at intervals, one of the said busks having one of its wires bent to form a hook projecting from the face of the busk and the other busk having one of its wires bent to form a loop projecting from the edge of the busk, substantially as herein shown and described.

402,261. DETACHABLE FAUCET. RIVERIUS MARSH, New Brunswick, N. J. Filed Jan. 18, 1889. Serial No. 296,706. (No model.)



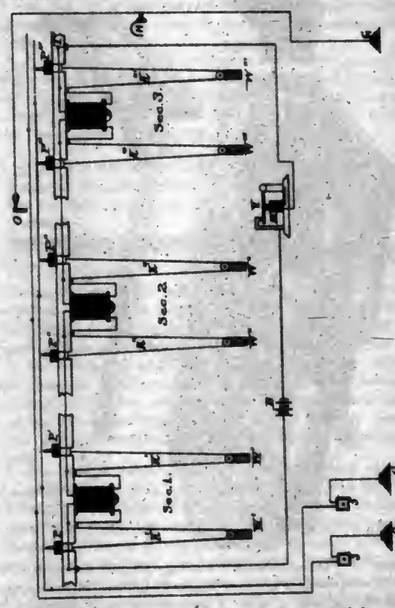
Claim.—1. The combination, with the threaded spout-sleeve having an inwardly-standing flange at its lower end, of the threaded sleeve, a stopper provided with a base portion, P, to force said flange L down on an underlying annular washer, and with a central depending circular portion having a downwardly-tapered side to bind against and compress the inner edge of said washer till said side comes in contact with the inner edge of the flange L, the said depending portion then closing the discharge-opening of the can to which the device is attached, substantially as specified.

2. The combination, with the base-sleeve attached to the top of a can, of the spout-sleeve screwing therein and having the flange L, the washer N, underlying said spout-sleeve, and the screw-stopper entering the spout-sleeve and provided with the flat base portion P and the depending circular base portion Q, having the downwardly-tapered side R, substantially as specified.

3. The combination, with the can and the base disk D, attached thereto and provided with the circular groove F, having the overhanging edges G G', of the base-sleeve carrying the upper portions of the faucet and provided with the flange I, that rests and turns in the groove F, substantially as specified.

4. The combination, with the can, the base-disk secured thereto and provided with the groove F, and the rotatory base-sleeve provided with the flange I, to enter and turn in the groove F, of the ring washer N, lying on the flange I and on the inner edge, G', of groove F, the spout-sleeve screwing in the base-sleeve and provided with the flange L, that overlies the washer, and the stopper screwing in the spout-sleeve and provided with the base portions P and Q, the latter having a depending downwardly-tapered side, R, substantially as and for the purpose specified.

402,262. SAFETY-BURNER. JOSEPH MASON and HENRY MASON, New York, N. Y. Filed Nov. 24, 1888. Serial No. 291,765. (No model.)



Claim.—1. The combination, with a burner-body divided into upper and lower chambers or compartments, of an arm extending upward from the side of the burner-body and formed with gas-passages which connect the burner-body chambers, a cap and diaphragm carried by the arm and forming an air-tight chamber, a valve mounted to control the gas-passages and arranged to bear against the diaphragm, and a spring arranged in connection with the valve, substantially as described.

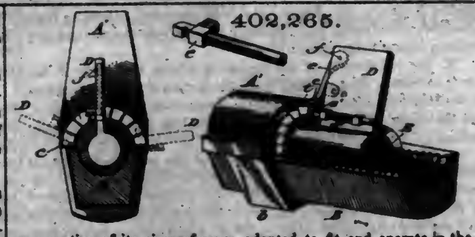
2. The combination, with a burner-body divided into chambers A and B, of an arm formed with passages *a* and *b* and a valve-chamber, a valve mounted within the chamber, a diaphragm arranged in advance of the valve, and a cap connected to the arm in advance of the diaphragm and forming therewith an air-chamber located in close proximity to the burner, substantially as described.

402,263. DENTAL ANÆSTHETIC. ALFRED L. MCCARTY, Des Moines, Iowa. Filed Jan. 17, 1889. Serial No. 296,650. (No specimens.)

Claim.—The herein-described compound to be used as an anæsthetic, consisting of crystallized muriate of cocaine, chloroform, fluid extract of staphisagria, (staves-acre,) oil of cloves, and water, in about the proportions specified.

402,264. MULTIPLE SWITCH-BOARD. CHARLES E. MCCLURE, Richmond, Va. Filed Oct. 22, 1888. Serial No. 288,676. (No model.)

Claim.—1. The combination, with a multiple switch-board and connected telephone-lines, of a testing apparatus comprising a local circuit with a battery and rheotome, said local circuit passing through the primaries of the induction-coils at each board, the terminals of the secondary of each induction-coil being connected to the switch-plugs of a flexible cord, with a testing-plug grounded through a receiver, as described.

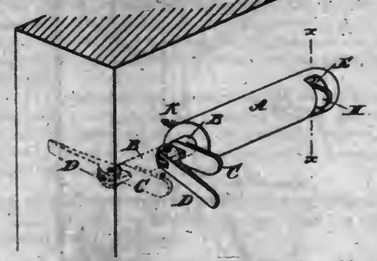


2. The combination, with a telephone-exchange multiple switch-board, of a local battery, a rheotome, and the primaries of a series of Ruhmkorff induction-coils connected up in metallic circuit, while the terminals of the secondaries of the induction-coils are connected each to a pair of flexible connecting cords and plugs, as described.

3. The combination of any number of Ruhmkorff induction-coils, with their primaries connected up in circuit with a local battery, and a vibrator or circuit-breaker for each circuit, thereby producing an intermittent or undulatory flow of electricity through the said primary coils, the secondary terminals of each induction-coil being connected to a separate pair of connecting cords and plugs in such manner that the necessary movement of the connecting-plugs when carried by the hand of the operator to the line-commutators in the act of making a connection will not disconnect them, but will cause an intermittent or undulatory flow of induced electricity to traverse the subscriber's lines thus connected together until they are disconnected, substantially as described, and for the purpose explained in the foregoing specification.

402,265. WRENCH. VINCENT J. MCDOWELL, Philadelphia, Pa. Filed Dec. 13, 1888. Serial No. 293,441. (No model.)

Claim.—1. In a wrench, a semicircularly-shaped screw-threaded groove provided on the main shank or stem, in combination with a tubular-shaped section secured to the adjustable section of the wrench, said section provided with a handle projection and with screw-threads

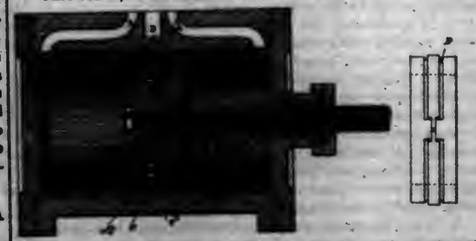


402,265.

on a portion of its circumference adapted to fit and operate in the screw-threads of the groove of the shank or stem, a pawl adjusted to the tube-section operated by a lever, and notches provided on the end of the adjustable section of the wrench to engage said pawl, substantially in the manner and for the purpose as hereinbefore set forth and described.

2. In a wrench, the screw-threaded groove *a*, in combination with the tubular section E, secured to the adjustable section A' and provided with screw-threads on a portion of its circumference and a handle or projection, D, the screw *d*, connecting the tubular section E with the adjustable section A', a pawl, *d'*, adjusted to the tubular section E, a lever, *e*, and teeth *t*, provided on A', substantially as hereinbefore set forth and described.

402,266. BURGLAR-ALARM. NEIL MCINTYRE, Brooklyn, N. Y., assignor to himself and James J. Manion, East Newark, N. J. Filed Nov. 24, 1888. Serial No. 291,782. (No model.)

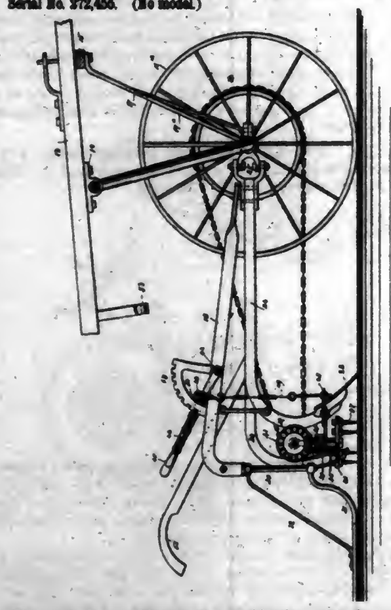


Claim.—1. In a burglar-alarm, the combination, with a tubular body and a plate loosely and transversely mounted in the said body, of a spring-actuated plunger-carrying bar sliding in the bore of the body, and an essentially wedge-shaped arm hinged to the outer end of the said bar, as and for the purpose specified.

2. In a burglar-alarm, the combination, with a tubular body, a screw integral with the inner face of the same, and a plate loosely and transversely mounted near the rear end of the said body, of a spring-actuated plunger-carrying bar reciprocating in the bore of the body, provided with a handle extending outward at a right angle therefrom, and an essentially wedge-shaped arm hinged to the outer end of the said bar, all combined to operate substantially as and for the purpose specified.

3. In a burglar-alarm, the combination, with a tubular body provided with aligning transverse slots in opposite faces near the rear end, a plate projecting through the outer slot and loosely held in a slot, and a screw integral with the body near the forward end, of a spring-actuated plunger-carrying bar reciprocating in the bore of the body, a handle attached to the said bar near the outer end, and an essentially wedge-shaped arm hinged to the outer extremity of the said bar, all combined for operation as and for the purpose specified.

402,267. PISTON-PACKING. GEORGE H. MEADER, Boston, Mass. Filed Oct. 26, 1888. Serial No. 289,125. (No model.)



Claim.—1. The combination, in a piston-packing, of a section of a ring or holder having the sleeve a^2, the wall a^3, and the inclined surface a^4, with the removable section having the annular recess a^4, the wall a^5, and the inclined section a^6, and the cleft or divided pack-

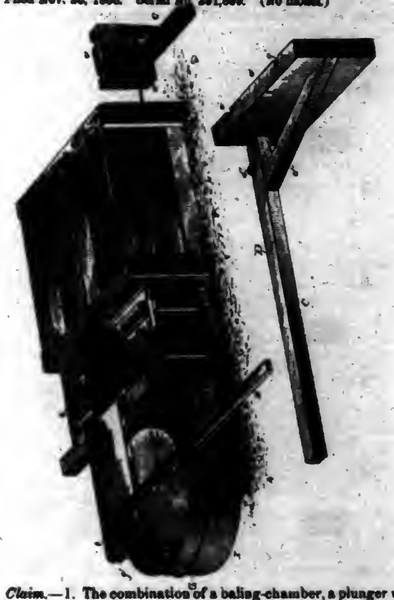
ing-ring B, having the flange *b* and head or rim *b'*, extending from both sides of the flange and contained or held between the said two sections, substantially as described.

2. The combination of the section *a*, having the sleeve a^3, the key C, extending from the sleeve, and the section *a'*, having the recess a^4, with the packing-ring B, having the flange *b* and the head or rim *b'*, and the recess *c'* in the flange to receive the key, substantially as described.

3. The combination of the section *a* of the bull-ring or support having the projection or cheek *c*, the section *a'* of the bull-ring or support having the projection or cheek *c'*, the two sections being shaped to provide, when together, the packing-ring-holding space D, with said packing-ring B, the head or rim of which is cut away on each side of the opening to provide recesses, into which said cheeks or projections *c c'* enter, substantially as described.

402,268. CULTIVATOR. THEODORE MEYER, Amity, Iowa, assignor of one-half to Frederick Meyer, same place. Filed May 1, 1888. Serial No. 272,450. (No model.)

Claim.—1. In a cultivator, the combination, with the axle and drive-wheels and a central frame, of vertically and laterally adjustable drag-bars attached to said axle, having bifurcated ends of unequal length, shovels secured to the shorter member of said drag-bars, a cross-bar supported by the longer members, rotary toothed frames carried by said cross-bar, and means, substantially as described, for revolving said toothed frames from the drive-wheels, as and for the purpose specified.



2. In a cultivator, the combination, with the axle and drive-wheels, a central frame, runners attached to said frame at the rear, and vertically and laterally adjustable drag-bars mounted upon the axle, having bifurcated ends of unequal length, of shovels attached to the shorter members of the drag-bars, a horizontal cross-bar supported in the longer members, rotary toothed frames carried by said cross-bar, and means for rotating the toothed frames and elevating the said drag-bars, as and for the purpose specified.

3. In a cultivator, the combination, with the axle, the drive-wheels, sprocket-wheels attached to the latter, a central frame provided with rearwardly-extending runners, and vertically and laterally adjustable drag-bars mounted upon said axle, having downwardly-curved bifurcated rear ends of unequal length, of shovels attached to the shorter members of the drag-bars, a horizontal vertically-adjustable cross-bar supported in the longer members, rotary toothed frames carried by said cross-bar, a horizontal drive-shaft geared to rotate said toothed frame, sprocket-wheels keyed upon said shaft, and an endless belt connecting the sprocket-wheels of the shaft and drive wheels, as and for the purpose specified.

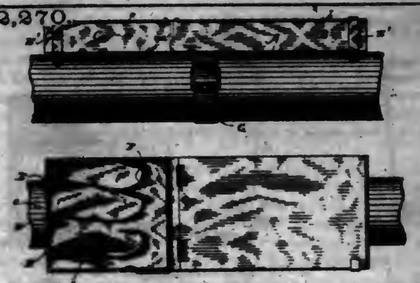
4. In a cultivator, the combination, with the axle, a frame secured to said axle, laterally and vertically adjustable drag-bars mounted upon the same, provided with bifurcated downwardly-curved rear ends of unequal length, and shovels secured to the shorter members, of a horizontal cross-bar supported in the longer members of the frame, rotary toothed frames carried by the cross-bar, a rack secured to the main frame, a lever pivoted to said frame engaging the rack, a crank-arm projected from said lever, and a chain-connection between the cross-bar and crank-arms, substantially as shown and described.

5. In a cultivator, the combination, with the axle, a frame secured at each side the center of the axle, laterally and vertically adjustable drag-bars pivoted upon the same at each side of the frame, provided with forked downwardly-curved rear ends of unequal length, and shovels secured to the shorter members, of a horizontal cross-bar supported by the longer members of the arms, having vertical play, toothed frames carried by said cross-bar, a rack secured to the main frame, a lever pivoted to said frame engaging the rack, a crank-arm projected from said lever, and a chain having lateral movement upon the crank-arm secured to said cross-bar, substantially as shown and described.

402,269. BALING-PRESS. JOSEPH D. MOON, Walnut Grove, Ga. Filed Nov. 26, 1888. Serial No. 291,869. (No model.)

Claim.—1. The combination of a baling-chamber, a plunger working therein comprising a block, a longitudinal beam projecting rearwardly therefrom, and a brace, a block eccentrically journaled in front of the chamber, and a rope or chain secured at one end to said block at a point farthest from its axis, and at the other end to the outer side of the follower, substantially as and for the purpose set forth.

2. The combination, with a baling-chamber, and a block eccentrically journaled in front thereof, of a follower comprising a block, a rearwardly-projecting longitudinal beam at one side thereof and a brace, and a rope or chain secured to said block and to the outer side of said longitudinal beam, whereby the latter is held in contact with the adjacent side of the chamber, said rope or chain passing through slots provided therefor and out of contact with the material to be pressed, substantially as and for the purpose set forth.



3. The combination of a baling-press comprising the baling-box divided into two separate chambers lying side by side, a block eccentrically journaled at the front thereof, and followers working in said chambers and connected by ropes or chains with said block at a point farthest from its axis, substantially as and for the purpose set forth.

4. The herein-described baling-press, comprising two separate parallel chambers provided with independent followers, and with top and side doors for the removal of the bales, an eccentrically-journaled block connected with the followers by chains or ropes, the latter being secured to the periphery of the block at the point farthest from the axis thereof, and an operating-lever secured to said block, all arranged and adapted to operate substantially as and for the purpose set forth.

402,270. HOOK AND BAIT SAFETY-BOX. WILLIAM R. MURFORD, Kansas City, Mo. Filed Apr. 6, 1888. Serial No. 269,655. (No model.)

Claim.—1. The combination, with a fishing-rod, of a combined bait and hook box having attached thereto a fastening device for securing the box to the pole, the said box being provided with a bait-

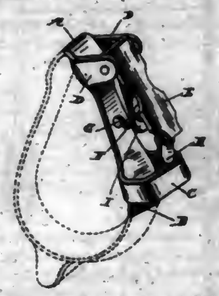
402,270.

compartment and a hook-compartment, and covers opening into said compartments, substantially as set forth.

2. The combination, with a fishing-rod and a combined bait and hook box, of a pair of spring-jaws secured to the box and adapted to be sprung around the pole to secure the box thereto, substantially as set forth.

3. A bait and hook box consisting of a receptacle having apertures in one of its ends and provided with a partition, and covers hinged to said receptacle and provided with catches for holding the covers in a closed position, in combination with a fastening device for securing the box to a fishing-rod, substantially as set forth.

402,271. METHOD OF MANUFACTURING SET-SCREW BLANKS. FREDERICK MOTHERS, Rockford, Ill., assignor of one-half to the Rockford Bolt Works, same place. Filed Dec. 8, 1888. Serial No. 293,031. (No model.)



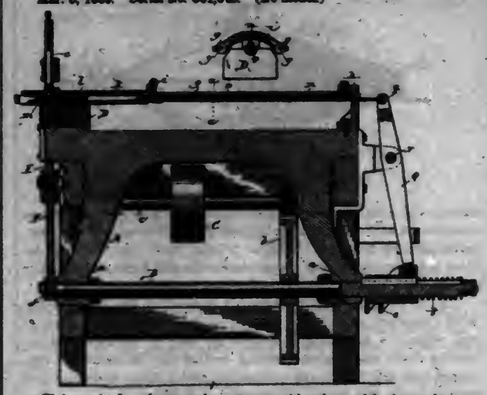
Claim.—1. The herein-described process of manufacturing set-screw blanks, consisting in reducing in a single operation a section of the bar material to a polygonal form of sufficient length to form the polygonal portion of two set-screw blanks, substantially as set forth.

2. The herein-described process of manufacturing set-screw blanks, consisting in feeding material enough to form two blanks, cutting it from the main bar, and reducing in a single operation a section of the cut portion to a polygonal form of sufficient length to form the polygonal portion of two set-screw blanks, substantially as set forth.

3. The herein-described process of manufacturing set-screw blanks, consisting in feeding material enough to form two blanks, cutting it from the main bar, reducing a section of the cut portion to a polygonal form of sufficient length to form the polygonal portion of two blanks, and transversely cutting the polygonal portion, thus forming two complete set-screw blanks, substantially as set forth.

4. The herein-described process of manufacturing set-screw blanks, consisting in reducing a section of the bar material to a polygonal form of sufficient length to form the polygonal portion of two set-screw blanks and transversely cutting the polygonal portion, thus forming two complete set-screw blanks, substantially as set forth.

402,272. HARNESS-BUCKLE. HENRY L. NORRIS, Providence, R. I. Filed Sept. 12, 1888. Serial No. 285,218. (No model.)

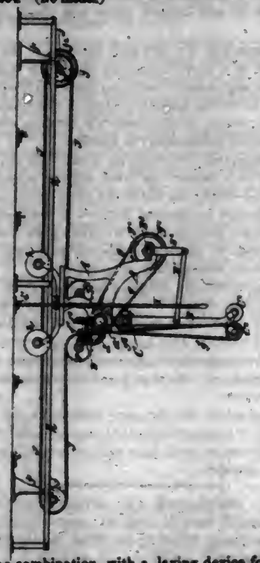


Claim.—1. In a harness-buckle, the base A B, loop C, ears D D, plate E, with tongue F thereon, and a device for keeping the tongue in place, all constructed and combined so as to operate substantially as set forth.

2. The combination of the base A B, loop C, ears D D, plate E, with tongue F thereon, button H, and spring I, all constructed and combined so as to operate substantially as set forth.

3. In a harness-buckle, the base A B, loop C, ears D D, and plate E, with tongue F thereon, all constructed and combined so as to operate substantially as set forth.

402,273. PIPE-PUNCH. CLARENCE S. CLEVELAND, Chicago, Ill. Filed Mar. 5, 1889. Serial No. 301,940. (No model.)

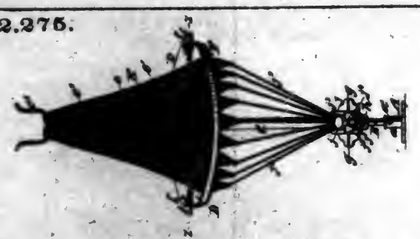


Claim.—1. In pipe-punches, the combination, with the reciprocating bar carrying the wedge-section of the mandrel, of the stiff vibrating lever to actuate said bar and the revolving shaft having a cam-collar to engage said lever, substantially as described.

2. In pipe-punches, the combination, with the reciprocating bar carrying the wedge-section of the mandrel, of the vibrating lever to actuate said bar, the revolving shaft having cam-collar sliding thereon to engage said lever, and the reaction-spring set upon said shaft and bearing against said collar to control the shift thereof, substantially as described.

3. In pipe-punches, the two-part mandrel divided at an incline longitudinally to form wedge-like contacting sections, one of said sections carrying the die and the other being slotted to receive the clippings, and both sections conforming externally to the curvature of the pipe, substantially as described.

402,274. APPARATUS FOR DELIVERING MATERIAL IN ROPY FORM. ISAAC R. PALMER, Middletown, Conn. Filed July 2, 1887. Serial No. 243,304. (No model.)



Claim.—The combination, with a laying device for laying ropy material in folds or layers throughout its range of movement, of a carriage supporting the laying device and a track whereon the carriage is movable in a direction parallel with the direction of movement of the laying device, and a traverse motion for reciprocating the material in a direction transverse to the direction of movement of said laying device, substantially as herein described.

402,275. APPARATUS FOR STRINGING HAMMOCKS. ISAAC R. PALMER, Middletown, Conn. Filed Sept. 13, 1888. Serial No. 285,201. (No model.)

Claim.—1. In an apparatus for stringing hammocks, the combi-

402,275.

nation, with a standard, of a rotary support mounted thereon, a frame mounted on said support, clamping devices for the body of the hammock adapted to clamp the same to said frame, and retaining devices also mounted on said support below the said frame, substantially as specified.

2. In an apparatus for stringing hammocks, the combination, with a standard, of a rotary support thereon, a frame mounted on said support, a supporting device for the body of the hammock extending above said frame, clamping devices for the hammock connected with said frame, and a retaining device also mounted on said support below said frame, substantially as specified.

3. In an apparatus for stringing hammocks, the combination, with a standard which is bent or deflected at an angle, of a rotary support thereon, a frame mounted on said support, a supporting device for the body of the hammock extending above said frame, clamping devices for the hammock mounted on said frame, and retaining devices mounted on said support below said frame, substantially as specified.

4. In an apparatus for stringing hammocks, the combination, with a standard, of a rotary support mounted upon the same and adjustable lengthwise thereon, a frame upon said support, a supporting device for the body of the hammock mounted upon said support, and retaining devices also mounted upon said support below said frame substantially as specified.

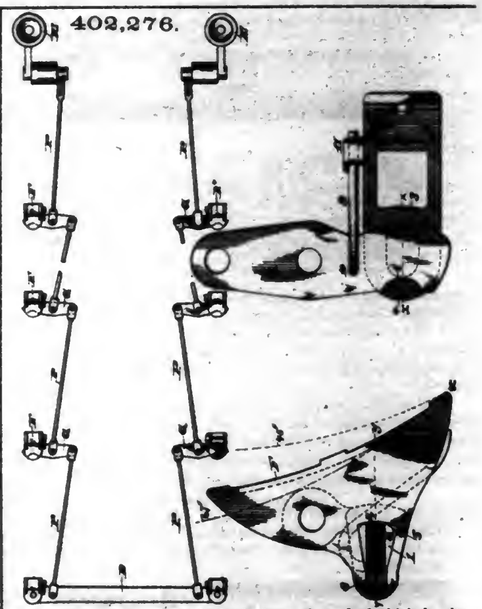
5. In an apparatus for stringing hammocks, the combination, with a standard, of a rotary support mounted thereon, a frame of circular or rounded form mounted upon said support, a supporting device for the body of the hammock extending above said frame, clamping devices for the hammock mounted on said frame, and retaining devices mounted on said support below said frame, substantially as specified.

6. In an apparatus for stringing hammocks, the combination, with a standard, of a support mounted thereon, a frame of circular form mounted on said support, a securing device for the hammock, consisting of bands extending about the edges of said frame and adapted to bind the end portions of the hammock between the edges of the frame and the bands, substantially as specified.

7. In an apparatus for stringing hammocks, the combination, with a standard, of a support mounted thereon, a frame secured to the said support, a supporting device for the body of the hammock, and clamping devices for the end portions of the hammock, which clamping devices are secured near one of their ends to said frame and at their other ends to tighteners, whereby they may be tightened about the hammock, substantially as specified.

8. In an apparatus for stringing hammocks, the combination, with a standard, of a support mounted thereon, a frame mounted on said support, and clamping devices for the end portions of the body of the hammock secured near one of their ends to said frame and extending in reverse directions about the same, and tighteners for causing the clamping devices to grip and secure the hammock, substantially as specified.

9. In an apparatus for stringing hammocks, the combination, with a standard, of a support mounted thereon and radially-adjustable retaining devices mounted upon said support, substantially as and for the purpose specified.



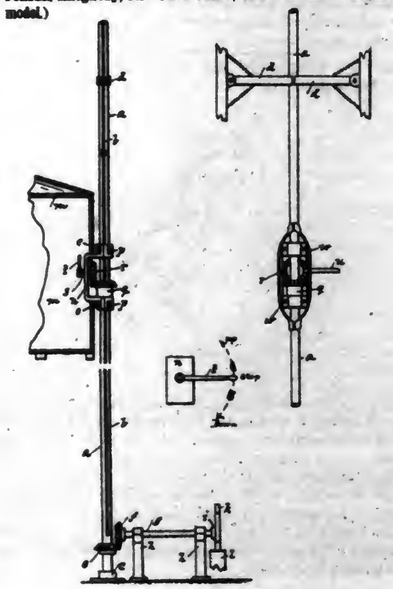
402,276. BRAKE-HEAD AND LEVER FOR OPERATING THE SAME. GEORGE H. POOR, St. Louis, Mo., assignor to the Westinghouse Air Brake Company, Pittsburg, Pa. Filed Feb. 2, 1889. Serial No. 298,499. (No model.)

Claim.—1. The combination of a brake-head recessed to permit of play between the head and its operating-lever, said recess having a concave bearing-surface for the operating-lever, and an operating-lever having a convex bearing face or edge, substantially as and for the purposes specified.

2. The combination of a brake-head having a triangular or key-hole slot with a concave bearing-surface for the reception of the end of the operating-lever and an operating-lever having a rounded or convex bearing edge, substantially as and for the purposes specified.

3. The combination, with a brake-head having a slot for the end of the brake-lever, said slot having walls which are curved or concentric in transverse section, of a brake-lever the end of which has its edges concentrically curved to correspond with the walls of the slot in the brake-head, substantially as and for the purposes specified.

402,276.

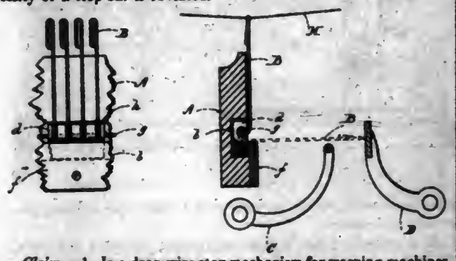


4. The combination, with a slotted brake-head, of an operating-lever or brake-lever having a hooked end to engage in the slot of the brake-head, substantially as and for the purposes specified.

5. The combination, with a brake-head having a tapering slot for the end of the brake-lever, and with the brake-lever, of a balance or support rod arranged parallel with the side of the brake-head for maintaining the brake-head in its proper position, substantially as and for the purposes specified.

6. The combination, with a brake-head having a tapering slot and a lug at its lower end, of a lever whose end engages in the slot of the brake-head and a rod arranged parallel with the side of the brake-head and having one end secured to the lever and the other end passing under the lug on the brake-head, substantially as and for the purposes specified.

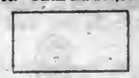
402,277. ELEVATOR-CAR-OPERATING DEVICE. GEORGE W. PORTER, Allegheny, Pa. Filed Jan. 3, 1888. Serial No. 259,635. (No model.)



Claim.—1. In an elevator-controlling device such as described, the vertical shaft *a*, having formed along its entire length a key-seat, *b*, and the same properly secured in a vertical position in an elevator-shaft, the gear-wheel *g*, operating along the shaft *a* by means of a spline, *s*, and mounted in a frame, *n*, attached to the side of the elevator-car *m*, and the beveled pinion *r*, secured to the operating-lever shaft *z* whereby the vertical shaft *a* may be revolved in either direction, as and for the purpose described.

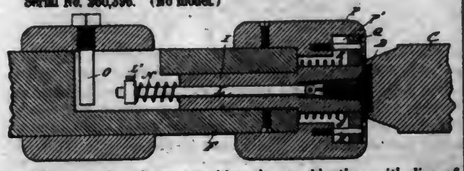
2. In a device for operating and controlling elevator-cars, the vertical shaft *a*, secured at the top and base in suitable bearings, *c*, the hinged braces *d*, and a means for retaining the same in a horizontal position, in combination with a shield or guard, *w*, secured about the device for operating the shaft *a*, whereby the said braces *d* may be temporarily removed from the vertical shaft, substantially as set forth.

402,278. DROP-WIRE STOP MECHANISM FOR WARPING-MACHINES. JOHN E. PERRY, Northbridge, Mass. Filed Sept. 17, 1888. Serial No. 285,585. (No model.)



Brief.—The object of the invention is to provide improved means for mounting the drop-wires in the supporting-bar, whereby they are prevented from clogging with lint, &c., and whereby the necessity of a stop-bar is obviated.

Claim.—1. In a drop-wire stop mechanism for warping-machines, the plate *d*, provided with the slots *h*, in combination with the wires B, pivoted in said plate with their bodies outside the pivoted point, and the supporting-bar A, provided with the groove *b*, for receiving said plate, substantially as described.

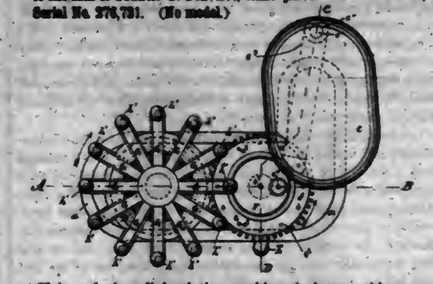


2. In a drop-wire stop mechanism for warping-machines, a supporting-bar provided with a longitudinal groove in its face, a plate inserted in said groove, drop-wires pivoted to said plate and having their bodies outside the pivotal point, and a retaining-plate secured to the face of said bar for holding the drop-wire plate therein, all being arranged to operate substantially as described.

402,279. PHOTOGRAPHIC PAPER. FREDERICK H. ROGERS, Los Angeles, Cal., assignor of one-half to Charles Conklin Bell, Minneapolis, Minn. Filed Apr. 9, 1888. Serial No. 270,122. (No specimens.)

Claim.—Photographic paper coated with a compound formed by the admixture of water, salt, albumen, and ammonia, in or about the proportions specified.

402,280. BUTTON-MACHINE. ANTON SCHOLZ, Brooklyn, assignor to himself, and Minnie E. Levy, New York, N. Y. Filed Jan. 11, 1888. Serial No. 260,396. (No model.)



Claim.—1. In a button-machine, the combination, with dies, of jaws held in one of the said dies to support the staple, and a yielding plate held to slide on one of the said dies to remove surplus material, substantially as shown and described.

2. In a button-machine, the combination, with a fixed die having a recess, of a movable die adapted to be pressed against the said fixed die, jaws held in the said movable die to support the staple, and a plate held to slide on the said movable die to remove surplus material, substantially as described.

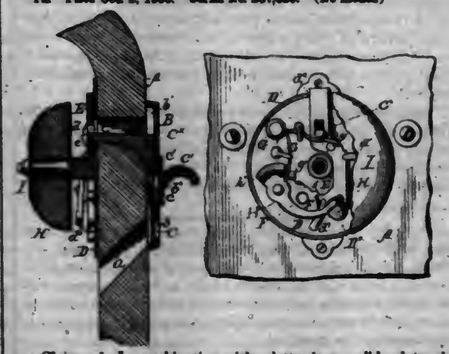
3. In a button-machine, a fixed die having a recess, a movable die adapted to be pressed against the fixed die, and jaws held in the said movable die and adapted to hold the staple, in combination with a plate held to slide on the said movable die, and a spring pressing against the said plate, substantially as shown and described.

402,281. STENCIL. ALBERT W. SMITH, Haverhill, Mass., assignor of one-half to Francis D. Benedict, same place. Filed June 11, 1888. Serial No. 276,731. (No model.)

Claim.—1. In a dial-painting machine, the intermeshing gears *d e*, journaled to the base-plate *a*, the gear *d* having a series of vertically-movable templets or stencils adapted to be moved to and from the dial secured to the gear *e*, substantially as and for the purpose set forth.

2. In a dial-painting machine, the base-plate *a* and the dial-supporting gear *e*, journaled to it and having means for securing to it the dial to be painted, combined with the gear *d*, intermeshing with the gear *e*, a series of radially-adjustable bars, G G, mounted on the disk D' on the gear *d*, and a series of vertically-movable templets or stencils arranged on spindles in said bars G and adapted to be moved to and from the dial that is being painted, substantially as and for the purpose set forth.

3. In a dial-painting machine, the base-plate *a*, having trunnion or pivot *a'*, adapted to be inserted in a corresponding recess in the support *b*, combined with the dial-supporting gear *e* and the intermeshing gear *d*, journaled to the said base-plate, and the radially-adjustable and vertically-movable stencils or templets I, all arranged and combined substantially as and for the purpose set forth.



4. In a dial-painting machine, the dial-supporting gear *e*, having a series of annular grooves, *e'*, on its upper side, adapted to receive the projections on the under side of the dial, and having recesses on its upper side for receiving the pins e^3 e^4, for holding the dial in place on such gear, combined with the locking-lever E, having projection E', adapted to be locked into one of the recesses e^4 on the gear *e*, substantially as and for the purpose set forth.

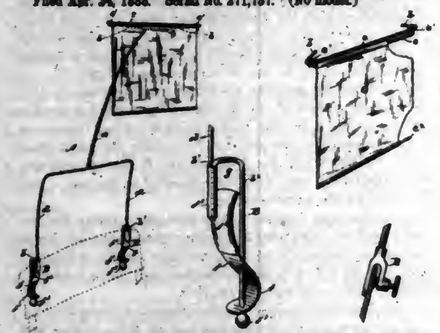
5. In a dial-painting machine, an intermittently-rotating dial-carrying device and an intermittently-rotating stencil-carrying device having radially-adjustable and vertically-movable stencils or templets I, combined with an oscillating and horizontally-adjustable wrist-rest, substantially as and for the purpose set forth.

6. In a dial-painting machine, an intermittently-rotating templet-carrier and an intermittently-rotating dial-support and a locking and releasing device for securing said parts firmly in position during the operation of painting the figures, marks, or designs on the dial, substantially as set forth and described.

7. In a dial-painting machine, the templet-carrying gear *e*, journaled to the plate *a* and having a radially-grooved disk, D', a series of radially-adjustable bars, G, mounted in said grooved disk D', a locking device, as described, for securing said bars in position, and the spring-pressed spindles H, movable in bearings on said bars G and provided with stencils or templets I, substantially as and for the purpose set forth.

402,282. LETTER-BOX ALARM. FREDERICK SNYDER, Lancaster, Pa. Filed Oct. 2, 1888. Serial No. 287,090. (No model.)

Claim.—1. In combination with a letter-box, a slide-plate which closes and opens the opening for letters and is provided with a rigid



rearwardly-extending arm, a trip-bar engaged by said arm, a hammer arranged to be drawn back by said trip-bar, and a spring for operating said hammer and replacing said trip-bar, substantially as set forth.

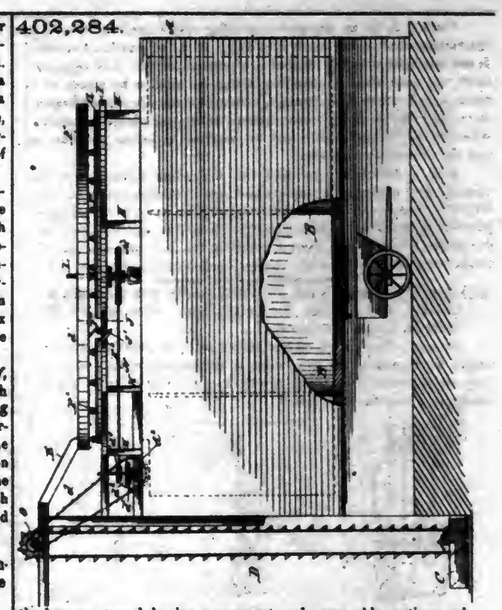
2. A hammer, a pivoted carriage on which it is pivoted, and a spring, *K*, between said hammer and carriage, in combination with a trip-bar having a nose which engages a nose on said hammer-carriage, a spring, G, engaging said carriage and trip-bar, and a slide-plate operating said trip-bar to turn the hammer-carriage against the action of the spring G, substantially as set forth.

3. In combination with alarm mechanism and a letter-box inclosing the same and having in its front a vertical slot and also a passage for letters, a front plate recessed on its inner face and provided with opening *a*, and a vertical slot communicating therewith, and a slide-plate which moves up and down in said recess to open and close opening *b*, said slide-plate being provided with a handle which extends forward through the vertical opening in said front plate, and an arm extending rearwardly through the vertical slot in the front of the box to engage with the alarm mechanism and operate it, for the purpose set forth.

4. The pivoted hammer-carriage F, constructed with a nose, *f*, and a tongue, *f'*, in combination with a trip-bar having a nose which engages and releases, as described, the nose aforesaid, a fixed lug which guides said noses and also limits the play of said hammer-carriage, a slide-plate arranged to raise the trip-bar for turning the hammer-carriage when said slide-plate is lifted, a hammer pivoted on said hammer-carriage to continue the stroke by momentum when the motion of said hammer-carriage ceases, and a spring in contact with said hammer which resists this independent motion of the latter and replaces it in its former position, substantially as set forth.

402,288. FAN ATTACHMENT. JACQUES B. STETTHEIMER, Rochester, N. Y., assignor of one-half to William H. Osthout, same place. Filed Apr. 24, 1888. Serial No. 271,737. (No model.)

Claim.—1. In an attachment such as described, the support A, constructed of wire bent and twisted, as described, to form a cross-piece, *c*, arms *b*, and standards *a d*, combined with clamps B, as and for the purpose set forth.



2. In an attachment such as described, the combination, with the support A, provided with a supporting wire or rod, *d*, bent or folded, as at $b' b^2$, to form a yoke, of a spring attached to one leg of said yoke, substantially as described.

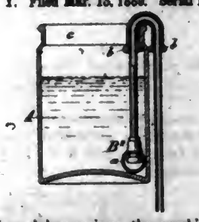
3. In an attachment such as described, the wire support A, bent and twisted together at or near the upper portion to form a support for the fan, and the supporting-wires *d*, constituting a continuation of said twisted portion and each provided with a clamp, B, adapted to engage the back of a chair or other support, substantially as described.

4. In an attachment such as described, the combination, with the support A, formed of a single piece of wire bent and twisted in the manner indicated to form cross-piece *c*, arms *b*, upright *a*, supports *b*, and yoke *g*, of the spring *f*, applied to leg b^2 of said yoke, substantially as described.

5. In an attachment such as described, and in combination with the yoke at the lower end for attachment to the chair-back formed by bending the wire upon itself, as at *b'*, and parallel thereto, as at b^2 the curved spring attached to wire b^2 of the yoke and with its free end adapted to be moved into position between the arms $b' b^2$ of the yoke, substantially as described.

402,284. COAL-CONVEYER. GUSTAVUS L. STOEBNER, Long Island City, N. Y. Filed Feb. 8, 1889. Serial No. 299,110. (No model.)

Claim.—1. A conveyer comprising several hoppers arranged in the form of a circle and mounted on wheels, and each provided with a door at the bottom, in combination with a track on which the hoppers travel and means for automatically opening and closing the said doors, substantially as described.



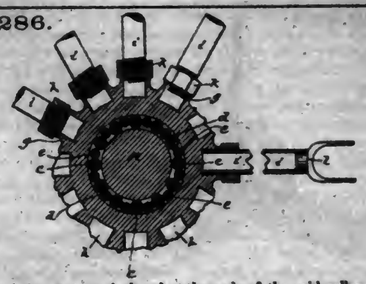
2. The conveyer comprising several connected hoppers, each having a trap-door at the bottom, in combination with a track on which the hoppers travel, having permanent and removable sections, substantially as described.

3. A conveyer comprising several hoppers connected in a circle, each having a trap-door at the bottom, in combination with a circular track having permanent and movable sections, each trap-door being provided with a support to run upon the track, substantially as described.

4. The receptacle A, divided into bins, and the circular track G, supported above the bins and having removable sections G', in combination with the circular conveyer F, having a series of hoppers placed upon the track, each hopper being provided with a trap-door at the bottom, substantially as described.

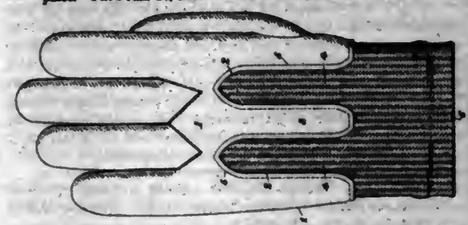
5. The receptacle A, divided into bins, and the platform I and track G thereon, supported above the bins, said platform being formed with the openings J, having inclines J', and said track being formed with movable sections G', in combination with the conveyer F, having doors F' at its bottom, substantially as described.

402,285. TUBE-REST FOR SYRINGES. BENJAMIN F. SUTTON, Brooklyn, N. Y. Filed Mar. 13, 1889. Serial No. 303,179. (No model.)



Claim.—In a siphon-syringe, the combination, with a syringe-tube, of a rest therefor adapted to support the same upon a vessel, said rest being made of india-rubber and in the form of a U-shaped tube of such internal diameter that the syringe-tube may be drawn through it, but which will normally maintain the syringe-tube in a position into which it may be adjusted by friction, substantially as specified.

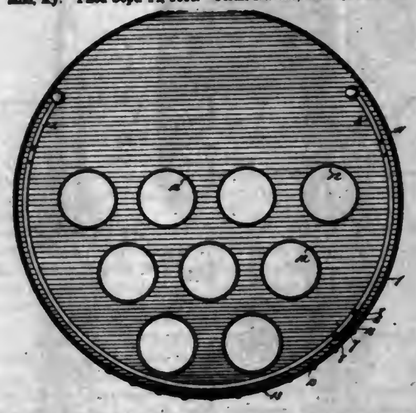
402,286. JOURNAL-BEARING FOR VEHICLE-WHEELS. CHARLES TAYLOR, Elizabeth, assignor of one-half to O. D. Levis, Pittsburg, Pa. Filed Aug. 25, 1888. Serial No. 283,777. (No model.)



Claim.—1. A journal-bearing, substantially as described, consisting of a box, *b*, having annular grooves formed in its ends of greater diameter than the longitudinal bore of the box, a series of friction-rolls, *c*, surrounding the axle and terminating at their ends within the annular grooves of the box, another series of friction-rolls, *e*, placed between the rolls *c* and corresponding in length thereto, and the elastic washers *f*, fitted snugly in said annular grooves, substantially as described.

2. A journal-bearing consisting of the two series of rollers *c e*, of large and small diameter and extending the entire length of the journal A, and the washers *f*, placed at the ends of the said rollers *c e*, in combination with the journal-box *b*, the annular hub *g*, the metallic hollow spokes *i*, fitted with a nut, *k*, and the U-shaped clamp *l*, substantially as described.

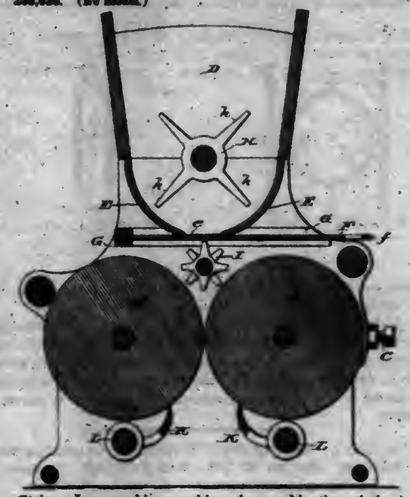
402,286.



402,287. GLOVE OR MITTEN. WILLIAM M. TERRELL, Gloversville, N. Y., assignor to Earl G. Thomas and Charles D. Thomas, same place. Filed Jan. 14, 1889. Serial No. 296,302. (No model.)

Claim.—In a glove or mitten, the combination, with the glove-facing 1, made of comparatively inelastic material and cut away at the back from the wrist to about the knuckle-line, of elastic material 4, inserted in the said cut-away part of the facing, and a stay-piece, 3, attached to the facing and secured to the elastic material and extending lengthwise the elastic back to stay it, and leaving openings 2 2, substantially as and for the purpose set forth.

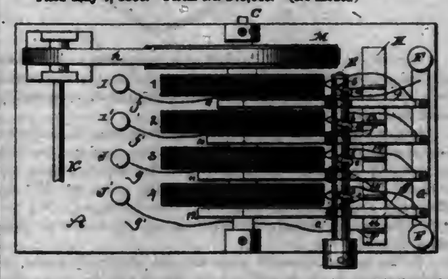
402,288. RIVET-HOLDING DEVICE. JOHN P. WEIDENSTEIN, Ashland, Ky. Filed Sept. 14, 1888. Serial No. 285,572. (No model.)



Claim.—1. A rivet-holding tool for boilers, consisting of a curved strip in the form of a segment of a circle, to extend over a portion of the interior surface of a boiler, and a holding-plate on the curved strip to hold the head of a rivet while being secured, substantially as shown and described.

2. A rivet-holding tool for boilers, consisting of a curved strip adapted to extend over a portion of the interior surface of a boiler and having detachable handles, and a rivet-head-holding plate adjustable lengthwise on the curved strip, substantially as shown and described.

3. In a rivet-holding tool for boilers, the curved strip 1, of a size adapted to pass through the man-hole of a boiler and to extend over a portion of the interior surface of a boiler, and having a series of holes, 9, the handles 2, secured by nuts 5 and bolts 3, passing through the shouldered overlapping ends 4 of strip 1 and handles 2, and the plate 6, with rivet-head recess 7, secured to strip 1 by nuts 10 and bolts 8, passing through holes 9, substantially as shown and described.



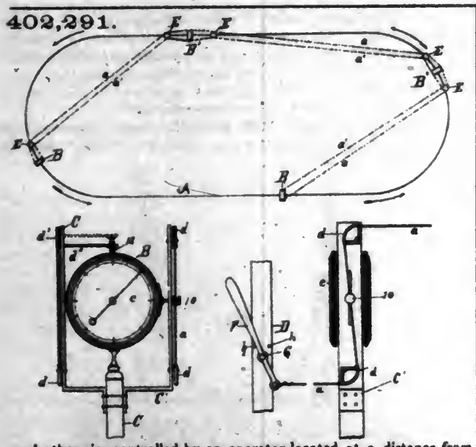
4. A rivet-holding tool for boilers, consisting of a curved strip of a size to extend over a portion of the interior surface of a boiler, and having detachable handles, a rivet-head-holding plate adjustable lengthwise on the curved strip, and a guide-rod detachably secured to the rivet-head-holding plate, substantially as shown and described.

402,289. COTTON-SEED CRUSHER. JOHN J. WOODWARD and PETTUS B. REID, Montgomery, Ala. Filed Dec. 14, 1888. Serial No. 293,630. (No model.)

Claim.—In a crushing-machine, the combination of the hopper having a discharge-opening, the crushing-rolls arranged below such opening, the clearing-distributer arranged immediately above the meeting faces of said rolls, and the cut-off operating between said distributer and the discharge-opening of the hopper, all substantially as described, whereby in case the rolls become clogged the supply may be cut off, the clearing-distributer meanwhile operating to clear the said rolls, substantially as and for the purposes set forth.

402,290. ELECTRIC MOTOR. FREDERICK YERGER, Tampa, Fla. Filed May 7, 1888. Serial No. 273,015. (No model.)

Claim.—1. An electric motor comprising a series of coils, a shaft journaled eccentrically in the coils, a series of armatures arranged around the shaft at equidistant points, a corresponding series of cams carried by the said shaft, and circuit making and breaking levers adapted to be operated by the arm, substantially as described.

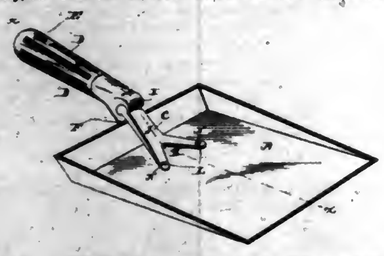


2. In an electric motor, the combination, with a series of coils, 1 2 3 4, of the armature-shaft C, carrying armatures 5 6 7 8, the cams 9 10 11 12, the circuit-operating levers 13 14 15 16, the spring-supported bar G, and the electrical connections, substantially as specified.

3. In an electric motor, the combination, with a series of circuit-operating levers provided with conducting-caps, of a spring-supported conducting-bar arranged to be touched by all of the levers, substantially as specified.

402,291. TIMING APPARATUS FOR RACE-COURSES. RICHARD O. ADAMS, Louisville, Nebr. Filed Mar. 15, 1887. Serial No. 230,967. (No model.)

Claim.—1. In a timing mechanism for race-courses, the combination of an operative timing-instrument mechanically mounted so as to be visible to the general class of spectators at a race-course, and controlling-connections between said timing-instrument and a distant operating-point, whereby said instrument may be started, stopped,



402,291.

and otherwise controlled by an operator located at a distance from said timing-instrument, substantially as shown and specified.

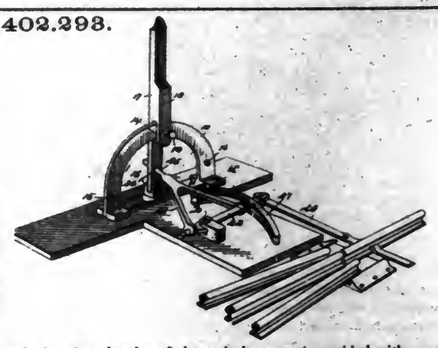
2. In a timing mechanism for race-courses, the combination of a series of operative timing-instruments arranged at intervals around the course and facing the direction of advance, and devices, substantially as described, arranged to control, stop, and start each timing-instrument of the series simultaneously, substantially as shown and specified.

402,292. HANDLE FOR DUST-PANS. LEWIS ABGEVINE, Sweden Valley, Pa. Filed Nov. 27, 1888. Serial No. 291,969. (No model.)

Claim.—1. A handle for dust-pans, comprising two members adapted to clamp the pan, the outer member having the overhanging lip I, and the upper end of the inner member engaging under said lip and held thereby, as set forth.

2. A handle for dust-pans, comprising the member B, having the tubular portion D, provided with a lip, I, a stem depending from the tubular portion, and a fork extending from the end of the stem, and a smaller member having the stem engaging under the lip I and adapted to bear against the stem of the member B, and a fork projecting from said stem and adapted to bear upon the fork of the other member, as set forth.

3. The improved handle comprising the member B, having the tubular portion D, the stem F, and the fork G, and the overhanging lip I at the angle of the stem and the tubular portion, and the member C, having a stem adapted to engage under the lip I and provided with a spur or pin, M, and the fork extending from the said stem, the ends of the forks of the two members being provided with openings adapted to receive securing-rivets, as set forth.

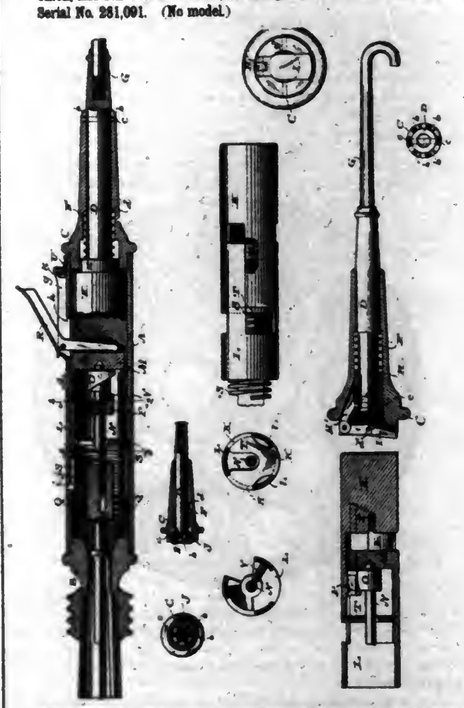


402,293. SWITCH-STAND. FRANK C. BAKER, Blue Island, Ill. Filed Oct. 15, 1888. Serial No. 288,066. (No model.)

Claim.—1. In a switch-stand, a pivoted switch-lever swinging in a plane parallel with the rails, and a horizontally-turning bell-crank lever pivoted at one end directly to the switch-lever and pivoted at its other end to the switch-bar, substantially as set forth.

2. In a switch-stand, the combination, with an apertured arch and an essentially straight lever sliding upon the same and provided with an aperture near the lower end, of a switch-bar and an essentially bell-crank lever attached to the said switch-bar and provided with one cylindrical end adapted to pass through the aperture in the straight or main lever, as and for the purpose specified.

3. In a switch-stand, the combination, with the base, an arch secured to the base, and an essentially straight lever pivoted upon the said base and guided over the said arch, provided with an aperture near the pivotal point, of a hinged bell-crank lever pivoted in alignment



402,293.

with the pivotal point of the main lever, and provided with a cylindrical shank end adapted to project through the aperture of the main lever, all combined to operate substantially as and for the purpose specified.

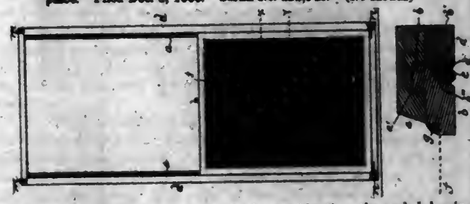
4. In a switch-stand, the combination, with the base, an arch secured to the base, and an essentially straight lever pivoted upon the said base, guided over the said arch, and provided with an aperture near the pivotal point, of a switch-rod, a bell-crank lever provided with a cylindrical shank end projecting through the aperture of the main lever, a semicircular guide, a transverse bar passing loosely through the opposing members of the bell-crank lever, uniting the same, the said transverse bar being pivoted in alignment with the pivotal point of the main lever, substantially as shown and described.

402,294. DENTAL PLUGGER. FRANK L. BARNEY, Prairie du Chien, and HILBERT R. TAYLOR, Bloomington, Wis. Filed July 26, 1888. Serial No. 281,091. (No model.)

Claim.—1. In a dental plugger, the combination of a spring-controlled tool-plunger, a mallet for the plunger, a shell loosely spliced to the mallet, a spring arranged to exert its pressure against said mallet, another spring arranged to exert its pressure against the shell, a cam or pin arranged on one of the mallet-splices, a jointed drive-shaft stepped in said shell and moved back and forth by the latter, and a cam carried by the shaft to come in and out of contact with the cam or pin on said mallet-splice, substantially as set forth.

2. In a dental plugger, the combination of a spring-controlled tool-plunger, a mallet for the plunger provided with a recess, a bell-crank lever fulcrumed to the casing or body portion of the plugger

and arranged to engage said recess, a spring arranged to exert its pressure against the mallet, a shell loosely spliced to said mallet, a spring arranged to exert its pressure against the shell, a cam or pin arranged on one of the mallet-splices, a jointed drive-shaft stepped in said shell and moved back and forth by the latter, and a cam carried by the shaft to be brought in and out of contact with the cam or pin on said mallet-splice by a movement of the bell-crank lever, substantially as set forth.



3. In a dental plugger, the combination of a spring-controlled tool-plunger, a mallet for the plunger provided with a recess, a bell-crank lever fulcrumed to the casing or body portion of the plugger and arranged to engage said recess, a sliding plate provided with a rest for the bell-crank lever, a spring arranged to exert its pressure against the mallet, a shell loosely spliced to said mallet, a spring arranged to exert its pressure against the shell, a cam or pin arranged on one of the mallet-splices, a jointed drive-shaft stepped in said shell and moved back and forth by the latter, and a cam carried by the shaft to be brought in and out of contact with the cam or pin on said mallet-splice by a movement of the bell-crank lever, substantially as set forth.

4. In a dental plugger, the combination of a spring-controlled tool-plunger, a tip for the latter, a series of notches, and a pin or lug arranged with relation to the plunger and its tip, whereby the tool carried by said plunger may be set at different angles, and means, substantially as described, for actuating the plunger.

5. In a dental plugger, the combination of a spring-controlled tool-plunger provided with a transverse pin or lug, the plunger-tip provided at its free end with a series of diametrically-opposed notches for engagement with said pin or lug, whereby the tool carried by said plunger may be set at different angles, and means, substantially as described, for actuating the plunger.

6. In a dental plugger, the combination of a tool-plunger, a mallet for actuating the plunger, a drive-shaft, and cams arranged with relation to the mallet and shaft, whereby the revolution of the latter causes an impact of said mallet against said plunger, a bell-crank lever for engagement with the mallet, and a spring in opposition to the lever, substantially as set forth.

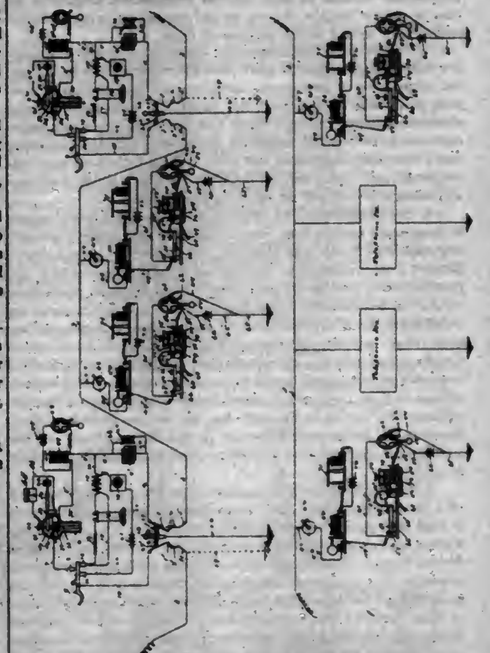
402,295. ADJUSTABLE WINDOW SCREEN AND FRAME. CHAS. H. BARRETT, Decatur, Ill., assignor of one-half to Otto R. Curtis, same place. Filed Dec. 3, 1888. Serial No. 292,549. (No model.)

Claim.—1. In window-screens, in combination, the sash *b*, having the rabbet-ledges *b'* and the beveled edges *b''*, the side strips, *a*, having rabbet-grooves *a'*, adapted to the ledges of the sash, and stops *d*, having beveled edges *d'*, adapted to the beveled edges of the sash, as set forth.

2. In window-screens, in combination, the sash *b*, having the rabbet-ledges *b'* and the beveled edges *b''*, the side strips, *a*, having rabbet-grooves *a'*, adapted to the ledges of the sash, stops *d*, having beveled edges *d'*, adapted to the beveled edges of the sash, and a spring or springs, *e*, between the sash and stop, as set forth.

402,296. EXPECTORANT. JEREMIAH W. BRADLEY, Marshall, N. C. Filed Feb. 13, 1889. Serial No. 299,751. (No specimens.)

Claim.—The herein-described composition of matter to be used in lung diseases, consisting of water, life-everlasting, (*Gnaphalium margaritaceum,*) ground-ivy, (*Glechoma hederacea,*) sal-soda, paregoric, sirup of squills, cinnamon, and sugar, in the proportions specified.



402,297. BOTTLE-STOPPER COVER. THOMAS C. BOOTING, East Mauch Chunk, Pa. Filed Oct. 3, 1888. Serial No. 287,130. (No model.)

Claim.—1. In a bottle-stopper cover, an inwardly-flanged closed tube removably attached by turn-buttons to an annular collar, the collar having a tapering opening inclosing the neck of the stopper and fixed thereto by bolts or pins which pass through the said collar and press down upon the neck of the stopper, substantially as described, for purpose set forth.

2. In a stopper-cover, an extensible case composed of the two closed tubes M and N, removably attached by the flanged edge L L to an annular collar having the tapering opening V, the turn-buttons F F, and the pins E E, substantially as and for the purpose herein shown.

402,298. COMBINED TELEPHONE AND TELEGRAPH SYSTEM. WILLIAM BURNLEY, North East, assignor of two-thirds to Charles A. Hitchcock and Samuel A. Davenport, Erie, Pa. Filed Jan. 30, 1888. Serial No. 262,436. (No model.)

Claim.—1. In a combined telegraphic and telephonic system, the combination of undulatory-current telegraphic transmitting-instruments adapted to operate and maintain a continuous current over a main line, and telegraphic receiving-instruments on said line, with telephonic transmitting and receiving instruments operating over said main line, and condensers between said telephonic instruments and said main line, substantially as and for the purpose set forth.

2. In a combined telegraphic and telephonic system, the combination of undulatory-current telegraphic transmitting apparatus, telegraphic relay, sounder, and battery apparatus with telephonic receiving, transmitting, and signaling apparatus, all operating on the same main line, and a condenser through which the telephonic current passes from the main line to the telephonic instruments, whereby both telegraphic and telephonic currents simultaneously pass over the main line to and from the telephonic and telegraphic instruments without interference with each other, substantially as and for the purpose set forth.

3. In a combined telegraphic and telephonic system, the combination, on a main line, of terminal stations having telephonic transmitting, receiving, and signaling instruments operating over said line, and condensers between said instruments and the main line, with intermediate telegraphic stations on said line having undulatory-current telegraphic transmitting-instruments through which a continuous current may be maintained over the main line, and telegraphic receiving-instruments on said line at said intermediate stations, substantially as and for the purpose set forth.

4. In a combined telegraphic and telephonic system, the combination, on a main line, of terminal stations having undulatory-current telegraphic transmitting-instruments through which the currents over the main line can continuously pass, and telegraphic receiving-instruments on said line at said stations, with intermediate telephone-stations having telephonic transmitting, receiving, and signaling instruments operating on said line, and condensers between said instruments and said main line, substantially as and for the purpose set forth.

5. In a combined telegraph and telephone system, the combination, on a single main line, of terminal telephone-stations having condensers between them and the main line, and intermediate telegraph-stations having undulatory telegraphic transmitting mechanism, with condensers located in the main line at some of the telegraph-stations, said telegraph-stations being located in derived lines shunted to and from the main line around said condensers, and rheostats between the relays and main line at each telegraph-station, substantially as and for the purpose set forth.

6. The combination, in a single main-line system, of a closed telegraphic circuit having undulatory-current telegraphic-transmitting mechanism, and ordinary relays, and receiving mechanism operating thereon, with telephonic mechanism and condensers at terminal and intermediate stations on said line, and intermediate telegraphic stations located in circuits shunted around condensers in the main line, substantially as and for the purpose set forth.

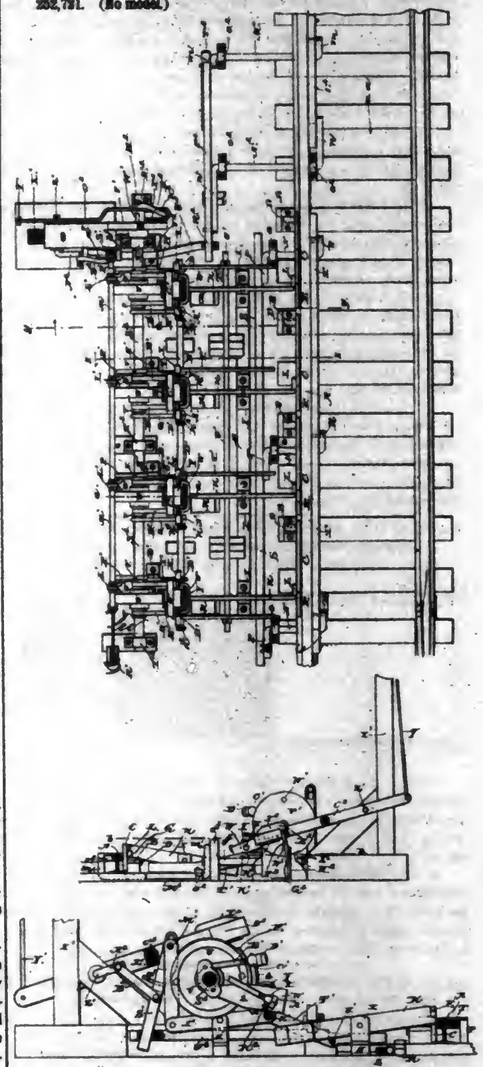
7. In a combined telegraphic and telephonic system having main-line wires bundled together into a cable and insulated from each other, the combination of undulatory-current transmitting-instruments operating over some of said wires and adapted to maintain continuous electrical currents over such wires, and telegraphic receiving-instruments on said wires, with telephonic transmitting and receiving instruments operating on other of said wires, and condensers between said telephonic instruments and the main-line wires over which they operate, substantially as and for the purpose set forth.

8. The combination, in a single main-line electrical-circuit system, of telegraphic stations each having undulatory telegraphic transmitting apparatus, relays, and sounders, and located in derived circuits shunted from the main line, and having rheostats therein, with telephonic stations each having a condenser, an induction-coil, a telephone transmitter and receiver, a local-battery circuit, a rapid-discharge signaling apparatus, a switch for putting the telephone induction-coil and local battery into and out of circuit and for putting the extra-current signaling apparatus into circuit when the telephone is not in use, and located in and connected to said circuit each way by means of contact-springs having a grounded switch between said contact-springs, whereby the current on the main line may be grounded from either direction and two classes of messages be simultaneously sent over the main line or circuit without interference with each other, substantially as set forth.

9. The combination, in a single main-line electrical-circuit system, of a closed telegraphic-circuit apparatus having one derived branch at each joint-station containing undulatory-current telegraphic transmitting apparatus, keys, relays, sounders, and rheostats, with another derived branch at each joint-station containing telephonic apparatus consisting of a condenser, induction-coil, telephonic transmitter and receiver, local-battery circuit, rapid-discharge signaling apparatus, and switches, whereby telephonic currents will pass through the condensers and through the undulatory-current telegraphic transmitting apparatus when the undulatory-current telegraphic transmitting apparatus is normally open or when the current is at its lowest potential, substantially as and for the purpose set forth.

10. The combination, in a single main-line electrical-circuit system, of a closed-circuit telegraphic apparatus consisting of undulatory-current telegraphic transmitters and keys, relays, sounders, and rheostats, with an extra or secondary current vibrator controlling a signaling apparatus in a local-battery circuit arranged in a branch circuit, shunting the telegraphic branch circuit, and containing a condenser, telephonic apparatus, and grounding-switches, substantially as and for the purpose set forth.

11. In a combined telegraphic and telephonic system, the combination of undulatory-current telegraphic transmitting-instruments through which electrical currents over the main line can continuously pass, telegraphic receiving-instruments on said line, telephonic transmitting and receiving instruments operating over said main line, and condensers between said telephonic instruments on said main line, with extra or induced current vibrators adapted to operate telephonic signaling apparatus, substantially as and for the purpose set forth.



12. In a combined telephonic and telegraphic system, the combination, on the same main line, of telephonic signaling, transmitting, and receiving mechanism with telegraphic receiving mechanism and combined undulatory-current telegraphic transmitting and Morse-key telegraphic transmitting mechanism, substantially as and for the purpose set forth.

13. The combination, in the telegraphic transmitting-instruments of a combined telegraphic and telephonic system operating on the same line, of undulatory-current telegraphic transmitters with make-and-break transmitting-keys, substantially as and for the purpose set forth.

14. The combination, in a telegraphic transmitter for combined telephonic and telegraphic systems operating on the same main line, of an undulatory-current transmitting key-lever operating to immerse a metal electrode in electrical connection therewith into and withdraw the same from a conducting-liquid in circuit, and also to simultaneously immerse a non-conducting medium connected with said electrode into and partially withdrawing the same from said liquid, with a make-and-break key-lever, so that the two key-levers can be simultaneously operated by means of the finger-knob of the make-and-break key, substantially as and for the purpose set forth.

402,299. SETTING APPARATUS FOR SIGNALS AND GATES.

TOWNSEND W. BURZ, Minoola, N. Y. Filed Oct. 16, 1887. Serial No. 252,731. (No model.)

Claim.—1. The combination of the revoluble operating-shaft having the wheels and the levers adapted to be operated in succession by a passing train, and each provided with a gripping device to engage the wheels of the shaft, for the purpose set forth, substantially as described.

2. The combination of the revoluble operating-shaft and the series of successively-operated independent levers provided with gripping devices to engage the shaft and rotate the same by a step-by-step motion, substantially as described.

3. The combination of the revoluble shaft having the wheel, the yoke having the gripping devices adapted to engage the wheel, and the lever to operate the yoke, substantially as described.

4. The combination of the revoluble shaft having the wheel, the yoke having the gripping devices adapted to engage the wheel, the lever K, to operate the yoke, and the lever C, connected to the lever K, substantially as described.

5. The combination of the revoluble shaft having the wheel, the gripping-shoe, and the eccentrically-pivoted yoke having the eccentric bearing against the shoe, substantially as described.

6. The combination of the revoluble shaft having the wheel, the links journaled on the shaft, and the yoke connected to the links and having the gripping devices to engage the wheel, substantially as described.

7. The combination of the revoluble shaft having the wheel, the links journaled on the shaft, the shoe arranged on the wheel, the rods connecting said shoe to the upper ends of the links, the yoke connected to the lower ends of the links and having the eccentric bearing against the shoe, substantially as described.

8. The combination of the revoluble shaft having the wheel, the links journaled on the shaft, the shoe-connections between the upper ends of the links, the yoke connected to the lower ends of the links, the eccentric journaled to the yoke and bearing against the shoe, and the hanger supporting the said eccentric, substantially as described.

9. The combination of the revoluble shaft having the wheel, the shoe, the yoke pivotally connected to the shaft at a point beyond the center of the latter, the eccentric journaled to the yoke, and the spring to keep the eccentric normally engaged with the shoe, substantially as described.

10. The combination of the revoluble shaft having the wheels, the gripping devices to engage the wheels, the levers to operate the gripping devices and thereby rotate the shaft, the detents to limit the rotation of the shaft, and the bar L^2, and connections between the same and the detents, substantially as described.

11. The combination of the rotating operating-shaft having the wheels, the detents to limit the rotation thereof, and the operating-bar L^2 and connections between the same and the detents, substantially as described.

12. The combination of the rotating operating-shaft having the wheels, the detents to limit the rotation thereof, the lever S', connected to said detents and adapted to trip the same, the lever U^3, adapted to engage the lever S', the operating-bar L^2, and connections between the said bar and the lever U^3, substantially as described.

13. The combination of the rock-shafts M^3 and N^3, having the oppositely-inclined crank-arms at their ends, the operating-bar L^2, having its ends supported by the cranks at one end of the said rock-shafts, and the link-bar P^3, supported by the crank-arms at the opposite ends of the rock-shafts, substantially as described.

14. The combination of the operating mechanism adapted to be actuated by a passing train, the detents to limit the movements of the operating mechanism, and the operating-bar L^2 and connections between the same and the detents to trip the latter, substantially as described.

15. The combination of the shaft having the wheels provided with the stop-pins, the yokes having the gripping devices to engage the wheels and rotate the shaft, the levers to raise the yokes, the movable detents to engage the stop-pins, and thereby limit the rotation of the shaft, and the levers I', connected to the detents and engaging the free ends of the yokes when the latter are raised, substantially as described.

16. The combination of the pressure-bar, the weight-bar, connections between the said pressure and weight bars, whereby they are moved vertically in opposite directions simultaneously, the operating-levers, the weighted levers K, connected thereto, and connections between the weight-bar and the weighted levers to cause the latter to depress the operating-levers when the pressure-bar is lowered, substantially as described.

17. The combination of the pressure-bar, the operating-levers C, the weighted levers K, connected thereto, the link-levers T, adapted to engage the levers K, and connections between the said link-levers and the pressure-bar to elevate the former when the latter is depressed, substantially as described.

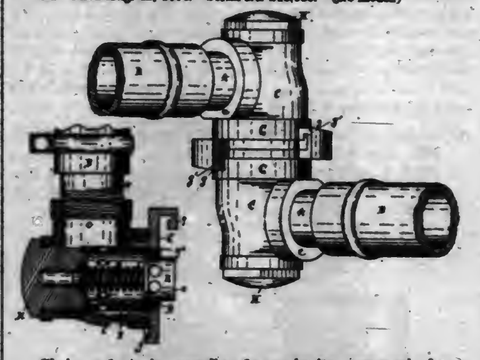
18. The combination of the gripping devices, for the purpose set forth, the operating-levers C, the levers K, connected to the operating-levers and adapted to operate the gripping devices, the said levers K being weighted, substantially as described.

19. The combination of the rotating shaft having the wheels provided with the stop-pins, the operating devices for the said shaft, the levers C, the levers K, connected to the same and operating devices, the pressure-bar, the detents to engage the stop-pins and thereby limit the rotation of the shaft, the link-levers T, adapted to engage the levers K, and connections between the said link-levers and the detents and pressure-bar, substantially as described.

20. The combination of the rotating wheel V^7, having the tappet-pins W^7, the lever O^3, adapted to be operated by said pins, the catch, and the locking-lever pivoted to the lever O^3, and having the locking-arm to engage the catch, and the trip-arm adapted to be operated by the tappet-pins to disengage the locking-lever from the catch, substantially as described.

21. The combination of the operating-shaft having the wheels, the detaining devices to limit the movement of the shaft, the rock-shaft Z', the lever O^3, connections between the same and the shaft, the lever U^3, the lever S', connected to the detaining devices, connections between the same and the lever O^3 to throw the lever S' in and out of connection with the lever U^3, the rock-shafts M^3 and N^3, having the crank-arms at opposite ends, the bar L^2, connected to the crank-arms at one end of the rock-shafts, and the link-bar P^3, connected to the crank-arms at the other end of the rock-shafts, and having the notch R^3 to engage the lever U^3, substantially as described.

22. The combination of the lever U^3, the rock-shaft N^3, having the crank-arms n and n', the link-bar supported by the arms m' and n', and having one end adapted to engage and disengage the lever U^3, and the bar L^2, supported by the arms m and n, substantially as described.



23. In a setting apparatus, the revoluble shaft having the wheels, the gripping device to engage the wheel and turn the same, and the lever to be operated by the passing train to work the gripping device, substantially as described.

24. In a setting apparatus, the combination of the lever O^3, to be connected to the gate or signal, the revoluble shaft having the wheel or wheels, the gripping device or devices to engage the wheel or wheels, the lever or levers connected to the gripping device or devices to be operated by a passing train, and connections between the revoluble shaft and the lever O^3, which connections are adapted to become disconnected from the lever at a certain point of the revolution of the shaft, for the purpose set forth.

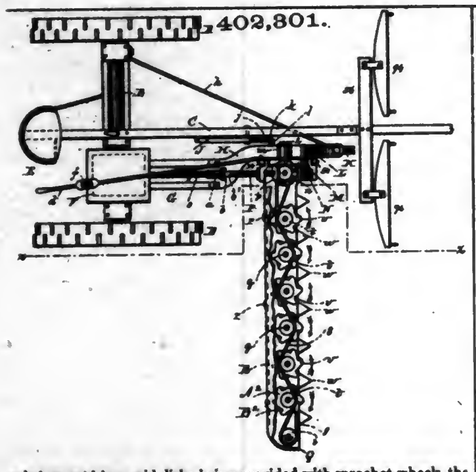
25. In a setting apparatus, the combination of the revoluble shaft, the gripping device or devices to engage the shaft, the lever or levers to operate the gripping device or devices, said lever or levers being operated by the wheels of a passing train, the detents to limit the rotation of the shaft, said detents being withdrawn from out of engagement by the wheels of a passing train.

402,800. BRAKE-PIPE COUPLING.

GEORGE P. CAMPBELL, Cincinnati, Ohio, assignor to the Friction Car Brake Company, East St. Louis, Ill. Filed Aug. 12, 1886. Serial No. 210,068. (No model.)

Claim.—1. A pipe-coupling for car-brakes, composed of two similar sections, each section consisting of case C, coupling-piece G, secured in the open end of said case and having oppositely-inclined locking members g g' upon its opposite faces, the perforated tube F, and packing-ring D, held between the coupling-piece and said tube, and the spring-actuated valve E, having its reduced part projecting through the packing-ring, the whole combined and arranged substantially as specified.

2. In a pipe-coupling consisting of two equal parts, the combination, substantially as specified, of the valve-case C, locking-piece G, having hooks g and flanges g', inclining in opposite directions, the spring-actuated valves E, and the perforated tube F, with the branches A in the opposite couplings so arranged that the couplings will separate when they are brought into the same horizontal plane and to be locked when they are at an angle to each other.

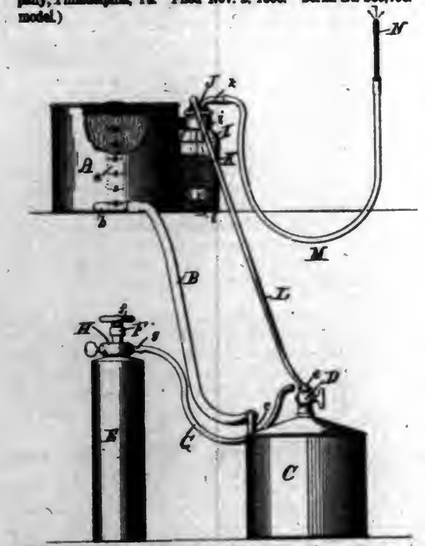


402,801. MOWING-MACHINE.

AMOS H. CARPENTER, Waterford Vt. Filed Mar. 22, 1888. Serial No. 268,061. (No model.)

Claim.—1. In a mowing-machine, the disk A^3, provided peripherally with the radially-arranged cutters or knives v, and having the sprocket-wheel t secured to its upper side, in combination with the disk B^3, provided peripherally with the radially-arranged cutters or knives x, and having the sprocket-wheel 4 secured to its lower side, said disks concentrically journaled one above the other on the cutter-supporting bar of the machine, and a single endless chain engaging all the upper and lower sprocket-wheels and turning each vertical pair of said disks in opposite directions, substantially as set forth.

2. In a mowing-machine, the cutter-supporting bar Q, provided with the fingers w, the disks A^3 and B^3, arranged in pairs and jour-

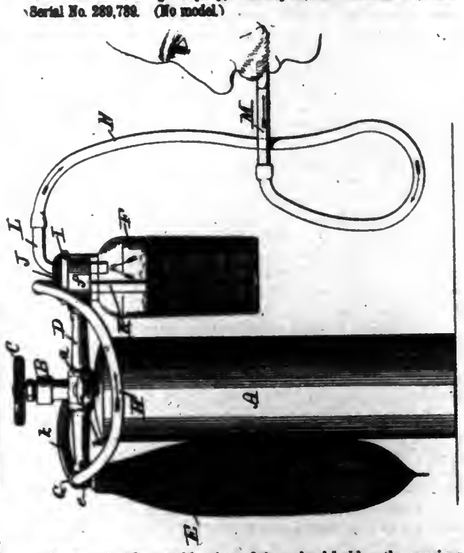


402,301.

naled on said bar, said disks being provided with sprocket-wheels, the guide sprocket-wheel *i*, journaled at the outer end of said bar, the sprocket-wheel 3, journaled at the inner end of said bar, the endless chain *g*, the two plies of the chain engaging each sprocket-wheel of a pair on the same side, and those of different pairs on opposite sides alternately, and means for actuating the sprocket-wheel, all being combined to operate substantially as set forth.

3. In a mowing-machine, the combination of the cutter-supporting bar Q, the sprocket-wheels *i* 3, journaled at the opposite ends of said bar, the cutting-disks A^2 B^2, provided, respectively, with the sprocket-wheels *t* 4 and journaled in pairs on said bar, the endless chain belt *g*, the two plies of the chain engaging each sprocket-wheel of a pair on the same side and those of different pairs on opposite sides alternately, the beveled gear *n*, connected with the sprocket-wheel 3, the beveled gear *p*, intermeshing with the gear *n* and mounted on the shaft P, journaled on said bar, the shaft O, jointed to the shaft P, and means for actuating said shafts, substantially as set forth.

402,302. APPARATUS FOR ADMINISTERING ENEMA OF OXYGEN. JOHN R. CASEY, Tottenville, and ARTHUR W. BROWNE, Prince's Bay, N. Y., assignors to the S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed Nov. 2, 1888. Serial No. 289,788. (No model.)



Claim.—1. The combination of the water-reservoir, the receiver provided with the valve at one end and having communicating connection near its opposite end with the reservoir near its bottom, the holder, its valve, and the communicating connection between the holder and receiver by way of their valves, substantially as and for the purpose set forth.

2. The combination of the water-reservoir, the receiver provided with the valve at one end and having communicating connection near its opposite end with the reservoir near its bottom, and the water-trap vessel with which the receiver has communicating connection by way of its valve, substantially as and for the purpose set forth.

3. The combination of the water-reservoir, the gage, the receiver provided with the valve at one end and having communicating connection near its opposite end with the reservoir near its bottom, the water-trap vessel with which the receiver has communicating connection by way of its valve, and the delivery-tube having communicating connection with the water-trap vessel and provided with the syringe-point, substantially as and for the purpose set forth.

402,303. OXYGEN-INHALER. JOHN R. CASEY, Tottenville, and ARTHUR W. BROWNE, Prince's Bay, N. Y., assignors to the S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed Nov. 2, 1888. Serial No. 289,789. (No model.)

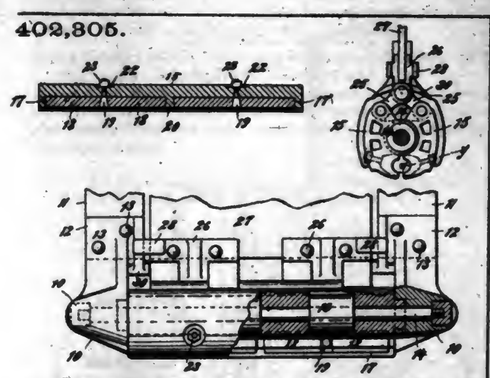
Claim.—1. The combination of the valved holder, the receiver having communicating connection with the holder, and the water-trap vessel supported by connection with the holder and with which the receiver has communicating connection, substantially as set forth.

2. The combination of the valved holder, the carrier supported thereby, the receiver supported by the carrier and having communicating connection with the holder, and the water-trap vessel supported by the carrier and having communicating connection with the receiver, substantially as set forth.

3. The combination of the valved holder, the receiver having communicating connection with the holder, the water-trap vessel with which the receiver has communicating connection, and the delivery-tube having communicating connection with the water-trap vessel and provided with the mouth-piece, substantially as set forth.

402,304. BICYCLE-STEP. HORATIO P. CHAPIN, Chicopee, Mass. Filed Aug. 31, 1888. Serial No. 284,363. (No model.)

Claim.—1. A bicycle-step formed of metal bent centrally, and having the outer ends of the step portion curved inwardly and interlocked by means of the tongue *c* and the recess *d*, substantially as specified.



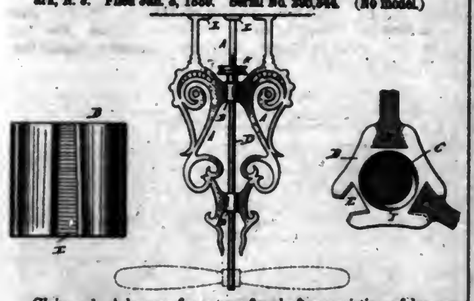
2. The bicycle-step formed from a single strip of sheet metal bent centrally, having the parallel portions interlocked at the outer ends by a tongue and recess, and having the upper edges provided with teeth and rounded inwardly, in combination with the clamping-bolt and nut, substantially as specified.

402,305. CABLE-GRIP. CHARLES S. CHAPMAN, Kansas City, Mo. Filed Dec. 20, 1888. Serial No. 294,174. (No model.)

Claim.—1. In a cable-grip, the combination, with jaws formed with undercut recesses, of shoes or dies fitting within said recesses, and bolts formed with wedge-shaped heads which bear against the shoe ends, substantially as described.

2. In a grip, the combination, with the grip-heads, of jaws supported thereby, and hoods carried by the grip-heads and extending over the jaw ends, substantially as described.

402,305.

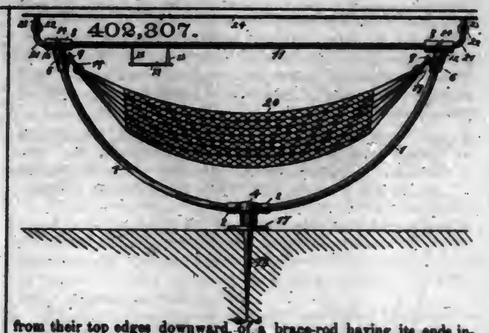


3. In a cable-grip, the combination, with grip-heads, of jaws pivoted in the heads, the body-sheet provided with a casting having side lugs or ears, and toggle-levers pivoted to the jaws and to the said casting, substantially as herein shown and described.

4. A cable-grip provided with a central movable jaw, two side jaws, and toggles by which the side jaws are connected, substantially as described.

5 In a cable-grip, the combination, with the grip-heads formed with recesses 54, of a central jaw, 52, formed with projections 53, which fit within the recesses 54, side jaws, 15, and toggles by which the side jaws are connected, substantially as described.

402,306. HANGER FOR ROTARY FAN-SHAFTS. ROBERT B. CRANE, Elizabeth, assignor to the Backus Water Motor Company, Newark, N. J. Filed Jan. 3, 1889. Serial No. 295,944. (No model.)



Claim.—1. A hanger for rotary fan-shafts, consisting of hanger-sections having lugs and coupling-blocks provided with grooves for receiving said lugs and a central bore for the fan-shaft, which blocks are supported by said hanger-sections, substantially as set forth.

2. In a hanger for rotary fan-shafts, the combination, with the hanger-sections having tapering dovetailed lugs, of coupling-blocks having a central bore for the fan-shaft, and a tapering dovetailed socket for the lugs of the hanger-sections, which coupling-blocks are supported by the hanger-sections, substantially as set forth.

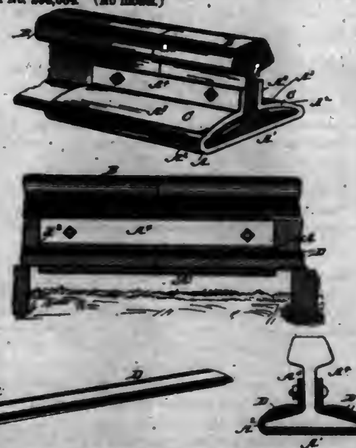
3. In a hanger for rotary fan-shafts, the combination, with hanger-sections having lugs, of coupling-blocks having grooves for receiving said lugs and bores for the fan-shaft, a washer resting on one of said coupling-blocks, and a pulley secured on the fan-shaft and resting on said washer, substantially as set forth.

4. In a hanger for rotary fan-shafts, the combination, with the hanger-frames, of Babbitt-metal coupling-blocks supported by and uniting said hanger-frames, which coupling-blocks have each a longitudinal bore, forming a bearing and guide for a rotary shaft, substantially as set forth.

402,307. HAMMOCK-SUPPORT. HORATIO E. COLLINS, Detroit, Mich. Filed July 16, 1888. Serial No. 280,086. (No model.)

Claim.—1. The combination, with the curved frame having a central vertical socket on its lower side and hammock-attaching devices at its upper ends, of the spike 18, having a supporting-plate, 17, and a pivot-pin, 16, entering said socket, substantially as set forth.

2. The combination, with the casting 4, having opposite side projections, 3, and a vertical intermediate socket, 5, of the curved arms 1 1, having sockets at their lower ends receiving said projections, hammock-attaching devices at their upper ends, a brace-rod connecting said upper ends, and a pivot entering said socket, substantially as set forth.



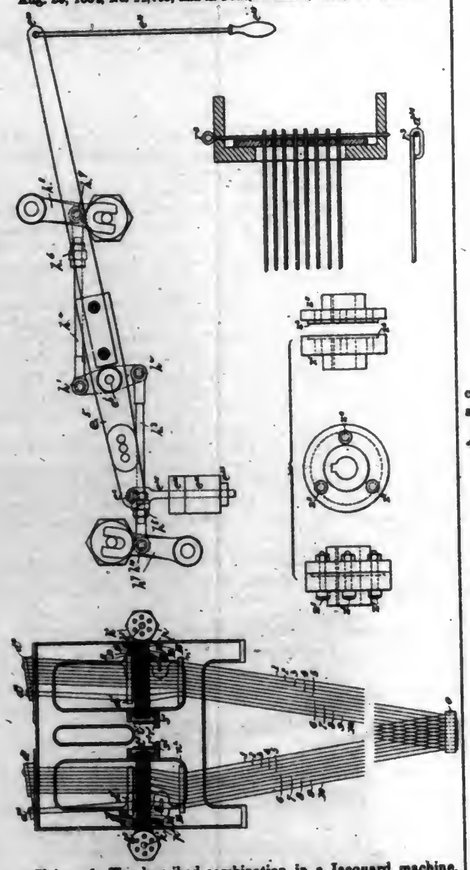
3. The combination, with the hammock-frame having socket-pieces on its ends open on their upper sides and having slots extending from their top edges downward, of a brace-rod having its ends inserted into the socket-pieces from above and provided with side projections entering said slots at the same time.

4. The combination, with the hammock having sleeves on its upper ends, provided with hammock-supporting hooks on their adjacent sides, and horizontal socket-pieces open on their upper sides and having transverse slots through their sides, of the brace-rod inserted at its ends into said sockets from above, and having transverse projections entering said slots at the same time, substantially as set forth.

5. The combination, with the hammock-frame, of the sleeves 6 on the upper ends of said frame, formed with horizontally-aligned socket-pieces 8 on the upper ends, having transverse slots 14, the tubular brace-rod 11, resting at its ends in said socket-pieces and provided with transverse projections 12, resting on said slots, the brackets 21, having upwardly-projecting ends entering the opposite ends of the tubular brace-rod within the socket-pieces, and the canopy-frame secured to said brackets, substantially as set forth.

6. The combination, with the canopy-frame and the transverse curved rods 23 at the ends thereof, of the angular supporting-brackets 21, having transverse sleeves 22 on the upper ends of their vertical members, through which the said rods pass, the horizontal members or arms of the brackets forming their attaching means, substantially as set forth.

402,308. RAIL-JOINT. EDWIN M. COOKE, Brooklyn, assignor of one-half to Noyes G. Worcester, New York, N. Y. Filed Feb. 4, 1889. Serial No. 298,694. (No model.)



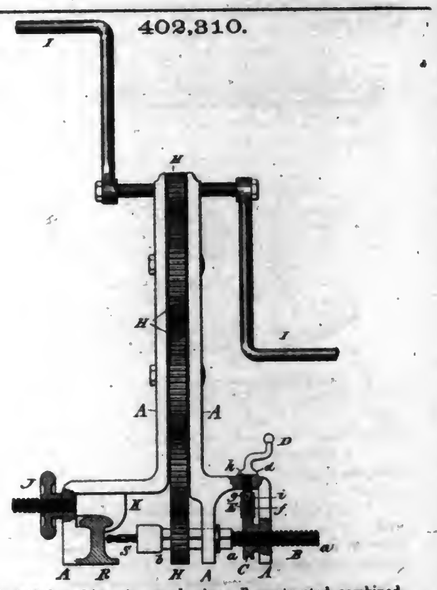
Claim.—1. In a rail-joint, the combination, with the rails and the jacket embracing the same, ways or recesses being provided between the upper side of the base of the rail and the jacket, of the wedges fitting said ways or recesses and formed of sections *d d'*, having each a straight and an inclined face, the section *d* being inserted in the way and the section *d'* being driven up on such section *d* and secured, substantially as set forth.

2. The improved rail-joint consisting of the jacket having a base-plate and provided with goffers or corrugations A^3, having their under sides or faces formed on horizontal lines, whereby in operation such surfaces will be on lines parallel with the tops of the rail-base, and the wedge formed in sections and adapted to bear between said goffers and the rail-base, substantially as set forth.

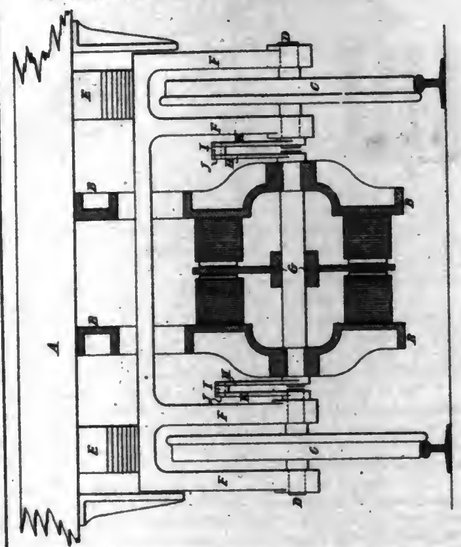
3. The improvement in rail-joints, substantially as herein described, consisting of the rails, the jacket A, fitted thereto and formed with goffers or corrugations A^3, having their under sides formed in

lines parallel with the tops of the rails, and the wedges formed in sections d d, the sections d being inserted in the ways between the goffers A^3 and the rail-base, and the sections d' being driven up on the sections d until the points pass the bases of sections d, and bent at d^3 down against the bases of sections d, all substantially as and for the purposes specified.

402,309. JACQUARD MECHANISM FOR LOOMS. EDWARD CROSSLEY and HENRY N. MELLOR, Halifax, County of York, England. Filed June 16, 1885. Serial No. 168,882. (No model.) Patented in England Aug. 29, 1884, No. 11,763, and in France June 6, 1885, No. 169,391.



Claim.—1. The described combination, in a Jacquard machine, of two card-cylinders placed front and back of each other, as set forth, the harness-cords and their lifting devices, and two sets of selecting-needles, with lever c^3, slotted rod c^5, and cranked lever b^7, rods h^2 h^4, studs h' h^3, regulating-swivels h^2 h^3, shafts h^{11} h^{12}, levers h^7 h^9, and their arms f' f^3, the combination serving to cause cards carried by the cylinders to act simultaneously on their respective sets of selecting-needles and to form the shed or lift of the warp, substantially as hereinbefore set forth.



2. The combination, with the cam-shaft of a loom, and with its cam and the intermediate devices—namely, lever a^2, rod a, lever a^3, bell-crank lever a^4, rod b', bell-crank b^7, and rod c^2—of different sets of selecting-needles placed one set behind the other from the front part of the loom, card-cylinders placed, respectively, one at the front and one at the back of the loom, and devices, substantially as described, consisting of the lever c^3, rods h^2 h^4, studs h' h^3, regulating-swivels h^2 h^3, shafts h^{11} h^{12}, levers h^7 h^9, and their arms f' f^3, whereby the cards carried by the respective cylinders shall be caused to act simultaneously on their respective sets of selecting-needles, substantially as and for the purpose set forth.

402,310. MACHINE FOR DRILLING RAILS FOR FISH-BOLTS. JOHN DAVIS, New Bedford, Mass. Filed June 30, 1888. Serial No. 278,714. (No model.)

Claim.—Frame A A A A A, drill-shaft B, friction-wheel C, crank-shaft D, thimble E, gear-wheels H H H H H, cranks I I, nut-wheel J, clamp K, drill S, and its other mechanism, all constructed, combined, and operated as and for the purposes set forth and described.

402,311. ELECTRO LOCOMOTIVE-ENGINE. SEBASTIAN ZIANI DE FERRANTI, Hampstead, County of Middlesex, England. Filed Sept. 24, 1888. Serial No. 286,204. (No model.) Patented in England Sept. 13, 1887, No. 12,419.

Claim.—1. The combination, with the frame and driving-wheels of an electric locomotive-engine, of a dynamo-electric machine placed between the driving-wheels of the locomotive, with its armature concentric with the axle or axles of the wheels, and flexing couplings between the axle and armature which allow the frame of the locomotive and the dynamo which it carries to play up and down freely.

2. In an electric locomotive, the combination, substantially as set forth, with the wheels and axle or axles, of a dynamo-electric machine having its armature arranged concentrically with the axle or axles and flexing couplings by which the armature drives the latter, whereby the armature may independently vibrate or play up and down.

3. In an electric locomotive, the combination, substantially as set forth, of the driving-wheels and axles, a dynamo-electric machine having a hollow armature through which the axle passes, and flexing couplings by which the armature drives the axle, whereby the armature may play independently of the axle.

402,312. BITTER TONIC. JOSEPH D. DELISLE, Lowell, Mass. Filed Mar. 5, 1889. Serial No. 302,007. (No specimens.)

Claim.—The above-described composition of matter to be used as a tonic medicine, consisting of citrate of iron and quinine, tincture of nux vomica, tincture of quassia, and white wine, in substantially the proportions specified.

402,313. VELOCIPEDE. CHARLES E. DURYEA, Washington, D. C. Filed June 13, 1888. Serial No. 277,015. (No model.)

Claim.—1. A bicycle in which the wheels are connected by a frame that passes to one side only of each wheel and that does not rise above a line passing through their axles.

2. A bicycle in which the wheels are connected by a frame that is single throughout its length, that is joined to one end only of each wheel-axle, and that does not rise above a line passing through the wheel-axles.

3. A bicycle having a frame of which that portion connecting the wheels does not rise above a line passing through the axles of the wheel and passes to one side only of the steering-wheel.

4. A bicycle having its steering centers located at one side of the steering-wheel.

5. A velocipede having its steering centers located at one side of the steering-wheel and inclined so that a line through the said centers would intercept the line of the wheel-bases.

6. A velocipede having its steering centers located at one side of the steering-wheel and inclined so that a line through the said centers would intercept the line of the wheel-bases at a point at or in front of the forward point of contact with the ground.

7. A bicycle having the frame that connects the wheels jointed between the wheels to swing vertically, each part being elastically connected with the saddle-support, whereby a vertical movement of either wheel out of its normal position may occur without affecting the saddle.

8. In a bicycle, an elastic frame so arranged that each wheel may swing vertically in an arc of a circle of which the center is at or near the crank-axle without affecting the saddle.

9. In a bicycle, a jointed elastic frame of which the joints are located at or near the crank-axle, the elasticity is supplied by adjustable springs, and which is elastically connected with the saddle-support, whereby either wheel may rise vertically without affecting the saddle.

10. In a bicycle of the class described, a frame connecting the wheels jointed at or near the crank-axle, and a saddle-support pivoted thereto, all being maintained in position by adjustable springs.

11. A bicycle of the class described, in which the frame connecting the wheels is jointed at or near the crank-axle to swing in a plane approximately vertical, whereby the parts may be brought into proximity for convenience in storing and shipping.

12. A bicycle of the class described, having the frame that connects the wheels jointed at or near the crank-axle to swing vertically and provided with a means to prevent accidental folding.

13. In a velocipede, a saddle-support pivoted to the supporting-frame at or near the crank-axle and supported in an upright position by springs.

14. In a velocipede, a support for handles and saddle pivoted at or near the crank-axle to swing in a vertical plane parallel to the plane of the wheels and supported in an upright position by springs.

15. In a velocipede, a support for handles and saddle pivoted at or near the crank-axle to swing in a vertical plane parallel to the plane of the wheels, and supported in an upright position by adjustable springs.

16. In a bicycle of the class described, a frame connecting the wheels jointed at or near the crank-axle and held in position by a spring which may be adjusted so as to hold the crank-axle at a greater or less distance from the ground, as desired.

17. A bicycle of the class described having a saddle-support pivoted to the frame that connects the wheels, and held upright by springs that have a means of adjustment, whereby it is possible to cause the saddle-support to lean forward or backward by adjusting one spring more than the other.

18. In a velocipede, a handle-bar removably attached to the top of the steering-post, so that it may be reversed either horizontally or vertically, as and for the purpose described.

19. A velocipede having the axis around which the handles move placed under the saddle and the bars so curved as to pass outward to the handles without interfering with the motion of the rider, and, further, having the bars so attached to the steering-post that they may be reversed, by which arrangement they may be caused to pass either before or behind the rider at will.

20. A velocipede wherein the saddle may have a lateral motion with respect to the wheels and pedals around the same center as the handles, and wherein the saddle is so connected with the steering-wheel that the said wheel is turned toward the side to which the saddle is moved.

21. A velocipede wherein the saddle may have a lateral motion with respect to the wheels and pedals around the same center as the handles, and wherein the saddle is so connected with the handles that motion of one causes the other to move around the same center in a reverse direction.

22. A bicycle of the class described having the saddle-support, forward part, and rear part separably joined together at or near the crank-axle, whereby either forward or rear part may be separated from the other two, for the purpose described.

23. In combination with the wheels of a rear-driving safety-bicycle, a frame which passes from the rear axle forward until beyond the periphery of the rear wheel, where it carries the crank-axle, thence forward till near the periphery of the front wheel, thence outward far enough to allow the front wheel to turn in steering, thence forward and inward to the steering center located near the front axle, to which the frame is connected by means of a neck.

24. The combination, with a front steering-wheel of a velocipede, a horizontal supporting-frame therefor, and a handle-bar axis approximately perpendicular thereto, of a crank or arm attached to the said axis perpendicular to the plane of the wheels, an arm similarly attached to that portion of the frame between the steering centers and the front axle, and a lever pivoted to the frame between the said arms and connected to their projecting ends by connecting-rods and universal joints, whereby motion of the handle-bar axis is transmitted to the said steering-wheel.

25. The combination, with a velocipede having a wheel centrally located behind the rider, of a brake applied to the tire thereof and operated from the vicinity of the handles by means of a lever attached to the handle-bar, and an arm attached to the brake and connected to the said lever by a connection which passes through the axis of the handle-bar.

402,314. ART OF ENGRAVING. WILLIAM S. RATOR, Sag Harbor, N. Y., assignor to the Fahys Watch Case Company, same place. Filed Dec. 26, 1888. Serial No. 294,846. (No model.)

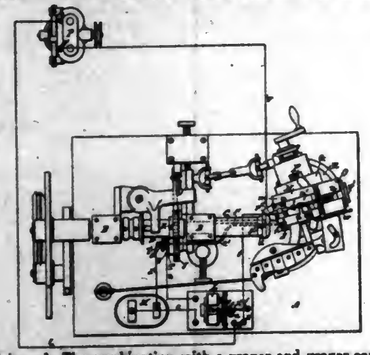
Claim.—1. The within-described improvement in the art of machine-engraving, which consists in producing a series of engraved pattern-plates, each of which has a fragment only of the design upon it, but collectively compose the entire design, and which are successively used in transferring the design to the article to be engraved, as set forth.

2. The improvement described in the art of engraving, which consists in first engraving upon a series of pattern-plates different fragments of the entire design to be produced, including lines which cross each other, and subsequently transferring on any desired scale, by a tracing and engraving instrument, successively, from said plates to the article to be engraved, the different fragments of the design, substantially as specified.

402,315. RUBBER-DAM CLAMP. JOHN D. ERWIN, Norfolk, Va. Filed Sept. 20, 1888. Serial No. 286,243. (No model.)

Claim.—1. A rubber-dam holder consisting of a base-clamp hav-

402,815.

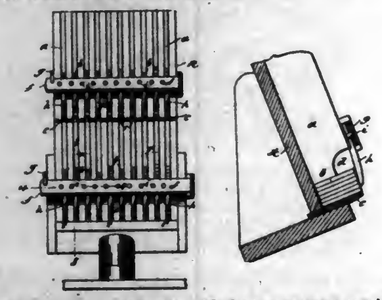


ing a front lip and a slotted angular rear fold provided with an edge approximating said base, a clamp-jaw having a V-form rear portion engaging said fold and a biting-lip to engage the lip of the base, and a removable pin in said fold, substantially as specified.

2. The combination, with the spring-base D, having an angular rear fold and front clamping-lip, of the longitudinally-adjustable clamp-jaw E, having a front lip, and a V-form rear portion consisting of a shoulder portion, *b*, and spring-tongue *c*, substantially as specified.

3. In a spring-jaw rubber-dam clamp, the slotted angular fold of the base, having a removable pin extending through said fold, substantially as specified.

402,816. ENGRAVING-MACHINE. CHARLES H. FIELD, Providence, R. I. Filed Nov. 9, 1888. Serial No. 290,404. (No model.)

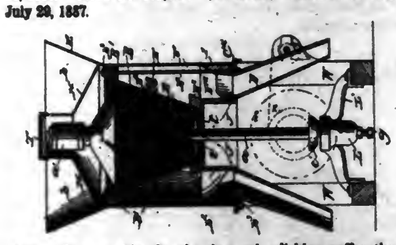


Claim.—1. The combination, with a graver and graver-carriage, of a main electric circuit and an electro-magnet adapted to operate the graver, a separate electric circuit, including a pattern-plate, tracing-point, and electro-magnet for closing or breaking the main electric circuit, and means for imparting traversing movement to the graver and tracing-point, substantially as and for the purpose specified.

2. The combination, with the graver and graver-carriage, of a main electric circuit and electro-magnet adapted to operate the graver, the separate electric circuit, including a pattern-plate, tracing-point, and electro-magnet for closing or breaking the main electric circuit, and the adjustable cam and multiplying lever for transmitting the traversing movement of the graver to the tracing-point, substantially as described.

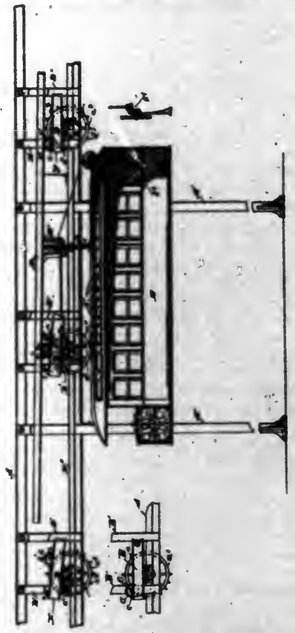
3. The combination, with the graver and graver-carriage, of the electro-magnet hinged to the graver-carriage and adapted to draw the graver backward from the work, and also for convenient removal from its armature, substantially as and for the purpose specified.

402,817. TYPE-CASE. HENRY FREEMAN, Hartford, Conn., assignor to the Thorne Machine Company, same place. Filed Mar. 10, 1888. Serial No. 266,787. (No model.)



Claim.—1. The combination, with the type or space case having the channels *a*, of the adjustable fingers *h*, located in front of the channels, with their lower ends just above the lower type or space in the lines, substantially as described.

2. The combination, in a type or space case, of the type or space channels *a*, a plurality of fingers, *c*, arranged at different heights in the same channel to support the type or spaces, and a corresponding number of fingers, *h*, located above the fingers *c* and extending downward in front of the channel, with their lower ends a short distance above the fingers *c*, substantially as described.



3. The combination, with the type or space case having the channels *a*, of the fingers *h* and the hinged bar *f*, supporting said fingers, substantially as described.

402,818. MACHINE FOR PEELING, POLISHING, AND CLEANING COFFEE. AUGUSTO GALLARDO, San José, Costa Rica. Filed Oct. 20, 1887. Serial No. 252,898. (No model.) Patented in Costa Rica July 29, 1887.

Claim.—In a machine for cleaning and polishing coffee, the combination, with a casing provided with a hopper at its upper end and with openings in its bottom, of a stationary inverted cone-frustum of wire-gauze, supported on the casing, a rotary inverted cone-frustum covered with wire-gauze, arranged within the stationary cone-frustum with a space between them, and provided with diagonal rods on its outside, and a spout leading from the space between the said inverted cone-frusta, substantially as herein shown and described.

402,819. ELEVATED RAILWAY. ALFONSO D. GATES, Cleveland, Ohio. Filed Jan. 16, 1889. Serial No. 296,514. (No model.)

Claim.—1. An elevated railway consisting of the supporting-pillars A', the main frame A, the girders B, provided with stops *c* and means for tilting said girders, the rollers C, and the platform D, substantially as shown.

2. In an elevated railway, the combination of the car-supporting platform D, the rollers C, the girders B, and means for tilting said girders, substantially as shown.

3. In an elevated railway, the platform D and the car E, suspended by and moving with said platform, in combination with girders adapted to be tilted within certain limits, and rollers C, adapted to move upon said girders within certain limits with the movement of the car, substantially as described, for the purpose stated.

4. In an elevated railway, the girders supported at intervals adapted for independent tilting movement within and on each side of the supporting structure, and provided on their upper surfaces with the fixed stops *c c*, near each end thereof, in combination with the rollers C, having their axis resting and rolling upon said girders between said stops, the platform D, supported upon said rollers, and the car suspended from said platform below said girders, substantially as described, for the purpose specified.

5. In an elevated railway, the platform D and the car E, suspended by and moving with said platform, in combination with girders B, supported at intervals and adapted for independent tilting movement within and on each side of the supporting structure, the rollers C, adapted to have a limited movement upon the said girders, and wheels a^3, supported by said structure and provided with means for engaging the car, substantially as described, for the purpose specified.

6. In an elevated railway, the combination of the platform D, the car E, suspended thereby and provided with projections *c'*, the girders B, mounted for independent tilting movement, the rollers C, adapted to have a rolling movement between stops on said girders, and the wheels a^3, having projections a^4 upon a portion of the circumference adapted to engage with the said car projections, in the manner and for the purpose stated.

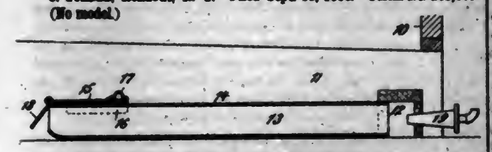
7. In an elevated railway, a car-supporting platform propelled upon rollers C and means for returning said rollers, substantially as shown.

8. In an elevated railway, the platform and the car suspended thereby, and means, substantially as described, for supporting said platform, consisting of the girders B, adapted to have independent tilting movement, the rollers C, adapted to have limited movement upon said girders in carrying the car forward, and means for returning said rollers to their starting-point, consisting of the spring *b*, substantially as described, for the purpose stated.

9. In an elevated railway, the combination, with a car and a platform which supports and carries the same in suspended relation thereto, of girders B at intervals in the superstructure and adapted to have independent tilting movements within certain limits, and provided with rollers C, adapted to support said platform, to roll upon said girders, and to be returned by gravity upon said girders to the starting-point, substantially as described, for the purpose specified.

10. In an elevated railway, the combination, with a car, a platform carrying and moving with said car in suspended relation thereto, and the rollers C, for supporting said platform, of a brake attachment depending from said platform in proper relation to a fixed part of the superstructure, and means, substantially such as described, for operating said brake from the car, whereby the weight of the car and its carrying-platform are partially or fully relieved from their rolling supports and transferred to the bearing of the brake-shoes upon the superstructure, substantially as described, for the purpose specified.

11. The combination, in an elevated railway, of the platform D, the rollers C, supporting the latter, a car suspended from said platform, with a brake suspended from the latter, consisting of the knee-joint and brake-shoe, the fixed frame-stringer part E, and means, substantially as described, for connecting said knee-joint with operating devices of the car, substantially as described, for the purpose specified.

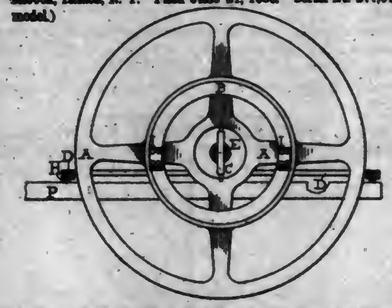


402,820. METHOD OF SECURING BLADES TO METAL HANDLES. HORACE GLIDDEN and WILLIAM W. HOLMES, Bridgeport, Conn. Filed Aug. 16, 1888. Serial No. 282,916. (No model.)

Claim.—1. The method of securing perforated blades to slotted shanks, the same consisting in forcing the metal of the shank inward through the perforations of the blade by pressure applied to the outside of the shank, substantially as specified.

2. The method of securing blades by their tangs within a metal handle, the same consisting in forming an elongated perforation in the end of the tang, then inserting the pierced end of the tang or tangs within the slotted shank, and finally forcing the metal of the shank inward through the perforations by pressure applied to the outside of the shank, substantially as set forth.

402,821. DRYING ATTACHMENT FOR BRICK-KILNS. PALMER J. GUERIN, Rondout, N. Y. Filed Sept. 18, 1888. Serial No. 285,075 (No model.)

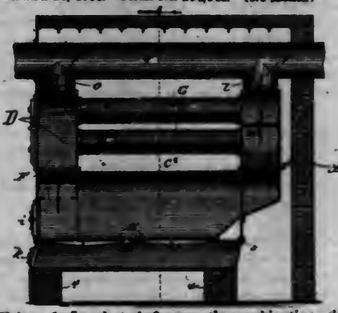


Claim.—1. The combination, with the arch of a brick-kiln and a burner introduced therein, of a heater located in said arch, having open ends and provided with a perforated top, and a damper capable of sliding over said top provided with a hinged gate, substantially as shown and described.

2. A portable heater for brick-kilns, consisting of a box having a perforated top and provided with an imperforate slide or damper fitted to slide upon its upper perforated surface, substantially as described.

3. The combination, with a heater provided with a series of graduated perforations and open at its ends, of a damper held to slide over the perforations and a gate hinged to said damper, substantially as shown and described.

402,822. DRIVING-GEAR FOR LOCOMOTIVES. ALFRED HASMOUK, Ithaca, N. Y. Filed June 21, 1888. Serial No. 277,944. (No model.)

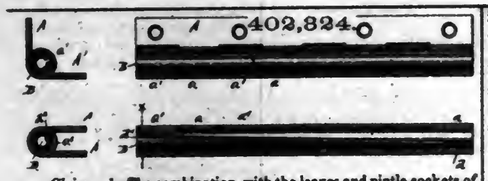


Claim.—1. The combination, in a locomotive, of the turn-plate D, the two annular bearings B, fixed thereon, and the draft-wheel A, journaled between and upon the said annular bearings, substantially as shown and described.

2. The combination of the frame P, the circular trucks H, fixed thereon, the turn-plate D, fitted to rotate on the said trucks, the annular bearings B, fixed to the said plate, and the draft-wheel A, journaled between and upon the said annular bearings, substantially as shown and described.

3. The combination of the shaft E, having a slot transversely through it, the wheel A, having a large central opening, and the pin C, having a square body, fitted through the said slot and journaled at its ends in the wheel at the sides of the said opening, substantially as shown and described.

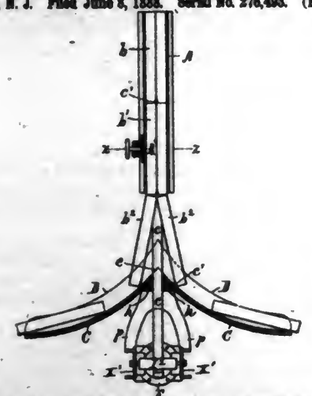
4. The combination of the drive-shaft E, bored in at its end and slotted in its side to meet the bore, the rod M, fitting the said bore and provided with a side key, O, projecting through the said slot, gear-wheels of different sizes journaled upon the said shaft and slotted to register with the said key, and the intermediate shaft, N, having gear-wheels fixed upon it, adapted to gear permanently with the gear-wheels on the drive-shaft, substantially as shown and described.



402,823. HOT-AIR FURNACE. HENRY G. HERBERT, Chicago, Ill. Filed Dec. 26, 1888. Serial No. 294,641. (No model.)

Claim.—1. In a hot-air furnace, the combination, with the casing A, fire-chamber, and ash-pit, of a radiator, D, comprising smoke-chambers F F', upper and lower flues G and flue *w*, dampers *o' p'* in the chamber F, an opening, *n*, damper *l*, and damper *m*, substantially as described, in the chamber F', substantially as and for the purpose set forth.

2. In a hot-air furnace, the combination, with the casing A and radiator, of an ash-pit, B, having a groove, *s*, in its upper edge, and a fire-chamber, C, comprising a wall portion, C', which rests in the groove *s* and is provided toward its upper edge with a flange, *r*, and a circular top portion, C^2, having a flange, *g*, riveted to the flange *r*, substantially as described.



402,824. SPRING-HINGE. HENRY HERTEL, Brooklyn, N. Y., assignor to the William Lang Company, same place. Filed Jan. 4, 1888. Serial No. 295,414. (No model.)

Claim.—1. The combination, with the leaves and pintle-sockets of a hinge, of a separate tubular longitudinally-slitted pintle, substantially as set forth.

2. The combination, with the leaves and pintle-sockets of a hinge, of a tubular longitudinally-slitted pintle, the ends of said pintle being attached to the opposite end sockets of the leaves in such a manner that a torsional spring action is imparted to the pintle, substantially as set forth.

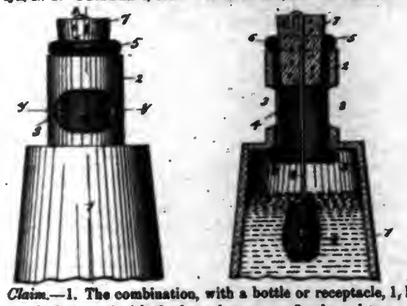
402,325. INGOT-FORMING APPARATUS. WILLIAM R. HINSDALE, Hoboken, N. J. Filed June 8, 1888. Serial No. 276,493. (No model.)

Claim.—1. In an ingot-forming apparatus, the combination, with a frame having ways to guide the mold-sections, of a series of ingot-mold sections movable in such ways, a spring-holder to retain the mold-sections within the ways, means for operating it to effect a varied pressure upon each mold-section in its passage through the ways, to permit the mold-sections to fall after filling, and means below such ways, applied directly to the ingot-bar, for severing the lower portion of the ingot, substantially as herein set forth.

2. In an ingot-forming apparatus, the combination, with a frame having ways to guide the mold-sections, of a series of ingot-mold sections movable in such ways, a spring-holder to retain the mold-sections within the ways, means for operating it to effect a varied pressure upon each mold-section in its passage through the ways, to permit the mold-sections to fall after filling, a stripping-space, a severing-chamber, and an apertured ingot-bearing for the ingot-bar below such ways, and means for severing the ingot, substantially as herein set forth.

3. In an ingot-forming apparatus, the combination, with a frame having suitable ways, of a series of mold-sections movable in such ways and adapted to be stripped from the ingot-bar, a stripping-space below such ways, a separator to detach the mold-sections from the bar, and means for severing the stripped portion of the bar, substantially as set forth.

4. In an ingot-forming apparatus, the combination, with a frame having suitable ways, of a series of mold-sections movable in such ways and adapted to be stripped from the ingot-bar a stripping-space below such ways, a separator to detach the mold-sections from the bar, and guides for receiving the mold-sections from the separator, and means for severing the stripped portion of the bar, substantially as set forth.

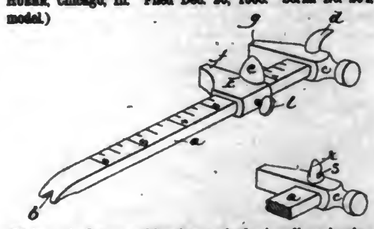


5. In an ingot-forming apparatus, the combination, with a frame having suitable ways, of a series of mold-sections movable in such ways and adapted to be stripped from the ingot-bar, a stripping-space below such ways, an apertured bearing below such stripping-space, a separator mounted upon such apertured bearing to detach the mold-sections from the bar, and guides for receiving the mold-sections from the separator, and means for severing the stripped portion of the bar, substantially as set forth.

6. In an ingot-forming apparatus, the combination, with a frame having suitable ways, of a series of mold-sections movable in such ways and adapted to be stripped from the ingot-bar, a stripping-space below such ways, inclined troughs C for the mold-sections, united in the path of the ingot-bar, an aperture through the troughs at their junction to form an ingot-bearing, the wedges *e*, for separating the ingot-sections and diverting them into the troughs, and means for severing the stripped portion of the bar, substantially as set forth.

7. In an ingot-forming apparatus, the combination, with a frame having suitable ways, of a series of ingot-mold sections movable in such ways, a holder applied to the ways to sustain the mold-sections therein, a spring applied to the holder, means for increasing the tension of the spring, means for stripping the mold-sections from the ingot-bar, and means for severing the ingot, substantially as set forth.

8. In an ingot-forming apparatus, the combination, with a frame having suitable ways, of a series of ingot-mold sections movable in such ways, a holder applied to the ways to sustain the mold-sections therein, a spring pressed upon the holder, and a cam to vary the pressure of the spring, means for stripping the mold-sections from the ingot-bar, and means for severing the ingot, substantially as set forth.



402,326. SHOE-VARNISH RECEPTACLE. JOHN HOSBLE, Brooklyn, N. Y. Filed Jan. 4, 1889. Serial No. 295,441. (No model.)

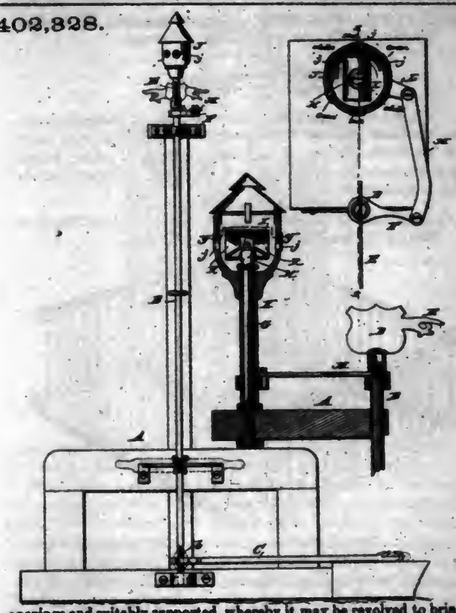
Claim.—1. The combination, with a bottle or receptacle, 1, having a neck, 2, formed with the lateral apertures 3, adapted to receive the ends of a thumb and forefinger, of a flexible tube, 4, fitting within the neck 2, and having projections located in the apertures 3, and ribs 5 overlapping the ends of the neck, substantially as shown and described.

2. The combination, with a bottle or receptacle having a neck formed with lateral apertures adapted to receive the ends of the thumb and forefinger, and a transversely-compressible tube located in the neck of the bottle and extending over the apertures therein, of a stopper having a wire attached thereto and extending through the neck into the bottle, with a sponge secured to its lower end, substantially as shown and described.

402,327. COMBINATION HOUSEHOLD-TOOL. FREDERICK A. HUBER, Chicago, Ill. Filed Dec. 26, 1888. Serial No. 294,685. (No model.)

Claim.—1. In a combination-tool, the handle *a*, having the claw *b*, and hammer *c*, provided with prong or spur *d*, and jaw *g*, in combination with the sleeve E, having knife *e*, jaw *f*, and set-screw *l*, substantially as shown and described, and for the purpose set forth.

2. In a combination-tool, the graduated handle *a*, having claw *b*, and hammer *c*, provided with prong or spur *d*, and jaw *g*, all made in one piece, in combination with the sleeve E, having knife *e*, jaw *f*, and set-screw *l*, substantially as shown and described, and for the purpose set forth.



3. In a combination-tool, the graduated handle *a*, in combination with hammer *c*, having the prong *k*, provided with notch or niche *s*, and the sleeve E, having the knife *e*, and set-screw *l*, and jaw *f*, substantially as shown and described, and for the purpose set forth.

4. In a combination-tool, the adjustable sliding sleeve E, having the knife *h*, jaw *f*, and set-screw *l*, in combination with the graduated handle *a*, having claw *b*, and hammer *c*, provided with jaw *g*, substantially as shown and described, and for the purpose set forth.

402,328. SWITCH-STAND SIGNAL. MICHAEL B. HURLY, Quebec, Canada. Filed Feb. 23, 1888. Serial No. 265,262. (No model.)

Claim.—1. In a switch-stand signal, the combination of a fixed signaling-lamp, an opaque hood fitted thereover and having light-openings in two opposite sides, and the lantern fitted over said lamp and hood and detached therefrom, such lantern being provided with light-openings and suitably supported, whereby it may be revolved to bring any two of its light-openings into register with those of the opaque hood, all substantially as and for the purposes specified.

402,328.

2. The combination of the switch-stand, the operating-shaft, a pointer on said shaft, a lamp fixed on said stand, a lantern fitted over said lamp and having light-openings and suitably supported, whereby it may be revolved, crank-arms connected with said lantern and with the operating-shaft, and a link connecting such cranks, whereby the turning of the shaft will effect a turning of the lantern, substantially as described, and for the purposes specified.

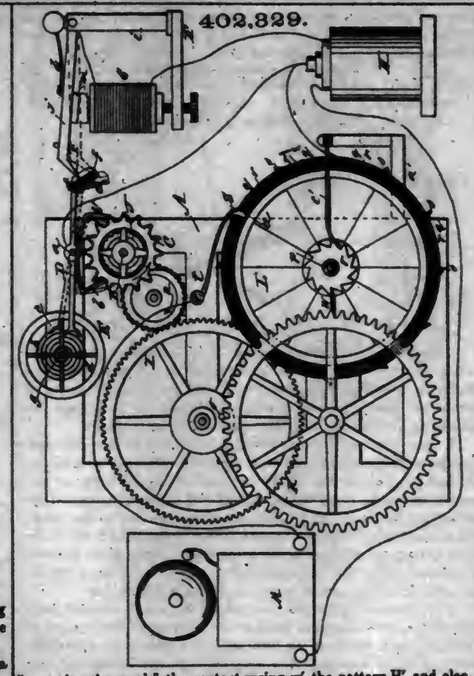
3. The improvement in switch-stand signals, substantially as herein described and shown, consisting of the operating-shaft, the upright shaft or rod mounted on the switch-stand and having the lamp fixed on its upper end, the opaque hood having opposite light-openings and fitted over the lamp, the lantern having light-openings and fitted over the hood and lamp and having a depending sleeve encircling the upright rod and provided with a crank-arm, a crank-arm on the operating-shaft, and a link connecting such arms, substantially as set forth.

4. In a switch-stand signal, the combination of a fixed signal-lamp, an opaque hood fitted over said lamp, and the lantern fitted over said lamp and hood and suitably supported, whereby it may be moved rotarily, substantially as set forth.

5. In a switch-stand signal, the combination, with a fixed lamp, of an opaque hood fitted over said lamp, and having a reflector or reflectors, R, and a lantern fitted over the lamp and hood and adapted to revolve, substantially as set forth.

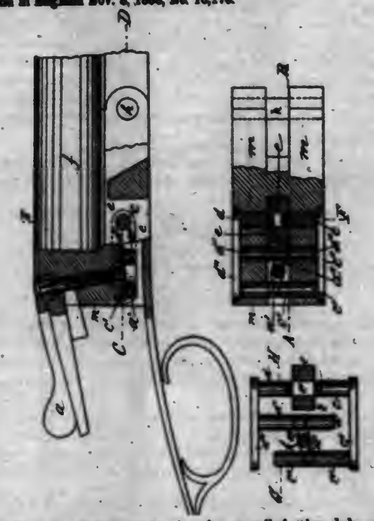
402,329. ELECTRIC STRIKING AND REPEATING CLOCK. ALPHONSE M. J. JANSEN and VISCOUNT J. A. M. JANSEN, San Willibrordo, Curaçoa. Filed Oct. 9, 1888. Serial No. 287,867. (No model.)

Claim.—1. In an electric clock, the combination of the impulse-wheel C, pallets *b b'*, the arbor *a*, carrying the said pallets, the lever D, provided with a contact-point, *c*, the balance-wheel and roller E *d*, for engaging said lever, the electro-magnet G, and the armature-lever *j*, provided with a contact-point, *k*, substantially as described.



2. In an electric clock, the combination of the impulse-wheel C, the pallets *b b'*, engaging said impulse-wheel, the lever D, provided with the fork *d* and the contact-point *c*, the balance E, the electro-magnet G, the armature-lever *j*, provided with a contact-point, *k*, and the retractile spring *l*, substantially as described.

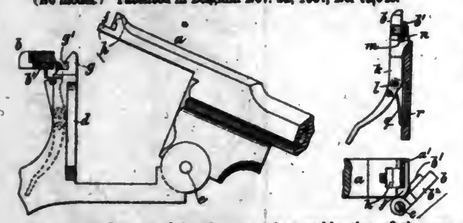
3. In an electric clock, the combination, with a time-movement of a clock, of the wheel K, arranged to be moved by step-by-step mechanism, and provided with the arm *w*, the strike-wheel L, provided with the insulated contact-bars *r*, the ratchet-wheel *v*, the contact-spring *u*, the electric bell M, the battery H, and circuit-connections, substantially as shown and described.



4. In an electric clock, the combination, with a time-movement of a repeating-wheel, L', arranged to be moved by a step-by-step movement, a series of contact making and breaking wheels, *d'*, carried by the repeating-wheel L', the electro-magnet O, the vibratory armature *l'*, carrying the pawl *l'*, the contact-spring *m'*, the battery H', and electrical connections, substantially as described.

5. In an electric clock, a repeating-wheel, L', a series of contact-wheels carried by the said repeating-wheel and provided with contact-points representing hours, and mechanism, substantially as described, for rotating the contact-wheels.

402,329.



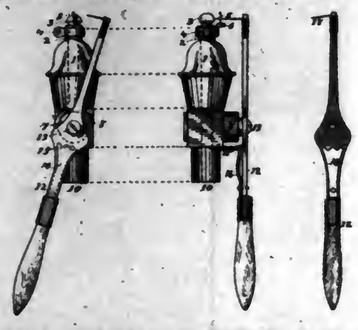
402,330. BARREL-LOCK FOR BREAKDOWN GUNS. LOUIS JUSSETTE, DENI D. HEBRARD, and HENRI HEBRARD, Hertal, Belgium. Filed Nov. 20, 1888. Serial No. 291,261. (No model.) Patented in Belgium June 20, 1888, No. 82,209; in France Nov. 2, 1888, No. 186,948, and in England Nov. 3, 1888, No. 16,176.

Claim.—A closing mechanism for so-called "breakdown guns," consisting of the combination of a lug, *c*, on the barrel, guiding-pins *c' d'*, seated in the breech-frame and adapted to be reciprocated transversely thereto in corresponding openings in the breech-frame, ties *c'' d''*, to which these pins are severally connected, locking-bolts *e d*, severally connected to said ties and seated in the breech-frame, a lever, *a*, arranged as described, a cross-head, *a' a''*, acted upon by said

lever and serving to move transversely of the breech-frame the said guiding-pins *d' d'*, ties *d'' d''*, and bolts *c d*, substantially as shown and described. and for the purposes set forth.

402,831. REVOLVING FIRE-ARM. MICHAEL KAUFMANN, Greenwich, County of Kent, England. Filed May 9, 1888. Serial No. 273,205. (No model.) Patented in Belgium Nov. 22, 1887, No. 78,640.

Claim.—1. In a revolving fire-arm, the combination of the supporting-frame having a notched or undercut lug, a tilting barrel provided with a recessed tail-piece or strap fitting over said lug, and a pivoted and laterally-swinging locking-bolt adapted to engage the notched lug and recessed tail-piece, substantially as set forth.



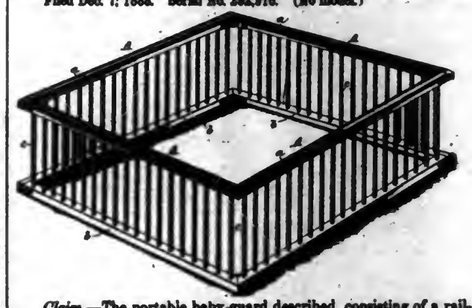
2. In a revolving fire-arm having a tilting barrel provided with a rearwardly-extending tail-piece or strap, the combination, with the rabbeted or grooved and slotted butt-end of the tail-piece, of the notched lug on the frame fitting in the slot of the tail-piece and of the locking-bolt, so pivoted as to move in a plane parallel to the longitudinal axis of the barrel, and perpendicular to the plane in which the barrel moves, said pivoted bolt being adapted to engage in the grooved or rabbeted end of the tail-piece, and to engage at the same time in the notch of the lug on the frame, substantially as specified.

3. In a revolving fire-arm, the combination, with a locking-bolt pivoted on a vertical axis at one side of the frame of the weapon, of a thumb-lever pivoted on an axis at right angles to the axis of the locking-bolt, and engaging at its upper end with said locking-bolt near its axis by a lug on the one received in a notch in the other, as specified, whereby motion of the thumb-lever on its axis will be transmitted to the locking-bolt, in the manner described.

4. In a fire-arm, the combination, with a locking-bolt pivoted on a vertical axis at one side of the frame of the weapon, of a thumb-lever pivoted on an axis at right angles to the axis of the locking-bolt, and engaging therewith by a lug and notch for transmitting motion, as described, and of a spring contained in a cavity in the frame and acting on the thumb-lever, as described.

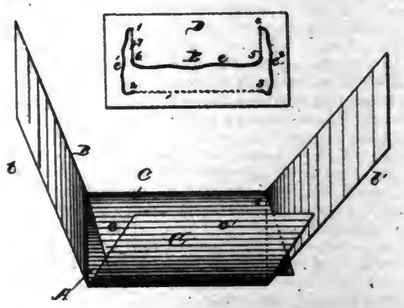
5. In a fire-arm, the combination, with the tail-piece *a*, having the slot *h*, and the rabbeted or grooved butt-end *f*, of the lug *g* on the frame, having the notch *g'*, the locking-bolt *b*, adapted to lie in the groove or rabbet *f*, and having the lug *b'*, adapted to engage in the notch *g'*, the bolt *b* being pivoted on the axis *c* at one side of the frame and moving in a plane parallel to the longitudinal axis of the barrel and perpendicular to the plane in which the tail-piece moves, and a thumb-lever, *k*, engaging with the locking-bolt *b* by a notch, *m*, and lug *n*, and a spring, *q*, the whole combined for operation, substantially as specified.

402,832. ELECTRICAL GAS-LIGHTER. DANIEL G. KNOWLTON, Boston, Mass. Filed Oct. 16, 1888. Serial No. 288,514. (No model.)



Claim.—A gas-burner and a cock controlling the passage of gas through the same, in combination with a lever attached to said cock and pivoted thereby in said burner, a pair of electrodes attached to said burner and said lever, a fixed pin, and a notched spring attached to said lever and engaging said pin, one of said notches being arranged to hold the cock open and the other to hold it closed by engaging with said pin, substantially as set forth.

402,833. WOOD-SCREW. HERMEN KNEPPEL, St. Louis, Mo. Filed Dec. 17, 1888. Serial No. 293,911. (No model.)



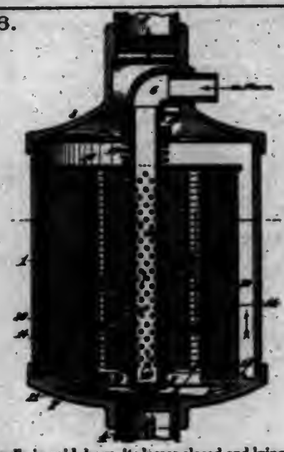
Claim.—The herein-described wood-screw A, having the tapering shouldered flat head B, provided with a slot, C, at right angles with the flat parallel sides E, and having a threaded portion consisting of disconnected spiral threads D, separated by the said parallel sides E, substantially as set forth.

402,834. GUARD FOR INFANTS. ARTHUR B. LANE, Chicago, Ill. Filed Dec. 7, 1888. Serial No. 292,916. (No model.)

Claim.—The portable baby-guard described, consisting of a railing forming a complete inclosure and composed of four sections hinged together in pairs, each pair consisting of two sections connected with each other by hinged joints and provided with oblique abutting faces by which the sections are held at right angles with each other, and having locking devices on their outer ends for detachably securing the pairs of sections together, whereby the railing may be separated into two parts and folded into a small compass for convenience in storing and transportation, substantially as described.

402,835. MERCHANDISE WRAPPER OR ENVELOPE. LOUIS P. LECLERCQ, Lille, France. Filed Aug. 16, 1888. Serial No. 282,915. (No model.)

Claim.—1. A wrapper or envelope comprising a tablet of a more or less rigid material, provided with an elastic fastening band or cord arranged to form the tying-loops *c c' c²*, and a wrapper of flexible material, substantially as and for the purposes specified.



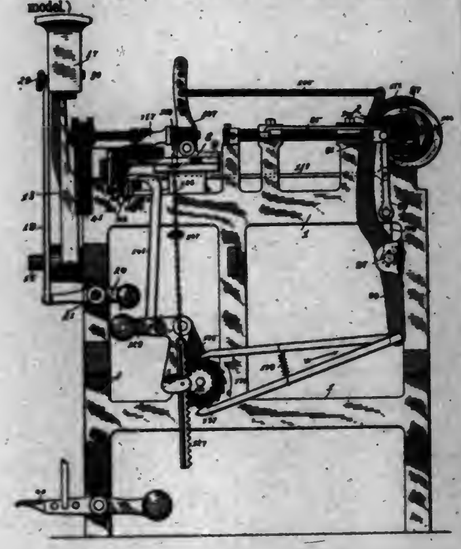
2. A wrapper or envelope comprising the tablet A, the wrapping-sheets B C, secured thereto, and the tablet D, having the elastic band E, secured thereto to form the tying-loops *c c' c²*, substantially as and for the purposes specified.

402,836. MUFFLER FOR STEAM OR OTHER HEATERS. EDWIN A. LELAND, Brooklyn, N. Y., assignor to Leonard Richardson, same place. Filed Feb. 19, 1889. Serial No. 300,443. (No model.)

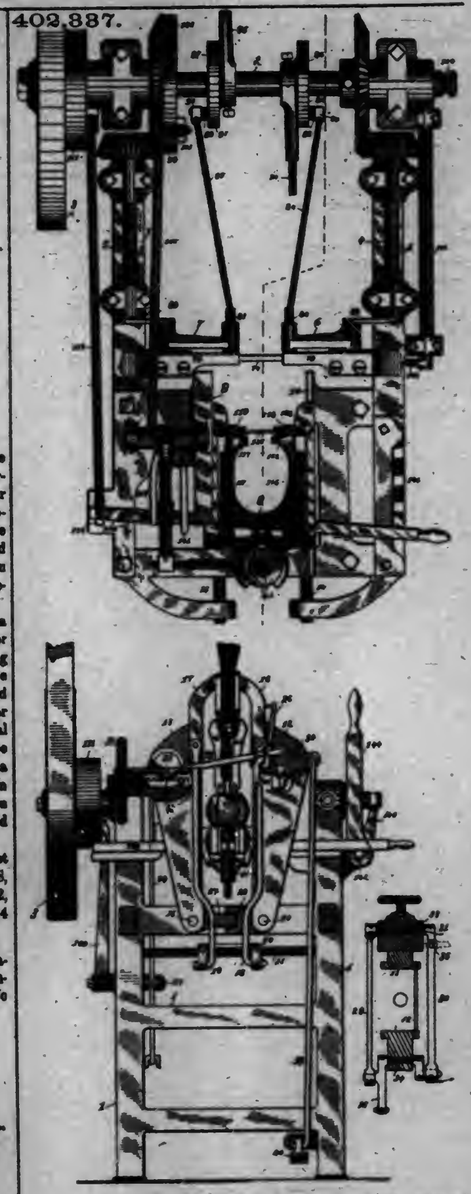
Claim.—1. In a steam-muffler for water-heaters, the combination, with a drum having an inlet and outlet, of a steam-pipe entering the upper portion of the drum and having the closed end dropped nearly to the lower end of said drum, a series of annular plates closely surrounding a perforated portion of said pipe, an outer series of annular plates supported within the drum and leaving an interior and exterior annular space, and an imperforate disk closely surrounding the pipe and resting on both series of annuli, the inlet current of water being compelled to pass between the two series and between the members of the outer series, substantially as described.

2. In a steam-muffler for water-heaters, the combination, with a drum having a water-inlet below and an outlet above, of a steam-pipe

402,836.



hanging centrally in said drum, its lower closed end lying a little above the inlet, a series of annular plates closely surrounding a finely-perforated portion of said pipe and resting one upon the other, an outer series of annular plates resting upon a horizontal annular shelf projecting from the inner face of the drum at its bottom, an imperforate disk closely surrounding the pipe above its perforated portion and resting upon the upper annuli in both series, a spring resting upon said disk, and means for compressing said spring, substantially as described.



3. In a steam-muffler for water-heaters, the combination, with a drum having a water-inlet at its lower end and an outlet at its upper end, of a steam-inlet pipe entering said drum at the top and dropping centrally therein, its lower closed end lying above the mouth of the inlet, a series of annular plates closely surrounding a finely-perforated portion of said pipe and supported by a collar, a series of outer annuli resting on a shelf projecting from the lower end of the vertical wall of the drum, an imperforate disk closely surrounding the pipe above the perforated portion and resting on both series of annuli, a spring resting on said disk, and means for compressing the spring, an annular space being left between the two series of annuli and between the outer series and the drum, and the disk and shelf being connected by tie-rods, confining the outer annuli, substantially as described.

4. The combination, with the drum 1, having inlet 2 and outlet 3, of the steam-pipe 6, having perforations 10, the annular plates 8, surrounding said pipe, the annular plates 14, resting on the shelf 12, the disk 16, and spring 17, compressed by the collar 19, the annuli 14 being held in place by tie-rods 21, substantially as described.

402,837. BROOM-SEWING MACHINE. CHARLES R. LIPE, Syracuse, N. Y., assignor to the Hand Stitch Broom Sewing Machine Company, Pittsburg, Pa. Filed Oct. 11, 1887. Serial No. 252,084. (No model.)

402,837.

Claim.—1. The combination, with a broom-holding vise, of a pivoted clamp provided with a bearing projection, and a second pivoted clamp having a corresponding projection, as described, in position to engage the first when the clamps are closed, substantially as described.

2. In a broom-sewing machine, a pair of pressing-levers actuated by usual compressing mechanism, a sliding pressing-pad attached to each lever, and a catch by which the pad can be held in adjusted position relatively to its lever, all in combination, substantially as set forth.

3. In a broom-sewing machine, the combination of the pressing-levers and their actuating mechanism, a sliding pressing-pad on each lever, a connecting-rod attached to each pad, and a counter-weight connected to both rods to counterbalance the weight of the pads, substantially as described.

4. In a broom-machine, a pair of pressing-levers suitably pivoted to the frame, an eccentric bushing on one lever, and an adjusting screw and rack operating on the eccentric to hold the same in adjusted position, and a link connecting the bushing to the other lever

and the lever-actuating devices, all combined substantially as described.

5. In a broom-machine, a broom-holding vise provided with a series of swinging clamps, bearing projections from said clamps, as described, and a catch for holding the clamp last operated, all combined substantially as described.

6. The combination, with a broom-holding vise, of a series of swinging clamps secured thereto, projecting bearing-surfaces on the clamps, and movable clamp-lifters in proximity to said clamps, substantially as described.

7. In a broom-machine, the combination, with the sewing-needle and the holding-clamps, of a series of yielding band-supporting spurs borne by said clamps, substantially as described.

8. In a broom-machine, the combination of the clamping-pads, a banding-hook, a hook-supporting rod, and connections from said rod to the pad-operating mechanism, whereby the banding-hook is made to maintain the proper relation with the pads, substantially as described.

9. In a broom-machine, the combination of the broom-holding jaws, a pair of movable pinch-bars in proximity thereto, and adjunctive mechanism bearing on the pinch-bars, substantially as described.

10. In a broom-sewing machine, the combination of the broom-jaws, a pair of pivoted pinch-bars in proximity to said jaws, a wedge with which said pinch-bars have engagement, and a locking-stop by which the wedge may be operated to hold the pinch-bars, substantially as described

11. In a broom-sewing machine, the combination of the broom-jaws, a pair of offset pinch-bars pivoted in the frame and having bearing-surfaces, as described, a wedge between the pinch-bars and having bearing on both said bars, and a screw-threaded spindle in position to engage and retain said wedge, substantially as described.

12. In a broom-sewing machine, a double-pointed needle and a guideway therefor, a crank, and a pitman and pin connecting the crank directly to the needle, all in combination, substantially as described.

13. In a broom-sewing machine, a needle having engaging means at each end thereof, a guideway for said needle, a crank at each end of the needle, and a pitman connected to each crank and having means for alternate engagement with the needle, in combination, substantially as described.

14. In a broom-sewing machine, a needle having engaging means at each end thereof, a guideway for said needle, a crank at each end of the needle, a pitman connected to each crank and having means for engaging the needle, and a switch engaging the pitman alternately with the needle, all in combination, substantially as described.

15. In a broom-sewing machine, a double-ended needle having engaging means at each end thereof, separate needle-drivers at each end of the needle, also provided with engaging means, and separate cams, whereby the needle-drivers are alternately coupled to the needle, all in combination, substantially as described.

16. In a broom-machine, the combination of the frame, swinging broom-jaws supported by the frame, and a flexible chain-support connected to the frame in position to support the jaws when swung down, all substantially as described.

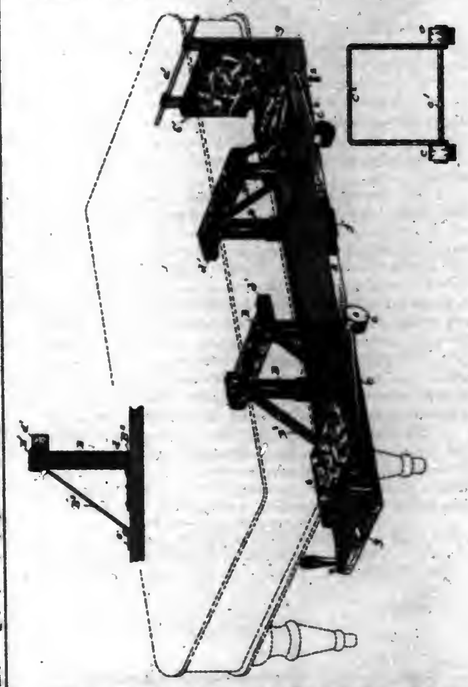
17. In a broom-sewing machine, the combination, with the broom-jaws, of a flexible chain-support for said jaws and a chain-tightener, whereby the flexure of the chain may be regulated, substantially as described.

18. In a broom-machine, the combination of the swinging jaws, a flexible chain-support therefor, a rack attached to said chain, and a pinion and driving-ratchet by which the chain may be tightened, substantially as described.

19. In a broom-machine, the combination of the swinging jaws, a chain-support therefor attached at one end to the frame, a rack attached to the other end of the chain, an actuating-pinion for said rack, and a lever by which the rack and pinion may be thrown into or out of engagement, substantially as described.

402,838. BOTTLE-STOPPER. EDWIN L. LLOYD, Philadelphia, Pa., assignor to the Joly Stopper Company, same place. Filed Jan. 16, 1889. Serial No. 296,494. (No model.)

Claim.—1. The combination, in a bottle-stopper, of the sealing-ring, with a stem having a rigid skeleton shank which fits snugly in the neck above said sealing-ring, and has an eye or loop below the same, no portion of said shank being of greater width than the most contracted portion of the neck, substantially as specified.



2. The combination, in a bottle-stopper, of the sealing-ring, with a stem having a flat shank above the ring and an eye or loop below the same, said shank being rigid and of a width equal or almost equal to the inside diameter of the bottle-neck, but having no portion of greater width than the most contracted portion of said neck, substantially as specified.

402,839. METHOD OF MAKING BUTTON-STRIPS. HENRY W. LYON, Bridgeport, Conn. Filed Feb. 16, 1889. Serial No. 300,167. (No model.)

Claim.—The method of making button-strips, the same consisting in forming within a strip of webbing a series of flexible transverse pockets open at both ends, inserting tape flatwise within and through said pockets and forming loops extending from the front of said pockets, threading said loops during their formation through the buttons, and stitching said strip lengthwise at the front and rear edges through said pockets and tapes, substantially as set forth.

402,840. GRAND-PIANO TRUCK. CHRISTIAN H. MARTIN, Sioux City, Iowa. Filed Dec. 20, 1888. Serial No. 294,963. (No model.)

Claim.—1. The skid provided with rollers carried by axles borne by bails, said skid having buttons or pivoted plates engaging with said axles, holding said rollers elevated, substantially as and for the purpose set forth.

2. The skid provided with elevated rests or supports, each consisting of a frame, with its lower cross piece or plate engaging with a cleat or keeper fastened to the skid, the upper side of the said frames having braces or props hinged or articulated to the skid and frames, substantially as and for the purpose specified.

3. The skid provided near its front and rear ends with cushioned supports, as also a cushioned back at its rear end, and with elevated folding cushioned supports or rests, substantially as and for the purpose set forth.

4. The piano-moving truck consisting of the skid provided with eyes or ears for the application of the draft thereto, and with a cushioned back having a hand push-rod connected therewith, the elevated folding cushioned supports having their braces hinged thereto and to the skid, the lower cross bars or plates thereof engaging with keepers or cleats applied to the upper side of the skid, and trucks or rollers hung upon said skid, and pivoted buttons or plates to engage with the axles of said rollers, holding the latter elevated, said skid also having fixed cushioned supports secured thereto, substantially as and for the purpose indicated.

402,841. UPRIGHT-PIANO TRUCK. CHRISTIAN H. MARTIN, Sioux City, Iowa. Filed Dec. 20, 1888. Serial No. 294,964. (No model.)

Claim.—1. The truck or skid having the swinging rollers or trucks, the axle of one being arranged to swing beyond and snap into position upon the vertical end portion of the skid, said vertical end portion having at its outer or upper end casters or rollers, said swinging rollers being used interchangeably with the base and vertical end portions, substantially as and for the purpose specified.

2. The truck or skid provided with an upright vertical end portion or arm and with the crossing straps connected together, one strap being applied to the skid or truck and the other strap being passed around said vertical end portion or arm, said swinging rollers being used interchangeably with the base and vertical end portions, substantially as and for the purpose specified.

3. The skid or truck provided with a vertical end portion, having applied to its outer end swiveled rollers or casters and to or near its other end a spring snap or catch, said skid or truck also having applied thereto swinging rollers or trucks, the axle of one pair of which snaps past or over said spring snap or catch, and the steadying or holding crossed straps connected together and applied to the skid or truck, said swinging rollers being used interchangeably with the base and vertical end portions, substantially as and for the purpose specified.

402,842. DOOR-HANGER. RICHARD MILLER and JOHN G. KAMOUSE, Appleton, Wis., assignors to the Eagle Manufacturing Company, same place. Filed Dec. 27, 1888. Serial No. 294,768. (No model.)

Claim:—1. The combination, with a suitable support, of a rail, spacing and supporting blocks interposed between the rail and support, and headed bolts for securing the said rail to the faces of the outer ends of the said block, the said bolts passing below the lower edge of the rail and into the said support, whereby the rail and spacing-blocks may be adjusted independently of each other, substantially as described.

2. The combination of the vertical bars *b b*, having their upper ends bent over, forming arches *b' b'*, the horizontal rails *c c*, secured to upper ends of the said bars, the inner one of the said rails being extended outwardly and downwardly and bolted to the said vertical bars *b b*, whereby the said vertical bars and their arches are effectually braced and strengthened.

3. The combination of a suitable support, a rail, tubular spacing-blocks interposed between the said rail and support, these spacing-blocks being notched at their outer ends for the reception of the lower edge of the rail, and headed bolts for holding the said rails in their notches and clamping the spacing-blocks to their support, as described.

402,843. REPEATING-WATCH. CHARLES MOELLER, Hoboken, N. J., assignor of one-half to Prosper Nurtman, New York, N. Y. Filed Sept. 12, 1888. Serial No. 285,162. (No model.)

Claim.—1. A repeating-watch having its moderating-gear mounted on a movable bridge, substantially as set forth.

2. A repeating-watch having its moderating-gear mounted on a bridge pivoted to oscillate on a plate of the works, substantially as set forth.

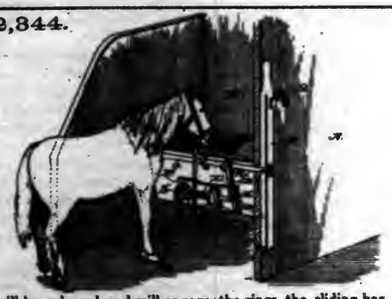
3. A repeating-watch having its moderating-gear mounted in a bridge pivoted at one end to oscillate on one of the plates of the works, the wheels at the opposite end of the bridge engaging one of the wheels driven by the motor of the repeating-gear, substantially as set forth.

4. In a repeating-watch, the combination, with the repeating-gear, of a moderating-gear mounted in an oscillating bridge on a plate of the works and a spring acting on said bridge and serving to keep one of the wheels on the oscillating bridge engaged with one of the wheels operated by the motor of the repeating-gear, substantially as set forth.

5. A repeating-watch having a motor for the repeating mechanism, composed of a helical spring surrounding a rod, substantially as set forth.

6. A repeating-watch having a motor for the repeating mechanism, composed of a helical spring surrounding a curved rod at the rim of the movement, substantially as set forth.

7. In a repeating-watch, the combination, with one of the plates, of a curved rod held at the rim of the same, a helical spring surrounding said rod, a slide on said rod, on which slide the spring can act, a rocking lever operated from said slide, and gearing for transmitting motion from said rocking lever to the repeating mechanism, substantially as set forth.



402,844. ANIMAL-RELEASING DEVICE. WILLIAM H. MCCURDY, York, Pa. Filed Dec. 31, 1888. Serial No. 296,018. (No model.)

Claim.—1. In an animal-releasing device, the combination of the spring-actuated sliding bolt with a spring-latch adapted to engage the end of the bolt, whereby when the ring on the halter-strap is pressed against said spring-latch the bolt will be released and projected through the ring, as set forth.

2. The combination of the sliding bolt, the spring-latch adapted to engage the end of the said bolt, whereby when the ring on the halter-strap is pressed against the spring-latch the bolt will be released and will engage the ring, the sliding bar or rod provided with means adapted to disengage the bolt from the ring, and means for operating said sliding bar or rod, as set forth.

3. The combination of the spring-bolts having legs at their free ends, the spring-latches adapted to engage the ends of the bolts, whereby when the rings on the halter-straps are pressed against the latches the

402,844.

bolts will be released and will engage the rings, the sliding bar, the tappet-arms carried by said bar and engaging the lugs on the bolts, and means for operating said bar, as set forth.

4. The combination, with the troughs having the notches G and longitudinal grooves H extending therefrom, of the spring-latches secured in said grooves and projecting into said notches and the bolts engaged by said latches, whereby when the rings on the halter-straps are pressed against the latches the bolts will be released and will engage the rings, as set forth.

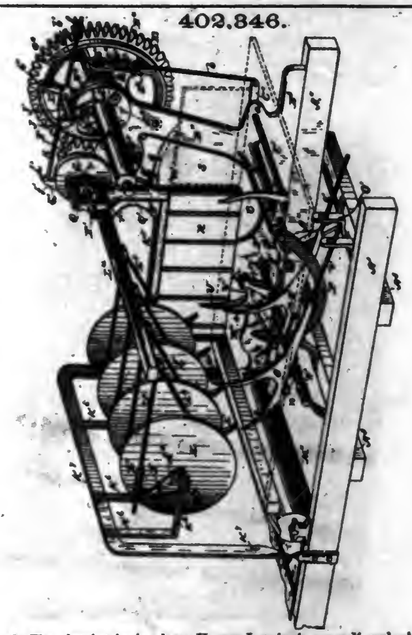
5. The combination of the base-plate having a slot at one end, the spring-actuated sliding bolt mounted on the base-plate, and the spring-latch arranged below the base-plate and having a projection extending through the slot in the base-plate to engage the end of the bolt, whereby when the ring on the halter-strap is pressed against the latch the bolt will be released and will engage the ring, as set forth.

6. The combination of the base-plate having a slot in one end and lugs projecting from its front side, the sliding bolt mounted in said lugs and having the stop N, adapted to come into contact with one of said lugs, the spring arranged around said bolt and adapted to project the same over the slot, and the spring-latch arranged beneath the base-plate and engaging the bolt to hold it from over the slot, whereby when the ring on the halter-strap is pressed against the latch the bolt will be released and engage the ring, as set forth.

402,845. OIL-DISTRIBUTING CARTRIDGE AND PROJECTILE. GEORGE H. MCKINNIS, New York, N. Y. Filed Dec. 7, 1888. Serial No. 292,876. (No model.)

Claim.—1. As a means of distributing oil on rough water, the combination, with an inclosing-shell, of a projectile containing oil within said shell, said projectile comprising an oil-holder in the form of a cup, and a loosely-fitting cap, which closes the mouth of said holder, and which embraces the forward end of the holder, so that it may not slip off laterally while the cartridge is in transit, said cap being cemented at its margin to the inclosing-shell to prevent leakage of the oil, as set forth.

2. As a means of distributing oil on rough water, the combination, with a cartridge-shell containing an explosive charge, of a projectile within said shell containing oil, said projectile comprising an oil-holder in the form of a cup, and a loosely-fitting cap, which closes the mouth of said holder, and which embraces the forward end of the holder, so that it may not slip off laterally while in transit, said cap being cemented at its margin to the cartridge-shell.



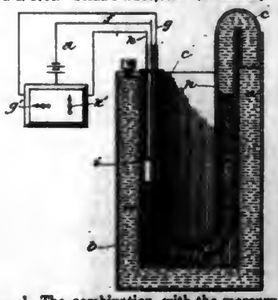
3. As a means of distributing oil on rough water, the combination, with the cylindrical cartridge-shell, of the projectile consisting of the oil-holder having a less exterior diameter than the interior diameter of the inclosing-shell, said holder being provided with a centering-guide at its base, and the conical cap, which closes the said holder at its forward end and projects over and houses the end of the holder and is cemented at its margin to the shell, as and for the purposes set forth.

4. An oil-projectile consisting of an elongated cup-like holder for the oil, provided with a weight, *g*, at its front end to prevent its turning over in transit, and a loosely-fitting conical cap, *e*, which embraces and incloses the end of said holder, so that it may not be displaced by lateral movement when the projectile is in transit, as set forth.

402,846. GRAIN-BINDING HARVESTER. WILLIAM F. OLIN, Chicago, Ill., assignor to William Deering & Company, same place. Filed Aug. 20, 1884. Serial No. 141,063. (No model.)

Claim.—1. The clutch-tripping lever H, bracket I, and swinging arm I', in combination with the driving-wheel E, having a track or flange, E^4, and a clutch mechanism connected with the driving-pinion, substantially as and for the purposes specified.

402,846.



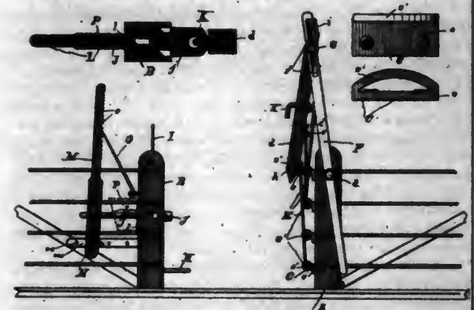
2. The clutch-tripping lever H, arm I, swinging arm I', and wheel E, having the track or flange E^4, in combination with the clutch-dog G', driver G, and pinion F, for throwing the binding apparatus into and out of gear, substantially as specified.

3. The clutch-tripping lever H, arm I, swinging arm I', wheel E, having the flange or track E^4, and spring J, in combination with a clutch-dog, G', driver G, and pinion F, substantially as and for the purposes specified.

4. The clutch-tripping lever H, swinging arm I', driving-wheel E, having flange E^4, and a clutch mechanism, in combination with a compressor-finger and a connection between the finger and the clutch-lever, substantially as and for the purposes specified.

5. The frame U', having a slot, U'', and carrying a finger, U, in combination with a crank-shaft, N', cranks *n'*, and pitman-rod *n''*, substantially as and for the purposes specified.

402,847. THERMOMETRIC INDICATOR. WILLIAM R. PATTERSON, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Oct. 1, 1888. Serial No. 286,535. (No model.)



Claim.—1. The combination, with the mercury, of a non-conducting liquid placed in the bent tube containing said mercury and electrical connections—one on each side of said mercury—with which the mercury is adapted to make electrical connections alternately as the temperature rises and falls, substantially as and for the purpose specified.

2. The combination, with a tube containing mercury, of closed chambers—one at each end of the said tube—one of said chambers containing an insulating-liquid and the other containing air, and an electric circuit permanently connected with said mercury and extending through a battery to two signal-instruments and from said signal-instruments in two branches to points *h* and *i* on opposite sides of the mercury, whereby the circuit is closed through one signal-instrument or the other as the oil expands or contracts to move the mercury into contact with one or the other of said points.

3. The combination, with the mercury, of oil contained in the same tube therewith and branch electric circuits and contact-points on different sides of the said mercury in said tube, whereby one circuit or the other will be closed as the temperature rises or falls below the point to which the apparatus is adjusted.

4. The combination, with the annular reservoir *b*, containing an insulating-liquid, *a*, of the bent tube *c*, containing mercury, placed within the opening in the reservoir, said mercury being in both branches of said tube, said tube being closed at one end of the reservoir *b*, and the other end of said tube, above the mercury, containing air, the battery *d*, one pole of which is connected permanently with the mercury, while the other pole is extended by the branches *g k* to points *h* and *i*, to which points the mercury is adapted to be alternately forced by changes in the temperature of the oil, and the signal-instruments *k' g'*—one in each of said branches—whereby changes of temperature within certain limits will be indicated by the signal-instruments, substantially as and for the purpose specified.

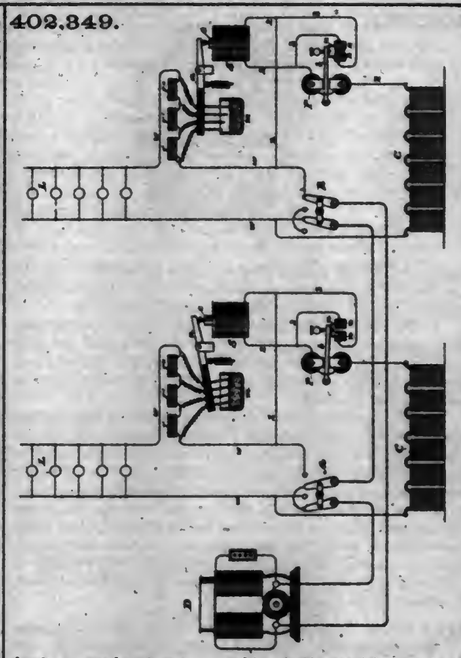
402,848. GATE. ALPHEUS I. PETERSON, Horsham, Pa. Filed Jan. 23, 1888. Serial No. 297,234. (No model.)

Claim.—1. The combination of the opposite posts, the series of elongated loops C C, connected to one of said posts, and the gate-fastening devices on the other post, substantially as described, with the gate composed of an upright bar, *d*, the series of staples connected thereto, and the wires and links connecting said wires to the respective loops, C C, of the post and staples and bar, all substantially as described.

2. The combination of the post and the gate consisting of an upright bar and a series of wires loosely connected to said post and bar, with the pivoted lifting-levers F, fulcrumed on the post, and having their front ends slotted and engaged by a bolt passing transversely through said bar, all substantially as described.

3. The combination of a gate-post, the headed bolt passing therethrough, and the lever for operating said bolt, with the gate consisting of an upright bar adapted to be connected to said bolt, a series of horizontal wires loosely connected to said bar and to the opposite gate-post, and the dogging-plate G, engaging ratchet-teeth on said lever, substantially as and for the purpose described.

4. The combination of the post, the horizontal bolt passing therethrough, and the horizontal perforated arm below said bolt, with the lever pivotally connected to said bolt and adjustably connected to said arm and having ratchet-teeth at its upper end, and the dogging-plate engaging and locking said lever, substantially as described.



5. The combination of the opposite gate-posts, the gate consisting of an upright bar, and a series of horizontal wires loosely connected to said bar and to one of said posts, the pair of levers pivotally mounted on said post and having slotted front ends, and the bolt passing through said slots and the upper end of said bar, with the horizontal vertically-slotted bolt passing through the opposite gate-post and adapted to be engaged by a finger on said bar, the lever for operating said bolt, and the locking devices therefor, all substantially as and for the purpose set forth.

402,849. DISTRIBUTION OF ELECTRICITY BY SECONDARY BATTERIES. MATTHIAS PFATISCHER, New York, N. Y., assignor to The Electrical Accumulator Company, of New York. Filed Nov. 2, 1888. Serial No. 289,834. (No model.)

Claim.—1. The combination of a dynamo-electric machine, a charging-circuit, a secondary battery, a working-circuit containing a series of translating devices in multiple arc with the battery, an artificial resistance in the working-circuit between the battery and translating devices, a switch or circuit-changer for inserting and withdrawing said resistance, an electro-magnetic device located in said circuit controlling said switch, and a polarized electro-magnet located in a branch circuit between the dynamo and battery and between the battery and lamps operating to control the first-named magnet, substantially as described.

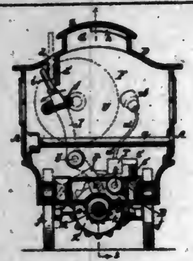
2. The combination of a dynamo-electric machine, a charging-

402,849.

circuit, a secondary battery, a working-circuit containing a series of translating devices in parallel circuit with the battery, a series of artificial resistances to be inserted and withdrawn with respect to the working-circuit between the battery and translating devices, a switch or circuit-changer for inserting and withdrawing said resistances successively, an electro-magnetic device located in said circuit controlling said switch, and a polarized electro-magnet located in a branch circuit between the dynamo and battery and between the battery and translating devices operating to control the first-named magnet, substantially as described.

402,850. BOTTLE-STOPPER. GEORGE RENFUM, JOHN G. RENFUM, and MARTIN G. RENFUM, Philadelphia, Pa., assignors to the Joly Stopper Company, same place. Filed Feb. 6, 1888. Serial No. 263,134. (No model.)

Claim.—1. The combination of the bottle with the stopper, the bail, and a tightening-lever hung to the bail and movable vertically on the bottle, the side bars of said lever occupying a position close to the sides of the neck and engaging with the shoulder formed by the head of the bottle, substantially as specified.



2. The combination of the shouldered bottle, the stopper, and the stopper-carrying bail, with the operating-lever hung to said bail and having opposite side bars for engaging with the shoulder of the bottle, and opposite yokes connecting the upper and lower ends of said side bars, substantially as specified.

402,851. COIN-OPERATED TOY CAR. ALFRED C. REX, Philadelphia, Pa. Filed Nov. 12, 1888. Serial No. 290,576. (No model.)

Claim.—1. The combination of the wheels and axle geared to a longitudinal shaft driven by a spring, with a ratchet-wheel secured to said shaft and a lever, one arm of which forms a pawl for retaining the ratchet-wheel, the other arm being adapted to be moved so as to throw the pawl out of engagement with the ratchet-wheel, and thus start the car, substantially as described.

2. The combination of the driving-wheels and axle, with a longitudinal shaft geared to said axle, a spring on said longitudinal shaft acting to drive the same, a lever having a short arm engaging with a ratchet-wheel on the spring-shaft, and a car-body provided with a coin slot or chute through which a coin may be passed, the long arm of the lever being in the path of the coin when the short arm is in

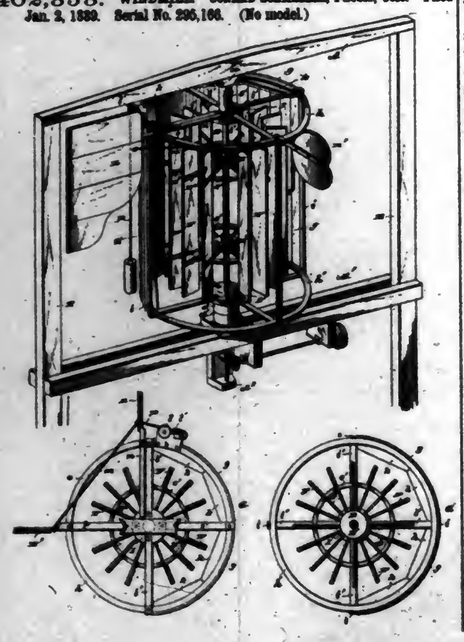
402,851.

engagement with the ratchet-wheel, so that as the coin is inserted the long arm will be moved and the short arm will be thrown out of engagement with the ratchet-wheel, substantially as described.

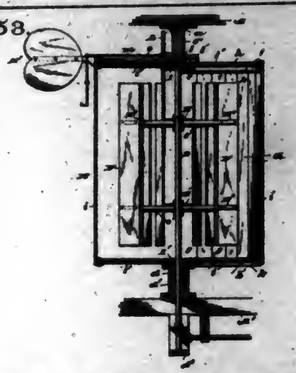
3. The combination of the driving-wheels and axle, a spring-actuated longitudinal shaft geared to said axle and having lugs *s s*, a lever having two arms, one arm acted on by the lugs and the other arm carrying a hammer, and a bell against which the hammer strikes, substantially as described.

4. The combination of the receptacle made in the form of a car or other vehicle, a spring-actuated propelling device for said car, and a lever governing said propelling device and terminating near the coin-slot, whereby, when a coin is inserted in said slot, the motor mechanism is released and the car started, substantially as described.

5. The combination of the driving-wheel and axle, the spring-actuated shaft geared to said axle and having a ratchet-wheel, and a governing-lever having one arm forming a pawl for said ratchet-wheel, and another and preponderating arm, the normal tendency of which is to hold said pawl out of engagement with the ratchet-wheel, all substantially as specified.



402,852. PROCESS OF FILLING TEETH. ALBERT ROBINSON, Grand Rapids, Mich. Filed Feb. 8, 1888. Serial No. 299,135. (No model.)



Claim.—1. The process of filling teeth by first making a mold by swaging metal foil into the cavity and then filling said mold with melted gold or other metal, substantially as described.

2. The process of filling teeth by first making a mold by swaging metal foil into the cavity, filling said mold with melted gold or other metal, grooving the bottom of the filling thus prepared, and fastening said filling into said cavity by means of cement inserted in said grooves, substantially as described.

402,853. WINDMILL. CONRAD SCHMELZER, Pueblo, Colo. Filed Jan. 2, 1889. Serial No. 295,166. (No model.)

402,853.

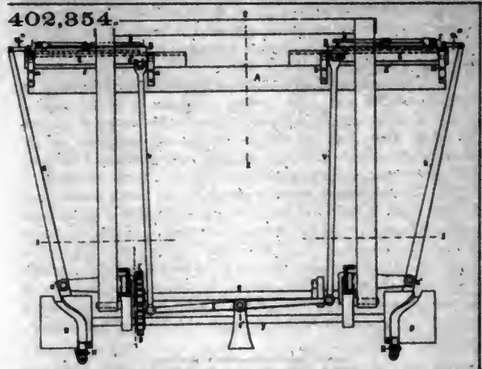
Claim.—1. In a wind wheel or engine, the combination of a vertical shaft having hubs with radial arms to which are attached vertical blades, a movable frame made up of upper and lower rings rigidly connected and provided with segmental pieces, to which are attached vertical strips forming a semicircular shield, a small fan or vane rigidly attached to the upper portion of the frame, and a fan or vane pivotally attached to one side of the center of the movable frame and provided with a roller which moves upon a segmental plate, under which the arm of the main fan or vane passes, a weighted cord attached to the main fan and passing over suitable guide-pulleys carried by the shield-supporting frame, and a cord attached to the opposite side of the main fan and guided through the smaller fan for drawing said vanes parallel with each other, the parts being organized substantially as shown, and for the purpose set forth.

2. The combination, in a wind wheel or engine, of a movable frame provided with a semicircular shield, a small vane or fan rigidly attached thereto, and an outwardly-projecting arm carrying a pulley, a main vane pivoted to one side of the center of the shield-carrying frame and provided with a weighted cord, whereby the shield is automatically moved by the force of the wind, and a vertical wheel journaled within the shield-carrying frame, substantially as shown, and for the purpose set forth.

3. The combination, in a wind-engine, of a central wheel, a shield-carrying frame made up of the upper and lower rings rigidly secured to radial arms, vertical bars having inturned ends which are bolted to the rings and radial arms, a segmental plate beneath which the supporting-arm of the main fan passes, said fan carrying a roller which travels above said plate, and segmental plates attached to the rings for securing thereto strips forming the shield, substantially as shown, and for the purpose set forth.

4. The combination, with a horizontal wind wheel or engine, of a frame carrying a shield and a small vane or fan rigidly secured thereto, a main vane or fan mounted on a suitable horizontal arm pivoted to one side of the center of the shield-carrying frame, and means, substantially as described, for moving the larger vane so as to lie parallel with the smaller vane, substantially as shown, and for the purpose set forth.

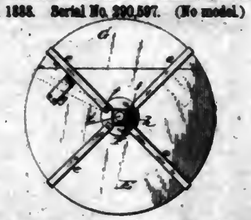
402,854. POSITIVE SHUTTLE-MOTION FOR LOOMS. FRANZ SCHNEIDER, Grossenhain, Saxony, Germany. Filed May 12, 1888. Serial No. 273,710. (No model.) Patented in Germany Nov. 12, 1886, No. 40,573, and May 1, 1887, No. 42,749; in England June 24, 1887, No. 9,014, and in Austria-Hungary Nov. 16, 1887, No. 21,050 and No. 52,779.



Claim.—1. In a loom, the combination, with the batten A, of the guides *a*, the grippers B, having each a pivoted jaw, *b*, provided with teeth *i* and projection *f*, mechanism for positively moving the grippers toward and away from each other, the bars *d*, hinged to the batten and having each an arm, *d'*, and an edge parallel to the guides *a*, adapted to bear against the projections *f*, and means connected with said arms *d'* for oscillating the bars *d* and pressing their edges against the projections *f*, substantially as set forth.

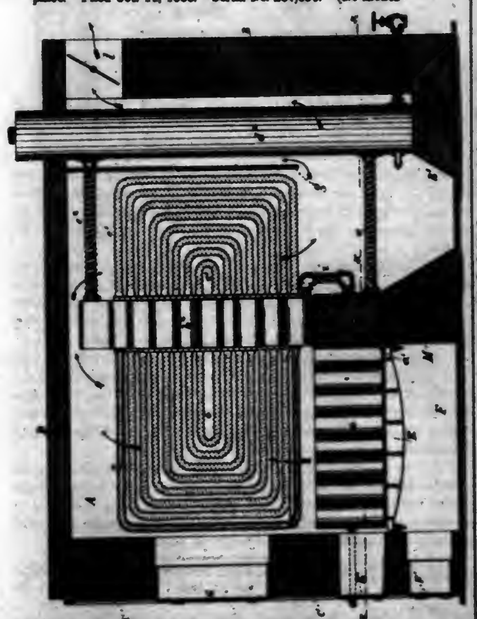
2. In a loom, the combination, with the batten A, of the guides *a*, the grippers B, having each a movable toothed jaw, *b*, with projection *f*, the shaft *y*, with cam-cylinders N, means of connection between the cylinders N and the grippers, the oscillating bars *d*, shaft *q*, with cam disk or disks F, means of connection between the disk or disks F and the bars *d*, and gear-wheels connecting together the shafts *y* and *q*, substantially as and for the purpose specified.

3. In a shuttle, the combination, with the body of the shuttle having recesses *i*, with shoulders *l'*, of the toothed gripping-plates *k*, lodged movably in the said recesses, and springs *k'*, pressing the plates *k* against the shoulders *l'*, substantially as and for the purpose set forth.



4. The combination, with the batten A and the shuttle having

402,854.

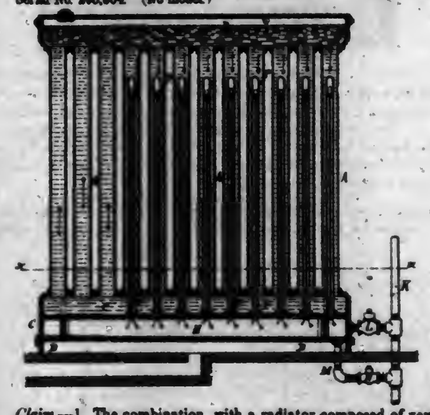


teeth, of the grippers B, each having a pivoted jaw provided with teeth adapted to engage said shuttle, mechanism for moving said grippers toward and from each other, a cam operating in unison with said mechanism, the pivoted lever *x*, operated by said cam, and bars connected to the respective ends of said lever *x* and arranged to engage with and oscillate said pivoted jaws, as set forth.

402,855. WASHING-MACHINE. HENRY SEAMAN, Memphis, Mo. Filed Nov. 12, 1888. Serial No. 290,507. (No model.)

Claim.—In a washing-machine, the combination, with the cylinder having removable portion G, of the castings F and the radial arms pivoted to said castings and extended across the face or periphery of said removable portions, and the catches *g* on the lower portion, substantially as and for the purpose specified.

402,856. STEAM-BOILER. JOSEPH SHACKLETON, New York, N. Y., assignor to the Shackleton Car Heating and Ventilating Company, same place. Filed Oct. 11, 1888. Serial No. 287,856. (No model.)



Claim.—1. In a steam-boiler, the combination of corrugated water-bases surrounding the fire-chamber on three sides, and upright corrugated chambers set edgewise and resting upon the water-bases and extending across between the side walls of the boiler, and pipes connecting the water-bases with the upright chambers, substantially as set forth.

2. In a steam-boiler, the combination, with the fire-chamber and grate-bars, of corrugated water-bases surrounding the fire-chamber on three sides, the upright water-chambers set edgewise and corrugated on their contiguous faces and resting on the water-bases, and pipes connecting the water-bases and upright chambers together, and series of U-shaped corrugated pipes connected upon each side of the upright water-chambers, substantially as set forth.

3. The combination, in a steam-boiler, with the L-shaped corrugated water-bases *a a'*, and the upright water-chambers resting thereon, and pipes connecting the bases and chambers, of the stand-pipes *d d' d''*, and a steam-receptacle connected therewith, and pipes connecting the lower portion of the stand-pipes to the water-bases and the upper portion of the stand-pipes to the top of the vertical water-chambers, substantially as and for the purposes set forth.

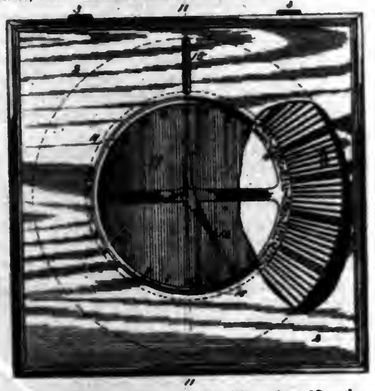
4. In a steam-boiler, the combination, with the L-shaped water-bases, the upright water-chambers, and the series of U-shaped corrugated circulating-pipes *e e'*, connected to the opposite sides of the upright water-chambers, of a deflecting-plate, *g*, back of the circulating-pipes *e'*, whereby the products of combustion passing up between the pipes *e* and over the upright chambers are caused to pass down between the pipes *e'* before reaching a chimney, substantially as set forth.

402,857. RADIATOR FOR HEATING BUILDINGS. JOSEPH SHACKLETON, New York, N. Y. Filed Jan. 16, 1888. Renewed Jan. 8, 1889. Serial No. 295,804. (No model.)

Claim.—1. The combination, with a radiator composed of vertical pipes with a hollow top chamber and a hollow base connected by said pipes, of steam-pipes applied within a portion of the vertical pipes and a steam-chamber with which the lower ends of the pipes are connected for heating the water contained in the radiator and causing an upward circulation, the return circulation being through the vertical pipes that are not provided with steam-pipes, substantially as set forth.

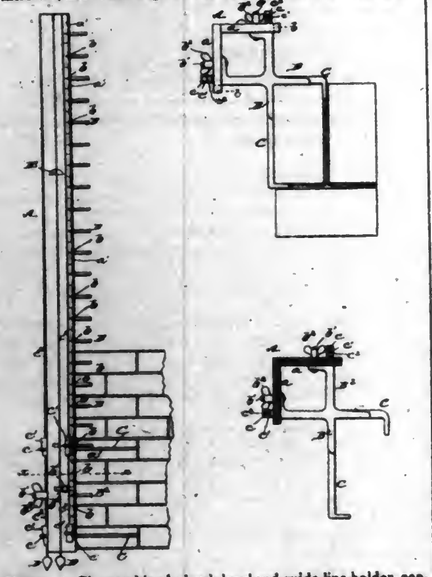
2. The hollow base C, vertical radiator-pipes A, and hollow top chamber, B, in combination with the steam-chamber H, the supply-pipe K and cock L, the pipe M and check-valve N, for the water of condensation, and the vertical pipes P, extending up from the steam-chamber H, within the radiator-pipes A, substantially as and for the purposes set forth.

402,858. PRESERVE-JAR FASTENING. GEORGE SIMKINS, Philadelphia, Pa. Filed Feb. 23, 1888. Serial No. 300,639. (No model.)



Claim.—The lid B, in combination with the bail C, having the lips D, the curved spring-piece F, having flaring ends bent downwardly and adapted to bear against the lid near the periphery thereof, and the band G, embracing both the bail C and the spring-piece, substantially as described.

402,358.



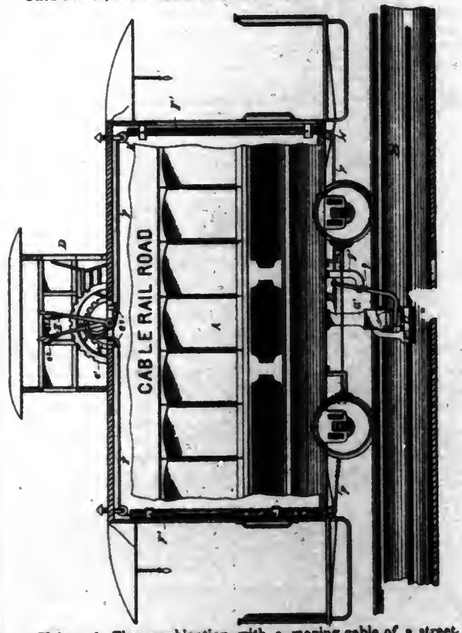
402,359. WATCHMAN'S TIME-REGISTER. HENRY W. SMITH, St. Louis, assignor of one-half to Henry C. Baker, Kansas City, Mo. Filed Dec. 26, 1888. Serial No. 294,623. (No model.)

Claim.—1. The revolving drum 9, with pockets 13 and recess 19, inclosing-case 1, having pin-hole 8, lock-cover 2, with slot 15, and spring-catch 4, all constructed and combined substantially as set forth.

2. The combination, in a watchman's time-register, of the case 1, with pin-hole 8, revolving drum 9, with numbered pockets 13, and recess 18, spring-catch 4, hands 11 and 12, and dial-plate 17, fixed to the cover, substantially as set forth.

402,360. BRICK-LAYER'S PLUMB-LEVEL, &c. JAMES SMITH, Centreville, Md. Filed Aug. 31, 1888. Serial No. 284,310. (No model.)

Claim.—1. The combined plumb-level and guide-line holder consisting of an angle upright provided with a series of angle castings or guides to fit the angle or corner of a wall and with clamps detachably connected therewith to engage with or enter the joints between the bricks of the wall, substantially as and for the purpose set forth.



2. The combined plumb-level and guide-line holder provided with angle guides or castings adapted to fit the implement to the angle or corner of a wall, the bottom guides being adjustable, substantially as set forth.

3. The combined plumb-level and guide-line holder having a graduated upright provided with the guide-line slits or notches, angle castings or guides to fit the angle or corner of a wall, and clamps to engage with or enter the joints between the bricks of the wall and confined to the upright by keys or wedges, substantially as and for the purpose specified.

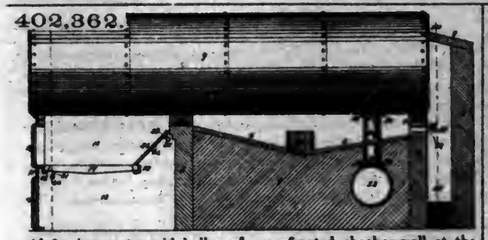
4. The combined plumb-level and guide-line holder having an upright provided with angle castings or guides to fit the angle or corner of a wall, clamps to engage with or enter the joints between the bricks of the wall, and keys or wedges suspended from the top or upper end of the upright and engaging with apertures in the inner ends of the clamps, substantially as and for the purpose specified.

5. The combined plumb-level and guide-line holder consisting of the graduated upright having a series of guide-line slits or notches, the angle castings or crossing-guides applied to the upright and adapted to fit the corner or angle of a wall, the clamps to engage with or enter the joints between the bricks of the wall and provided at their inner ends with apertures, the keys or wedges engaging with the apertures of the clamps, and the suspending cords or wires of the keys or wedges connected or applied to the top or upper end of the upright, substantially as set forth.

402,361. GRIP-CAR. CHARLES T. SHEDEKOR, New York, N. Y. Filed Dec. 19, 1888. Serial No. 294,067. (No model.)

Claim.—1. The combination, with a moving cable of a street-railway system and a car, of brake and grip mechanism on the under side of the car, a compartment on the top of the car, and levers in the compartment having connection with the mechanism below the car for controlling the movement of the same, substantially as described.

2. The combination, with a car of a cable system of street-railways, having its interior arranged for the reception of passengers, of a cable-gripping device on the bottom of the car, and mechanism located on the top of the car having connection with the gripping device for operating the same, substantially as described.



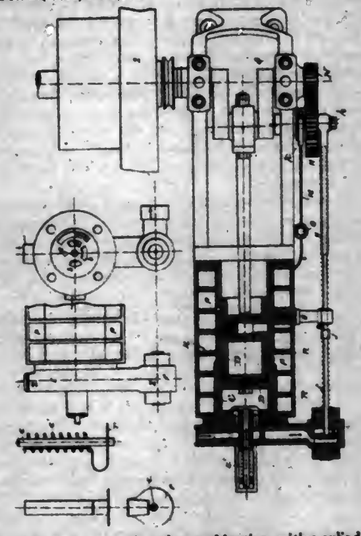
3. In a street-car for cable roads, the combination, with the top, of a compartment centrally located thereon, operating-levers in the compartment, brake and grip mechanism below the car, and means secured to the levers and extending in opposite directions to the bottom of the bar for connecting the levers with the brake and grip mechanism, substantially as described.

4. The combination, in a street-car for cable roads, of brake and grip mechanism on the bottom thereof, levers on the top of the car having connection with the brake and grip mechanism, and tubes on the car through which the connecting means of the levers and brake and grip mechanism pass, substantially as described.

402,362. SMOKE-CONSUMING BOILER-FURNACE. JAMES STAPLETON, St. Louis, Mo. Filed Oct. 23, 1888. Serial No. 288,981. (No model.)

Claim.—1. In a boiler-furnace, the combination, with the fire-box having a grate, the boiler, and a combustion-chamber extending from

402,362.

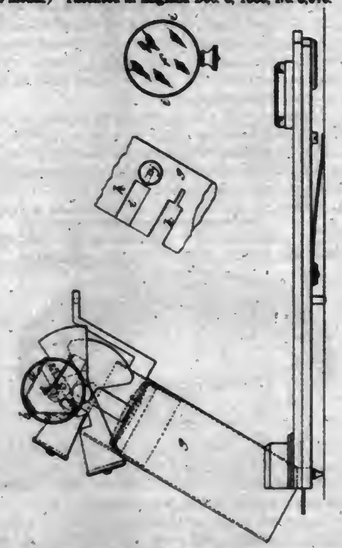


said fire-box under said boiler, of a perforated checker-wall at the end of said combustion-chamber remote from the fire-box, a steam-pipe arranged under the grate and having jets for forcing the products of combustion into the combustion-chamber, and a steam-pipe arranged behind the checker-wall and having jets discharging through said perforations into the combustion-chamber for retarding the current of the products of combustion and supplying the combustion-chamber with aqueous gases to promote combustion therein, substantially as set forth.

2. In a furnace, the combination, with the fire-box having a grate, the combustion-chamber, a bridge-wall dividing said combustion-chamber from said fire-box, and a perforated checker-wall arranged at the end of said combustion-chamber, of steam-jets arranged behind said checker-wall and discharging into said combustion-chamber toward the fire-box, and steam-jets arranged under said grate remote from said bridge-wall and inclined upwardly and toward the jets behind the checker-wall, substantially as set forth.

3. In a steam-boiler furnace, the combination of the fire-box, the combustion-chamber, the grates beneath said fire-box, the bridge-wall between the fire-box and combustion-chamber, the perforated bridge-plate, the perforated checker-wall at the rear terminal of the combustion-chamber, the steam-pipe 30, the jet-tubes from said pipe that discharge between the grate-bars, the steam-pipe 35, the jet-tubes from said pipe that discharge through the perforations of the bridge-plate, the steam-pipe 39 at the exhaust of the combustion-chamber, and the jet-tubes that discharge through perforations in the checker-wall and provide a buffer-draft at the exhaust of the combustion-chamber to prevent the too rapid exhaust from the same, substantially as and for the purpose set forth.

402,363. GAS-ENGINE. HENRI TRITSCH, Paris, France. Filed Jan. 16, 1888. Serial No. 296,505. (No model.) Patented in France July 7, 1887, No. 184,406; in Belgium Feb. 13, 1888, No. 80,630, and in England Feb. 24, 1888, No. 2,804.

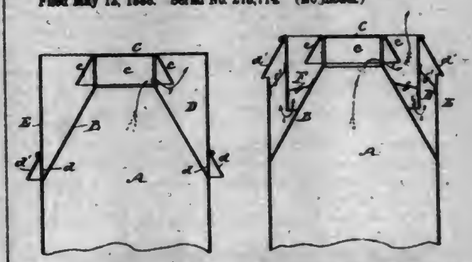


Claim.—1. In a gas-engine, the combination, with a cylinder and piston, of the ports for admission of air and gas, a single valve opening by operation of the piston at each alternate forward stroke thereof while the exhaust-port is closed, an exhaust-valve, a valve-rod therefor provided with a collar or boss, an actuating-rod connected with the main shaft by suitable gearing, so as to make one reciprocation for two revolutions of the main shaft, a governor, and a movable stop operated thereby and adapted, when excessive speed is developed, to be thrown into the path of the collar or boss on said valve-rod and prevent the complete closing of the valve, substantially as described.

2. The combination, with the cylinder and piston, of the valve-box cast in one piece and bolted to the end of the cylinder, said valve-box containing passages for supplying air and gas, a single valve controlling the same, an exhaust passage or outlet, and a valve controlling the same, substantially as described.

3. The combination, with the valve, valve-rod, and spiral retracting-spring encircling the same, of a spring-blade arranged in contact with the coils of said spring for preventing concussion of the valve against its seat, substantially as described

402,364. AZIMUTH-INSTRUMENT. WILLIAM THOMSON, Glasgow, County of Lanark, Scotland. Filed Nov. 5, 1885. Serial No. 181,986. (No model.) Patented in England Dec. 8, 1883, No. 5,676.



Claim.—1. An azimuth-mirror having one or more eccentrically-mounted lenses, substantially as described.

2. An azimuth-mirror having a tube, *g*, formed with slot or slots and provided with one or more lenses, substantially as described.

3. An azimuth-mirror having a totally-reflecting prism, *c*, and one or more lenses, substantially as described.

4. An azimuth-mirror having a tube, *g*, formed with slot or slots, provided with one or more eccentrically-mounted lenses and a totally-reflecting prism, substantially as described.

402,365. CHIMNEY-COWL. ISAAC J. TURNER, Princeton, N. J. Filed May 12, 1888. Serial No. 273,714. (No model.)

Claim.—1. In a chimney-cowl, the combination, with a number of outwardly-swinging doors for the escape of downdrafts located on the cowl at different points of the compass, of a deflector arranged within the cowl for directing the downdrafts to the doors, substantially as and for the purpose set forth.

2. In a chimney-cowl, the open flue or body A, arranged centrally therein, the cover C, the casing or flange E, and the outwardly-swinging doors for the escape of downdrafts.

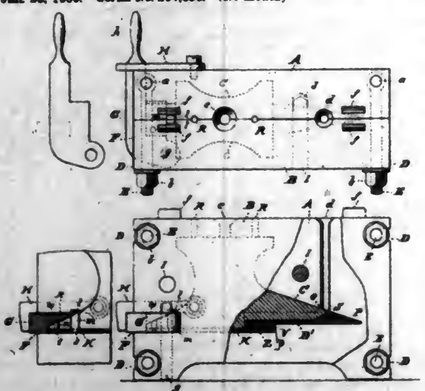
3. The combination of the flue or body A, having a contracted top, the cover C, placed over and in close proximity to the flue or body A, the outer flange or casing extending around the mouth of the flue or body A, and the hinged doors *d'*, substantially as set forth.

4. The pyramidal or contracted flue or body A, having the cover C, in combination with the flange or casing E, intermediate plate, F, and doors *d'*, hinged to the top of the plate F, substantially as described.

402,366. HEEL FOR BOOTS OR SHOES. FRANCISCO P. URRUELA, Madrid, Spain. Filed Dec. 3, 1888. Serial No. 292,561. (No model.) Patented in Spain Aug. 16, 1888, No. 8,507, and in England Nov. 14 1888, No. 16,548.

Claim.—1. The combination, with a boot or shoe heel having the top lift with the U-shaped recess above said lift, of the removable sliding heel-plate having the U-shaped plate thereon fitting within the U-shaped recess in the heel, and the screw passing through said parts within the space between the arms of the U-shaped plate for holding the parts in position, substantially as described.

2. The combination, with a boot or shoe heel having the extended top lift with the U-shaped recess above the same around the outside of the heel, of the removable sliding heel-plate having the flanged U shaped plate substantially U-shaped in cross-section secured thereto and fitting within the circumferential U-shaped recess in the heel, and the screw for holding the parts in position, substantially as described.



402,367. ELECTRIC BELT. WILLIAM L. VAN DORN, Brooklyn, N. Y. Filed Mar. 5, 1889. Serial No. 301,924. (No model.)

Claim.—1. An electric belt carrying positive and negative electrodes and a strip of cloth or flannel interposed between the same and saturated with a composition of water, capsicum, calcic chloride, and oxide of zinc, to serve substantially as specified.

2. As an improved article of manufacture, the electric belt described, consisting, essentially, of the web A, having punctures therein, the outer zinc and copper plates B C, also having punctures and secured to the web by metallic eyelets, the wire *c*, flexibly connecting said plates, the inner zinc and copper plates B C, the flannel strip saturated with an exciting solution and interposed between the two sets of plates, the flannel strip E, covering the battery-plates, and the terminal electrodes F, arranged substantially as shown and described.

402,368. ANVIL-MOLD. THOMAS W. VARE, Trenton, N. J. Filed Jan. 28, 1889. Serial No. 297,858. (No model.)

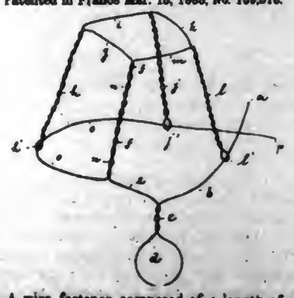
Claim.—1. A metallic anvil-mold consisting of lateral mold-sections and having an opening at the level of the floor of the matrix for the insertion of a face-plate piece, and a closing-gate forming a part of the matrix, substantially as specified.

2. The combination, with the lateral sections of a metallic anvil-mold, notched or recessed to form an opening into the matrix at the level of its floor, of the fastenings holding the sections together, the dowel guide-pins, and the closing-gate for said opening and its fastening, substantially as specified.

3. In a metal anvil-mold, the combination, with its lateral sections notched or recessed to form a horizontal opening into the matrix, and the closing-gate for said opening, of the face-plate piece adapted to be inserted through said opening into the matrix, substantially as specified.

4. In a metal anvil-mold, the combination, with the lateral sections of the mold notched or recessed to form a horizontal opening, and having the pouring-gates for the body and horn portions, as indicated, of the closing-gate and the face-plate piece consisting of the main plate and horn-plate connected, substantially as specified.

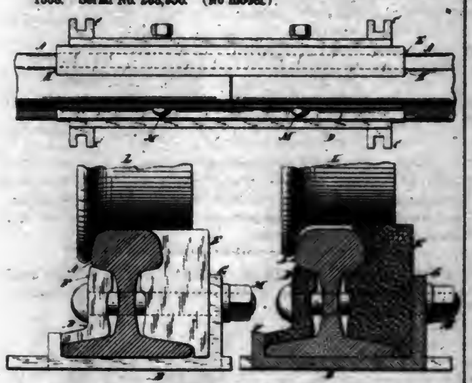
402,369. BRICK-KILN. ERNEST VON OVEN, Naperville, Ill. Filed Dec. 20, 1888. Serial No. 294,161. (No model.)



Claim.—1. In combination with the superstructure of a kiln for burning brick, tile, and the like, a kiln-bottom, B, having a series of flues, *r*, a series of flues, *m*, and an intervening flue, H, into which the flues *r* lead, a main flue, I, in the base of the bottom B and forming the ultimate outlet for the products of combustion, and flues M, communicating directly with the flues *m* and extending below the flues *r* into the main flue I, substantially as described.

2. In combination with the superstructure of a kiln for burning brick, tile, and the like, a kiln-bottom, B, having a series of flues, *r*, a series of flues, *m*, and an intervening flue, H, flues G, extending radially from near the center of the kiln into the flue H and communicating directly with the flues *r*, a main flue, I, in the base of the bottom B and forming the ultimate outlet for the products of combustion, and flues M, extending radially from near the wall of the kiln between the flues G into the main flue below the flues *r* and communicating directly with the flues *m*, substantially as described.

3. In combination with the superstructure of a kiln for burning brick, tile, and the like, a kiln-bottom, B, having a series of flues, *r*, a series of flues, *m*, and an intervening deeper flue, H, flues G, extending radially from near the center of the kiln into the flue H and communicating directly with the flues *r*, a main flue, I, extending from near the center of the base of the bottom to the chimney K, flues M and M', extending radially from near the wall of the kiln between the flues G into the main flue below the flues *r* and communicating directly with the flues *m*, and lateral branches *x* on the flues M', substantially as described.

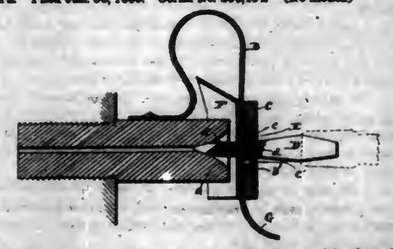


4. In a kiln for burning brick, tile, and the like, the superstructure comprising an outer wall, D, and crown E, forming together, substantially, a hemisphere, an inner wall, D', joining the outer wall near its junction with the crown, and fire-chambers L, formed at intervals between the walls D and D' and opening at their upper ends into the kiln, substantially as and for the purpose set forth.

402,370. WIRE FASTENING FOR BOTTLE-STOPPERS. PAUL O. WALCH, Paris, France. Filed Aug. 8, 1888. Serial No. 282,260. (No model.) Patented in France Mar. 13, 1888, No. 189,318.

Claim.—A wire fastener composed of a length of wire bent to form a series of twisted shanks connected on top and terminating in loops at their lower ends, and to form a neck-wire which is provided with a twisted portion, *c*, and loop *d*, and which passes through the loops at the ends of the twisted shanks, substantially as specified.

402,371. FISH-PLATE AND CHAIR. GEORGE A. WEBER, New York, N. Y., assignor to Caroline C. Weber, same place. Filed Mar. 30, 1888. Serial No. 268,950. (No model.)



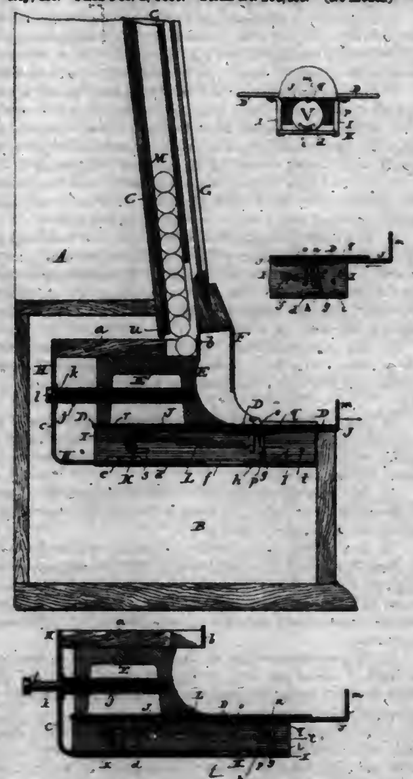
Claim.—The combination of the rail A, fish-plate D, fish-block E, occupying part of the surface of the rail at the joint, the bearing-surface of said block E being equal in length to the block itself, and the chair B, having bends F and G, for holding the parts D and E, and the transverse horizontal bolt M, locking together the chair and fish-plates, substantially as described.

402,372. RAIL-JOINT. GEORGE A. WEBER, New York, N. Y., assignor to Caroline C. Weber, same place. Filed Feb. 1, 1889. Serial No. 298,394. (No model.)

Claim.—The combination of the rail 12, fish-plate 6, fish-plate 7, having chambers 8 and 9, each filled with elastic packing, and the chair 1, having lips or flanges 3 and 4, the flange 4, extending over the elastic packing in chamber or recess 9, and the bolt 10, locking together the chair and fish-plates, substantially as described.

402,373. GAGE-COCK. DAVID B. WHITEHILL, North Clarendon, Pa. Filed Jan. 30, 1889. Serial No. 298,134. (No model.)

Claim.—1. In a gage-cock, the combination, with the tube, of the spring B, attached thereto and extending in front of the end thereof, and the adjustable plug attached to the spring and fitting in the outer end of the bore of the tube, substantially as specified.



2. In a gage-cock, the combination, with the tube and the spring attached thereto, of the block provided with a recess, *c*, the plug mounted in registering perforations in the block and spring and provided with a series of perforations, and the transverse adjusting-pin fitting in the said perforations and operating in the recess *c*, substantially as specified.

3. In a gage-cock, the combination, with the tube, of the spring attached thereto and carrying a plug which fits in the bore of the tube, and the cap attached to the spring and fitting over the outer end of the tube, substantially as and for the purpose specified.

4. In a gage, the combination, with the tube and the spring attached thereto, of the revoluble plug D, mounted in the spring, fitting in its inner end in the bore of the tube and provided with a squared outer end, substantially as specified.

5. In a gage-cock, the combination, with a tube having the outer end of its bore flared and the spring attached to the tube, of the revoluble plug mounted in the free end of the spring and provided with a tapered inner end fitting in the flared bore of the tube, substantially as specified.

402,374. VENDING APPARATUS. JOHN A. WILLIAMS, Kansas City, Mo. Filed Feb. 2, 1889. Serial No. 298,460. (No model.)

Claim.—1. In a vending-machine, the combination, with a reciprocating delivery-slide provided with a lug, as *i*, of a reciprocating operating-slide, and a coin-holder secured to the operating-slide in rear of the lug on the delivery-slide and adapted to hold and support the coin, whereby, when a coin of the requisite size is inserted, it will, upon movement of the operating-slide, come into engagement with the lug on the delivery-slide and actuate the latter.

2. In a vending-machine, the combination, with the operating-slide provided with the separated arms *p p*, adapted to hold the coin by its side edges, of a lug, *q*, on the operating-slide in advance of and midway between the arms *p p*, and a delivering-slide provided with a lug, *i*, in advance of and midway between the arms *p p*, all substantially as shown.

3. In a vending-machine, the combination, with a delivery-slide, of an independent operating-slide, a coin-holder secured to the latter and adapted to hold the coin in position to strike the delivery-slide, and a lug, as *k*, secured to the latter, whereby, when the operating-slide is released, the coin will strike the lug and be deposited in the box.

4. In a vending-machine, the combination, with a delivery-slide and an operating-slide adapted to be connected by means of a coin, of a locking device for holding the delivery-slide in its extended position during the return movement of the operating-slide.

5. In a vending-machine in which the delivery and operating slides are connected by means of a coin, the combination, with said slides and a suitable coin-holder, of a pawl or dog adapted to engage the delivery-slide, said dog being arranged in position to be struck by the operating-slide.

6. In a vending-machine, the combination, with the delivery and operating slides and their retracting-springs, of a coin-holder secured to the operating-slide, as and for the purpose set forth, and a pawl or dog to engage the delivery-slide and arranged in the path of the operating-slide.

7. In a vending-machine in which the delivery and operating

slides are connected by a coin, the combination, with said slides and their retracting-springs, of the coin-holder secured to the operating-slide, the lugs *h* and *i*, secured to the delivery-slide, and a pawl or dog to engage the delivery-slide, arranged in the path of the operating-slide, whereby, when the latter is released, the coin will be discharged before the delivery-slide begins to move backward.

8. In a vending-machine, the combination, with the delivery-slide provided with a ratchet, *c*, and a spring, of the operating-slide provided with a coin-holder and a spring, and a pivoted pawl or dog having a tail or arm to extend upward behind the operating-slide.

9. In a vending-machine, the combination, with the delivery-slide provided with a ratchet and a spring, of the operating-slide provided with a coin-holder, a pivoted pawl or dog provided with an arm to engage the ratchet and an arm to extend upward behind the operating-slide, and a spring connecting the said slide with the pawl.

10. In a vending-machine, the combination, with the delivery-slide provided with lugs *h* and *i*, separated as shown, of the operating-slide provided with a slot, *n*, and arms *p p*, and a rib, *q*.

11. In a vending-machine, the combination, with a delivery-slide and a slotted operating-slide adapted to be connected by a coin, of the arms *p p*, secured to the under side of the operating-slide in line with the rear wall of the slot, and a rib or lug, *q*, also on the under side of the slide, and adapted, if the coin be of the proper size, to hold said coin at its upper edge.

12. In a vending-machine, the combination, with the operating-slide provided with a slot, *n*, arms *p p*, and lug or rib *q*, of the delivery-slide provided with a sharpened or pointed lug, *i*, to engage the coin.

13. In a vending-machine, the combination, with the main plate D, provided with a coin-slot, *o*, of the operating-slide provided with a slot, *n*, to register with slot *o*, and having its rear wall sharpened, as and for the purpose set forth.

14. In a vending-machine, the combination, with the frame, of the parallel grooved guides I, secured thereto, and the operating and delivery slides mounted in said guides.

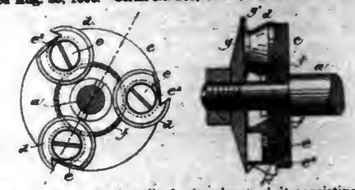
15. In a vending-machine, the combination, with the frame A, of the plate D, the block E, resting thereon, the operating-slide beneath the plate, and the delivery-slide provided with a delivering-frame, *a b*, to rest upon the block, and with a plate, *d d*, to be engaged by the coin, the frame *a b* and plate *d d* of the delivery-slide being connected by an arm, *c*.

16. In a vending-machine, the combination, with the chutes and the block E below the same, of the delivery-slide provided with a flat block and a forwardly-extending open frame, and means for actuating the slide.

17. In a vending-machine, the combination, with the chutes and the block E, of the delivery-slide, the bolt or stem secured to the block and provided with a head or enlargement at its outer end, a spring coiled about the bolt and bearing at its ends against the block and a part of the slide, and means for actuating the slide.

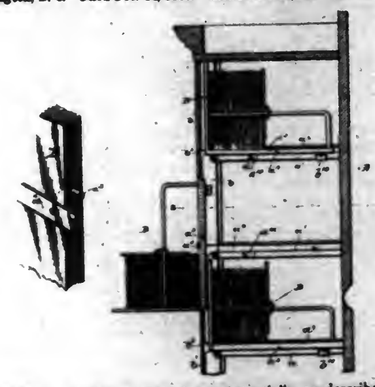
18. In a vending-machine, the combination, with the frame A, having chutes C, of the block E below the chutes, having its front face curved, as shown, the door provided with a guard, and the delivery-slide interposed between the block and the chutes.

402,375. LEATHER-CUTTING TOOL. HENRY W. WINTER, Boston, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed July 16 1888. Serial No. 280,057. (No model.)



Claim.—1. The herein-described cutting-tool, composed, essentially, of a plate or hub, *c*, one or more hollow cutters slotted to form throats, and the guard *g* at the outer end of the cutter, and having a thin edge, *g'*, to enter the rand-crease, to operate substantially as described.

2. The plate or hub *c*, recessed to receive the cylindrical ends of several cutters, and the plate *g*, combined with a series of cutters cylindrical in cross-section, each slotted to form an open throat for the discharge of the material, and screws to fix the cutters to the plate *c*, and with the register having pins to insure the correct position for the edges of the cutters, substantially as described.



3. The plate or hub *c*, provided with a boss, combined with a cutter cylindrical in cross-section and slotted to form an open throat, and with a screw to confine the cutter in place, the said boss entering a hole in the cutter, and thereby serving to locate the center of the cutter properly with relation to the center of the plate, substantially as described.

402,376. TRIMMING-TOOL FOR BOOTS OR SHOES. HENRY W. WINTER, Boston, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Aug. 25, 1888. Serial No. 283,733. (No model.)

Claim.—The herein-described trimming-tool, it consisting, essentially, of a plate, a series of circular cutters attached thereto, and connected pinions or teeth, combined with a plate or gear to engage and simultaneously rotate the said cutters more or less on the said plate, substantially as described.

402,377. FILE CASE OR CABINET. WILLIAM T. WOOD, Washington, D. C. Filed Dec. 14, 1888. Serial No. 293,546. (No model.)

Claim.—1. The combination, substantially as described and shown, of a file case or cabinet, movable file-boxes therein, and vertical guides at the front to receive the boxes when withdrawn and admit of their being carried upward and downward.

2. A case or cabinet and a contained file-box removable at the front, in combination with two side guides extending downward at the front of the case to receive the box when withdrawn and guide it in its descent.

3. A case or cabinet and two vertical guides, bars, or rails at its front, in combination with a vertical row of file-boxes arranged to slide inward and outward between the guides and to slide upward and downward thereon when withdrawn from the cabinet.

4. The case or cabinet provided with the horizontally-grooved bars or guides *a* and the vertical grooved guides at the front, in combination with the file-boxes having studs arranged to travel in said guides, whereby the boxes are held and guided in both their horizontal and their vertical movements.

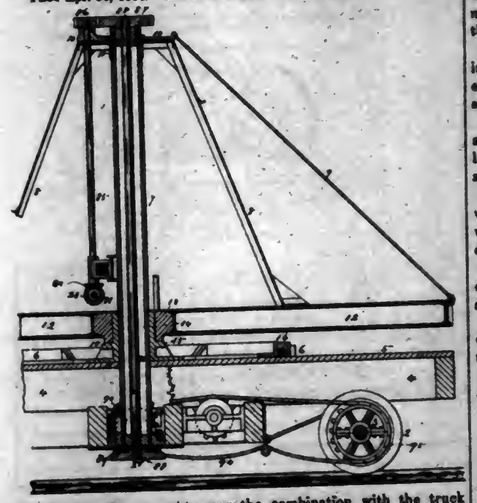
5. A file case or cabinet provided at the front with vertically-grooved guides or rails, in combination with file-boxes provided with side studs or projections to enter the said vertical grooves as the boxes are withdrawn from the case.

6. A file case or cabinet provided with vertical front guides or rails having horizontal notches or openings therethrough, in combination with file-boxes arranged to slide into and out of the cabinet and provided at each side with two projections, one of which passes through the corresponding notched guide when the file is withdrawn from the case, whereby the box is adapted for withdrawal to slide upon and interlock with vertical guides.

7. In combination with a cabinet having the horizontal rails or bars *a*, the vertical notched guides, and the cross-bars *d*, the file-boxes provided with lateral studs or projections a^3 and a^4, whereby the boxes are vertically guided and automatically suspended when withdrawn from the cabinet.

8. The file case or cabinet composed of the standards, the horizontal guides *a*, attached thereto, the transverse rods extended through the standards, and the keys or fastening devices connecting the rods and standards.

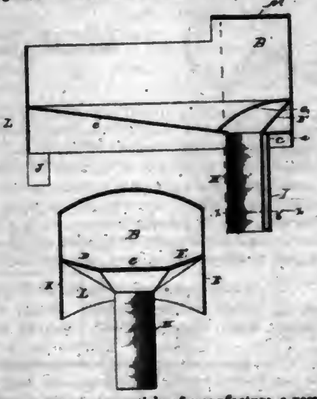
9. The knock-down file-case consisting of parallel vertical frames provided with horizontal bars or guides *a* and cross-bars passed through and keyed to the standards, as shown.



10. The sheet-metal standard for a file-case, composed of the vertical halves having their forward edges bent apart to form vertical guides or flanges.

11. In combination with the bar *a*, having the notched ends, the two-part standard having its rear edges brought together and inserted into the bar *a*, as shown.

12. The case having the vertically-grooved front guides and the horizontally-grooved guides *a*, with notches a^{10} therein, in combination with the file having the rear lips, b^{16}, and the side studs to ride in the grooves, whereby the box is compelled to slide horizontally on guides *a*, but permitted to tip forward and slide downward in the vertical guides.



13. The case or cabinet provided with vertical guides, the movable file-boxes adapted to engage said guides, and a shelf applied to the case and adapted to sustain the boxes when lowered thereon.

402,378. WRECKING-CAR. MORRIS WUKEFEL, St. Louis, Mo. Filed Apr. 30, 1888. Serial No. 272,365. (No model.)

Claim.—In a wrecking-car, the combination, with the truck mounted on wheels, of the master-wheel mounted on said truck and having a hub, 14, provided with a flange, the frame 12, having a hub surrounding the hub 14 and resting upon said flange, a hollow mast passing through said hubs, the collar 11, secured to the upper end of said mast, a shaft, 88, passing through said mast and collar and carrying a gear-wheel at both ends, the head 10, swiveled upon said collar, braces supporting said head, the driving mechanism, the vertical shaft 85, passing through said head and having a gear meshing with the gear on the shaft 88 and geared to the driving mechanism, and gearing connecting the said shaft 88 with the truck-wheels, substantially as set forth.

402,379. FUNNEL. CHRISTIAN XANDER and WILLIAM THOMAS, Washington, D. C. Filed June 14, 1888. Serial No. 277,119. (No model.)

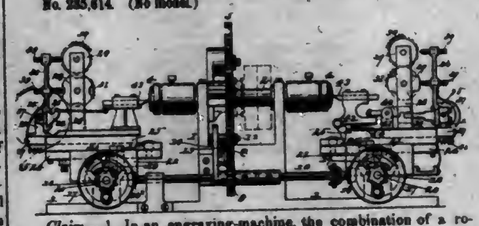
Claim.—1. As a new article of manufacture, a vessel for filling barrels, tanks, or the like, comprising a tank, constructed substantially as set forth and to rest upon the exterior of the barrel, provided with a downwardly-inclined bottom, and a funnel-nozzle extending from the lowest portion of said bottom, substantially as described.

2. A vessel for filling barrels or the like, comprising a tank, constructed substantially as set forth and provided with downwardly-extending sides or legs to hold the same in position upon the exterior of the vessel to be filled, and a funnel-nozzle extending downwardly from the bottom of said tank, substantially as described.

3. As a new article of manufacture, a vessel for filling barrels or the like, comprising a tank, constructed substantially as set forth, to rest upon the exterior of the barrel, a funnel-nozzle extending downwardly from the bottom of said tank, and a hood partially closing the top of the tank at end, constructed and arranged substantially as described.

4. A barrel-funnel comprising a tank, constructed substantially as set forth, to rest upon the exterior of the barrel, a nozzle extending downwardly from the bottom of the tank, said bottom slanting downwardly to the mouth of the nozzle from all sides, a screen permanently secured over the mouth of said nozzle, and a vent-tube for the nozzle, substantially as described.

5. The combination, in a vessel having sides and ends, of the inclined bottom terminating in a funnel-nozzle provided with an air-eduction tube, and the screen, and concave ends, substantially as described.



6. The combination, in a vessel for filling barrels, having sides and ends to fit the contour of the barrel, and provided with an angularly-inclined bottom, of a screen and funnel-nozzle, the latter having a vent-tube, substantially as described.

7. The combination, in a vessel for filling barrels and the like, provided with two parallel sides and concave ends, the former being provided with legs, whereby the vessel is kept in a horizontal position, of the angularly-inclined bottom and a funnel-nozzle, as set forth.

8. The combination, in a vessel for filling barrels, having sides and ends, as described, and a funnel-nozzle, of the hood or crown M, constructed and arranged substantially as described.

9. The combination, in a vessel for filling barrels, as described, of the inclined bottom, a funnel-nozzle, and a screen, air-eduction tube, and hood M, all operating together as set forth.

402,380. MACHINE FOR ENGRAVING WATCH OR OTHER CASES. ANI ZUAHLEN, Philadelphia, Pa. Filed Sept. 17, 1888. Serial No. 285,614. (No model.)

Claim.—1. In an engraving-machine, the combination of a rotary shaft having journal-bearings between its ends, heads or mandrels secured to said ends and adapted to receive the cases, and engraving mechanism adapted to contact with the cases on both of said ends, substantially as described.

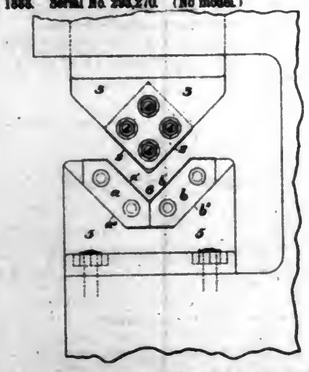
2. In an engraving-machine, the combination of a shaft having cases on each of its ends, gearing operated by said shaft, traveling screws operated by said gearing, and carriages mounted on said screws carrying engraving mechanism for engraving the cases on the ends of the shaft, substantially in the manner described.

3. In an engraving-machine, the combination of a frame having a central upright, a driving-shaft journaled in said upright with cases on its free ends, gearing operated by the driving-shaft, traveling screws mounted in the frame, on each side thereof, and operated by said gearing, and carriages carrying engraving mechanism traveling on said screws, substantially in the manner described.

4. In an engraving-machine, the combination of a driving-shaft having cases on each end thereof, gearing operated by said shaft, a shaft operated by said gearing and having a bevel gear-wheel on each end thereof, bevel gear-wheels meshing with the gears on said shaft, traveling screws operated by said last-named gear-wheels, carriages having engraving mechanism mounted thereon, said carriages being operated by the traveling screws, substantially in the manner and for the purpose described.

5. In an engraving-machine, the combination of a shaft having a bevel gear-wheel at each end, the bevel gear-wheels meshing therewith, the screws on which said gear-wheels are loosely mounted, the toothed wheels on the screws, and devices on the bevel gear-wheels for engaging the toothed wheels to cause the motion of the bevel gear-wheels to be transmitted to the screws, substantially as and for the purpose described.

6. In an engraving-machine, the combination of the arm having a curved slot, the arm having an elongated slot, and a pin or stud arranged in the curved slot of the first-mentioned arm, a gear-wheel having a stud or pin arranged in the elongated slot, and the gear-wheel meshing with said gear-wheel, said parts being arranged and adapted to operate substantially in the manner and for the purpose described.



7. In an engraving-machine, the combination of the carriages having the channels in their upper faces, the plates fitting in said channels, the plates pivoted to said plates having curved grooves in their under side and channels in their upper sides, posts, studs, or rollers adapted to enter the curved grooves, the plates fitting in the chambers, and the design-rollers, rock-arms, and grooves mounted on the last-mentioned plate, all arranged and adapted to operate in the manner and for the purpose described.

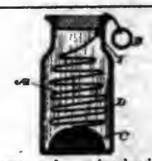
8. In an engraving-machine, the combination of the carriage having the channel in its upper side, the plate fitting and adapted to slide in said channel, the plate pivoted to said sliding plate and having a channel in its upper side, the plates fitting in said channels, the uprights rising from said plates, the design-rollers mounted in said uprights, the rock-arms and operating-screws therefor, the rods connected at one end to the lower ends of the rock-arms, and the cutter or graver connected with the other ends of said rods, all of said parts being arranged and adapted to operate substantially in the manner and for the purpose described.

9. An engraving-machine having a series of rotary shafts, each having bearings between its ends, heads or mandrels secured to said ends, the said series of shafts having gearing operating from a common driving-shaft, and engraving mechanism adapted to contact with the cases on each of said heads, said parts being combined substantially as and for the purpose set forth.

10. In an engraving-machine, the plate 27, with uprights 33, the pivoted lever 34, having beveled outer ends, the rock-arms 36, with beveled lower end, the pins 39, and design-rollers, said parts being combined substantially as and for the purpose set forth.

402,881. SHEAR-KNIFE. HENRY AIKEN, Homestead, Pa. Filed Dec. 11, 1888. Serial No. 293,270. (No model.)

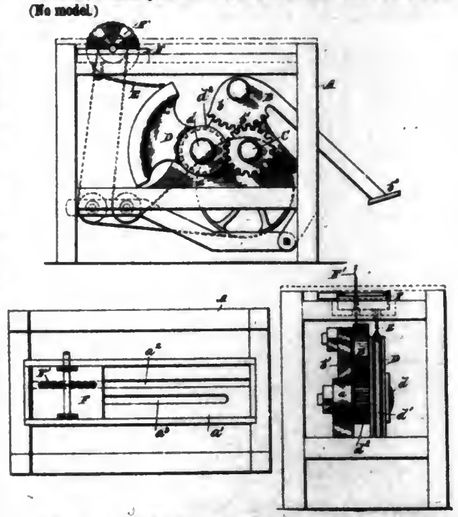
Claim.—1. An angled shear-knife made in separate interchangeable sections constituting the sides of the angle, substantially as and for the purpose described.



2. An angled shear-knife made in sections which constitute the sides of the angle, each section having its ends formed at equal angles, so that the knife may be shifted to present fresh cutting-edges, substantially as and for the purposes described.

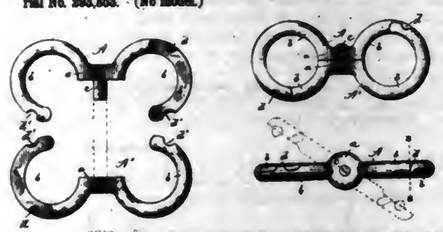
3. An angled shear-knife made in sections which are reversible and which constitute the sides of the angle, each section having its ends formed at equal angles, so that the knife may be shifted to present fresh cutting-edges, substantially as and for the purposes described.

4. An angled shear-knife made in separate interchangeable sections constituting the sides of the angles, and a knife-holder having an angular recess in which the said sections are fitted, substantially as and for the purposes described.



5. A shear-knife holder having an angular recess for reception of the shear-knife, and an equiangular polygonal shear-knife secured therein having shearing-edges which fit against the sides of said recess, in virtue of which any one of its salient angles may be presented in cutting, in combination with a bed-knife having an angular cutting-edge the counterpart of the salient angle of the first-named shear-knife, substantially as and for the purposes described.

402,882. FLY-CATCHER. ALBERT ARENTS, Alameda, Cal. Filed Aug. 29, 1888. Serial No. 284,072. (No model.)

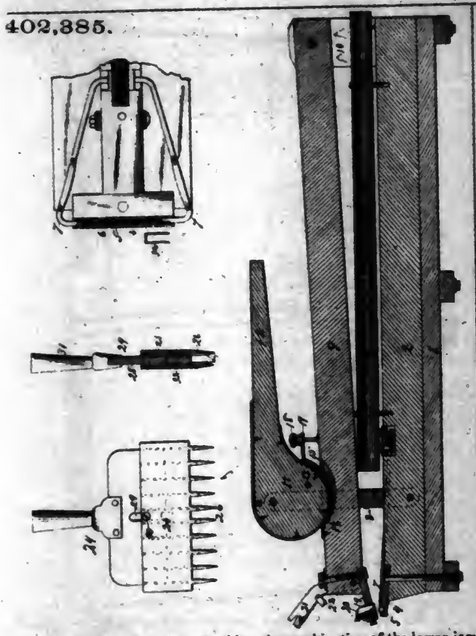


Claim.—An improved fly-catcher consisting of a bottle containing a suitable sticky compound, a string having a suspending-loop at one end and a button at the opposite end for securing the string within the bottle, said string having also the knot I, which lies under the bottle-stopper and serves to remove it when desired, as herein set forth.

402,883. TREADLE SAW-FEEDER. HENRY ARNDT and FRANK STUTZMAN, Williamsport, Pa. Filed Dec. 31, 1887. Serial No. 258,497. (No model.)

Claim.—In a treadle saw-feed, a saw-plate having a saw suitably mounted in it, combined with the mechanism, as described, consisting of a treadle having a curved rack, a cog, and a cam having cogs on its shaft, and a connecting bar or chain whereby the forward movement of said plate can be obtained.

402,884. LAP-RING. WILLIAM H. BAKER, Pontiac, Mich., assignor of one-half to Samuel W. Smith, same place. Filed Dec. 17, 1888. Serial No. 293,863. (No model.)

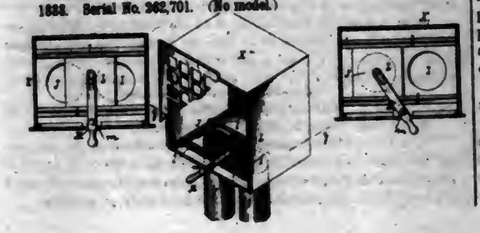


Claim.—As an improved article of manufacture, a lap-ring consisting of the two sections A A', these sections being pivoted together and constructed each of a disk, *a*, and the oppositely-projecting hook portions *b*, having their adjacent faces flattened and their exposed surfaces rounded, each of the said hook portions having projecting from its outer edge an integral lug, *d*, these lugs fitting in recesses formed in the outer edges of the adjacent hook portions and having their outer or exposed portions rounded to conform to the contour of the rings formed by the said hook portions, substantially as herein set forth.

402,885. BROOM-MAKING MACHINE. GEORGE H. BALDWIN, Grand Summit, Kans. Filed July 16, 1887. Serial No. 244,480. (No model.)

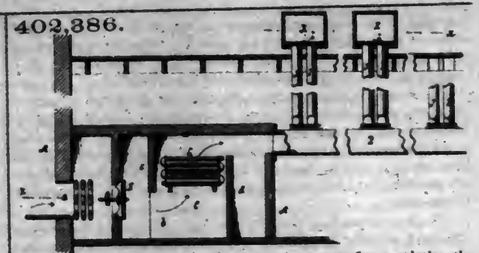
Claim.—1. In a broom-making machine, a staple-driver consisting of a narrow box having registering and tapering teeth upon the lower edges of its sides formed with grooves for the reception of the legs of the staples in their inner sides, and a flat block sliding in the box, as and for the purpose shown and set forth.

402,885.



2. In a broom-making machine, the combination of the lower jaw of a broom-holding vise formed with a groove having oblique pairs of notches in it, an upper jaw formed with a narrow box open at top and bottom and registering with the groove, a staple-driver consisting of a narrow box fitting in the box of the upper jaw and having registering and tapering teeth upon the lower edges of its sides formed with grooves for the reception of the legs of the staples in their inner sides and a flat block or plunger sliding within the box, and means for forcing the staple-driver through the broom, as and for the purpose shown and set forth.

3. In a broom-making machine, the combination of the lower jaw of a broom-holding vise formed with a groove having oblique pairs of notches in it, an upper jaw formed with a narrow box open at the top and bottom and registering with the groove, a bifurcated lever pivoted upon the upper jaw with its ends and having pivoted bearing-blocks near its ends, and a staple-driver consisting of a narrow box fitting in the box of the jaw and having tapering teeth arranged in registering pairs upon the lower edges of the sides and formed with grooves upon the inner sides for the reception of the legs of the staples and of a flat block or plunger sliding within the box, as and for the purpose shown and set forth.

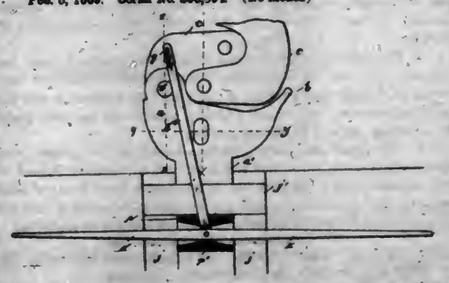


4. In a broom-making machine, the combination of a beam for the lower jaw having two uprights near the forward end, a beam for the upper jaw pivoted between upright ears at the rear end of the lower beam and having a recess in its upper side near the free end, an eccentric cam-disk pivoted between the uprights and having a handle, and a segmental strip or bar pivoted with one end in the forward end of the recess and having its rear end bent and provided with a set-screw passing through it and bearing against the upper side of the beam, as and for the purpose shown and set forth.

5. In a broom-making machine, the combination of a stationary lower jaw, a pivoted upper jaw having means for forcing it down, and a tube for the reception of the broom-handle secured to the lower jaw between it and the upper jaw, as and for the purpose shown and set forth.

402,886. APPARATUS FOR HEATING AND VENTILATING BUILDINGS. WILLIAM J. BALDWIN, Brooklyn, N. Y. Filed Feb. 2, 1888. Serial No. 262,701. (No model.)

402,886.



Claim.—1. The combination, in an apparatus for regulating the supply of hot and cold air to different rooms of a building, of a head communicating at one side with the room, the separate pipes I J, opening into said head, and a valve or slide moving in a right line across the openings of the pipes and adapted to close or partly close either one and effect an equal opening of the other pipe, substantially as shown and described.

2. The combination, with a furnace having a hot-air chamber and a separate chamber containing a radiator or coil for removing the chill from the air, of separate pipes connected with said chambers, a head with which said pipes have separate and adjacent communication, and a valve sliding in a right line across the open ends of both pipes and adapted to close or partly close either one of said pipes and effect an equal opening of the other pipe, substantially as described.

3. The combination, with the furnace A, having separate chambers B and C, one adapted to supply heated air and the other to supply cold air, of the fan H, the extensions D and E, the pipes I and J, running from the extensions to the rooms, the head K, in which the pipes I and J have their terminals side by side, the valve L, moving in said head to cover or partly cover either terminal and equally uncover the other, and the lever M, substantially as described.

4. The combination, with the pipes I and J, one for hot and the other for cold air, of a head, K, opening on one side into the room to be heated, and having upon another side the terminals of the pipes entering side by side, a valve, L, moving in a right line over said terminals, and having such dimensions as to wholly close or partly close either pipe and effect an equal opening of the other, and a lever operating said valve, substantially as shown and described.

402,887. CAR-COUPLING. NICHOLAS BARR, Cayuta, N. Y. Filed Feb. 5, 1889. Serial No. 298,894. (No model.)

Claim.—1. In a twin-jaw car-coupler, the combination of the coupling-head having a recess in its front end and a vertical passage for the locking-pin extending through the head and opening into the recess, a movable jaw pivoted in the head and having a heel to swing into the recess, a locking-pin to lock the heel in the recess, and a swinging pin-holder adapted to hold the pin suspended and extend into the path of the heel when the same is swung out, whereby, when the heel is swung in, the holder is swung back and the pin dropped into locking position, substantially as described.

2. In a twin-jaw car-coupling, the combination of the coupling having a rigid jaw, a movable jaw pivoted to the head and having a heel to swing in and out of the head, a vertically-movable locking-pin in the head adapted to lock the heel in the head, and a swinging pin-holder in the head adapted to removably hold the pin suspended and movably extend into the path of the heel when the heel is swung out, substantially as described.

3. In a car-coupling, the combination of a coupling-head, the rigid guide or jaw, the movable jaw, said head having a recess in which the movable jaw is pivoted and in or out of which the heel of said jaw can swing, a locking-pin to lock said heel in the recess, said head being provided with a vertical passage for the locking-pin opening into the jaw-heel recess, and with a recess to the rear of the jaw-heel recess and pin-passage, and a pin-holder provided with pintles

journaled in the pin-passage adapted to support the pin on its upper edge and extend in the heel-recess, whereby, when the heel is swung in, said holder is swung back into said rear recess and the pin is dropped in front of the heel, substantially as described.

4. A coupling-head having a rigid jaw or guide and a recess in its front end, in combination with a movable jaw pivoted in said recess by a pivot-pin and having recesses in its upper and lower sides directly in rear of said pivot, and shoulders on the inner walls of said recess to fit in said recesses, and thereby remove the strain from the pin and withstand the strain when the pin is removed, substantially as described.

5. In a car-coupling, the coupling-head with its draw-bar and the rigid and movable jaws, in combination with a lever pivoted to the draw-bar and extending to one side of the car, and having a forwardly-extending arm loosely pivoted to the movable jaw, whereby the same can be swung out or in from the side of the car, substantially as described.

6. In a car-coupling, the coupling-head and its draw-bar and pivoted jaws, in combination with a lever extending across the bottom of the car and pivoted to swing horizontally and provided with a downward bend around the draw-bar, and an arm extending forwardly from the lever and loosely secured to the under side of the movable jaw, and provided with a downward bend to pass beneath a support of the draw-bar, substantially as described.

402,388. SPRING-HINGE. RICHARD BELCHER, Haymarket, Va.

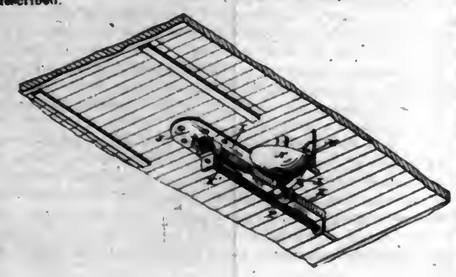
Filed Aug. 13, 1888. Serial No. 282,586. (No model.)

Claim.—1. The combination, with the base having the two guides thereon, of the bolt moving in such guides, formed in two parts hinged together, and the hinge-plate hinged to one of said sections, substantially as described.

2. The combination, with the base having the two guides thereon and the slots beneath such guides, of the bolt moving in the guides, formed in two sections hinged together, and the hinge-plate hinged to one of said sections, substantially as described.

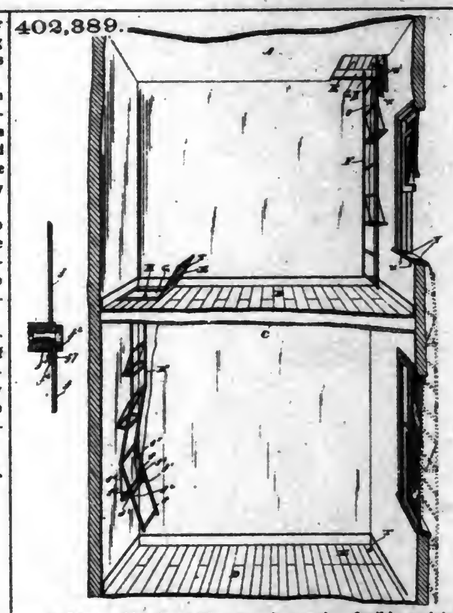
3. The combination, with the base having the two guides thereon, the bolt formed in two sections hinged together, one section adapted to normally rest in each guide and the hinge-plate united to one section, of the spring engaging one of said sections and abutting against the base for returning the bolt to normal position, substantially as described.

4. The combination, with the base having the guides thereon, the two-part bolt, and the hinge-plate united thereto, of the rod connected to the base and working through a guide on the bolt, and the spring surrounding the rod and abutting against the base and guide for returning the bolt to normal position.



5. The combination, with the base having the two guides, with slots beneath the same, of the bolt moving in said guides, formed in two sections hinged together, the hinge-plate hinged to one of said sections, the rod and its guide, and the spring surrounding said rod for returning the bolt to normal position, substantially as described.

402,389. FIRE-ESCAPE. RICHARD BELCHER, Haymarket, Va.



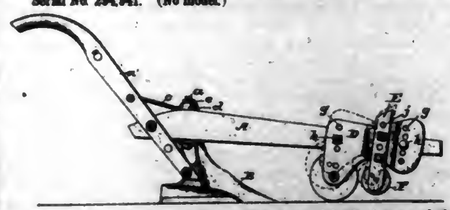
Filed Aug. 23, 1888. Serial No. 283,531. (No model.)

Claim.—1. The combination, with the ladder composed of the strap-iron side pieces jointed together at the rounds to fold toward each other in but one direction, of the braces pivoted to the ladder and extending on the side toward which the sections of the ladder fold, substantially as and for the purpose set forth.

2. The combination, with a trap-door and a flexible ladder, of a connection between said door and ladder, whereby upon fully extending the ladder the door will be automatically closed, substantially as described.

402,889.

3. The combination, with a trap-door and a flexible or jointed ladder, of a connection between the ladder and door, which raises a portion of the ladder when the door is opened and automatically closes the door when the ladder is fully extended, substantially as described.



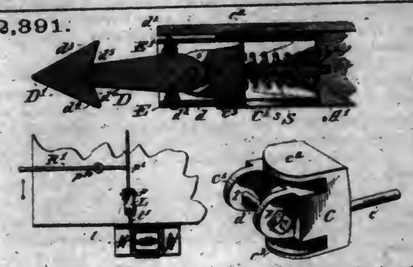
4. The combination, with the trap-door, of the hinge for holding the door off the center, the flexible ladder, and the door-closing connection between the door and ladder, substantially as described, for the purpose specified.

5. The combination, with the ladder-compartment between adjacent upper and lower rooms, of a stripping-bar in said compartment extending transversely across the laths, and a device, such as a bolt, extending through the ceiling below by which to operate the said stripping-bar from the room below, substantially as described.

6. The combination, with a ladder-compartment and a ladder therein, of a hinged stripping-bar extending transversely across the laths at the bottom of said compartment, substantially as described.

7. The combination, with a ladder-compartment and a ladder therein, of a ball-shaped stripping-bar extending transversely across the laths at the bottom and at each side of the compartment, substantially as described.

402,890. PLOW. CRALY BILLUPS, Norfolk, Va. Filed Dec. 29, 1888. Serial No. 294,941. (No model.)



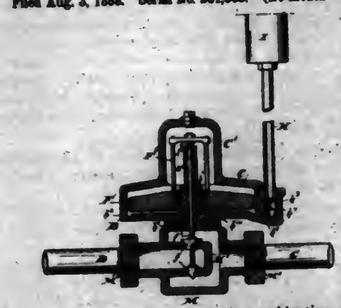
Claim.—1. In a plow, the combination, with the beam, of the brace *c*, secured to one of the handles and having an eye resting on the beam and hung over the top end of the beam-bolt, the concave washer having a notch in its edge to fit the brace, the bolt *a*, and nut, all substantially as shown, and for the purpose described.

2. In a plow, the combination, with the beam, of a pair of adjustable jaws attached thereto at or near its forward end and adapted to carry a rolling colter, and a pair of legs or brackets having a roller vertically adjustable on the jaws, substantially as described.

402,891. CAR-COUPLING. PHILIP BOELER, Stewart, Minn. Filed Oct. 9, 1888. Serial No. 287,661. (No model.)

Claim.—1. The combination, with the bed-frame of the car, having the transverse plates F and E, of the pivot-block C, provided with horizontal flanges c^2 and c^3, loosely engaging the plates F and E and carrying the pivoted draw-bar D, substantially as specified.

402,891.



2. The combination, with the bed-frame of the car, having the transverse plates E and E, of the pivot-block C, engaging such transverse plates and provided with the vertical jaws c' c', carrying the spring-supported draw-bar D, and provided also with the rearwardly-extending spring-carrying spindle *c*, substantially as shown and described.

3. The combination, with the bed-frame A', of the pivot-block C, having the top and bottom horizontal flanges, c^2 and c^3, and the vertical jaws c' c', and the draw-bar D, pivoted in the jaws c', and provided with top and bottom sustaining-springs, d' and d^2, substantially as specified.

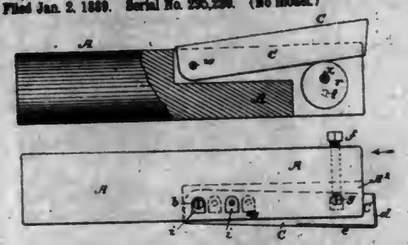
4. The combination, with the pivot-block C, having engaging-flanges, vertical jaws, and rearwardly-extending spindle, of the draw-bar D, pivoted in the vertical jaws of the block C, provided with top and bottom springs and with arrow-head, and having lifting-chain *f'*, attached to the side of such arrow-head, substantially in the manner and for the purposes set forth.

402,892. PRESSURE-REGULATOR. JOHN D. BOWMAN, Altoona, Pa. Filed Aug. 3, 1888. Serial No. 281,883. (No model.)

Claim.—1. In a pressure-regulator, the combination, with a conduit, of a regulator-valve situated therein, a chamber adapted to contain mercury and made of two sections, B and C C', a central tube, E, extending upward in the chamber from the lower section, B, and opening into the conduit, a passage, b^2, leading from the bottom of the chamber, an upright pipe connecting with said passage and open to the air, an annular float, F, fitting in the enlarged bottom of the chamber, as described, a tube, F', or its equivalent, extending from said float along and above the tube E, and a connecting device securing the tube F' to the regulating-valve.

2. In a pressure-regulator, the combination of a chamber adapted to contain mercury and made of two sections, B and C C', with a central tube, E, having a valve-seat at its top and extending upward in the chamber from the section B, a passage, b^2, leading through section B to the tube E, by which said tube is connected with a supply-pipe, a narrow passage, b^3, leading from the bottom of the chamber, an upright pipe connecting with said passage and open to the air, a pipe, G, leading from the chamber, an annular float, F, fitting in the enlarged bottom of the chamber, as described, a tube, F', or its equivalent, extending from said float along and above the tube E, and a valve secured to the end of tube F' and above the valve-seat *e*, all substantially as and for the purpose specified.

3. In a pressure-regulator, the combination of a chamber adapted to contain mercury and made of two sections, B and C C', with a central tube, E, having double valve-seats *e e*, facing each other at its top and extending upward in the chamber from the section B, a passage, b^2, leading through section B to the tube E, by which said tube is connected with a supply-pipe, a narrow passage, b^3, leading from the bottom of the chamber, an upright pipe connecting with said passage and open to the air, a pipe, G, leading from the valve-chamber, an annular float, F, fitting in the enlarged bottom of the chamber, as described, a tube, F', or its equivalent, extending from said float along and above the tube E, and a double-faced valve, *f f'*, secured between the valve-seats *e e* by means of a rod, f^2, extending from the end of tube F', all substantially as and for the purpose specified.



4. In a pressure-regulator, the combination of a chamber adapted to contain mercury and made of two sections, B and C C', with a central tube, E, having a valve-seat at its top and extending upward in the chamber from the section B, a passage, b^2, leading through section B to the tube E, by which said tube is connected with a supply-pipe, a narrow passage, b^3, leading from the bottom of the regulator-chamber, an upright pipe connecting with said passage and open to the air, a chamber, I, secured to said pipe and provided with devices, as described, for intercepting mercury, a pipe, G, leading from the regulator-chamber, an annular float, F, fitting in the enlarged bottom of the regulator-chamber, as described, a tube, F', or its equivalent, extending from said float along and above the tube E, and a valve secured to the end of the tube F' and above the valve-seat *e*, all substantially as and for the purpose specified.

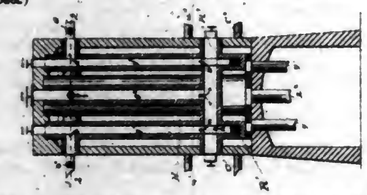
402,893. MACHINE FOR MIXING MINERAL COMPOUNDS. MILTON BROUGHTON, Syracuse, N.Y. Filed Apr. 30, 1888. Serial No. 272,311. (No model.)

Claim.—In a machine for mixing minerals, &c., the combination of troughs arranged parallel side by side, shafts extending longitudinally through said troughs and geared to rotate in opposite directions, and paddles projecting from the shafts only part way toward the center between the shafts and standing with the entire lengths of their flat sides at the same angle in relation to the axes of the shafts, substantially as described and shown.

402,894. BORING-TOOL. ALEXANDER R. BROWN, Cleveland, Ohio. Filed Jan. 2, 1889. Serial No. 295,290. (No model.)

Claim.—1. In a boring-tool, the combination, with the tool-holder or bar A, of a plate-like cutter, C, pivotally connected near its inner end to said tool-holder, means for adjusting or setting out the outer end of said cutter laterally of the tool-holder, and means for clamping or securely holding in adjustment said cutter, the whole constructed and operating substantially as specified, for the purposes set forth.

2. In combination with a suitable tool-holder or spindle-bar, A, a series of plate-like cutters arranged partially within suitable housings in said holder and having their cutting-edges in planes which pass radially through the said holder, suitable means for adjusting the cutting edges or portions of said plate-like cutters radially of the tool-holder and equidistant, respectively, from the axis of said holder, and means for clamping or holding in place said cutters when properly adjusted, all in substantially the manner hereinbefore set forth.

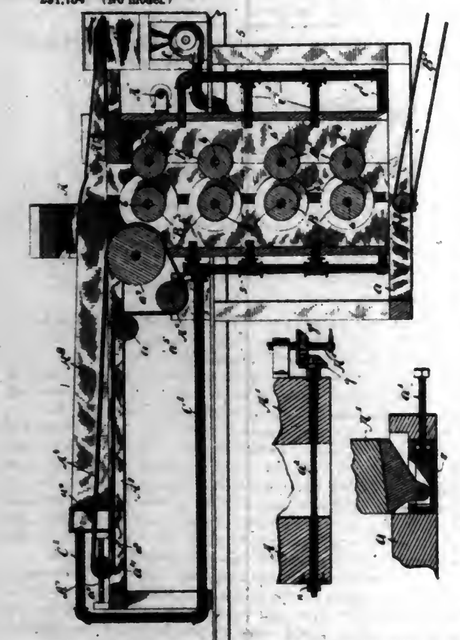


3. In combination with the tool-holder A and a plate-like cutter, C, arranged partially within a housing in said holder, a movable or adjustable pivotal connection between said cutter and holder, and means for holding fast the outer or operative end of the adjustable cutter, all substantially as and for the purposes set forth.

4. In a boring-tool of the type shown and described, the combination, with the slotted-out tool-holder A and a series of plate-like cutters, C, pivotally connected therewith, as specified, of a series of adjusting cam-like disks and a series of clamping-screws for holding fast said cam-like disks and said cutters, all substantially as hereinbefore set forth.

5. In a boring-tool of the type shown and described, the combination, with the tool-holder A and a cutter, C, arranged partially

within a housing of said holder and laterally adjustable therein, of a series of screw-holes in the holder, a series of indentations in the cutter-plate C, and a removable set-screw adapted to effect the pivotal engagement of the cutter and holder at different points as the cutter becomes worn and has to be set farther out endwise, all substantially as hereinbefore set forth.



402,395. APPARATUS FOR THE MANUFACTURE OF GAS. GEO. H. BROWN, St. Louis, Mo. Filed Jan. 16, 1889. Serial No. 296,561. (No model.)

Claim.—1. The combination, with the generators and the fixing-chamber, of the series of superposed horizontal and vertical retorts contained in said chamber, the vertical retorts constituting at the same time flues through which the gas is both supplied to and carried off from each one of the horizontal retorts, substantially as and for the purposes hereinbefore set forth.

2. The fixing-chamber provided with a vertical partition-wall dividing it into two combustion-chambers communicating with each other at one end and at the opposite end provided each with a valve-controlled outlet, and the generators communicating one with one and the other with the other combustion-chamber, in combination with the superposed series of horizontal and vertical retorts contained in said fixing-chamber, the vertical retorts constituting at the same time flues through which gas is both supplied to and carried off from each one of the horizontal retorts, substantially as and for the purposes hereinbefore set forth.

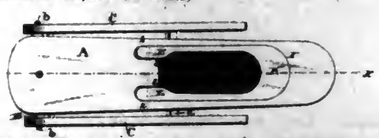
402,396. BREAD-MAKING MACHINE. PETER F. BRYCE and ALEXANDER F. BRYCE, Indianapolis, Ind. Filed Nov. 24, 1888. Serial No. 291,734. (No model.)

Claim.—1. The combination, in a bread-making machine, of the two-part frame, one part of which is adjustable toward and from the other, a series of rolls arranged in pairs, one roll of each pair being mounted on said adjustable portion of the frame, and the gearing for operating said rolls, substantially as set forth.

2. In a bread-making machine, the combination of the frame consisting of the rigid portion A, the adjustable portion A', and the table portion A^2, a series of rolls arranged in pairs, one roll of each pair being mounted on the rigid portion A and the other on the adjustable portion A' of the frame, an endless feeding-apron mounted on said table portion, and the gearing for operating said several parts, substantially as set forth.

3. The combination, in a bread-making machine, of the frame, the rolls for reducing the dough, and an apparatus for dusting said rolls, consisting of a blow-fan connected with the flour-supply, and pipes connecting said blow-fan with the casing in which said rolls are mounted, and the operating mechanism, substantially as set forth.

4. The combination, in a machine for rolling out dough, of the frame, the reducing-rolls, the feeding-apron, the hopper C^2, casing C', a conveyer connecting said hopper and said casing, a blow-fan, and a pipe running from said casing to the casing containing said reducing-rolls, and the gearing for driving said several operating parts, substantially as set forth.



5. In a machine for rolling out dough, the combination of the reducing-rolls, the feeding-apron, the blow-fan, the flour-supply connected with said blow-fan, the system of pipes connected with said blow-fan and arranged to discharge onto said rolls and feeding-apron, and the air-supply pipe for said blow-fan, arranged with its mouth just above said rolls and the discharge end of said feeding-apron, substantially as described, and for the purpose specified.

6. The combination, in a bread-making machine, of a frame consisting of a rigid portion carrying one of each of the pair of rolls, an adjustable portion carrying the other rolls, and the screw-threaded rods a^3, by which the movement of said adjustable portion is effected, substantially as set forth.

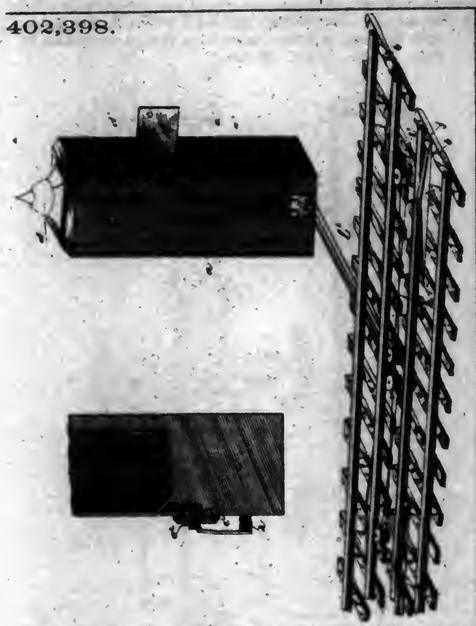
7. The combination of the rigid frame portion A, the adjustable portion A', sills *a*, carrying sliding parts or shoes to which said adjustable portion is hinged, screws for adjusting said sliding shoes, the screw-threaded rods at the top extending from said portion A' to said portion A for securing and adjusting the top of said portion A', the pairs of rolls, one of each pair being journaled on the portion A and the other on the portion A', and the gearing for driving said rolls, substantially as set forth.

8. In a machine for rolling dough, the combination of the frame, the series of rolls arranged with the space between the rolls of each pair narrowing from the top to the bottom of the machine, gear-wheels on the ends of the journals of each roll of an increasing size from the bottom to the top, and intermediate gear-wheels connecting the gear-wheels of the rolls on each side, all arranged and operating substantially as set forth.

402,397. IRONING-BOARD. GEORGE W. CARR, Richmond, Va., assignor of one-half to Edwin W. Grafton, same place. Filed Dec. 1, 1888. Serial No. 292,423. (No model.)

Claim.—The ironing-board A, cut out to form a recess, I, and bosom-board J, in combination with the pivoted piece K, adapted to fit into the recess, substantially as and for the purpose herein shown and set forth.

402,398. AUTOMATIC RAILWAY-SIGNAL. JOHN T. CARTER, Baltimore, Md., assignor of one-half to Frank J. Hilbert, same place. Filed Nov. 8, 1888. Serial No. 290,283. (No model.)



Claim.—1. In a railway-signal, the combination of a signal-box, a movable semaphore normally located therein, an audible alarm, a rocking shaft to sound the alarm, a vertically-swinging lever pivoted within the box and carrying the semaphore and adapted to display or withdraw the same and simultaneously rock said shaft to start or stop the alarm, and a trip connected with the lever and located on the track and operated by a passing train, substantially as described.

2. In a railway-signal, the combination of a movable semaphore, a gong, an electric circuit including the gong, a circuit-controller in the circuit, a lever to simultaneously display the semaphore and operate the circuit-controller to close the circuit and sound the gong, and mechanism connected with said lever and operated by a passing train, substantially as described.

3. A railway-signal comprising a centrally-pivoted lever movable in a vertical plane, an upwardly-extending rod carried by and swinging with said lever, a semaphore carried by the upper portion of said rod, an inclosing signal-box, whereby, when one arm of the lever is depressed, the semaphore is displayed, and when the other arm is depressed the semaphore is withdrawn, and mechanism for operating the lever, substantially as described.

4. In a railway-signal, the combination of a signal-box, a lever pivoted therein and movable in a vertical plane, an upwardly-extending swinging rod carried by and moving with the lever, a weight upon the upper end of said rod, a semaphore carried by the upper portion

402,398.

of the rod and displayed when the rod is swung in one direction and withdrawn when the same is swung in the opposite direction, and a trip located on the track and connected with said lever, substantially as described.

5. A railway-signal comprising a signal-box, a lever centrally pivoted in the box to swing in a vertical plane, a swinging rod secured at its lower end to said lever and extending upwardly from the same and counterbalanced at its upper free end, a semaphore carried by the upper portion of said rod and adapted to be displayed when the lever and rod are swung in one direction and to be withdrawn when the same are swung in the opposite direction, and a pair of trips located upon opposite sides of a railway-crossing and connected, respectively, with the opposite free ends of said lever, substantially as described.

6. A railway-signal comprising a signal-box, a vertical support therein, a lever pivoted at its center to said support to swing in a vertical plane, a swinging rod carried by the lever and counterbalanced at its upper end, a semaphore carried by the upper portion of the rod, an electric circuit including a gong and circuit-controller, a rock-shaft mounted on said support to close or open the circuit and operated by said lever, and trips located on a track and connected with the opposite ends of said lever, substantially as described.

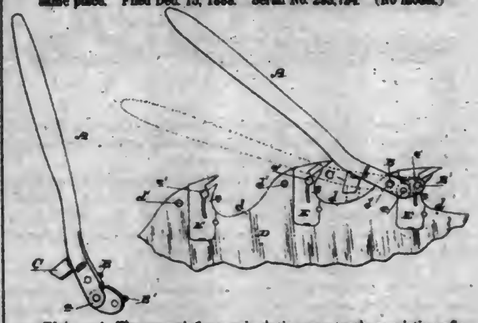
7. A railway-signal comprising a T-lever pivoted to swing in a vertical plane, a swinging rod secured at its lower end centrally to the same and weighted at its upper end, a visual signal carried by the upper portion of the rod, and a pair of trips located upon a railway-track and connected, respectively, with the opposite ends of said lever to swing the rod in opposite directions, substantially as described.

8. A railway-signal comprising a rod mounted to swing in a vertical plane, a hollow apertured counterbalancing-weight upon its upper end, a signal lamp or light within the weight, a signal-box, and mechanism upon the track to swing the rod to display or withdraw the signal-light, substantially as described.

9. A railway-signal comprising a signal-box, a counterbalanced rod mounted at its lower end in the box upon a lever to swing in a vertical plane, a lamp or light carried by the upper end of the rod, a flag or similar signal carried by the upper portion of the rod, and mechanism upon the track connected with the lever to swing the rod and display or withdraw the signals, substantially as described.

10. A railway-signal comprising a movable visual signal and an audible alarm, an electric circuit including the alarm, a circuit-closer, and mechanism located upon the track and operated by a passing train to simultaneously operate the visual signal and audible alarm, substantially as described.

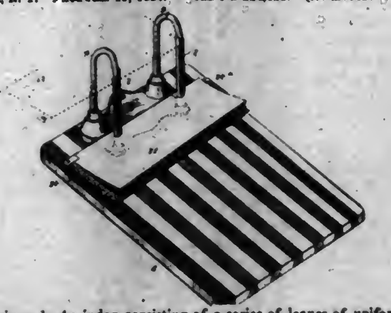
402,399. BACK-BAND TRACE-CARRIER. JOSEPH COLLIN, New Orleans, La. Filed Oct. 27, 1888. Serial No. 289,901. (No model.)



Claim.—The within-described back-band buckle consisting of the bars *a b c*, having spaces *d e* between the same, the bar *b*, provided with outwardly-projecting spurs *f*, and the sides of the buckle pro-

402,399.

jecting downward, thence inwardly, and having a connecting-web to form a broad flat hook, *x*, substantially as and for the purpose specified.

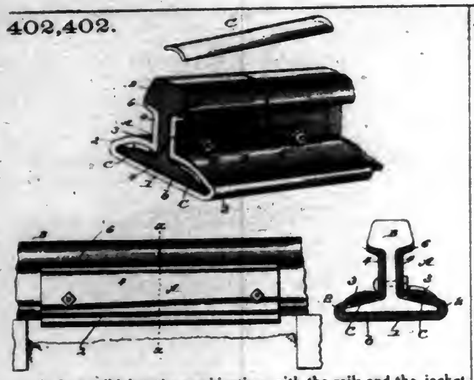


402,400. TOOL FOR MANIPULATING SAW-TEETH. FREDERICK W. COOK, San Francisco, Cal., assignor of one-half to H. F. Gregory & Co., same place. Filed Dec. 15, 1888. Serial No. 293,734. (No model.)

Claim.—1. The wrench for manipulating saw-teeth, consisting of a stock having separated pins for engaging sockets in the saw-plate and bit-holder, as described, said stock being hinged or pivotally jointed on a line between the pins, whereby the latter may be brought closer together or forced farther apart by the bending of the stock at its joint, substantially as herein described.

2. The wrench for manipulating saw-teeth, consisting of a stock having separated pins for engaging sockets in the saw-plate and bit-holder, as described, said stock being hinged or pivotally jointed on a line between the pins, whereby the latter may be brought closer together or forced farther apart by the bending of the stock at its joint, and a stop-piece on said stock for limiting its movement by contact with the saw-plate, substantially as herein described.

402,401. PAPER-FILING INDEX. WILLIAM A. COOKE, Jr., Brooklyn, N. Y. Filed Jan. 19, 1887. Serial No. 224,822. (No model.)



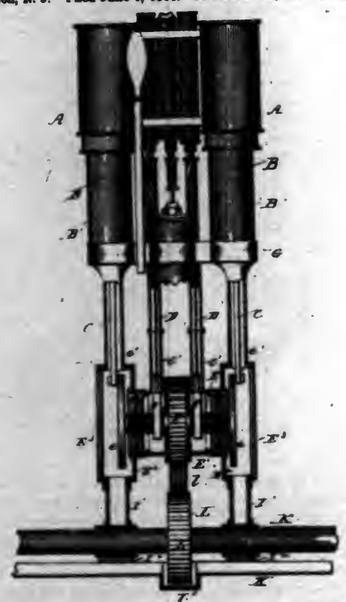
Claim.—1. An index consisting of a series of leaves of uniform width and length provided with index-characters, the series being divided into parts and the parts distinguished from each other by having the index-characters on opposite edges of their respective leaves, substantially as specified.

2. In combination with a letter-file composed of fixed and movable wires, a series of disconnected leaves of uniform width and length having perforations in one edge and provided with index-characters on both sides, the characters on one side being the next in order and in a reversed position relatively to those on the opposite side, and the said leaves being divided into parts distinguished from each other by having the index-characters on opposite sides or edges of their respective leaves, substantially as specified.

402,402. RAIL-JOINT. EDWIN M. COOKE, Brooklyn, assignor of one-half to Noyes C. Wooster, New York, N. Y. Filed Aug. 13, 1888. Serial No. 282,670. (No model.)

Claim.—1. In a rail-joint, a jacket formed with a base-plate, 1, goffers or corrugated portions 3, made of equal thickness throughout and inclined longitudinally, and side plates, 4, all substantially as set forth.

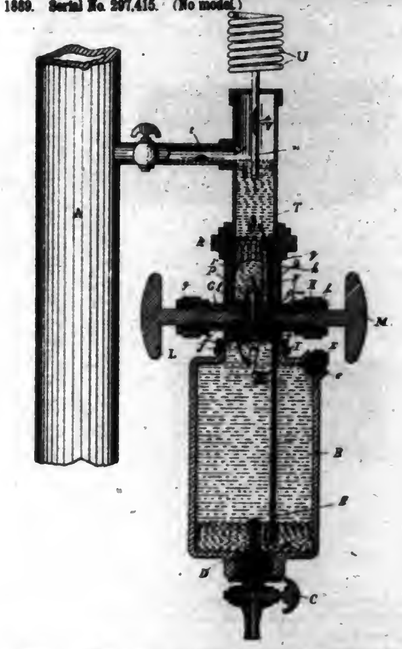
402,402.



2. In a rail-joint, the combination, with the rails and the jacket fitted thereon, of the wedges or keys curved or arched transversely, substantially as and for the purposes specified.

3. The improved jacket for rail-joints, consisting of the base-plate 1, edge portions 2, goffers or corrugated portions 3, made of equal thickness throughout and inclined longitudinally, the portions 3 on opposite sides being inclined in reverse directions, and the side plates, 4, all substantially as and for the purposes specified.

4. The combination of the rails, the jacket formed with base-plate 1, edge portions 2, goffers or corrugated portions 3, inclined from end to end, and side plates, 4, the upper edges of the side plates fitting snugly under the tread of the rail, and a space being provided between the base of the rail and the base of the jacket, and the wedges or keys curved or arched transversely, all substantially as and for the purposes specified.



402,403. CASING FOR MARINE ENGINES. LUCIUS D. COPELAND, Camden, N. J. Filed June 1, 1888. Serial No. 275,739. (No model.)

Claim.—1. The combination, with a pair of twin engines coupled to a single driving-shaft, of a casing or shield inclosing the working parts of said engines and made in separable sections, that portion of the casing inclosing the main shaft being formed of the tubular cast section E' and circular boxes or heads E^2 E^3, fitted thereto by threaded connections and provided with removable end caps, E^3, substantially as described.

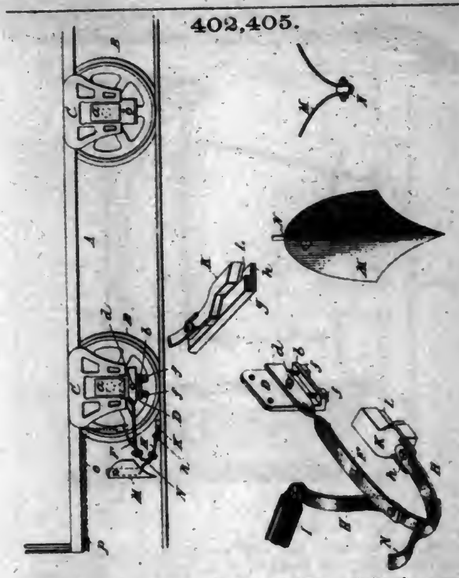
2. The combination, with a pair of twin engines coupled or connected to a single driving-shaft and with a horizontal propeller-shaft of a hollow casing inclosing the working parts of said engine, the hollow pillars I' I', supporting said casing and communicating with the interior thereof, and the arched plates or bearings I^2 I^2, upon which said pillars rest, substantially as described.

402,404. LUBRICATOR. WILLIAM H. COOPER, San José, Cal., assignor of one-half to Christian Anderson Fox, same place. Filed Jan. 24, 1889. Serial No. 297,415. (No model.)

Claim.—1. The combination of the oil-cup, the casing connected thereto having oil and water passages valved, as described, and sight-openings, and the pipe connected to said casing and to the main steam-pipe, the pipe *q*, rising in said casing, with the water-pipe depending in said cup, and the coiled condenser U, having depending perforated portion *u*, substantially as described.

2. The combination of the oil-cup and the casing having a partition provided with valved oil and water passages, the vertical pipe communicating therewith and connected at a single point with the main steam-pipe, with the coiled condenser U, connected to the upper end of said vertical pipe and having its inner end depending therein and perforated above its point of connection with the main steam-pipe, substantially as and for the purpose set forth.

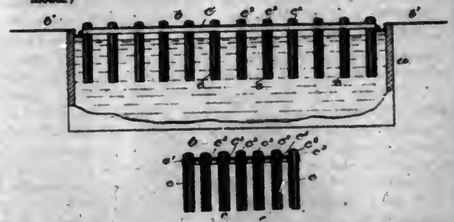
3. The combination of the oil-cup and the valve-casing F, having partition K, formed with oil and water passages, and a tubular extension above said partition, the valves closing said passages, the pipe depending in said cup and connected to the water-passage, and the pipe T, connected to said extension above the passage, with the pipe *t*, connecting pipe T and the main steam-pipe, and the condenser-coil U, outside of and above pipe T, and having an end depending therein and perforated above the point where pipe *t* opens thereinto, substantially as described.



4. In a lubricator, the combination of the oil-cup having a petcock and drain-pipe D, and the valve-casing F, connected to said cup and having a partition, K, provided with oil and water passages, the valve-stems for closing said passages, and a tubular extension, *k*, above said partition having sight-openings *r*, closed by a glass tube, and the pipe S, connected to the water-opening and depending in the oil-cup below the upper end of pipe D, and the tube *q* in extension *k*, communicating with the water-passage, and the nipple Q, connected to the oil-passage, with the pipe T, connected to extension *k*, the valve-pipe *p*, making a single connection between pipe T and the steam-pipe, and the condenser-coil U, all substantially as specified.

402,405. TRACK-CLEARER. JOHN M. CHRISTOPHER, Clifton, Md. Filed June 1, 1888. Serial No. 275,736. (No model.)

Claim.—1. In a track-clearer, a spring-bar attached to the axle-box of a car, extending forward of the wheel and then backward toward the said wheel, and provided at its ends with a box or holder containing a block of rubber having a face adapted to fit the face of the track-rail, substantially as and for the purpose specified.



2. In a track-clearer, a spring-bar attached to the axle-box of the car, extending forward and then backward toward the wheel, having at its ends a box containing a block of rubber of angular shape as seen from its top, and provided with a face adapted to fit

402,405.

the surface of the track-rail, substantially as and for the purpose specified.

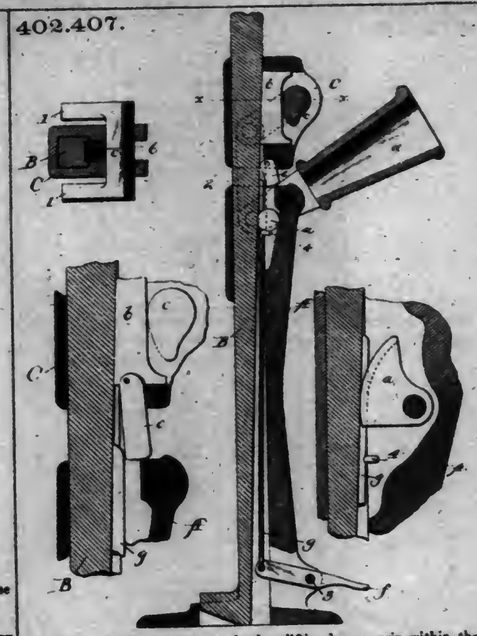
402,406. DRYING-FRAME FOR COATED CANDIES. ELIZABETH CLIFFORD, Boston, Mass. Filed May 10, 1888. Serial No. 273,406. (No model.)

Claim.—1. In an apparatus for drying coated drops of the kind described, a liquid-holding tray and an open-work frame, combined with several posts or rests, held in said frame and adapted to be heated by the contents of said tray and to support thereon the coated drops, substantially as described.

2. In an apparatus for drying coated drops, several posts or rests, *c*, having convex tops, combined with a support, a frame for said posts or rests, and the longitudinal stripe *c'*, substantially as described.

3. In an apparatus for drying coated drops, several tubular or hollow posts or rests, combined with the supporting-frame *b*, through which they pass, substantially as described.

4. In an apparatus for drying coated drops, the tubular or hollow posts or rests having open lower ends, convex upper ends or tops, c^2, and one or more vent-openings in the said ends or tops, combined with a liquid-holding tray into which said posts or rests are partially immersed, and a support for said posts or rests above said tray, substantially as described.



402,407. LIFTING-JACK. LOUIS J. CRECELIUS, St. Louis, Mo., assignor to Andrew Warren, same place. Filed Jan. 26, 1889. Serial No. 297,610. (No model.)

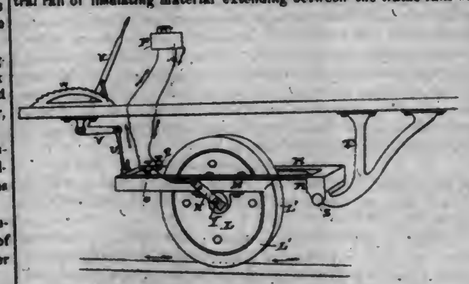
Claim.—1. In a lifting-jack, a standard, a lifting-bar, a holding-grip in the standard, a clutch-box, a cam-shaft within the clutch-box as operating-lever, and a positive connection between said lever and the cam-shaft for operating the same to grip and raise the lifting-bar, substantially as described.

2. In a lifting-jack, a standard, a lifting-bar, a clutch-box, a cam-shaft within said clutch-box, an operating-lever pivoted on the standard, arms I I, secured to the cam-shaft, and links connecting said arms with the lower end of the lever, substantially as described.

3. In a lifting-jack, a standard, a lifting-bar, a clutch-box, a cam-shaft, an interposed clutch-block between said shaft and the face of the lifting-bar, an operating-lever, and connections between said lever and the cam-shaft, substantially as described.

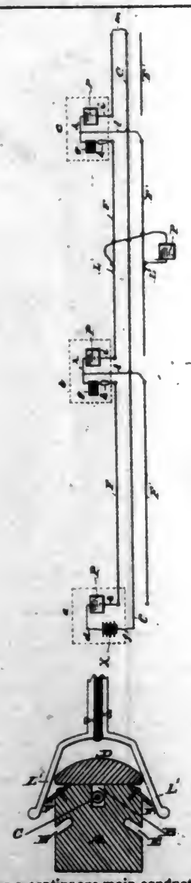
402,407.

4. In a lifting-jack, a standard, a lifting-bar, a grip within the standard, a clutch-box carrying a grip, a lever and connections for operating said grip, a lowering-lug carried by the clutch-box, the standard having an opening in line with the normal position of the lowering-lug, and means for releasing the grip in the standard and throwing aside the lowering-lug, substantially as described.



5. In combination, a standard, a lifting-bar, a grip within the standard, a clutch-box, a grip within the same, and an operating-lever, a lowering-lug carried by said clutch-box and pivoted at one side of the standard having an opening in line with the lowering-lug, a foot-lever at the base of the standard, and connections therefrom for releasing the grip in the standard and for throwing aside the lowering-lug, substantially as described.

6. In combination, a standard, a lifting-bar, a grip in the standard, a clutch-box, a clutch-block within the same, an operating-lever, a lowering-lug carried by said clutch-block and pivoted at one corner, the standard having an opening in the top thereof in line with the normal position of the lowering-lug, and a rod for releasing the grip in the standard and for throwing aside the lowering-lug, substantially as described.



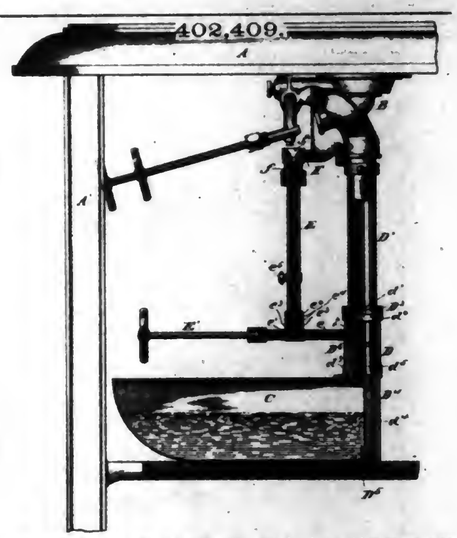
402,408. RAILWAY-TELEGRAPH. FRANK J. CROUCH, Oakland, assignor of one-half to C. P. Houston, Junction City, Oreg. Filed Jan. 21, 1887. Serial No. 225,088. (No model.)

Claim.—1. In a system of railway-telegraphy, a central rail of insulating material located between the traffic-rails of the road, having a continuous main conductor embedded therein, and sectional contact-plates fixed on bevels formed on the upper edges of the rail, in combination with a roof or water-shed over the top of the rail and partly extending over the contact-plates, and a longitudinally-inclined slot in each side of the rail for preventing the moisture of the ground from reaching the contact-rails, substantially as described.

2. In a system of railway-telegraphy, the combination of a central rail of insulating material extending between the traffic-rails of

402,408.

the road and having a continuous main conductor embedded therein, and sectional contact-plates fixed on bevels formed on the upper edges of the rail, with a contact-wheel carried upon a car of a train in a hinged frame, a lever fulcrumed in the car, and connections of the same with the frame for raising the wheel out of contact with the contact-plates and for lowering the same to establish contact, substantially as described.

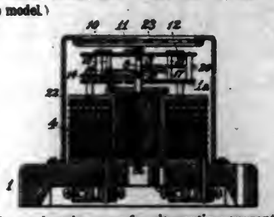


3. In a system of railway-telegraphy, the combination of an insulated main conductor and two sectional contact-plates extending between the traffic-rails of the road with a hinged frame upon a car traveling upon the road, having a contact-wheel mounted therein for establishing and breaking contact with the contact-plates, and a spring connecting the body of the frame with its hinges, whereby the frame and wheel will yield laterally to accommodate themselves to the curves of the road, substantially as described.

4. In a system of railway-telegraphy, the combination of a continuous main conductor and two sectional lines of contact-plates extending between the traffic-rails of the road, and signal-stations equipped with telegraphic apparatus and a resistance-coil located at the breaks in the sections of contact-rails, bridging the continuous sections of one of these lines, and also connected with one section of the other line, with a telegraphic outfit and a battery at one end of the road bridging the main conductor and the line of sectional rails bridged by the intermediate signal-stations, a permanent connection between the main conductor and said line of contact-plates at the other end of the road, and a traveling car provided with telegraphic instruments and with means for deriving current from the lines of contact-plates, substantially as described.

402,409. VAPOR-STOVE. SAMUEL DANIELS, Chicago, Ill., assignor to J. McGregor Adams, same place. Filed Nov. 17, 1888. Serial No. 291,120. (No model.)

Claim.—1. The combination, with a gasoline-tank, a generating-burner, and liquid and air pipes, respectively, for supplying and initially heating the generator, of a fitting, D, having a passage extending to the lower portion of the liquid-tank and a passage extending



402,409.

from the upper portion of said tank, and having said passages connected, respectively, with the liquid and air pipes.

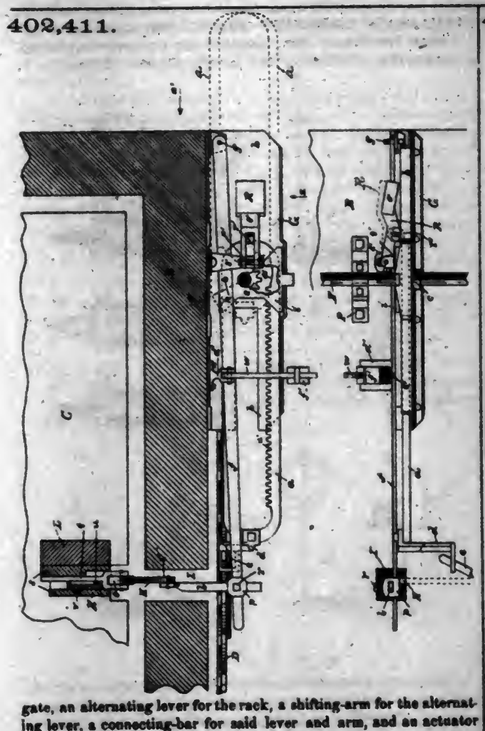
2. In combination with a gasoline-tank and a vapor-generator, an air-pipe leading from the air-space of the gasoline-tank and provided with a valved inlet for the admission of external air, substantially as described.

402,410. ELECTRIC METER FOR ALTERNATING CURRENTS. DELAMORE L. DAVIS, Salem, Ohio. Filed Jan. 15, 1889. Serial No. 296,409. (No model.)

Claim.—1. In an electric meter for alternating currents, the combination of an electro-magnet, an armature vibrating with the current-alternations and having a connected friction-plate, a disk subject to pressure from the friction-plate and rotated by its vibrations, and an indicating mechanism actuated by the disk, substantially as set forth.

2. In an electric meter for alternating currents, the combination of an electro-magnet, an armature which is movable in opposite directions under the attraction of the magnet and under its own elasticity, respectively, a friction-plate secured to the armature, a rotatable disk subject to pressure from the friction-plate, and an indicating mechanism actuated by the disk, substantially as set forth.

3. In an electric meter for alternating currents, the combination of a coil or helix, a core journaled on pivots and adapted to rotate within the helix, a disk fixed to said core concentric with its pivots, an armature-bar fixed at one end and extending therefrom adjacent to the disk and substantially tangential thereto, a friction-plate fixed to the free end of the armature-bar and bearing against the periphery of the disk, and an indicating mechanism actuated by the disk, substantially as set forth.



402,411. MECHANISM FOR OPERATING THE GATES OR DOORS OF ELEVATOR-WELLS. ORION L. DAVIS, Rochester, N. Y. Filed June 7, 1888. Serial No. 276,327. (No model.)

Claim.—1. In combination with a gate, a shaft and gear secured thereto, a rack for the gear, and a connecting-link for the rack and gate, said shaft turning always in the same direction, and the rack being capable of moving independently of the gate, substantially as described.

2. In combination with a gate, a revolving shaft and gear thereon, a sidewise-shiftable rack having rows of teeth facing each other for the gear, and a connecting-link for the rack and gate, substantially as described.

3. In combination with a rotatory shaft and gear and a movable gate, a laterally-shiftable rack, a connecting-link for the rack and

402,411.

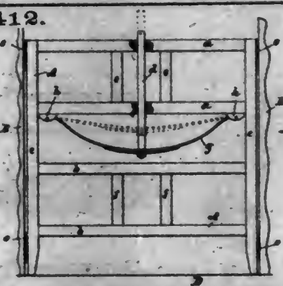
gate, an alternating lever for the rack, a shifting-arm for the alternating lever, a connecting-bar for said lever and arm, and an actuator for the shifting-arm carried by the car, substantially as shown and described.

4. In combination with a rotatory shaft and gear and a movable gate, a laterally-shiftable rack, a connecting-link for the rack and gate, an alternating lever for the rack, a shifting-arm for the alternating lever within the well, a connecting-bar for said lever and arm, and an adjustable actuator projecting from the car to act upon the shifting-arm, substantially as and for the purpose set forth.

5. In combination with a rotatory shaft and gear and a movable gate, a rack, a connecting-link for the rack and gate, an alternating lever for the rack, a shifting-arm for the alternating lever within the well, a connecting-bar for said lever and arm, and an actuator for the shifting-arm carried by the car, said shifting-arm adapted to have a part of its surface traversed by the actuator in a vertical plane, substantially as and for the purpose set forth.

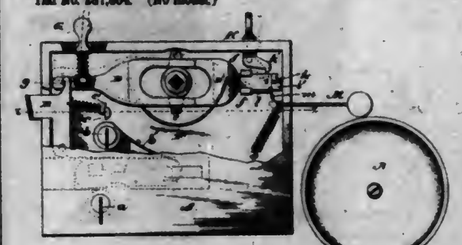
6. In combination with a gate, a revolving shaft, and gear thereon, a shiftable rack having opposing rows of teeth, and a connecting-link for the rack and gate, said rows of teeth of the rack extending longitudinally one beyond the other, as and for the purpose set forth.

7. In combination with a gate, a revolving shaft, and gear secured thereto, a rack for the gear, a connecting-link for the rack and gate, and a pushing-lever to force the rack beyond the action of the gear, for the purpose set forth.



8. In combination with a revolving shaft and gear, a gate, a movable rack, a connecting-link for said rack and gate, a shifting-arm for the rack, and a returning-lever for the rack, substantially as shown and described.

402,412. ELEVATOR-GATE. ORION L. DAVIS, Rochester, N. Y. Filed June 18, 1888. Serial No. 277,451. (No model.)



Claim.—In combination with the lifter of an elevator-car, a gate for the well, provided with a catch-bar held to move in vertical bearings in the gate, and a spring-connection between said catch-bar and gate, substantially as shown and described.

402,412.

402,413. ALARM-LOCK. GEORGE C. DAY, Nineveh, Pa., assignor of one-half to George M. Condit, same place. Filed Oct. 11, 1888. Serial No. 287,804. (No model.)

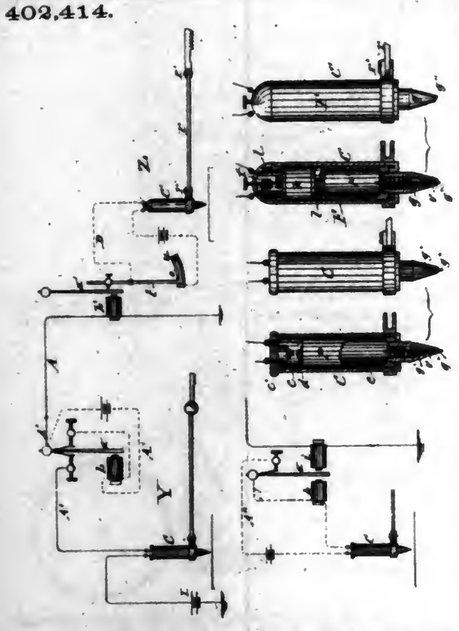
Claim.—1. The combination, in an alarm-lock, of the bifurcated bolts D and D′, having hooks which engage with the arms of the knob-spindle, a spring for holding said bolts apart and in contact with the arms of the knob-spindle, a pivoted latch, B, operated by one of the bolts, and a bell-hammer actuated by the other bolt, substantially as shown, and for the purpose set forth.

2. The combination, in a lock having bolts D and D′, and a bell-hammer actuated by one of said bolts, of a pivoted latch having an arm, *c*, stud *c′*, through which said arm passes, and a spiral spring for throwing said latch outwardly, the upper portion of said latch being bifurcated to engage with a pin, *g*, carried by the bolt D, substantially as shown, and for the purpose set forth.

3. The combination, in a lock, of the bifurcated bolt D, having hooks *d d*, which engage with arms on the knob-spindle, and a pin, G, extending through the lock-casing and engaging with the bolt for elevating the end thereof to throw the same out of engagement with the latch, substantially as shown, and for the purpose set forth.

4. The combination, in an alarm-lock, of the bolt D′, adapted to be actuated by the knob-spindle, said bolt being provided with an inclined notch, *k*, and a pivoted dog, K, provided with a hook to engage the notch *k* to hold said bolt out of engagement with the arms of the knob-spindle, so that the alarm will not be actuated, substantially as shown, and for the purpose set forth.

5. The combination, in an alarm-lock, of the bell, spring-actuated bell-hammer, and arm *m*, the bolt D′, having inclined portions *i* and *i′* and an inclined plate, *l*, over which the arm *m* rides to release the same from the notches formed on the end of the bolt D′, substantially as shown, and for the purpose set forth.



6. The combination, in an alarm-lock, of the bolts D and D′, constructed substantially as shown, and adapted to be operated by a single knob-spindle having arms *e e*, said bolts being provided with a common spring, F, guide-lugs *f f*, notches *i*, *i′*, and *k*, formed in the bolt D′, a dog, K, for engaging with one of said notches, and a spring-actuated bell-hammer with which the bolt D′ engages, a pin, G, extending through the lock-casing and engaging with the bolt D to hold the same out of engagement with the latch, and a latch, B, carrying a pivoted arm encircled by a spring, with which a key can engage for operating said latch independent of the knob-spindle, substantially as shown, and for the purpose set forth.

402,414. TELEGRAPHY. MARK W. DEWEY, Syracuse, N. Y., assignor, by direct and mesne assignments, to the Dewey Corporation, same place. Filed Oct. 3, 1888. Serial No. 287,069. (No model.)

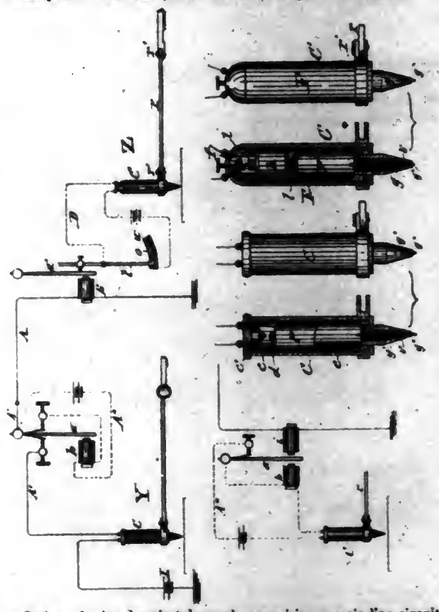
Claim.—1. In the art of reproducing written characters electro-telegraphically, the method which consists in varying the strength of the line-current formed of rapid impulses and causing such varying line-current to actuate electro-magnetic devices to control the flow of ink or marking-fluid of the receiving-instrument.

2. In the art of reproducing written characters electro-telegraphically, the method which consists in varying the strength of the line-

402,414.

current formed of rapid impulses of varying amplitude and causing such varying line-current to actuate electro-magnetic devices to vary proportionally and synchronously the impulses and their amplitude, and a local circuit in which are located electro-magnetic valve-operating devices to control the flow of ink or marking-fluid of the receiving-instrument.

3. In the art of reproducing written characters electro-telegraphically, the method which consists in transmitting over a line-circuit rapid electrical impulses of varying strengths, varying the strength of said impulses by the pressure exerted upon the transmitting-instrument, and operating electro-magnetic devices at the receiving end of the line-circuit by the varying electrical impulses to control the flow of ink or marking-fluid of the the receiving-instrument.



4. In the art of reproducing written characters electro-telegraphically, the method which consists in transmitting over a line-circuit rapid electrical impulses of varying strengths, varying the resistance of the line-circuit and with it the strengths of said impulses by the pressure exerted upon the transmitting-instrument, and operating electro-magnetic devices at the receiving end of the line-circuit by the varying electrical impulses to decrease or increase the flow of ink or marking-fluid of the receiving-instrument synchronously with the increase or decrease of the resistance of the line.

5. In the art of reproducing written characters electro-telegraphically, the method which consists in varying the strength of the line-current formed of rapid impulses by the action of a transmitting-instrument and causing the impulses of the line-current to energize to a varying degree, and an electro-magnetic device controlling the strength of a local circuit formed of rapid impulses by said electro-magnetic device in the line-circuit and operating an electrically-actuated ink or marking-fluid feeding device in a receiving-instrument to vary the flow of said ink or marking-fluid.

6. In the art of reproducing written characters electro-telegraphically, the method which consists in transmitting over the line-circuit electrical impulses by varying the resistance in the line-circuit and simultaneously (by the aid of electro-magnetic devices actuated by said line-current) varying the resistance of a local circuit synchronously with the variations in the resistance of the line-circuit, and by the varying current in the local circuit operating an electro-magnetic fluid-controlling device of a receiving-instrument.

7. In the art of reproducing written characters, the method which consists in supplying current to a line-circuit and controlling the strength of the current by interposing a variable resistance in the operating-circuit, varying the resistance by the pressure of a transmitting-instrument upon a surface, and synchronously operating through the agency of the line-current a receiving-instrument having an electro-magnetically-operated point or marking part to move said marking part of the receiving-instrument in accordance with the varying current transmitted over the line-circuit.

402,415. TELEGRAPHY. MARK W. DEWEY, SYRACUSE, N. Y., assignor, by direct and mesne assignments, to the Dewey Corporation, same place. Filed Oct. 3, 1888. Serial No. 287,040. (No model.)

Claim.—1. An electric telegraph comprising a main-line circuit, a table upon which to trace the message, a transmitting-instrument arranged yieldingly in contact with the table, a current-controller operated by the pressure of the transmitting-instrument upon the table and varying the strength of the current, and a receiving-instrument yieldingly in contact with the sheet to be inscribed and controlled in its degree of pressure upon the sheet by the aforesaid current.

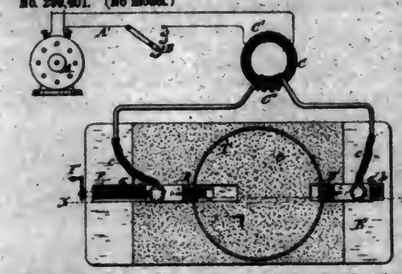
2. In a writing-telegraph, the combination, with the stylus or pen, of a variable resistance attached directly to said stylus or pen and moving with the same over the surface receiving the inscription.

3. In a writing-telegraph, the combination of a table upon which to trace the message, a stylus or pen yieldingly in contact with said table, and a variable resistance carried directly on said stylus or pen and controlled by the pressure of the latter upon the aforesaid table, as set forth.

4. In combination with the table upon which to trace the message, a transmitting stylus or pen consisting of a holder arranged movable laterally over said table and toward and from the same, a marker carried movably on said holder, and a variable resistance operated by the movement of the marker on its said holder.

5. In combination with the table upon which to trace the message, a transmitting stylus or pen consisting of a holder arranged movably laterally over said table and vertically toward and from the same, a marker arranged movably longitudinally on said holder, a carbon on the holder, an electric contact-point on the marker and pressed against the carbon by the inward movement of the marker in the holder, and electric conductors connected with said carbon and contact-point, substantially as described and shown.

6. In a writing-telegraph, the combination, with a main-line circuit, of a branch of said circuit, a reed in said branch, a transmitting stylus or pen consisting of a holder arranged movable laterally over the writing-table and vertically toward and from the same, a marker arranged movably longitudinally in said holder, a carbon on the holder, an electric contact-point on the marker, and electric conductors connected with said carbon and contact-point, substantially as described and shown.



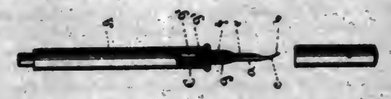
7. In a writing-telegraph having a receiving stylus or pen adapted to conform its movements to the movements of the transmitting stylus or pen in different directions, the main line having a branch including a reed, the transmitting stylus or pen yieldingly in contact with the writing-table, and a combined circuit maker and breaker and variable resistance controlled by the pressure of said stylus or pen upon the surface over which it moves, as set forth.

8. In a receiving-instrument of a writing-telegraph, a reed vibrated with different degrees of amplitude by impulses in a magnet in the main line, a maker and breaker and variable resistance in a local circuit controlled by the difference of amplitude of the said reed, and the receiving stylus or pen having a solenoid included in said local circuit and adapted to raise and lower said receiving stylus or pen by the varied strength in the said local circuit, substantially as set forth.

9. In a receiving-instrument of a writing-telegraph, a reed vibrated with varying degrees of amplitude by impulses in a magnet in the main line, a circuit maker and breaker, and a variable resistance in a local circuit controlled by the difference of amplitude of said reed, the receiving-pen having a solenoid also included in said local circuit and adapted to raise and lower said receiving-pen, and a valve controlling the flow of ink operated by lowering and raising said pen when in contact with the paper, substantially as described and shown.

10. In a telegraphic receiving-instrument, the combination of a bar having an operative end capable of universal movement within one uniform plane, a stylus or pen carried on said operative end of the bar and movable at right angles to the aforesaid plane, an armature connected to the stylus or pen, and an electro magnet or solenoid for moving said armature, as set forth.

402,416. METHOD OF EXPANDING HOOPS OR TIRES. MARK W. DEWEY, Syracuse, N. Y., assignor, by direct and mesne assignments, to the Dewey Corporation, same place. Filed Feb. 11, 1889. Serial No. 299,401. (No model.)

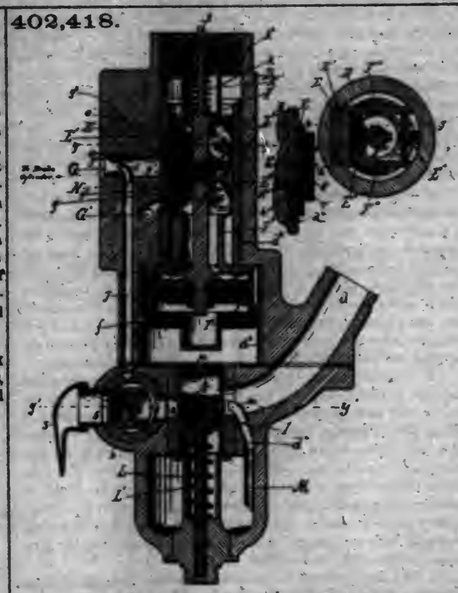


Claim.—1. As a preliminary step in the process of setting hoops or tires, the within-described method of expanding said hoops or tires, consisting in suitably insulating the same and then subjecting the hoops or tires to the heating effect of an electric current, as set forth.

2. The method of heating hoops or tires, consisting in bringing in contact therewith at points diametrically opposite each other the terminals of a low-resistance supply-conductor and passing an electric current of large volume through said conductor and hoop or tire, substantially as set forth.

3. The method of expanding a hoop or tire preparatory to setting the same, consisting in circulating uniformly or substantially uniformly within the entire circumference thereof an electric current of large volume, as set forth.

402,417. FOUNTAIN-PEN. SIMEON D. DIAS, New York, N. Y. Filed July 2, 1888. Serial No. 278,727. (No model.)



Claim.—A fountain-pen having a spring-tongue with its free end bearing against and covering the slit between the nibs of the pen, and also having a continuous ink-reservoir, part of which is in the handle and which extends between the pen and the tongue and to the free end of the latter, substantially as shown and described.

402,418. AIR-BRAKE. THERON S. R. DEVOE, Hyde Park, Ill. Filed Feb. 13, 1888. Serial No. 300,252. (No model.)

Claim.—1. In a fluid-pressure brake mechanism, the combination of the train-pipe, auxiliary reservoir, and brake-cylinder with two exhaust ports or passages from the brake-cylinder to the atmosphere controlled by a governing-valve device provided with means for opening and closing either of said ports or passages at different times, at the will of the engineer, by varying the air-pressure in the train-pipe, substantially as described.

2. In a fluid-pressure brake mechanism, the combination of the train-pipe, auxiliary reservoir, and brake-cylinder with two exhaust ports or passages of different size from the brake-cylinder to the atmosphere, controlled by a governing-valve device provided with means for opening and closing either of said ports or passages at different times, at the will of the engineer, by varying the air-pressure in the train-pipe, substantially as described.

3. In a fluid-pressure brake mechanism, the combination of the train-pipe, auxiliary reservoir, and brake-cylinder with an exhaust port

or passage from the brake-cylinder to the atmosphere and a governing-valve device so provided with ports as to adapt it to open said port or passage upon an increase of train-pipe air-pressure and to close it automatically by the equalization of pressure between the train-pipe and the auxiliary reservoir, substantially as described.

4. In a fluid-pressure brake mechanism, the combination of the train-pipe, brake-cylinder, and auxiliary reservoir with both a main and a second or supplemental exhaust port or passage from the brake-cylinder to the atmosphere, the latter of which is controlled by a valve which is operated by varying the pressure in the train-pipe and which is opened against an opposing spring force, substantially as described.

5. In a fluid-pressure brake mechanism, the combination of a train-pipe, auxiliary reservoir, and brake-cylinder with two exhaust ports or passages from the brake-cylinder to the atmosphere and two valves of different sensitiveness operated by varying the pressure in the train-pipe to control the discharge of air from the brake-cylinder to the atmosphere through said ports or passages, substantially as described.

6. In a fluid-pressure brake mechanism, the combination of a train-pipe, auxiliary reservoir, and brake-cylinder with two exhaust ports or passages of different size from the brake-cylinder to the atmosphere, and a main valve which, while holding the service-port open, holds the larger of said ports or passages closed, and a supplementary valve which, while the main valve holds the service-port open, is capable, by an independent movement, of opening and closing the smaller of said ports or passages, substantially as described.

7. In a fluid-pressure brake mechanism, the combination of the train-pipe, auxiliary reservoir, and brake-cylinder with two exhaust ports or passages of different size from the brake-cylinder to the atmosphere, a non-sensitive valve operated by varying the pressure in the train-pipe to govern the larger of said ports or passages, and a sensitive valve operated by varying the pressure in the train-pipe to govern the smaller of said ports or passages, substantially as described.

8. In a fluid-pressure brake mechanism, the combination of a train-pipe, auxiliary reservoir, and brake-cylinder with two exhaust ports or passages from the brake-cylinder to the atmosphere and a governing-valve device operated by varying the pressure in the train-pipe and adapted to open said ports or passages separately at different positions in its movement, substantially as described.

9. In a fluid-pressure brake mechanism, the combination of a train-pipe, auxiliary reservoir, and brake-cylinder with an ample exhaust port or passage from the brake-cylinder to the atmosphere for quickly releasing the brakes, a valve operated by varying the pressure in the train-pipe and adapted to open said port or passage upon arrival at the inner end of its traverse, a restricted exhaust port or passage from the brake-cylinder to the atmosphere for slowly grading down the brake-pressure, and a valve operated by varying the pressure in the train-pipe adapted to open and close said restricted port or passage, at the will of the engineer, when the governing-valve device is at the service-port, substantially as described.

10. In a fluid-pressure brake mechanism, the combination of a train-pipe, auxiliary reservoir, and brake-cylinder with a governing-valve device having a main valve and supplementary valve operated by varying the pressure in the train-pipe, and with an exhaust port or passage from the brake-cylinder to the atmosphere and an equalizing port or passage from the train-pipe to the auxiliary reservoir, said governing-valve device being adapted to open both of said ports or passages when the main valve is at the service-port and the supplementary valve has been moved inward independently of the main valve, substantially as described.

11. In a fluid-pressure brake mechanism, the combination of a train-pipe and auxiliary reservoir with a governing-valve device having a main valve and supplementary valve operated by varying the pressure in the train-pipe, an equalizing port or passage from the train-pipe to the auxiliary reservoir, arranged and adapted to be open when the main valve is at the service-port and the supplementary valve is moved inward to the extent of its limited independent movement, and a spring acting outwardly to close or nearly close said port or passage when the pressure has substantially equalized between the train-pipe and the auxiliary reservoir, substantially as described.

12. In a fluid-pressure brake mechanism, the combination of the train-pipe, auxiliary reservoir, and brake-cylinder with an ample exhaust port or passage from the brake-cylinder to the atmosphere, a refilling port or passage from the train-pipe to the auxiliary reservoir, and a valve device which opens said ports or passages when the governing-valve is at the inner extremity of its traverse, and with a restricted exhaust port or passage from the brake-cylinder to the atmosphere, an equalizing port or passage from the train-pipe to the auxiliary reservoir, and a valve device which opens and closes said last-named ports or passages when the governing-valve is at the service-port, substantially as described.

13. In a fluid-pressure brake mechanism, the combination of the train-pipe, auxiliary reservoir, and brake-cylinder with a port or passage for locally exhausting from the train-pipe, and with a governing-valve device adapted to open said port or passage upon a preliminary reduction of train-pipe pressure and close it by the movement of the governing-valve device to open the service-port, substantially as described.

14. In a fluid-pressure brake mechanism, the combination of the train-pipe, auxiliary reservoir, brake-cylinder, and governing-valve device with a port or passage for locally exhausting from the train-pipe, which is opened by the movement of a supplementary valve upon a preliminary reduction of train-pipe pressure and closed by the movement of the governing-valve device to open the service-port, substantially as described.

15. In a fluid-pressure brake mechanism, the combination of the train-pipe and auxiliary reservoir with a port or passage for locally exhausting from the train-pipe, and a valve device actuated to open said port or passage upon a reduction in the train-pipe pressure and adapted to automatically close said port or passage by an outward movement, substantially as described.

16. In a fluid-pressure brake mechanism, the combination of the train-pipe and auxiliary reservoir with a valved port or passage for locally exhausting from the train-pipe and a piston and valve operated by the reduction of train-pipe pressure thus produced to close the local exhaust, substantially as described.

17. In a fluid-pressure brake mechanism, the combination of the train-pipe and auxiliary reservoir with two ports or passages of different size for locally exhausting from the train-pipe and a governing-valve device adapted to open said ports or passages at different positions in its movement, substantially as described.

18. In a fluid-pressure brake mechanism, the combination of a train-pipe and auxiliary reservoir with a main valve controlled by varying the pressure in the train-pipe and a supplementary valve having a play in both directions from its normal position with respect to the main valve, substantially as described.

19. In a fluid-pressure brake mechanism, the combination of the train-pipe and auxiliary reservoir with two valves, one of which has with relation to the other a normal position, from which it can be moved in two directions and tends to return automatically to such normal position when relieved from the moving force, substantially as described.

20. In a fluid-pressure brake mechanism, the combination of the train-pipe, auxiliary reservoir, and main valve with a supplementary valve held in normal position with relation to the main valve by the action of opposite spring forces and capable of being moved in both directions from said normal position without necessarily moving the main valve, substantially as described.

21. In a fluid-pressure brake mechanism, the combination of the train-pipe and auxiliary reservoir with a main slide-valve, E, a supplementary slide-valve, E', and a spring or springs, K', adapted to resist the movement of the latter valve in both directions from its normal position with relation to the former, substantially as described.

22. In a fluid-pressure brake mechanism, the combination of the train-pipe and auxiliary reservoir with a port or passage for refilling said reservoir from said pipe, and a piston or valve which normally holds said port or passage restricted to the dimensions of a small equalizing port or passage, but opens the same wide open when the train-pipe pressure is increased for the purpose of refilling said reservoir, substantially as described.

23. In a fluid-pressure brake mechanism, the combination of the train-pipe and auxiliary reservoir with a port or passage for refilling said reservoir from said pipe, a piston or valve for controlling said port or passage, and a spring acting outwardly against said piston or valve, and thereby causing it to hold said port or passage normally restricted to the dimensions of a small equalizing port or passage, but allowing it to yield and open the same wide open when the train-pipe pressure is increased for the purpose of refilling said reservoir, substantially as described.

24. In a fluid-pressure brake mechanism, the combination of the train-pipe and auxiliary reservoir with a port or passage for normally maintaining communication between them, and a piston or valve subject to the outward pressure of a spring for controlling said port or passage and operated by varying the relative pressures of the train-pipe and auxiliary reservoir, the whole being adapted to hold said port or passage restricted to the dimensions of a small equalizing port or passage when the pressures in the train-pipe and auxiliary reservoir are substantially equal to open said port or passage wide open when the train-pipe pressure is slightly increased above that of the auxiliary reservoir and to completely close said port or passage when the train-pipe pressure is slightly reduced below that of the auxiliary reservoir, substantially as described.

25. In a fluid-pressure brake mechanism, the combination of the train-pipe, auxiliary reservoir, brake-cylinder, and governing-valve device with an equalizing port or passage which effects communication between the train-pipe and auxiliary reservoir when the main valve is at the service-port and the supplementary valve is holding said service-port closed, substantially as described.

26. In a fluid-pressure brake mechanism, the combination of the train-pipe, auxiliary reservoir, brake-cylinder, and governing-valve device with two equalizing ports or passages from the train-pipe to the auxiliary reservoir, one of which is adapted to come into action when the governing-valve device is in its normal position and the other when the main valve is at the service-port and the supplementary valve is holding the latter closed, substantially as described.

27. In a fluid-pressure brake mechanism, the combination of the brake-cylinders, auxiliary reservoirs, controlling-valve devices, and the train-pipe with two main compressed-air reservoirs controlled by a cock or cocks for the admission of fluid-pressure into the train-pipe from either of said reservoirs at the will of the engineer, substantially as described.

28. In a fluid-pressure brake mechanism, the combination of the brake-cylinders, auxiliary reservoirs, controlling-valve devices, and the train-pipe with two main compressed-air reservoirs, and with a controlling cock or valve which, at different positions of its movements, successively puts them into communication with the train-pipe, substantially as described.

29. In a fluid-pressure brake mechanism, the combination of the brake-cylinders, auxiliary reservoirs, controlling-valve devices, and the train-pipe with two main compressed-air reservoirs, and with a controlling cock or valve provided with two ports, one of which when open discharges the contents of one main reservoir into the train-pipe and the other of which when open discharges the contents of the other main reservoir into the train-pipe, substantially as described.

30. In a fluid-pressure brake mechanism, the combination of the brake-cylinders, auxiliary reservoirs, controlling-valve devices, and the train-pipe with two main compressed-air reservoirs and a controlling cock or cocks, and with separate passages leading from said reservoirs to said cock or cocks, one of which passages is provided with a reducing-valve and the other is without a reducing-valve, substantially as described.

31. In a fluid-pressure brake mechanism, the combination of a train-pipe, two main reservoirs, an air-pump, and a controlling cock or valve with two passages, *o o'*, a reducing-valve, and a check-valve, o^3, substantially as described.

32. In a fluid-pressure brake mechanism, the combination of the brake-cylinders, auxiliary reservoirs, controlling-valve devices, and the train-pipe, two main compressed-air reservoirs, and passages *o o'* Q with a way-cock, P, provided with a through-port, *p*, and valve-surfaces $p' p^3$, adapted to operate with relation to said passages substantially as described.

33. In a fluid-pressure brake mechanism, the combination of the train-pipe, auxiliary reservoir, brake-cylinder, and governing-valve device with two main reservoirs communicating with the train-pipe by independent passages, and with a way-cock, P, provided with a through-port, *p*, and valve-surfaces $p' p^3$, and having the edges of said valve-surfaces rounded or beveled, as shown at *v v'*, substantially as described.

34. In a fluid-pressure brake mechanism, the combination of the train-pipe, auxiliary reservoir, brake-cylinder, and governing-valve device having a main valve and supplementary valve with an air port or passage, H, leading from the train-pipe to the face of the main valve, an exhaust-port, G', communicating with the face of the main valve, a main valve provided with two through-ports which, when it is at its normal position, open into the passages H and G', respectively, and a supplementary valve which, when in its normal position with relation to the main valve, holds said through-ports out of communication with each other, but provided with a recess or passage which, in case of an outward movement of the supplementary valve with relation to the main valve, puts said through-ports into communication with each other, substantially as described.

35. In a fluid-pressure brake mechanism, the open duct J, extending from an air-space behind the piston 6 to the passage G, which leads from the auxiliary reservoir to the brake-cylinder, and arranged to act as an ejector or siphon to reduce the air-pressure behind said piston while air is flowing violently from the auxiliary reservoir to the brake-cylinder, substantially as described.

36. In a fluid-pressure brake mechanism, the combination of the chamber J', the open duct J, and nozzle *j* with the piston 6 and passage G, substantially as described.

37. In a fluid-pressure brake mechanism, the combination of the chamber J', the piston 6, the open duct J, nozzle *j*, and passage G, having its diameter reduced at the end of the nozzle, substantially as described.

38. In a fluid-pressure brake mechanism having means for suddenly exhausting the train-pipe through a valved port, 2, in the act of applying the emergency-stop, the enlarged stem L, provided with the ample transverse passage N, arranged to come in line with the train-pipe and port aforesaid and afford a direct and unobstructed exhaust-passage for the train-pipe air when the governing-valve is at the emergency-port, substantially as described.

39. In a fluid-pressure brake mechanism, the open duct M, extending from a lower recess of the valve-casing to an exhaust-passage through which the air is discharged at great velocity, and arranged to act in the manner of an ejector or siphon to draw up and discharge collected water, substantially as described.

40. In a fluid-pressure brake mechanism, the combination of the main valve E, having the ports *e g g'*, with a supplementary valve, E', having the passage g^3, substantially as described.

41. In a fluid-pressure brake mechanism, the combination of the main valve E, having the ports *e g g'*, with a supplementary valve, E', having the passage g^3, and with a spring, K', substantially as described.

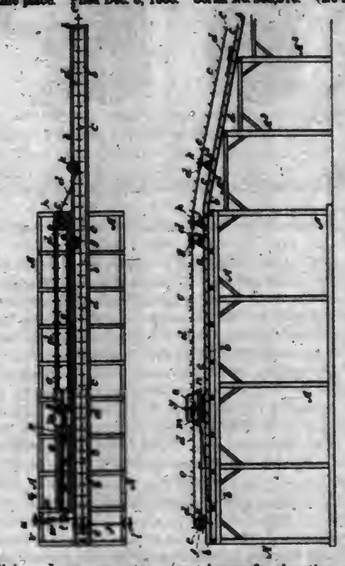
42. In a fluid-pressure brake mechanism, the combination of the main valve having an elongated exhaust-passage, *g*, with a supplementary valve having an elongated exhaust-passage, g^3, substantially as described.

43. In a fluid-pressure brake mechanism, the combination of a casing having the passages G G', and a main valve having the ports *e g g'*, and a supplementary valve having the port g^3, substantially as described.

44. In a fluid-pressure brake mechanism, the combination of a casing having the passages G G', and a main valve having the ports *e g g'*, and a supplementary valve having the port g^3, and a spring, K', tending to hold the supplementary valve in a normal position with respect to the main valve, but allowing it to be moved in both directions therefrom by the application of sufficient force, substantially as described.

45. In a fluid-pressure brake mechanism, the combination of a main valve having a surface-channel, *g*, in communication with the exhaust-port G', and a supplementary valve having an internal passage, g^3, open at both ends to the face of the valve, substantially as described.

46. In a fluid-pressure brake mechanism, the combination of a casing having opposite passages, 2 *d*, through its walls, and a spring-stem, L, enlarged to fill the casing between said passages and provided with a tapering opening through it in the plane of said passages, the larger end of said opening being on the side toward the passage *d* and always in communication therewith, and with an air-chamber at the outer end of the governing-valve device, substantially as described.



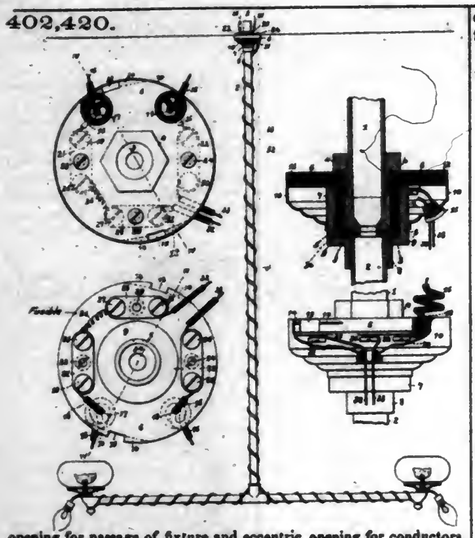
47. In a fluid-pressure brake mechanism, the combination of the local outlet-port 5 with the elastic tubular dust-shield S, substantially as described.

48. In a fluid-pressure brake mechanism, the combination of the two valves E E' with the spring K', the spring-holding device *k*, attached to the main valve, and the plates $k' k^2$ at the ends of the spring and operated by the piston-stem to compress the spring in both directions, substantially as described.

49. In a fluid-pressure brake mechanism, the combination of the two main reservoirs, an air-pump, a passage leading from the air-pump to one of said reservoirs, and a passage leading from the air-pump to the other of said reservoirs and provided with a reducing-valve, substantially as described.

50. In a fluid-pressure brake mechanism, the combination of the two main reservoirs, air-pump, train-pipe, way-cock or engineer's valve, and passages leading from each of said reservoirs to said cock or valve, with a passage leading from one to the other of said reservoirs and provided with a check-valve, whereby the turning of said cock or valve to one position will vent air from one only of said reservoirs to the train-pipe, and to another position will vent air from the other reservoir to the train-pipe until the pressure in the two reservoirs is equalized, and will then vent from both of said reservoirs to the train-pipe, substantially as described.

402,419. APPARATUS FOR UNLOADING BOATS. JAMES M. DODGE, Philadelphia, Pa., assignor to the Dodge Coal Storage Company, same place. Filed Dec. 3, 1888. Serial No. 292,516. (No model.)



Claim.— In an apparatus or contrivance for elevating and conveying coal or other material, the combination of the following instrumentalities, viz: first, a conveyer-trough mounted upon and supported by suitable frame-work, as specified; second, the conveyer-chain provided with suitable flights which co-operate with said trough and doubled on itself in a plane transverse to that in which lie those portions of the upper and lower runs of the chain, the flights of which lower run coact with the conveyer-trough; third, a suitable driving sprocket-wheel in engagement with said chain and that is mounted on a fixed axis of motion, as specified; fourth, a series of idler sprocket-wheels over which the loops or contractive turns of the chain are made, and which are in a plane transverse to that in which are located the upper and lower runs of the chain, the flights of which lower run travel in the trough, and, fifth, a take-up device and means for operating the same, the whole adapted to operate in substantially the manner and for the purpose hereinbefore set forth.

402,420. INSULATING CUT-OUT JOINT. HARRY M. DOUBLEDAY and RUSSELL DOUBLEDAY, Pittsburg, Pa. Filed Sept. 18, 1888. Serial No. 285,732. (No model.)

Claim.—1. In a combined insulating-joint and cut-out for electric lamps, the combination of a gas-pipe terminal, 1, sleeve 3, screwing on the terminal, insulating-jacket 5, screwing on the sleeve 3 and having flange 6, for carrying the connectors and cut-out, and outer sleeve, 7, screwing on the insulator 5 and having shoulder 9 and neck 8, the fixture 2, screwed into said neck, the gasket 34, supported by shoulders 9 and impinged by sleeve 3 and end of fixture 2, the cap 10, secured to the flange 6 and having the central opening for passage of the joint, and an eccentric opening in which is the bushing 11, through which the lamp-supplying conductors 32 33 pass from the connectors, as hereinbefore set forth.

2. The combination, with the gas-pipe terminal 1 and gas-fixture 2, of the interposed insulating-joint and cut-out consisting of sleeve 3, screwed on the terminal, insulating-jacket 5, screwed on the sleeve and carrying the supply-wires, connectors, cut-out, and lamp-wires, the outer sleeve, 7, screwed on the insulator and supporting the gas-fixtures, and cap 10, for concealing the connectors, having central

402,420.

opening for passage of fixture and eccentric opening for conductors, as set forth.

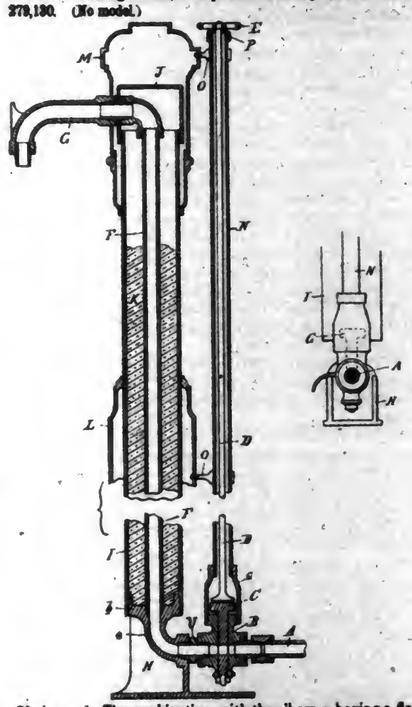
3. The combination of a suitable support, 1, sleeve 3, screwing on said support, insulating-jacket 5, screwing on sleeve 3, and cap 10, surrounding the insulator, having a central opening for the joint, said insulator having suitable electrical connections and carrying the cut-out, and the lamp-conductors passing through an eccentric opening in the cap, all substantially as herein described.

4. The combination, with the terminal 1 and gas-fixture 2, of an insulating-jacket carried by the terminal, a sleeve carried by the insulator and supporting the gas-fixture, and a transverse surrounding flange, 6, formed on the insulating-sleeve and carrying the cut-out, and connections whereby the electric lamp is connected on the opposite side of the insulator from the terminal, as fully explained.

5. In combination with a gas-fixture supply-pipe, a screw-threaded insulating-sleeve having a passage therethrough interpolated between two portions of the fixture and having a broad insulating surrounding flange formed integrally therewith for supporting the connections for an electric lamp, whereby a continuous passage for gas is maintained without affording ground-connection for leakage.

6. In combination with a gas-fixture, an insulating-sleeve interposed between two parts of the fixture to completely insulate them, said insulator having a broad lateral insulating-flange formed integrally therewith, supporting the cut-out and other connectors for an electric lamp, as shown and described.

7. In an insulating-joint and cut-out, the combination, with an insulating-support, 6, carrying the conductors, as explained, and having a cylindrical portion for coupling the gas fixture and pipe, of a cap, 10, having a central opening for the passage of the fixture and an opening without the center for the passage of the lamp-conductors, as explained.

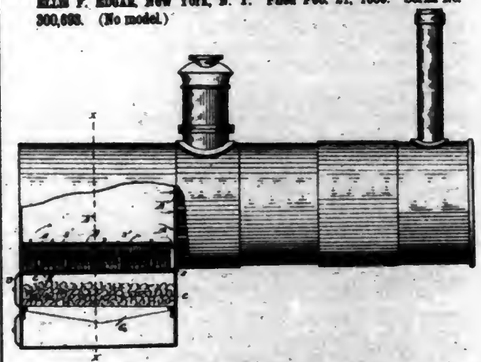


8. In a cut-out for electric lamps, the combination, with the support 8, carrying the electrical connections and lamp-supplying conductors 32 33, of a cap, 10, having a passage for the conductors 32 33 and secured to the support by bayonet-joints extending from said recess, the said conductors being secured to the support to one side of their passage through the cap, whereby upon being bent they form an effective stop to the movement of the cap, as explained.

9. In a cut-out for electric lamps, the combination, with the support carrying the cut-out wire and suitable connectors, of the lamp-supplying wires depending from the support and the cap fitting over the support and secured thereto by a catch and having an eccentric opening for the lamp-wires, the said lamp-wires being attached to the support on opposite sides of the opening through which they pass, whereby they prevent the movement and consequent disengagement of the cap, as explained.

10. In a combined insulating-joint and cut-out for electric lamps, the combination, with the insulating-support 6, from which depend the lamp-conductors, of a cap, 10, having an eccentric passage for said conductors, a central passage for the joint, and an insulating-bushing, 11, screwed into said eccentric passage, as set forth.

11. The combination, with a gas-fixture and electric lamps supported on the same, of a combined cut-out and insulating-joint interposed in the fixture, consisting of an integral screw-threaded insulating-sleeve and broad annular flange carrying cut-out wires and electrical connection between the cut-out and lamps, as and for the purpose set forth.

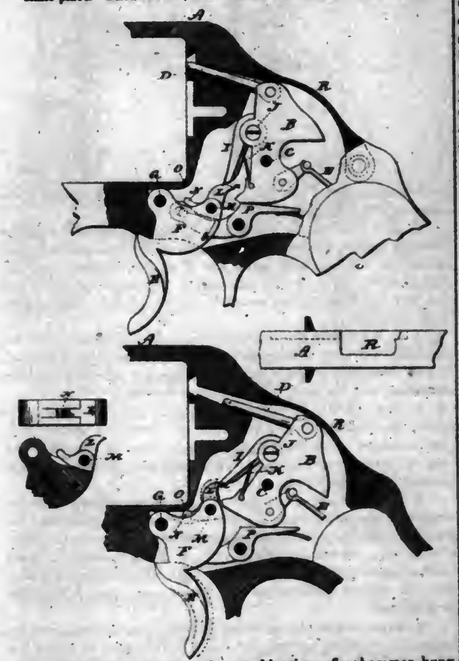


402,421. HYDRANT. JOHN F. DURHAM, Detroit, Mich., assignor of one-half to George Bliss, same place. Filed July 5, 1888. Serial No. 279,130. (No model.)

Claim.—1. The combination, with the elbow *a*, having a flange, *b*, of the delivery-pipe E, set into the orifice of the elbow *a* and extending with an unobstructed discharge to the nozzle, the casing I, screwed water-tight to the outside of the flange, the non-conducting impervious material set between them, and the connection with the shut-off cock below the union of the elbow and delivery-pipe, substantially as described.

2. The combination, with the elbow *a*, having a flange, *b*, and both ends of its passage screw-threaded, the delivery-pipe screwed into one end thereof, the casing I, screwed water-tight to the same, the impervious non-conducting filling between the two, the shut-off cock B, the union U, connecting the shut-off cock to the elbow, the coupling *c*, secured water-tight to the shut-off cock, the casing N, screwed water-tight into the coupling *c*, and the valve-rod D, passing through the casing N and operating the shut-off cock, substantially as described and shown.

402,422. PROCESS OF BURNING CARBONACEOUS MATERIAL. ELLIS F. EDGAR, New York, N. Y. Filed Feb. 21, 1889. Serial No. 300,698. (No model.)



Claim.—1. The process of producing heat by igniting a mass of fuel, passing the flame, gas, and unconsumed particles thereof between the interstices of a mass of small pieces of highly-heated incombustible material, introducing air by separate passage-ways evenly and generally throughout the interstices of said mass, there combining it with the unconsumed material of fuel passing through said interstices, and there igniting the combined mixture by the heat of said incombustible mass, substantially as set forth.

2. The process of producing heat by igniting a mass of fuel, passing the flame, gas, and unconsumed particles thereof between the interstices of a mass of small pieces of incombustible material, which said interstices are smaller at the point farthest from the fuel than at that nearest to it, and which material is thereby highly heated, introducing air by separate passage-ways evenly and generally throughout the interstices of said mass, there combining it with the unconsumed particles of fuel and gas passing through said interstices, and igniting the combination by the heat of said incombustible mass, substantially as set forth.

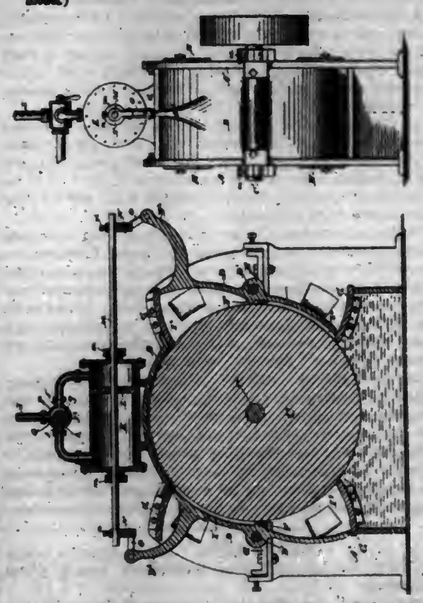
3. The process herein described of burning carbonaceous material by first locating a mass of incombustible material in the line of draft to the chimney, then causing the gases from the combustion-chamber to enter said mass, retarding their progress and causing them to take a circuitous route, then supplying air to said retarded gases in finely and evenly distributed quantities, whereby the mixture of the air and gases is brought in contact with highly-heated mass of the incombustible material, as set forth.

4. The process herein described of burning carbonaceous material, consisting in passing the products of combustion through a highly-heated mass of refractory incombustible material, and introducing atmospheric air finely divided into said mass in such manner that it is evenly and generally distributed throughout the mass and in this state meets and mingles with the products of combustion, whereby perfect combustion takes place, as set forth.

402,423. LOCK FOR FIRE-ARMS. CARL J. ERESS, Hartford, Conn., assignor to the Colt's Patent Fire Arms Manufacturing Company, same place. Filed Jan. 14, 1889. Serial No. 296,323. (No model.)

Claim.—1. In a fire-arm, the combination of a hammer hung upon a pivot in a frame, a trigger hung forward of the hammer, a dog hung upon the trigger in rear of its pivot, the nose of the dog extending upward, a shoulder on the trigger to arrest the rear movement of the dog, a tail extending forward from the dog, the nose of the dog adapted to engage the hammer on the pull of the trigger, and a stationary bearing in the frame in the path of the tail of the dog, and against which bearing the tail of the dog will strike as the hammer is brought to the full-cocked position and before its release, substantially as described.

2. In a fire-arm, the combination of the hammer B, hung upon a pivot in the frame, a strut, I, hinged to the hammer above and forward of its pivot, the said strut extending downward and provided with a spring the tendency of which is to turn the strut forward, the trigger F, hung in the frame forward of the hammer, the dog L, hung upon the trigger in rear of its pivot, the trigger constructed with a bracing, *b*, against which the dog rests in its normal position, the dog extending upward, its nose adapted to engage the lower end of said strut and provided with a forwardly-projecting tail, N, and a stationary bearing, O, in the frame in the path of the tail of the dog, substantially as and for the purpose described.



402,424. CARTRIDGE-FEED PACK FOR REVOLVERS. CARL J. ERESS, Hartford, Conn., assignor to the Colt's Patent Fire Arms Manufacturing Company, same place. Filed Feb. 4, 1889. Serial No. 298,576. (No model.)

Claim.—1. In a cartridge-pack, a ring constructed with an internal flange at one end and with an annular groove upon the inside, adjacent to the flange, the diameter of the ring contracted toward the opposite end, combined with a plug adapted to be inserted from the flange end of the ring, the head end of the plug constructed with an annular shoulder adapted to bear against the inner edge of the cartridge-heads as they rest in the groove on the ring, and the plug near its inner end adapted to bear against the inner side of the cartridges near the points, substantially as described.

2. In a cartridge-pack, a ring constructed with an internal flange at one end and with an annular groove upon the inside adjacent to the flange, the diameter of the ring contracted toward the opposite end, combined with a plug adapted to be inserted from the flange end of the ring, the head end of the plug constructed with an annular shoulder adapted to bear against the inner edge of the cartridge-heads as they rest in the groove of the ring, the plug near its inner end adapted to bear against the inner side of the cartridges near the points, and the inner end of the plug constructed corresponding to the center at the rear end of the cylinder, and so that the said rear center of the cylinder serves as a guide in the arrangement of the pack upon the cylinder, substantially as described.

402,425. WOOD-GRINDER FOR PULP-MAKING. BERNARD BIELER, Jr., Rochester, N. Y. Filed July 9, 1888. Serial No. 279,432. (No model.)

Claim.—1. The combination, with a grinding-cylinder, of two or more stock-pressing surfaces or plates for feeding material to the cylinder, connected for simultaneous operation in opposite directions relative to the portions of the cylinder-surface with which they co-

operate, and a motor connected to said plates for causing their positive operation in both directions, substantially as described.

2. The combination, with a grinding-cylinder, of two pivoted stock-pressing surfaces or plates for feeding material to the cylinder, connected for simultaneous operation in opposite directions relative to the portions of the surface of the cylinder with which they co-operate, and a motor connected to said plates for causing their positive operation in both directions, substantially as described.

3. The combination, with a grinding-cylinder, of two pivoted presser-plates for feeding material to the cylinder, both ends of each plate being adapted to be brought alternately in proximity to the cylinder-surface, connections between the plates for causing their simultaneous operations on the pivots, and a motor for causing the positive movements of the plates, substantially as described.

4. The combination, with a grinding-cylinder, of two pivoted presser-plates for feeding material to the cylinder, both ends of each plate being adapted to be brought alternately into proximity to the cylinder-surface, connections between the proximate ends of the plates for causing their movements in the same direction, and a motor for causing the positive movements of the plates in both directions, substantially as described.

5. The combination, with a grinding-cylinder, of two pivoted presser-plates for feeding the material to the cylinder, located on opposite sides of the same, both ends of each plate being adapted to be brought alternately in proximity to the cylinder-surface, connections between the corresponding ends of the plates, and a motor connected to the plates for causing their positive movements in both directions, substantially as described.

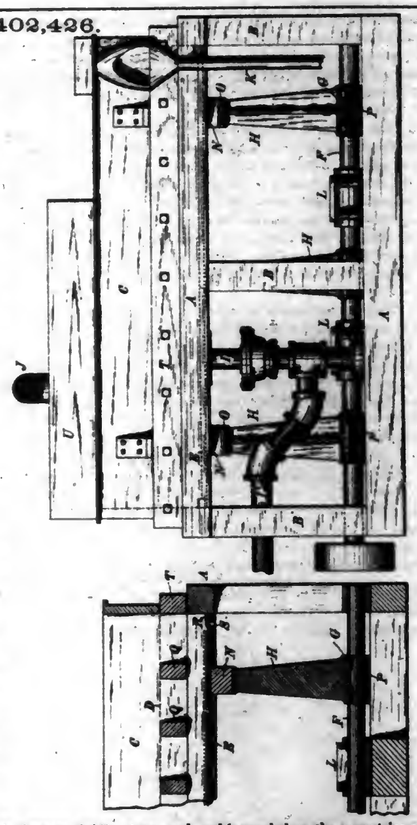
6. The combination, with a grinding-cylinder, of two pivoted presser-plates for feeding material to the cylinder, located on opposite sides of the same, both ends of each plate being adapted to be brought alternately into proximity to the cylinder-surface, a rod connecting the corresponding ends of the plates, and a motor for causing the positive movements of the rod in opposite directions, substantially as described.

7. The combination, with a grinding-cylinder, of two pivoted presser-plates for feeding material to the cylinder, both ends of each plate being adapted to be brought alternately into proximity to the cylinder-surface, a rod connecting the proximate ends of the plates, a piston connected to said rod, a cylinder in which the piston operates, and valve mechanism for admitting pressure on opposite sides of the piston to operate it positively in both directions, substantially as described.

8. The combination, with the grinding-cylinder, of a pivoted presser-plate both ends of which are adapted to be brought alternately into proximity to the cylinder-surface, and a motor connected to the plate for moving it on its pivot, substantially as described.

9. The combination, with a grinding-cylinder, of a pivoted presser-plate both ends of which are adapted to be brought alternately into proximity to the cylinder-surface, and adjustable bearings in which the plate is pivoted located substantially in the plane of the axis of the cylinder, and adjustable toward and from said cylinder, substantially as described.

10. The combination, with the grinding-cylinder, of a pivoted presser-plate both ends of which are adapted to be brought alternately into proximity to the cylinder-surface, the pivotal point of the plate being substantially in the plane of the cylinder-axis, and a rib on the plate on the side next the cylinder, substantially in line with the plate-bearings, substantially as described.



11. The combination, with the main casing having a series of feeding-apertures and the grinding-cylinder located therein, of two presser-plates for feeding material to the cylinder pivoted to the casing, both ends of each plate being adapted to be brought alternately into proximity to the cylinder-surface, a pressure-cylinder secured to the casing, a piston operating therein, and a piston-rod extending out at opposite ends, and links forming the connection between the rod ends and the presser-plates, substantially as described.

12. The combination, with the casing having the feeding-apertures and the grinding-cylinder therein, of the presser-plates for feeding material to the cylinder pivoted to the casing, both ends of each plate being adapted to be brought alternately into proximity to the grinding-cylinder surface, connections between the presser-plates for causing their simultaneous operations, and the segmental plates secured to the casing at the ends of the presser-plates, constituting the ends of the chambers in which they operate, substantially as described.

402,426. PAPER-PULP SCREEN. BERNARD EILERS, Jr., Rochester, N. Y. Filed Oct. 5, 1887. Renewed Mar. 6, 1889. Serial No. 302,196. (No model.)

Claim.—1. In a machine for screening pulp, the combination, with the trough and the screen located therein, of the vibratory bottom secured to the trough at its edges by flexible material, and the shaft having two or more eccentrics thereon, and the rods secured to

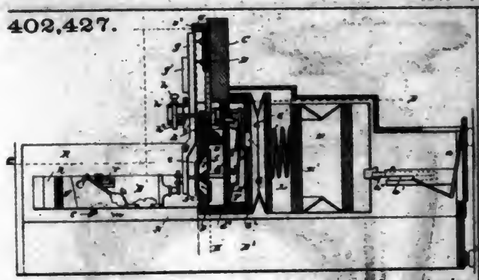
402,426.

the bottom rigidly at one end and journaled on the eccentrics at the other, substantially as described.

2. In a machine for screening pulp, the combination, with the vibrating bottom, of the shaft having two or more eccentrics formed thereon in line with each other and of smaller diameter than the shaft, and the arms or rods attached to the bottom at their upper ends and journaled on the eccentrics at their lower ends, substantially as described.

3. In a machine for screening pulp, the combination, with the screen, the vibrating bottom, and means for vibrating it, of the outlet-pipe connected to the bottom, the stationary pipe, and a flexible connection between them, substantially as described.

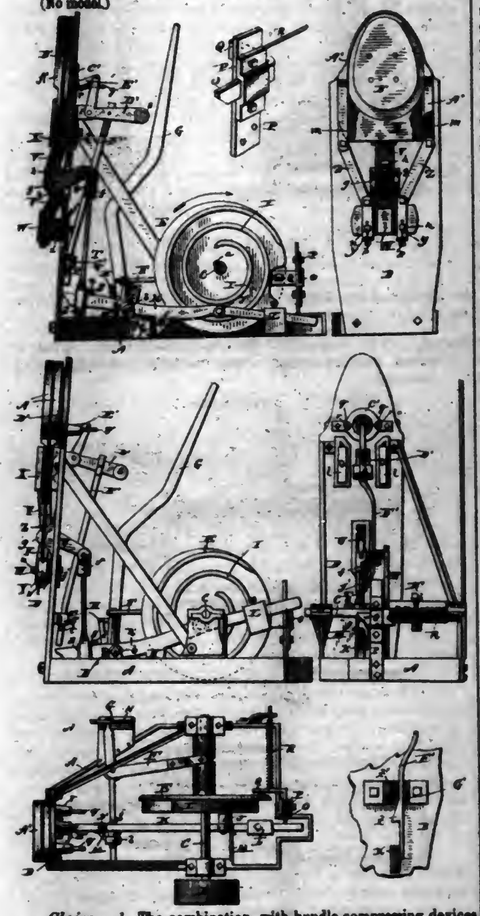
4. In a machine for screening pulp, the combination, with the screen, the vibrating bottom, and means for vibrating it, of the outlet-pipe connected to the bottom, the stationary pipe, an extensible connection between the two, and a trap located in said stationary pipe, substantially as described.



5. In a machine, for screening pulp, the combination, with the receptacle, the screen located therein, the vibrating bottom, and the flexible connection with the receptacle, of the shaft having the eccentries thereon, the rods connected rigidly to the bottom and journaled on the eccentrics, the outlet-pipe attached to the bottom, the stationary pipe, and the flexible connection between said pipes, substantially as described.

6. In a machine for screening pulp, the combination, with the screen, the vibrating bottom, and means for vibrating it, of the outlet-pipe connected to the bottom, the stationary pipe having a trap therein, and the diaphragm connected to the movable and stationary pipes, substantially as described.

402,427. COMBINED PIANO AND HARMONIUM. JACOB W. ERBE, Bischach, Saxony, Germany. Filed Sept. 28, 1883. Serial No. 286,680. (No model.) Patented in Germany Feb. 18, 1883. No. 23,201.



Claim.—In a combined piano and harmonium, as hereinbefore described, the decrescendo mechanism consisting of the folding parts P P, sliding piece Q, lever *p p'*, acoustic hammer or anvil covered with felt, *r*, and a cam-shaped bow, *s'*, mounted in the frame B of the mechanism, substantially as described, for reducing the intensity of the tones of the piano or for entirely arresting the action of the hammers upon

402,427.

the string or chords and drawing back the frame of the mechanism, as set forth.

402,428. MACHINE FOR BUNDLING KINDLING-WOOD. JONAS FISCHER, Williamsport, Pa. Filed Aug. 9, 1888. Serial No. 282,347. (No model.)

Claim.—1. The combination, with bundle-compressing devices and a pivoted lever, K, connected to the compressing devices by means of a connecting-rod, of the drive-shaft and a rotating disk upon the shaft, this disk being provided with a spiral cam upon its face adapted to engage with the said pivoted lever and gradually elevate the same, substantially as described.

2. The combination of bundle compressing and forming devices, a pivoted lever connected to and operating the said compressing devices, a weight on the said lever, a pin, J, secured on the lever, a sliding cam-wheel adapted to elevate the rear end of the lever, and an automatic locking-bar adapted to hold the rear end of the said lever in an elevated position, as and for the purposes set forth.

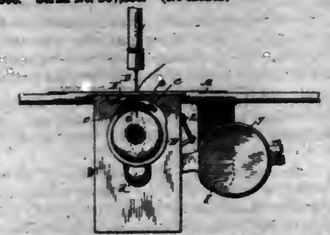
3. The combination of bundle compressing and forming devices, a rod, T, connected to the compressing devices, a pivoted weighted lever, K, a clip, S, pivotally connected to the lower end of the said rod and adjustably connected to the said lever K, and means for elevating the rear end of the said lever K, substantially as described.

4. The combination, with bundle-compressing devices, of the pivoted lever K, connected to the bundle-compressing devices and provided with a weight, a cam-wheel for elevating the rear end of this lever, and a sliding beveled locking-bar adapted to hold the said lever in an elevated position, substantially as described.

5. The combination, with the bundle-compressing devices, of the pivoted weighted lever connected to the bundle-compressing devices, a cam for elevating the rear end of the said lever, and an automatic spring-actuated locking-bar provided with a beveled nose, the said bar being provided with a lateral arm, as and for the purposes herein set forth.

6. The combination, with compressing devices, of an ejector-plate, weighted angle-lever pivotally connected to the ejector-plate, a depending rod, F', attached to the angle-lever, a pivoted weighted lever, K, for elevating this rod F', and means for operating the said lever K, substantially as described.

7. The combination of ejector-plate, pivoted angle-lever connected to the same, a depending rod, F', connected to the angle-lever, the lower end of this rod being provided with a beveled lug, *f*, a confining loop or box, G, for the lower end of this rod F', and a pivoted lever for elevating the said rod F', substantially as described.



8. The combination of the sliding former X, the sliding cross-head W, means for moving these parts in opposite directions, yokes A' A', embracing the former X, and pivotal links Z, for connecting the said yokes with the cross-head W, substantially as described.

9. The combination of the sliding former X, the sliding cross-head W, toggle-levers for forcing these parts in opposite directions, spring-yokes A' A', embracing the former X, and pivotal links connecting the ends of the yokes with the cross-head, substantially as described.

10. The combination of a former, X, provided with beveled lugs *m m* on its vertical edges, spring-yokes A' A', embracing the said former and lugs, a sliding cross-head, pivotal links Z Z, connecting the cross-head to the spring-yokes, and means for forcing the cross-head in a downward direction, substantially as described.

11. The combination, with a former, of vertically-movable and laterally-expansible yokes embracing the said former, lugs or projections for expanding the said yokes, pivoted links connected to the said former, and means for operating the yokes, substantially as set forth.

402,429. OSCILLATING LOOP TAKER AND SPREADER FOR SEWING-MACHINES. JOSEPH L. FOLLETT, Brooklyn, N. Y. Filed Oct. 4, 1888. Serial No. 287,233. (No model.)

Claim.—1. The combination of the oscillatory hook and the oscillating spreader pointed and moving in a direction opposite to that in which the hook is pointed and moves, substantially as and for the purposes hereinbefore set forth.

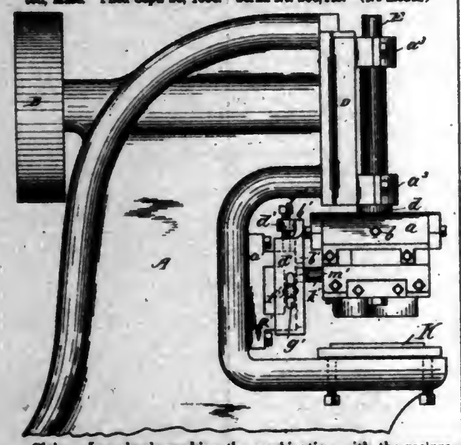
2. The combination of the oscillating hook, the retainer moving in unison with the hook, and the oscillating spreader pointed and moving in a direction opposite to that in which the hook is pointed and moves, substantially as and for the purposes hereinbefore set forth.

3. The combination of the bobbin case or holder for the under thread, the oscillating hook, the retainer moving in unison with the hook, and the oscillating spreader pointed and moving in a direction opposite to that in which the hook is pointed and moves, substantially as and for the purposes hereinbefore set forth.

4. The combination of the cloth-plate, the needle, the oscillating hook, and the oscillating spreader pointed and moving in a direction opposite to that in which the hook is pointed and moves and interposed between the hook and the cloth-plate, substantially as and for the purposes hereinbefore set forth.

402,430. MECHANICAL MOVEMENT. JOSEPH L. FOLLETT, Brooklyn, N. Y. Filed Nov. 10, 1888. Serial No. 290,413. (No model.)

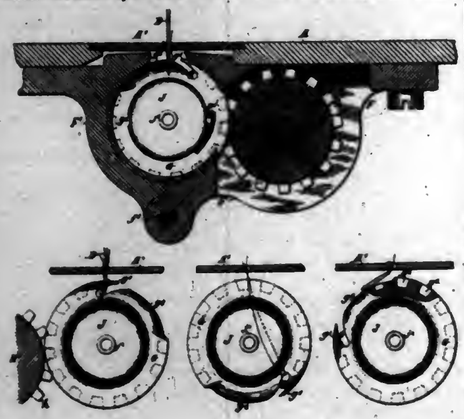
Claim.—1. The combination, with the arm A, oscillatory upon an axis, 1, of the vibratory bar C, connected directly to arm A at *a*, with its axis 2 on or nearly on a circle described from axis 1 with a radius, 1 *a*, and means for vibrating said bar C, substantially as hereinbefore set forth.



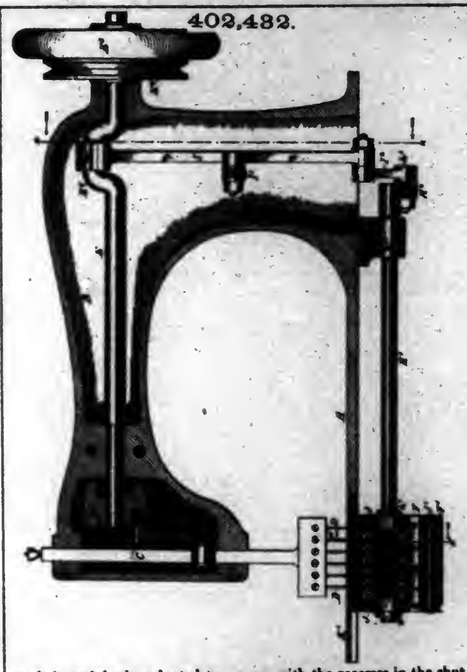
402,430.

2. The combination of the oscillatory arm A, the main vibrating bar C, having its axis 2 on or nearly on a circle described from axis 1 of arm A with 1 *a* as a radius, and the auxiliary vibrating bar D, having its axis 3 in line with axes 2 1, substantially as and for the purposes hereinbefore set forth.

3. The combination of a rotary shaft, B, the arm A, the main vibrating bar C, having its axis located with reference to arm A, as specified, the auxiliary vibrating bar D, having its axis in the same line with those of arm A, and bar C, and an eccentric or crank and connecting-rod for imparting movement from the shaft B to bar D, substantially as and for the purpose hereinbefore set forth.



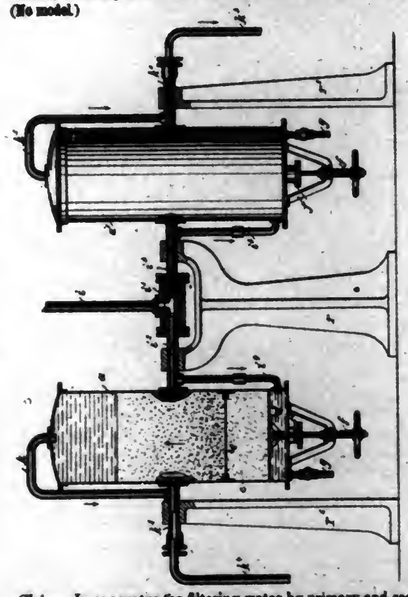
402,431. SHOE-SHANK MACHINE. WILLIAM H. FOWLER, Newton, Mass. Filed Sept. 26, 1888. Serial No. 286,445. (No model.)



Claim.—In a shank-machine, the combination, with the reciprocating piece or head *a*, of the knife-carrying blocks pivoted thereto and provided with studs *k'*, and the cam-plate *b'*, having the cam-slots *k'*, into which the said studs extend, substantially as set forth.

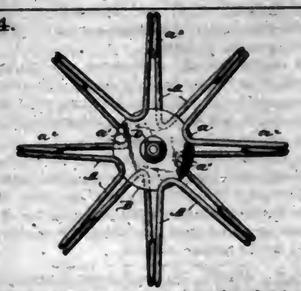
402,432. SEWING-MACHINE. MARSHALL GARDNER, Aurora, Ill., assignor to Thomas H. Ball and James Stone, same place, and Simon Florsheim, Chicago, Ill. Filed July 8, 1887. Serial No. 243,734. (No model.)

Claim.—The combination, with a plurality of reciprocating needles, of a series of circular revolving hooked shuttles moving in planes parallel with planes passing through the vertical axes of the needles at right angles to the common axes of the shuttles, circular guides or bearings engaging the margins of said shuttles, said shuttles having recesses formed in their peripheries, and revolving driving-wheels mounted upon one side of the shuttle and having teeth formed



402,432.

on their peripheries adapted to engage with the recesses in the shuttles whereby the same are driven, substantially as described.

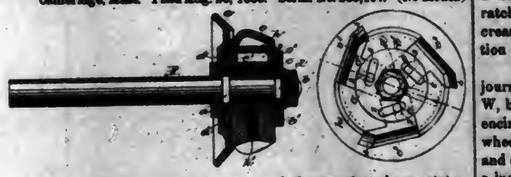


402,433. APPARATUS FOR FILTERING WATER. GEORGE D. GIBSON, Hamburg, Germany. Filed Dec. 4, 1888. Serial No. 292,611. (No model.)

Claim.—In apparatus for filtering water by primary and secondary filtration, the combination of turnable primary and secondary filtering vessels *a a'* and *b b'*, arranged in series, with the three-way cocks *i*, *l*, *l'*, and *n*, the conducting-pipes, and hollow trunnions, substantially as and for the purpose specified.

402,434. FURNITURE-SPRING. ALEXANDER M. GJERVARD, Christiania, Norway. Filed Feb. 23, 1888. Serial No. 265,077. (No model.) Patented in Norway Jan. 3, 1888, No. 773; in Sweden Jan. 31, 1888, No. 1,300; in England May 11, 1888, No. 7,088, and in France June 4, 1888, No. 180,986.

402,434.



Claim.—1. A spring consisting of a plurality of spring-arms bent into or substantially into the form of a half-ellipse and arranged to converge toward a common center, said spring being constructed of a single or continuous wire, substantially as described.

2. A spring consisting of a plurality of spring-arms converging toward a common center, each spring-arm comprising two members or branches bent into or substantially into the form of a half-ellipse, and having one or more convolutions formed in the members thereof at a point or points intermediate of the extremes of such branches, substantially as and for the purposes specified.

3. A spring consisting of a plurality of spring-arms converging toward a common center, each spring-arm comprising two members or branches bent into or substantially into the form of a half-ellipse, and having one or more convolutions formed in the members thereof at a point or points intermediate of the extremes of such arms, said spring being made of a single or continuous wire, substantially as and for the purposes specified.

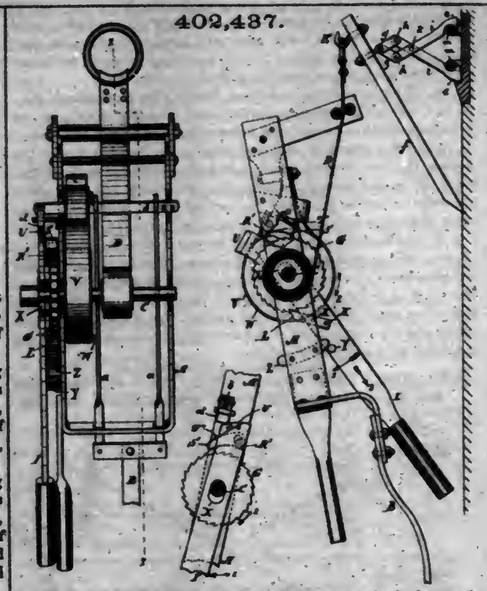
4. A spring consisting of a plurality of spring-arms, each comprising two members or branches bent into the form of a half-ellipse, in combination with the retaining-disk B, provided with the angular recesses *b*, and the retaining-disk C, provided with corresponding angular projections, *c*, substantially as and for the purposes specified.

402,435. ROTARY TRIMMING-TOOL FOR BOOTS OR SHOES. CHARLES W. GLIDDEN, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Aug. 20, 1888. Serial No. 283,197. (No model.)

Claim.—1. In a rotary trimming-tool, the two slotted cam-plates, the slotted hub, and the strap cutter-blades having ears, combined with pins extended through the slots in the head, through the ears of the cutter-blades, and into the slots of the cam-plates, whereby change of relative positions of the hub and cam-plates effects the simultaneous adjustment of the blades, substantially as described.

2. The combination, with the hub of a rotary cutter, of strap-like blades bent at right angles to their width to present ears the flat faces of which are substantially parallel to each other and to the face of the hub to which they are secured, the said blades being made substantially straight in the direction of their depth, as from heel to cutting-edge, the said cutting-edge being beveled from the inner side of the blade backwardly toward the heel thereof, substantially as described.

3. A rotary cutter containing blades molded in the direction of their width to correspond with the shape to be given to the heel, and substantially straight from their heels to their cutting-edges, and beveled, as at 4, as shown and described.



402,436. RED CARBON COLOR. ROBERT GNEHM, Basle, Switzerland, assignor to the Society of Chemical Industry of Basle, same place. Filed Sept. 24, 1888. Serial No. 286,945. (No specimens.)

Claim.—The red coloring-matter obtained from succinic acid and diethylmetaamidophenol, forming a hygroscopic powder soluble in water and alcohol, and dyeing wool, silk, and mordanted cotton a brilliant red with yellow fluorescence.

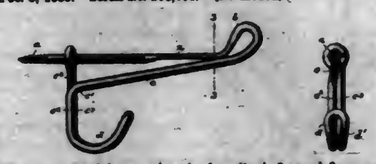
402,437. FIRE-ESCAPE. PHILIPP GOLDMANN, New York, N. Y. Filed July 30, 1888. Serial No. 280,490. (No model.)

Claim.—1. A fire-escape combining in its structure a frame, A, a suspended support or rest, B, for carrying the person, an axle, C, journaled in the frame, a cable, D, a ratchet-wheel, G, secured to the axle, a detaining-detent, S, pivoted to the frame above the ratchet-wheel to engage therewith, an oscillatory pendent lever, I, pivoted and swinging directly on the axle, extended above the latter, having a

402,437.

lug, R', to disengage the detent from the ratchet-wheel when said lever is swung in one direction, and provided with an attached pawl, L, below the ratchet-wheel to engage and disengage the same, and a brake mechanism for the axle, substantially as described.

2. The combination, in a fire-escape, of a frame, A, an axle, C, journaled therein, a cable, D, a ratchet-wheel, G, and a brake-wheel, W, both fixed to the axle, a brake-band, V, secured to the frame and encircling the brake-wheel, and an oscillating lever, I, loosely hung directly from the axle, having a pawl, L, to engage and disengage the ratchet-wheel and extended above the axle into an arm, U, for increasing or diminishing the pressure of the brake-band by the oscillation of said pawl-carrying lever, substantially as described.



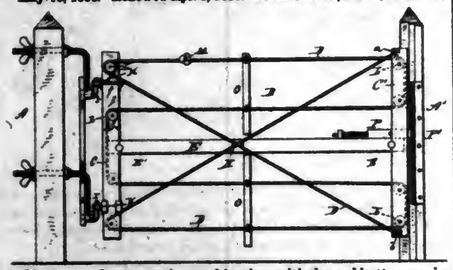
3. The combination, in a fire-escape, of a frame, A, an axle, C, journaled therein, a cable, D, a ratchet-wheel, G, and a brake-wheel, W, both fixed to the axle, a brake-band, V, secured to the frame and encircling the brake-wheel, a detent, S, on the frame above the ratchet-wheel to engage therewith, an oscillatory pendent lever, I, pivoted and swinging directly on the axle, extended above the same, having a lug, R', to disengage the detent from the ratchet-wheel provided with a pawl, L, to engage and disengage the ratchet-wheel and extended above the axle into an arm, U, for increasing or diminishing the pressure of the brake-band by the oscillation of said pawl-carrying lever, substantially as described.

4. The combination, with the frame A and an axle or bar, C, adapted for the reception of a rope or chain, of a detent and brake, a handle, I, secured by a slot-connection to said axle and adapted to engage the brake and detent, and provided with a pawl, L, adapted to engage a ratchet-wheel, G, connected to said axle or bar, substantially as described.

5. The combination, with the frame A and an axle or bar, C, adapted for the reception of a rope or chain, of a detent and brake, a seat or rest, B, made to act on said brake, and a handle, I, adapted to engage said detent and being made to communicate with the seat or rest B, to regulate its action on the brake, substantially as described.

6. An attaching device for fire-escapes, consisting of an arm, *f*, having an attaching-point, E, and provided with links *g*, jointed to the attaching-jaws *i*, substantially as described.

402,438. WIRE HOOK. ROBERT GORTON, Plainfield, N. J. Filed Feb. 5, 1889. Serial No. 298,700. (No model.)



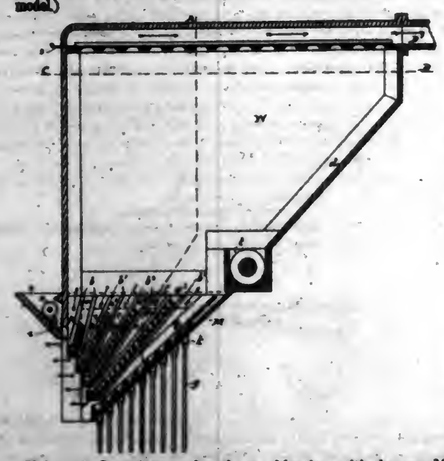
Claim.—1. The hanger herein described, formed from a continuous piece of wire, having the horizontal portion screw-threaded at its inner end for attachment to a support, the portion *c*, extending rearwardly and downwardly to the rear face of the hanger, the down-

wardly-extending vertical part c^4, the outwardly and upwardly curved parts d d', forming the lower hook and arranged in the same horizontal lines, and the vertical part c^5, extending up to the horizontal arm in the same transverse plane with the portion c^3

2. The hanger herein described, formed from a continuous piece of wire, having the horizontal portion screw-threaded at its inner end for attachment to a support, and rolled or swaged, as at x, the portion c, extending rearwardly and downwardly to the rear face of the hanger, the downwardly-extending vertical part c^3, the outwardly and upwardly curved parts d d', forming the lower hook and arranged in the same horizontal lines, and the vertical part c^5 in the same transverse plane with the portion c^3 and extending up to the horizontal arm.

3. The hanger herein described, formed from a continuous piece of wire, having the horizontal portion screw-threaded at its inner end for attachment to a support, a return portion, c, extending to the rear face of the hanger, the vertical part c^3, double wires, as d d', forming the lower hook, and the vertical portion c^5 in the same transverse plane with the vertical part c^3 and extending up to and around the inner end of the horizontal portion.

402,439. GATE. WILLIAM I. HAAS, Charles City, Iowa. Filed May 18, 1888. Renewed Apr. 1, 1889. Serial No. 305,646. (No model.)

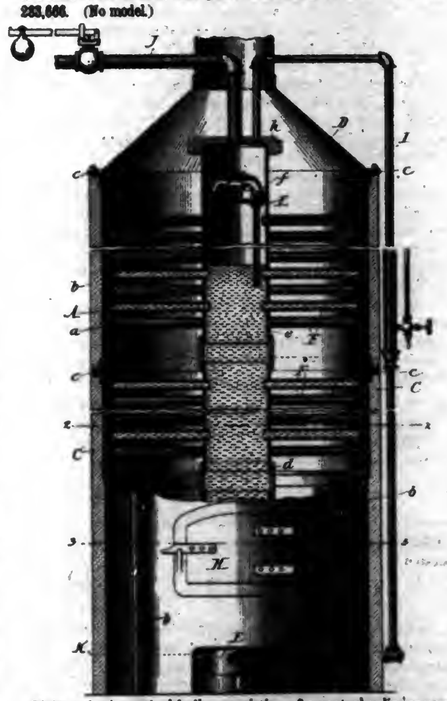


Claim.—1. In a gate, the combination, with the end battens, a pivotally-supported center beam, and pulleys journaled between the said battens, of a continuous wire, D, passed around the said pulleys and extending back and forth across the gate, substantially as described, and a wire-stretcher applied to said continuous wire.

2. In a gate, the combination, with the end battens, a center beam pivotally supported between the end battens, and pulleys journaled on the battens, of a continuous single wire, D, passing around the said pulleys and passing horizontally back and forth across the gate, the two ends of the said wire being extended in opposite directions diagonally across the gate, a bolt for securing the diagonal portions of the wire to the center beam, where they intersect each other, and a wire-stretcher, substantially as herein set forth.

3. The combination, with the end battens, a horizontal center beam, and pulleys journaled upon said battens, of a continuous wire passing around these pulleys and extending back and forth across the gate, substantially as herein described, and means for stretching the said continuous wire.

402,440. CHOP-GRADER. CARL HAGENMACHER, Buda-Pesth, Austria-Hungary. Filed July 13, 1888. Serial No. 280,311. (No model.)



Claim.—1. In a chop-grader, the combination, with the case M, of the inclined upwardly-diverging frames arranged in a series and provided with slats forming gathering-passages p and q, substantially as and for the purpose set forth.

2. In a chop-grader, the combination, with the case M, of the inclined upwardly-diverging frames provided with slats forming the gathering-passages p and q, the guides between which the said removable frames are slid, and the hopper provided with an air-valve, substantially as and for the purpose set forth.

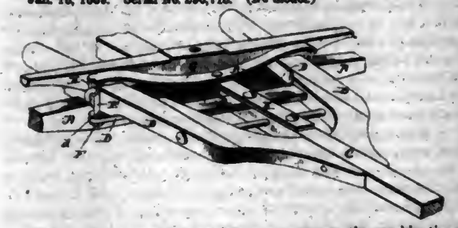
3. In a chop-grader, the combination, with the case M, of the inclined upwardly-diverging frames provided with slats forming the gathering-passages p and q, the air-case W, provided with a sloping side and the discharge-chamber t, the air-regulating slide at the top of the air-case, and the hopper e, provided with an air-valve, substantially as and for the purpose set forth.

402,441. BOILER. CHARLES HALLETT, Riverhead, N. Y., assignor to Francis Carll Hallett, same place. Filed Aug. 24, 1888. Serial No. 283,666. (No model.)

Claim.—1. A vertical boiler consisting of a central cylinder composed of separable sections provided with radial tubes F and connected by couplings d, in combination with a shell or casing composed of separable sections connected by flanges and bolts, substantially as described.

2. A vertical boiler consisting of a central cylinder composed of separable sections, and having screwed therein radial tubes, in combination with a casing and jacket divided horizontally and vertically into separable sections, and a packing of asbestus interposed between said casing and jacket, substantially as described.

402,442. GAS-GOVERNOR. CORNELIUS J. HAMILTON, Philadelphia, Pa., assignor to James H. Wilson, same place. Filed Dec. 15, 1888. Serial No. 293,748. (No model.)

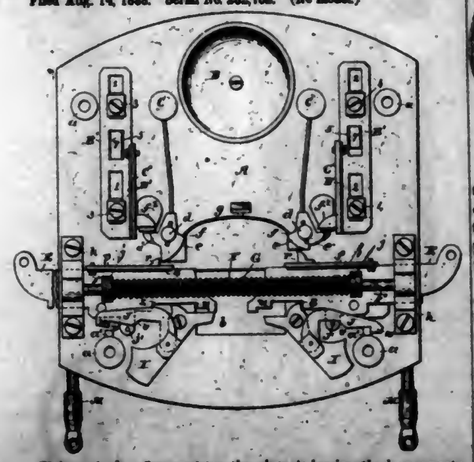


Claim.—1. In a gas-governor, the inlet-tube a, the orifices f and e, the valve n, the chambers D and C, the connecting-tubes d d' d^2, and the outlet a', in combination with a spring-regulated float, E, substantially as hereinbefore set forth and described.

2. In a gas-governor, the chambers D and C, connected, respectively, with the inlet and outlet tubes a and a', said chamber D connected with said chamber C by the tubes d d' d^2 and the chamber C connected with the inlet-tube a by the orifice e, the float E, provided to fit closely in the chamber C, and the spring s, in the manner and for the purpose substantially as hereinbefore set forth and described.

3. In a gas-governor having inlet and outlet tubes or orifices a and a', the chambers C and D, the chamber D connected with the inlet-tube by the valved orifice f, the tubes d d' d^2, connecting the chambers D and C, the orifice e, connecting the chamber C with the inlet-tube, the outlet-tube being also connected with the chamber C, the float E, provided in the chamber C, having the sides c', and the spring s, in the manner and for the purpose substantially as set forth and described.

402,443. TONGUE-SUPPORT. ELIAS HANSHAW, Russell, Ky. Filed Jan. 18, 1889. Serial No. 296,713. (No model.)



Claim.—As an improvement in tongue-supports, the combination, with the hounds and the tongue pivoted between the ends of the same, of the transverse bar D, secured to the under sides of the hounds and having perforated ends projecting beyond the sides of the hounds, the leaf-spring having an arm, K, projecting forward from its center, the said arm being secured on the upper side of the tongue at the rear end of the same, and the ends of the spring projecting over the hounds, the swinging loops secured to the ends of said spring, the hooks engaging said loops and having threaded lower ends projecting through the perforated ends of the bar D, and the nuts on the lower ends of the hooks turning up against the said bar D, as specified.

402,444. CULINARY VESSEL. ORLIN B. HARMON, Bloomingdale, Mich. Filed Feb. 10, 1888. Serial No. 263,615. (No model.)

Claim.—The combination, with a vessel provided with ears, of a bail having spiral eccentrics near its ends, the ends beyond the eccentrics being passed through the ears of the vessel, a bowed handle passed around the sides of the vessel, the ends of the bail and ends of the handle being hooked together, and the tie-wire holding the handle close to the vessel, substantially as set forth.

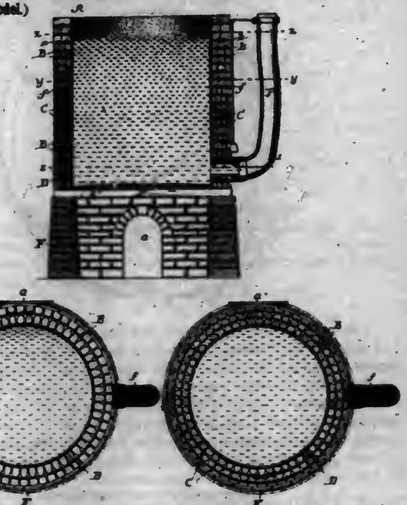
402,445. FARE-REGISTER. JOSEPH L. HARLEY, Baltimore, Md. Filed Aug. 14, 1888. Serial No. 282,702. (No model.)

Claim.—1. In a fare-register, the plate A, having the lower posts, e, squared as shown, forming guide-bearings for the push-bars E, in combination with the pawls J and l and the said push-bars E, substantially as and for the purposes specified.

2. In a fare-register, the horizontal push-bars, each having a notch in its lower edge of a different extent from that of the other, and having studs K K, in combination with the levers v and the wheels H, substantially as and for the purposes specified.

3. The combination, with the toothed register-wheels H, of the sliding push-bars E, notched on their under sides for a distance equal to the distance between one, two, or more teeth of the said wheels, and the spring-actuated pawls l l, adapted to engage said wheels, substantially as specified.

4. In a fare-register, the combination, with the sliding push-bars having notches in their inner lower sides, of the pivoted gravitating pawls, the disks or wheels operated thereby, the detent-levers secured thereto, and the projections on the bars, whereby the levers are released when the bars are moved inward, substantially as specified.



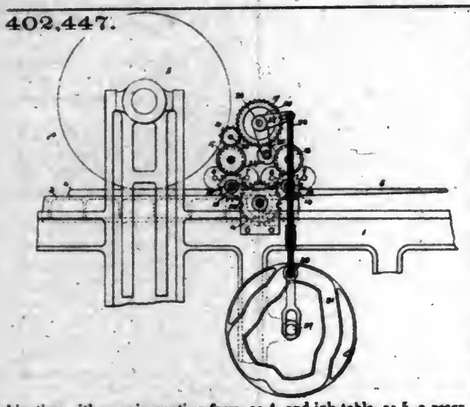
5. The combination, with the bell or alarm mechanism, of the plate A, provided with brackets h h, the horizontal bars having collars j j, the right-angled shelves, and the guide-rod having a surrounding spring interposed between the sliding bars, whereby they are pressed normally outward, substantially as specified.

6. In a fare-register, the combination, with the registering-wheels, of the vertically-sliding pull-bars, each being notched for a length differing or varying from the other, the said bars being slotted to receive guide-pins and notched at their upper edges, substantially as and for the purposes specified.

7. The combination, with the registering-wheels, of the pull-bars having notches in their sides, each of a different length from the other, and provided with projections g' g', the weighted dogs B' B', having shoulders, and the levers a', arranged to operate substantially as specified.

8. The combination, in a fare-register, of the vertically-sliding bars, the slides B' B', having right-angled shelves and spring-arms D' D', provided with lips f f, and the alarm-hammers, the whole arranged to operate substantially as specified.

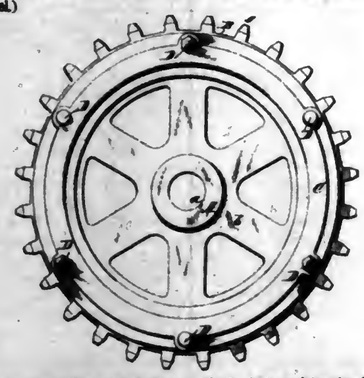
402,446. CONSTRUCTION OF WATER-TANKS. WILLIAM H. HARRELSON, Kansas City, Mo. Filed Dec. 5, 1888. Serial No. 292,742. (No model.)



Claim.—1. In the construction of water-tanks, &c., the combination, with the constituent parts of the wall of the structure, of series of encircling bands embedded in the wall and arranged each series of two or more bands in the same horizontal plane and firmly bound in place, the bands in each series increasing in number toward the bottom of the structure, substantially as set forth.

2. In the construction of water-tanks, &c., the combination, with the constituent parts of the wall of the structure, of series of encircling bands embedded in the wall and arranged each series of two or more bands in the same horizontal plane and let into grooves in the bricks of the wall, the bands in each series increasing in number toward the bottom, the same being decreased toward and to a minimum at the top, substantially as and for the purpose specified.

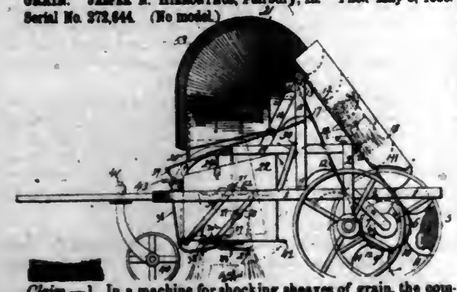
402,447. INKING APPARATUS FOR PRINTING-PRESSES. JOHN T. HAWKINS, Taunton, Mass. Filed Mar. 30, 1888. Serial No. 267,706. (No model.)



Claim.—In the inking apparatus of a printing-machine, in com-

402,447.

bination with a reciprocating form, as 4, and ink-table, as 5, a reservoir-roller, as 19, pairs of form-rollers, as 6 and 7 8 and 9, one pair or both pairs, riding or distributing rollers, as 10 and 11, one or both, in contact each with a pair of said form-rollers, and a doctor roller or rollers, as 24 24ª, in constant contact with said reservoir-roller, and automatically oscillated in and out of contact with said riding or distributing roller or rollers, whereby the ink deposited upon said ink-table is first partially conveyed to said reservoir-roller, afterward distributed to the form-rollers, and by them deposited upon the form in an equable manner, substantially as described, for the purposes set forth.



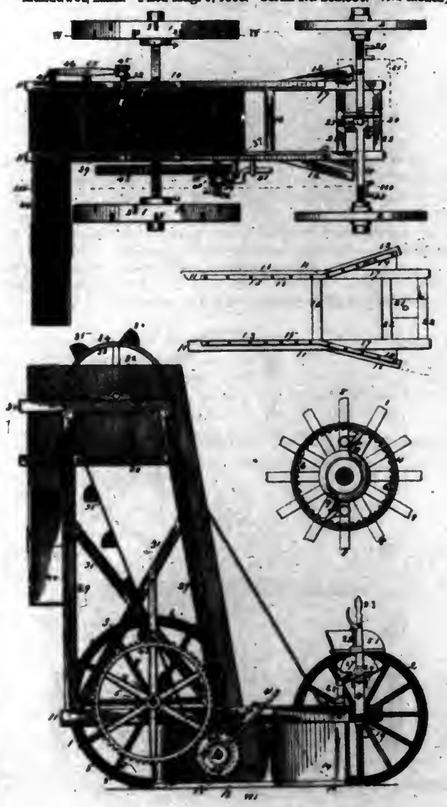
402,448. SPROCKET-WHEEL. JOHN R. HERSH and JAMES M. STALEY, Dayton, Ohio. Filed Feb. 12, 1889. Serial No. 299,605. (No model.)

Claim.—1. The combination, with the hub and its rim formed with shoulder *d* and recess *e*, of the ring B, formed with a toe, *f*, the retaining-ring, and the securing-bolts, substantially as described.

2. The combination, with the hub and its rim formed with shoulder *d* and recess *e*, provided with inclined side, of the ring provided with teeth and with a toe having an inclined side, the retaining-ring bearing against the toothed ring and the side of the rim, and the bolts or rivets passed through the retaining-ring, the ring, and the rim of the hub, substantially as shown and described.

402,449. MACHINE FOR SHOCKING SHEAVES OF SMALL GRAIN. JASPER N. HIBBONSTRAW, Fairbury, Ill. Filed May 3, 1888. Serial No. 272,644. (No model.)

Claim.—1. In a machine for shocking sheaves of grain, the combination, with a table and tines secured to an endless belt for elevating the sheaves from the ground to said table, of a box to receive the sheaves from said table, wings pivoted in said box and actuated by means of lever 30, and bell-cranks 30½ and 31, connected at their opposite ends by rod 32, and provided with stud-pins 33 on their free ends adapted to engage arms 29, which form bent extensions of said wings outside the bottom of the box, whereby the wings are turned to compress the sheaves, substantially as shown and described.



2. In a machine for shocking sheaves of grain, the combination of a drum secured to a supporting-wheel, a roller journaled in standards on the main frame, an inclined frame having a closed bottom which serves as a supporting bed or way, an endless belt in said inclined frame on said drum and roller provided with cross-bars having curved tines for gathering the sheaves from the ground and supporting them while being elevated, a downwardly-slanting table, and a pivoted shocking-box, substantially as shown and described.

3. In a machine for shocking sheaves of grain, the combination, with a box having wings pivoted therein, and arms forming bent extensions of said wings, located outside of said box, of bell-cranks pivoted on said wings outside of the box and provided with stud-pins on their free ends, a rod connecting the opposite ends of said cranks, and a lever pivoted to the outside of the box for actuating the bell-cranks and wings, substantially as shown and described.

4. In a machine for shocking sheaves of grain, the combination, with a box having wings pivotally secured therein, and arms forming bent extensions of said wings, of bell-cranks provided with stud-pins on their free ends, a rod connecting the opposite ends of the bell-cranks, and a lever pivoted to the box for actuating with cranks and wings, substantially as shown and described.

5. In a machine for shocking sheaves of grain, the combination, with a box having wings pivotally secured therein, arms forming bent extensions of said wings, bell-cranks pivoted on said wings and provided with stud-pins on their free ends, and a rod connecting the opposite ends of the bell-cranks, of spring-arms secured to said box provided with notches to lock the arms extending from the wings, and a pivoted lever for operating said spring-arms to release the extension-arms of the wings and allow the wings to fall back against the sides of the box, substantially as and for the purposes shown and described.

402,450. DIRT-LOADING MACHINE. EDWARD T. HOFFMAN, Simmunduwot, Kans. Filed Aug. 9, 1888. Serial No. 282,356. (No model.)

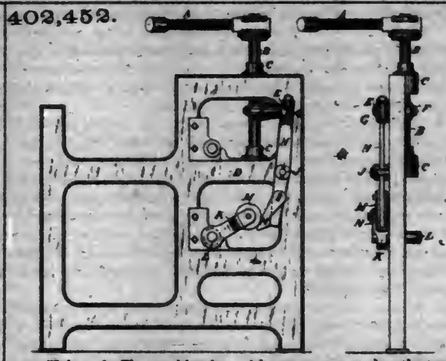
Claim.—1. The combination, in a dirt-loading machine, of an endless elevator carrying scoops adapted to enter the dirt before the latter is elevated from the ground, supporting-wheels with suitable driving mechanism connecting said wheels with the elevator, and mold-boards at the sides entering the earth and having parallel rear portions between which the scoops descend, and laterally-flaring front portions adapted to collect the dirt and crowd it between the parallel portions, whereby its depth is increased at the foot of the endless belt, as set forth.

2. The combination, in a dirt-loading machine, of an endless elevator provided with scoops, a main frame constructed to tilt on the rear axle of the machine, a bell-crank lever upon the front axle, a link connecting said lever to the front end of the main frame, a lock bar or plate, 27, a latch on said lever for engaging said plate 27, and mold-boards attached to the frame and descending to the dirt each side of the elevator, and having rear parallel portions, 13, and flaring front portions, 14, substantially as set forth.

3. The combination, in a dirt-loading machine, of a frame constructed to tilt on the rear axle, an arched front axle with a tie-bar connecting the lower ends of the arch and leaving space for the front end of the tilting frame to rise and fall between the arched part of the axle and the tie-bar, a king-bolt passing through the middle of the arch and the tie-bar and through a part of the tilting frame, and a lever fulcrumed to the axle and connected to the tilting frame, substantially as and for the purpose set forth.

4. In a dirt-loading machine, the longitudinal timbers 10, having parallel portions 11, and the extensions 17, forming draft-timbers, the outwardly inclined or flaring parts 12, secured to said timbers, and the mold-boards or scrapers suspended from said portions 11 12 and having parallel rear and flaring front portions, 13 14, respectively, in combination with an elevator having an elevator-belt provided with scoops arranged to descend between said parallel portions 13, as set forth.

402,451. STOVE. HERBERT HOPKINS and JOSEPH R. PERRY, Wilkes-Barré, Pa. Filed Jan. 11, 1889. Serial No. 296,097. (No model.)



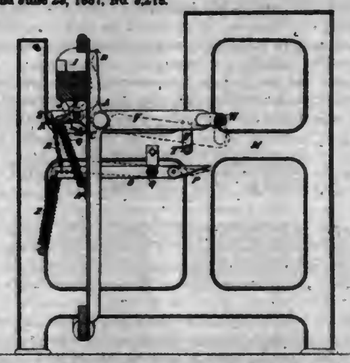
Claim.—1. The combination, with the base-ring, of the hot-water or steam pipe or cylinder, the inner central hot-air pipe or flue, and the rings *b* and *d*, substantially as set forth.

2. The combination, with the base-ring and the air-inlet pipes, of the outer pipe or cylinder and the inner pipe or flue having a lower apertured end, substantially as set forth.

402,452. PICKING MECHANISM FOR LOOMS. JOSEPH HORROCKS and EDWIN HORROCKS, Bradford, County of York, England. Filed June 4, 1888. Serial No. 276,946. (No model.) Patented in England June 30, 1887, No. 9,279, and in Germany June 29, 1888, No. 46,718.

402,452.

Claim.—1. The combination, with an arm mounted on the tappet-shaft, of an approximately-vertical lever adapted to be oscillated by the said arm at each revolution of the tappet-shaft, and a picking-shaft provided with a projecting arm engaging the upper end of said lever, substantially as described.



2. The combination, with an arm projecting from and rotating with the tappet-shaft, of a lever, a pawl or pendant pivoted to the lever, so that the pawl will be engaged and the lever oscillated by the arm as the tappet-shaft revolves in one direction, but the lever will not be oscillated when the shaft rotates in the opposite direction and the arm engages the pawl, and a picking-shaft provided with an arm engaging the lever and operated by the same when the lever is oscillated, substantially as described.

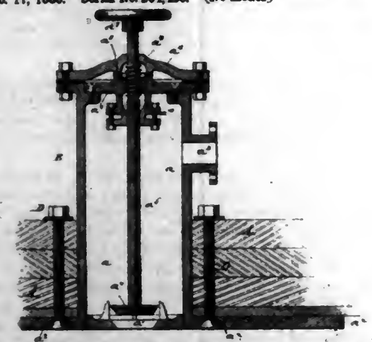
3. A mechanism for actuating the pickers in looms, comprising a vertical rocking-shaft, a picking-stick extending from the same, an arm projecting from the shaft, a lever adapted to engage the arm and rock the shaft, and mechanism for intermittently oscillating the lever, substantially as described.

4. In a mechanism for actuating the pickers of looms, the combination of a vertical picking-shaft, a picking-stick extending from the same, an arm projecting laterally from the shaft, a conical or taper anti-friction roller journaled on the arm, a lever to engage said roller and intermittently rock the picking-shaft, and the tappet-shaft provided with an arm to rock the lever, substantially as described.

5. The combination of a picking-shaft provided with a projecting arm, an anti-friction roller mounted on the arm, a lever provided on one end with a roller to engage the roller on said arm, a tappet-shaft provided with a projecting arm, and a roller mounted on said arm to engage the opposite end of the lever, substantially as described.

402,453. SHUTTLE-RELIEF MECHANISM FOR LOOMS. JOSEPH HORROCKS and EDWIN HORROCKS, Bradford, County of York, England. Filed June 4, 1888. Serial No. 276,947. (No model.) Patented in England June 29, 1887, No. 9,218.

Claim.—1. The combination, with the lathe, a shuttle-box swell, and a stop-rod having an arm engaging the swell, of a stationarily pivoted lever, a flexible connection between one end of the lever and the stop-rod, a supplementary spring normally holding the connection taut and the arm exerting pressure on the swell, a light spring connected with the rod and holding the arm constantly bearing on the swell, and a finger carried by a movable portion of the loom to depress the lever and relieve the swell of the pressure of the supplementary spring when a pick is made, substantially as described.



2. In a loom, the combination of the frame, the lathe, a shuttle-swell, a stop-rod provided with arms, one of them bearing on the swell,

a light spring secured to and exerting a constant pressure upon the rod, a lever pivoted to the frame, a spring secured to and tending to depress an end of the lever, a flexible connection between said end of the lever and an arm of the stop-rod, the crank-arm, and a finger carried by the same and adapted to intermittingly engage and raise the spring end of the lever, substantially as described.

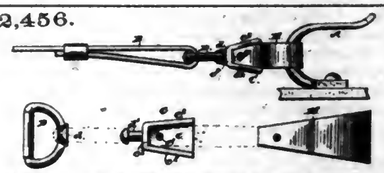
3. The combination of a lathe, a shuttle-box having a pivoted swell, a stop-rod having an arm engaging said swell, a light spring connected to the stop-rod, causing it to exert a constant pressure on the swell, a pivoted lever, a supplemental spring secured to and tending to depress one end of the same, a chain connecting said end of the lever and the stop-rod, whereby the supplemental spring normally exerts its pressure together with the light spring upon the swell and the driving mechanism, and a finger carried by the same and adapted to intermittingly engage the lever and raise the spring end of the same, substantially as described.

4. In a loom, the frame, a lathe, a rod carried by the same having arms, a shuttle-swell engaged by one of the arms carried by said rod, a spring connected with said rod and yieldingly causing said arm to bear on the swell, and a crank-shaft and pitman to swing the lathe, in combination with a lever pivoted to the frame, a chain connecting one end of the same and an arm of said rod, a spring tending to depress said end of the lever and hold the chain taut, a pawl pivoted to the opposite end of the lever to have an independent upward swing, and a finger carried by the pitman and adapted to engage said pawl from above and raise the spring end of the lever, for the purpose set forth.

402,454. SEA-COCK. BENJAMIN S. HORTON, Vermilion, Ohio. Filed Feb. 17, 1888. Serial No. 264,420. (No model.)

Claim.—1. In a sea-cock, the hollow closed body adapted to extend through the hull of a vessel, and provided at its extreme outer end with the valve-seat and at its inner end with a pipe-receiving neck, in combination with an inwardly-opening valve adapted to close against the seat practically flush with the outer end of the body, the valve-operating spindle extended through the inner end of the body, and guides for said spindle located wholly on the inner side of the valve, whereby the formation of ice within the body outside of the valve proper, injury to the valve by contact with external objects, and the closure of the valve by such contact are all prevented.

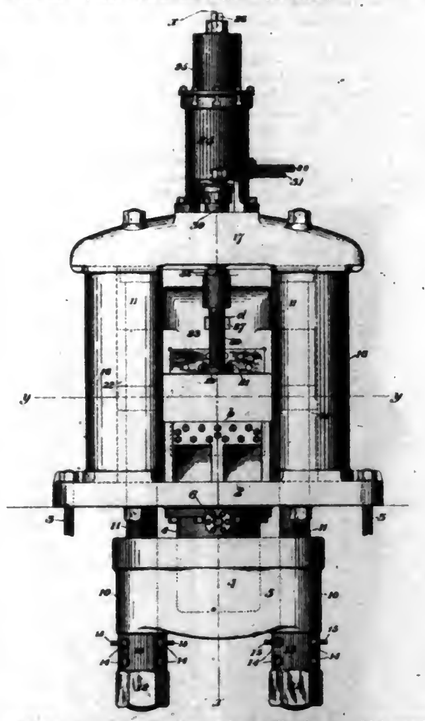
2. In a sea-cock, the body having the seat at its extreme end, the inwardly-opening valve, the threaded valve-operating spindle, its supporting-bar attached to the body, and the independently-removable cap or cover a^4, combined as and for the purpose described.



402,455. FILTER-PRESS. JOHN JOHNSON, Brooklyn, N. Y. Filed Sept. 3, 1888. Serial No. 284,873. (No model.)

Claim.—1. The combination, with the diaphragm or partition-plates severally in a filter-press, of a filtering-cloth support consisting of a bar extending along the top of the same and fixed adjustably thereon toward and from the plate, and a filtering-cloth suspended from said bar, substantially as described.

2. The combination, with the diaphragms or partition-plates severally in a filter-press, of a filtering-cloth support consisting of a bar extending along the top of the same and fixed adjustably toward and from the plate, and a duplex filtering-cloth suspended on said support and each side of the plate, substantially as described.



402,456. OVERDRAW OR CHECK REIN ATTACHMENT. RICHARD W. JOHNS, Syracuse, N. Y. Filed Jan. 21, 1889. Serial No. 297,009. (No model.)

Claim.—1. As an improved article of manufacture, a loop for overdraw or check reins, consisting of a body portion or plate with a recess on each side thereof and marginal flanges on the side and rear end and perforated to receive the rivet or bolt for securing the strap-loop, in combination with said loop and provided with the attaching-ring, substantially as described.

2. The attaching device for overdraw or check reins, substantially as described, of a plate having a tongue with flanges projecting from the edges of the sides and one end thereof, a closed yoke swiveled to one end of said plate by a headed stud or pin engaging a central socket of said yoke, and a leather-strap loop whose ends are snugly fitted between the flanges of the plate and bearing upon and secured to the tongue thereof by a single rivet, substantially as described.

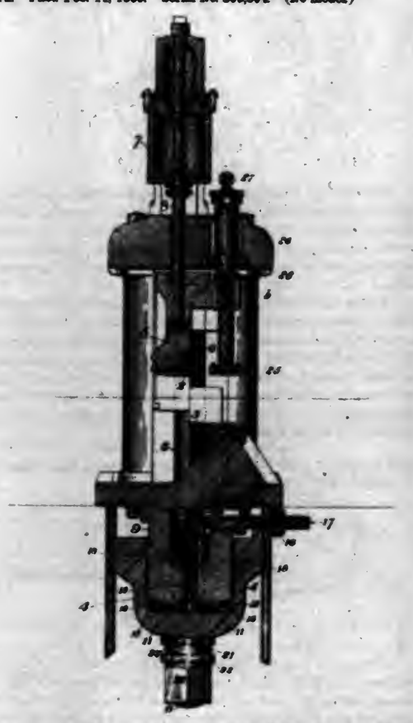
402,457. HYDRAULIC SHEARS. JULIAN KENNEDY, Latrobe, Pa. Filed Oct. 29, 1888. Serial No. 289,407. (No model.)

Claim.—1. An improvement in hydraulic shears, which consists in the combination, with the moving shear-knife and the hydraulic cylinder by which it is actuated in the act of shearing, of a gag or holder having a hydraulic cylinder which is connected with the same power-supply which supplies the cylinder of the shear-knife, whereby the pressure applied to the gag is proportioned to the pressure applied to the shear-knife, substantially as and for the purposes described.

2. An improvement in hydraulic shears, which consists in the combination, with the moving shear-knife and holder and its actuating-cylinder, of a gag or holder and the cylinder by which it is moved in the act of shearing, and a projection or collar which connects the gag and knife-holder, whereby the gag is supported and lifted by the ascent of the knife-holder, and the knife is permitted to descend independently of the gag after the latter has engaged the metal to be sheared, substantially as and for the purposes described.

3. An improvement in hydraulic shears, which consists in the combination, with the moving shear-knife and the hydraulic cylinder by which it is actuated in the act of shearing, of a gag or holder having a hydraulic cylinder which is connected with the same power-supply which supplies the cylinder of the shear-knife, whereby the

pressure applied to the gag is proportioned to the pressure applied to the shear-knife, the said gag passing through the knife-holder and being provided with a projection or collar which affords means whereby the gag is raised in raising the knife-holder, substantially as and for the purposes described.



4. An improvement in shears, which consists in the combination of the two shear-knives and their holders, and guideways by which the moving holder is guided, said shear-knife holders being provided with portions at their ends which are situate in the guideways, and which overlap each other and brace the moving holder in the act of shearing, substantially as and for the purposes described.

5. An improvement in shears, which consists in the combination of the two shear-knives and their holders, guideways by which the moving holder is guided, said shear-knife holders being provided with portions at their ends which are situate in the guideways, and which overlap each other and brace the moving holder in the act of shearing, a hydraulic cylinder for operating the moving knife-holder during the act of shearing, and bolts which extend from the cylinder in recesses between the meeting faces of the knife-holders in the guideways and are connected with the moving knife-holder, substantially as and for the purposes described.

6. In hydraulic shears, the combination, with the moving shear knife or holder and the cylinder by which it is moved in the act of shearing, of a gag or holder connected with the moving parts of the shear-knife, the said connection being loose, whereby the gag is restrained during the descent of the knife, and the knife is permitted to descend independently of the gag or holder after the latter has engaged the metal to be sheared, and a cylinder for actuating the gag, substantially as and for the purposes described.

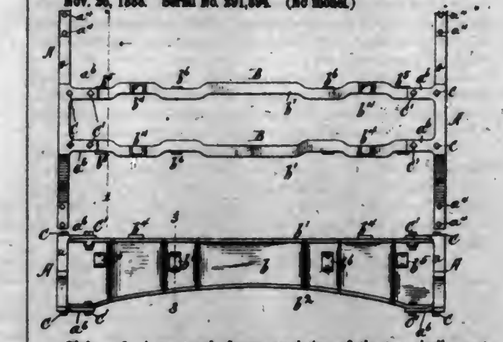
7. In hydraulic shears, the combination, with the moving knife-head, of a stationary plunger and movable cylinder situate below the same, and vertical bolts connecting the cylinder with the knife-head, whereby the descent of the cylinder will draw the knife-head with it, and a second cylinder for raising the knife-head and the first-named cylinder, substantially as and for the purposes described.

402,458. HYDRAULIC MACHINE. JULIAN KENNEDY, Latrobe, Pa. Filed Feb. 11, 1889. Serial No. 299,394. (No model.)

Claim.—1. The combination of the cylinder, the piston fitting within the same, and a pipe-connection for the water-supply pipe extending through the piston and having an integral flange at the end of the latter, substantially as and for the purposes described.

2. The combination of the cylinder, the piston fitting within the same, and a flange or facing for the end of the piston having an integral pipe-connection for the water-supply pipe and having also a suitable peripheral packing, substantially as and for the purposes described.

3. The combination of the cylinder, the piston fitting within the same and having at the margin of its base a peripheral recess, and a facing for the end of the piston having a marginal band or bead which fits in said recess and forms the bearing-surface of the piston, substantially as and for the purposes described.



4. The combination of the cylinder, the piston fitting within the same, a facing for the end of the piston having an integral pipe-connection for the water-supply pipe and having also a suitable peripheral packing, and a retaining-ring by which the packing is held in place, substantially as and for the purposes described.

5. In hydraulic machinery, the combination, with a moving head or plunger, of a hydraulic motor which actuates the same, connecting-rods extending from the head or plunger and having heads or nuts on which the movable element of the hydraulic motor is supported, and removable separators or collars interposed between the said heads or nuts and the said movable element, substantially as and for the purposes described.

6. In hydraulic machinery, the combination, with a moving head or plunger, of a hydraulic motor which actuates the same, connecting-rods extending from the head or plunger and having heads or nuts on which the movable element of the hydraulic motor is supported, and removable separators or collars interposed between the said heads or nuts and the said movable element, said separators being divided longitudinally into separable parts, substantially as and for the purposes described.

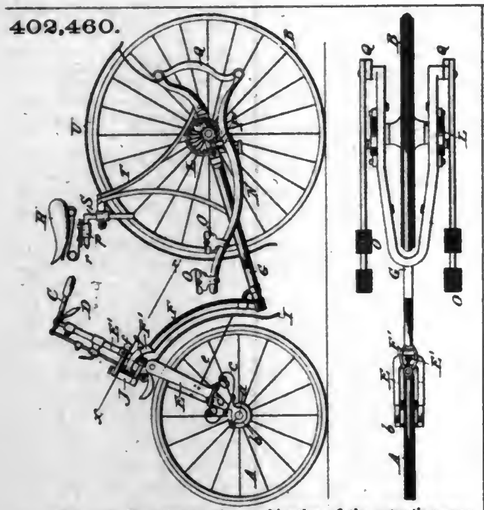
7. In hydraulic machinery, the combination, with a moving head or plunger, of a hydraulic motor which actuates the same, connecting-rods extending from the head or plunger and having heads or nuts on which the movable element of the hydraulic motor is supported, removable separators or collars interposed between the said heads or nuts and the said movable element, and a second hydraulic motor connected with the said head or plunger for raising the same, substantially as and for the purposes described.

402,459. CAR-TRUCK. MARTIN KENNEDY, Hegewisch, Ill. Filed Nov. 26, 1888. Serial No. 291,894. (No model.)

Claim.—1. A car-truck frame consisting of the two similar end pieces, A, each cast in a single piece and provided with inwardly-extending projections, the two similar cheek-pieces, B, each cast in a single piece, and suitable bolts connecting the cheek-pieces to the projections on the end pieces, substantially as and for the purposes specified.

2. A car-truck frame consisting of the end pieces, A, having recesses a^3 and projections a^6, the cheek-pieces B, fitting at their ends in said recesses and between said projections, and the long bolts C and short bolts C', connecting said end pieces and cheek-pieces, substantially as and for the purposes specified.

3. In a car-truck frame, the end piece, A, having the arch-bars a and columns a' cast in a single piece, substantially as and for the purposes specified.



4. In a car-truck frame, the end piece, A, having arch-bars a, columns a', and tie-bars a^5, all cast in a single piece, said tie-bars being in the same plane with and forming extensions of the lower portion of the lower arch-bar, substantially as and for the purposes specified.

5. In a car-truck frame, the end piece, A, having the arch-bars a and columns a' cast in a single piece, said columns being provided with recesses a^3 and having their opposite faces plane and parallel, substantially as and for the purposes specified.

6. In a car-truck frame, the cheek-piece B, cast in a single piece and having formed thereon recesses b^3, apertured lugs b^4, and hooks b^5, substantially as and for the purposes specified.

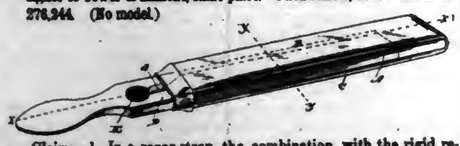
402,460. BICYCLE. GERRIT KIEBE, Amsterdam, N. Y. Filed Oct. 27, 1888. Serial No. 289,200. (No model.)

402,460.

Claim.—1. In a bicycle, the combination of the actuating-gearing for the drive-wheel, consisting of the pinion on the axle, the internally-toothed gear engaging it, the casing on the main frame, and the ball-bearing in said casing for the gear, the pedal-lever, connecting-rod between it and the gear, and the link pivoted to the said lever and the main frame, substantially as described.

2. In a bicycle, the combination, with the actuating-gearing for the drive-shaft, consisting of the pinion on the axle, the internally-toothed gear engaging it, the casing on the frame, the ball-bearing in said casing for the gear, and a pedal-lever, substantially as described.

3. In a bicycle, the combination of the forked standard E, the wheel A, its axle *a*, the axle-bearings *b*, and the interposed springs between the bearings and the standard, consisting of parts *c* and *c'*, substantially as described.



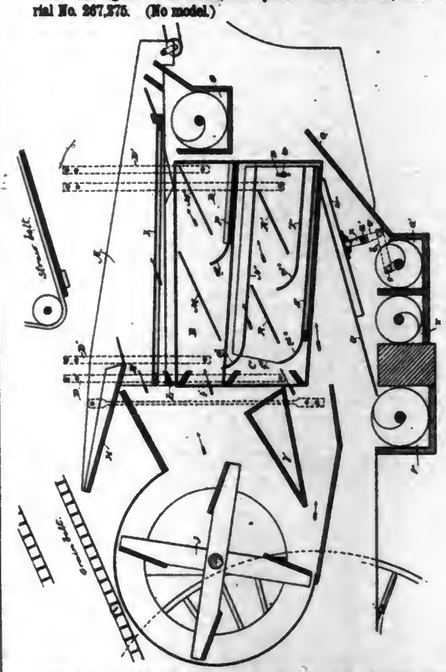
4. In a bicycle, the combination of the forked standard E, the steering-rod E', carrying steering-bar C, the steering-head J, carrying bearings for said rod, and the frame F, supporting said head and looped at F' to inclose the steering-rod, substantially as described.

5. In a bicycle, the combination of the forked standard E, the bearings *b* for the axle of the front wheel, the interposed springs *c c'* between said bearings and the standard, the steering-rod E', carrying the steering-bar, the steering-head J, located in front of the steering-rod and having bearings *f f* therefor, and the looped part F' of the main frame, substantially as described.

6. In a bicycle, the combination of the saddle H, its spring connected to an adjustable sleeve, *p*, the seat-frame having the horizontal rod *r* enter said adjustable sleeve and the vertical rods R, and the part T of the main frame, having clamped ends adapted to receive and hold the vertical rods R R, substantially as described.

7. In a bicycle, the combination of the actuating-gearing consisting of pinion M on the axle, gear K, engaging this pinion, casing L on the main frame, the ball-bearing in the casing for the gear, the multiple-pedaled lever N, the connecting-rod P on said lever, pivoted to the gear K, and the link Q, pivoted to the lever and the main frame, substantially as described.

402,461. RAZOR-STROP. JOHN LAMONT, Rochester, N. Y., assignor to Tower & Lamont, same place. Filed June 6, 1888. Serial No. 276,344. (No model.)

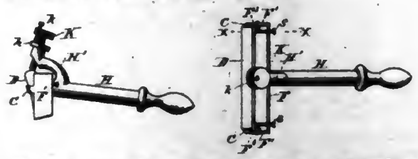


Claim.—1. In a razor-strop, the combination, with the rigid removable center piece and the sheath entirely surrounding the same, of the pads having the stropping-surfaces on the outside and secured to opposite sides of the sheath, substantially as and for the purpose set forth.

2. In a razor-strop, the combination, with the rigid removable center piece and sheath having the finished edges, of the pads with the stropping-surfaces on the outside secured to opposite sides of the sheath, substantially as described.

3. In a razor-strop, the combination, with the rigid center piece and the sheath within which the center piece fits, open at both ends, of the pads secured to the sides thereof and having the extended ends secured over one end of the sheath to close the same and present a finished appearance, substantially as described.

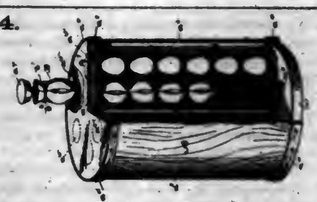
4. In a razor-strop, the combination, with the central sheath and the pads secured on opposite sides thereof, of the rigid removable center piece fitting within the sheath, and the raised strips or ribs secured thereto and extending longitudinally thereof on opposite sides to retain the pads in proper shape, substantially as described.



402,462. GRAIN SEPARATOR AND CLEANER. MICHAEL N. LAUFENBURG, Stockton, Cal., assignor to the Stockton Combined Harvester and Agricultural Works, same place. Filed Mar. 15, 1888. Serial No. 267,375. (No model.)

Claim.—1. The shoe or gang having the side walls, the screens by which the grain is separated from the barley and oats, the inclined plates whereby the grain is returned to the front of the succeeding screen, and the vertical partitions or diaphragms by which the shoe is separated into longitudinal channels, substantially as herein described.

2. The vertical rotary shaft journaled upon the frame of the machine and the eccentric fixed to the shaft, so as to rotate in a horizontal plane, in combination with the shoes suspended to oscillate from side to side about their points of suspension, rollers journaled upon the sides of the shoes and partaking of the pendulous movements of the shoes, the faces of said rollers turning in contact with those of the eccentrics and made crowning, so as to rock thereon without jar, substantially as described.



402,468. SAFETY-RAZOR. HENRY B. LEACH, Boston, Mass. Filed Sept. 6, 1888. Serial No. 284,735. (No model.)

Claim.—1. In a safety-razor, the combination, with the frame or holder having fixed clips C C and the razor-blade, of a clamping device operating upon the top edge of said blade, and the rearward adjusting-screws S S, operating upon the rear face of the blade, substantially as described.

2. In a safety-razor, the combination of the frame or holder having clips C C, the razor-blade, the clamping-screw K and gage-screw *k*, and the rearward adjusting-screws S S, substantially as described.

402,464. EGG-CRATE. ALLEN D. LEE, Grand Rapids, Mich. Filed Jan. 30, 1889. Serial No. 298,103. (No model.)

Claim.—1. The egg-crate consisting of an external case or body, and a series of independent tubes each sustained at its two ends in the body, and composed of a flexible sheet adapted to encircle a row of eggs, and provided with contractions to maintain their separation.

2. In an egg-carrier, a rigid case or body having openings through one end, in combination with a series of independent egg-receiving tubes adapted to be introduced through the end openings and sustained at their ends within the body, substantially as described and shown.

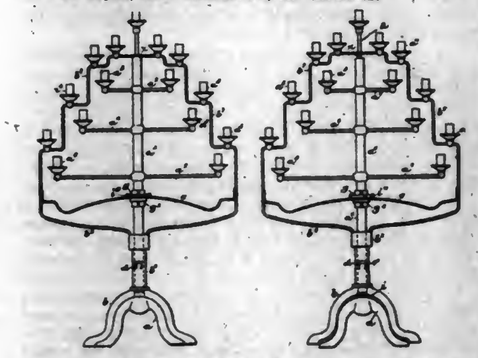
3. The egg-carrier consisting of the cylindrical body having top openings, the caps to close the openings, and the series of removable tubes, each divided longitudinally and provided with transverse contractions.

4. In an egg-carrier, the combination of the two heads, the sustaining-post, the outer shell, and the series of tubes sustained at their ends in said heads.

5. An egg-holder consisting of a sheet of veneer bent into tubular form with the grain lying longitudinally, and the contractions therein at different points in its length.

6. An egg-holder consisting of a longitudinally-divided tube having a series of circumferential contractions to maintain the separation of the eggs.

7. An egg-holder consisting of a longitudinally-divided tube with a series of circumferential contractions and removable encircling bands.



402,465. DEVICE TO FACILITATE GRINDING SECTIONS OF MOWING-MACHINES. FREDERICK J. MCCLENON, Walton, N. Y. Filed Dec. 21, 1888. Serial No. 294,299. (No model.)

Claim.—1. A section-bar holder consisting of the side bars connected by a transverse guide-bar and having shoulders upon their inner sides near their lower ends, the planes of which extend one at a proximate right angle to the other, the base-bar to which said side bars are pivoted, the clamp of the base-bar, the notched guides pivoted to the upper ends of the side bars, the adjustable clamp on the guide-bar, and its pivoted jaw and set-screw, substantially as specified.

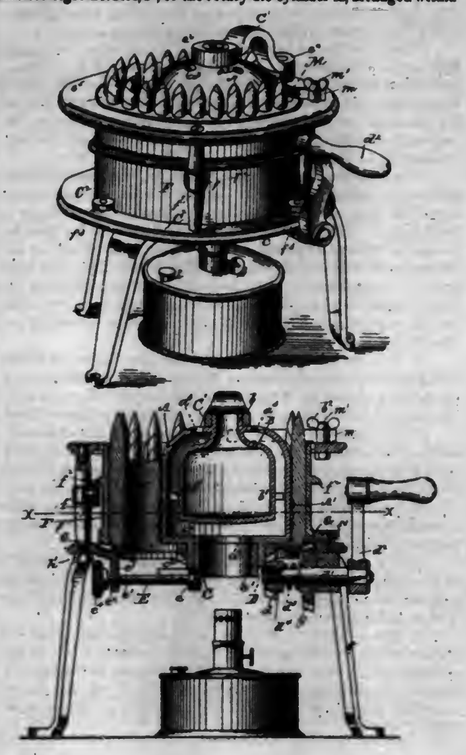
2. The combination, with the guide-bar of the section-bar holder, of the clamp consisting of the slide adjusted upon said guide-bar and having a concave shoulder, and the pivoted jaw applied to said slide and having a curved end fitting in the concavity of said shoulder, said jaw having a set-screw, substantially as set forth.

402,466. CANDELABRUM. THOMAS MCGOVERN, New York, N. Y. Filed May 23, 1888. Serial No. 274,796. (No model.)

Claim.—1. In a candelabrum, the combination, with the inner member comprising a foot, a stem secured to and rising from said foot, and branches from said stem bearing candle holders or sockets, of the outer member comprising a foot adapted to embrace the foot on the inner member, a tubular stem which embraces the stem of the inner member, and a frame to support candle holders or sockets, secured below to the tubular stem and having a bearing above on the stem of the inner member, said outer member being adapted to embrace or fold over the inner member, substantially as and for the purpose set forth.

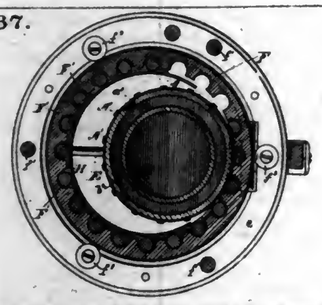
2. In a candelabrum, the combination, with the two substantially flat members mounted rotatively on each other and adapted to fold the one within the other, of the elastic bar *e*, secured at its ends to the frame of the outer member and having a bearing on the stem of the inner member, said members being provided with limiting stops and locks, substantially as and for the purposes set forth.

3. In a candelabrum composed of two substantially flat members rotatively mounted on each other, as described, the combination, with the cylindrical stem *a'* of the inner member provided with connected grooves *c c'*, of the tubular stem *b'* of the outer member embracing stem *a'*, and provided with a stud or screw, *d*, the end of which engages the connected grooves in the last-named stem, substantially as and for the purposes set forth.



4. In a candelabrum, the combination, with the inner member having an upright stem, *a'*, with branches a^2 of the outer member rotatively mounted on the inner member and having a frame, b^2, with steps or offsets formed therein to receive the candle sockets or holders, substantially as set forth.

5. In a candelabrum composed of two flat members rotatively mounted the one on the other, the combination, with the stem of the inner member provided with a groove, *c' c c'*, and a square, *i*, of the outer member provided with a stud which engages said groove, and a square socket which receives said square, said square and socket being auxiliary to the said groove and stud, substantially as set forth.



402,467. MACHINE FOR IMPRESSING LETTERS OR MARKS IN CIGARS. GEORGE F. MCINDOE and JAMES W. MCINDOE, Boston, Mass. Filed Jan. 31, 1887. Serial No. 226,000. (No model.)

Claim.—1. In a machine for impressing or stamping cigars, the combination, with a rotary cigar-carrier adapted to hold a number of cigars, of a rotary cylinder having a series of dies in relief thereon, and a flame-producing device, substantially as described, for heating said dies from the interior of the said cylinder, as set forth.

2. In a machine for impressing or stamping cigars, the combination, with the rotary cylinder or cigar-carrier F, having a series of interior cigar-holders, F', of the rotary die-cylinder A, arranged within

402,467.

and eccentric to the said cylinder F and provided on its exterior with a series of dies or molds, and means, substantially as described, for heating said dies, as set forth.

3. In a machine for stamping cigars, the combination, with the rotary cylinder F, having a series of interior cigar-holders, of the guard-plate H, extending partly around the interior of the said cylinder, the rotary die-cylinder A, arranged within and eccentric to the said cylinder F, and means, substantially as described, for heating the said die-cylinder, as set forth.

4. In a machine for impressing cigars, the combination, with a rotary cigar-carrier, as cylinder F, provided with a series of open cigar-holders, of an adjustable guard-plate for retaining the cigars in the said holders, whereby the same holders may be used for cigars of different sizes, substantially as set forth.

5. In a machine for impressing or stamping cigars, the combination, with a rotary cigar-holding cylinder, of an adjustable die-cylinder within and eccentric to the said cigar-holding cylinder, substantially as set forth.

6. In a machine for impressing or stamping cigars, the combination, with a rotary cigar-cylinder having a series of cigar-holders, of a rotary die-cylinder, a guard-plate for retaining the cigars in the holders until they have been impressed, and a stripper for removing the cigars after the impressing operation has been completed, substantially as set forth.

7. In a machine for impressing letters, &c., in cigars, the combination of a movable cigar-carrier having a series of cigar-holders open upon their sides, a guard-plate for maintaining the cigars in their holders during the movement of the carrier, and a plate for closing the bottoms of the holders, substantially as described.

8. In a machine for impressing letters, &c., in cigars, the combination of a movable cigar-carrier having a series of cigar-holders open upon their sides, a guard-plate for maintaining the cigars in their holders during the movement of the carrier, and a plate for closing the bottoms of the holders, provided with an opening beyond the impressing-die, through which the cigars escape from their holders, substantially as described.

9. In a machine for impressing letters, &c., in cigars, the combination of a movable cigar-carrier having a series of cigar-holders open upon their sides, a guard-plate for maintaining the cigars in their holders during the movement of the carrier, and a plate for closing the bottoms of the holders, provided with an opening beyond the impressing-die, through which the cigars escape from their holders, and a stripping or freeing device arranged to project into the line of movement of the cigars to free or strip them from their holders and arranged above the opening in the said plate, substantially as described.

10. In a machine for impressing or stamping cigars, the combination, with a rotary cigar-holding cylinder, of a die-cylinder open at its bottom and provided with an interior deflecting shell or casing, B, and means, substantially as set forth, for heating the said die-cylinder.

11. In a machine for impressing or stamping cigars, the combination, with a rotary cigar-holding cylinder, of a rotary die-cylinder open at its bottom and provided on its outer surface with a series of relief-dies at uniform distances apart, and having at its top the holes a^2, and the deflecting shell or casing B, concentrically placed within the said die-cylinder to form an annular heating-chamber, substantially as set forth.

12. The combination, with the rotary cigar-holding cylinder F, of the rotary die-cylinder A within and eccentric to the said holding-cylinder, and the supporting-arms C and C', by which the die-cylinder is supported, substantially as set forth.

13. The combination, with the rotary cigar-holding cylinder F and the rotary die-cylinder A within the said cylinder F, of the supporting-arms on which the die-cylinder is mounted, and means, substantially as described, for varying the position of the said arms to adjust the die-cylinder relative to the cigar-holding cylinder, as set forth.

14. In a machine for impressing or stamping cigars, the combination, with a rotary cigar-holding cylinder, of a die-cylinder within the said holding-cylinder and adjustable relative thereto, substantially as set forth.

15. The combination, with the die-cylinder A and its supporting-arm C, of the threaded adjusting-rod E, having a ball-joint connection with the said arm, and a stationary nut, as c^3, through which the said rod passes, substantially as set forth.

16. The combination, with the die-cylinder A, having a bottom plate, c^6, provided with the flange c^7, of the arm C, having the annular supporting end c', fitting within the said flange, substantially as set forth.

17. The combination of the adjustable die-cylinder A, provided with the gear-wheel D, the shaft d', the gear-wheel d, splined to said shaft to revolve therewith, but movable lengthwise thereof, and the spring for maintaining the said gear d in operative contact with gear D in different positions of the said cylinder, substantially as set forth.

18. The combination, with the rotary cigar-carrier F, provided with the internal cigar-holders, F', and with the external flange or lip, f^3, of the machine-frame provided with the anti-friction rolls f, on which the said flange or lip rests, substantially as set forth.

19. The combination, with the rotary cigar-carrier F, having the internal cigar-holders, F', of the machine-frame having the anti-friction rolls f^3, with which the base of the said rotary carrier is in contact, substantially as set forth.

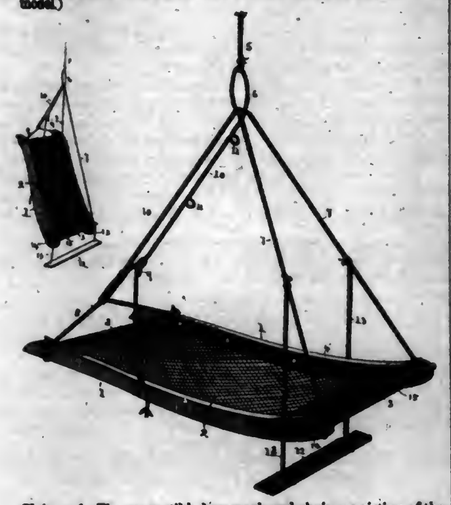
20. The combination, with the rotary cigar cylinder or carrier F, provided with the internal cigar-holders, F', and the exterior flanges or lip, f^3, of the frame of the machine having the supporting anti-friction rolls f and the centering anti-friction rolls f^3, substantially as set forth.

21. The combination, with a rotary cigar-carrier, of the inclined stripper M, arranged at one end of the said carrier, and the thumb-nut by which said stripper may be secured in different positions of adjustment, substantially as set forth.

22. In a machine for impressing cigars, the combination, with a heated die, of a concave cigar-holder constructed to surround more than one-half of a cigar circumferentially, and thereby prevent the cigars from spreading when subjected to the impression of the die, substantially as set forth.

402,468. METHOD OF FORMING AN ORNAMENTAL BORDER ON FABRICS. JOSEPH M. MERROW, Merrow, Conn. Original application filed Sept. 12, 1887, Serial No. 249,491. Divided and this application filed Jan. 12, 1888. Serial No. 260,573. (No model.)

Claim.—1. The improvement in the art of crocheting or overseaming, which consists in forming along the edge of the fabric a series of connected clusters or loops by passing the thread through the fabric from one side and grasping the thread alternately on opposite sides of the fabric, to form and draw loops beyond the edge of said fabric, and interlocking the loops thus formed by drawing one loop through two preceding loops projected from the opposite sides of the fabric, repeating the operation a number of times at one point to form a cluster of loops, and subsequently passing the thread through the fabric at another point, drawing loops from opposite sides, and interlocking them, substantially as described.



2. The mode herein described of producing an ornamental border upon fabrics, said mode consisting in forming a group of stitches while the fabric is stationary by carrying the thread through the fabric, drawing a loop from one side of and beyond the edge of the fabric, then from the other side in like manner, and interlacing said loops at their outer ends, repeating said operation until a given number of loops are formed, then spreading the group to assume a shell-like form by feeding the fabric and repeating the loop-forming operation.

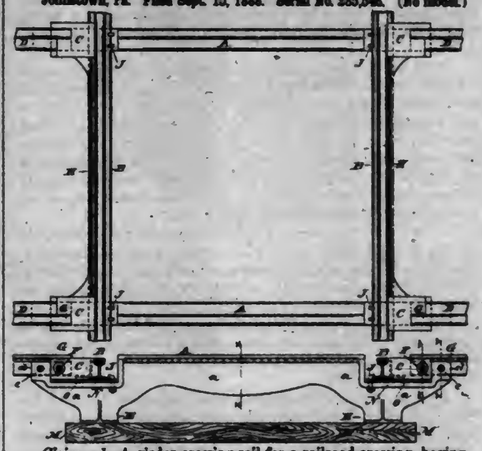
3. The mode herein described of producing an ornamental border or finish upon fabrics, the same consisting in forming a group or cluster of stitches at a given point by passing the thread repeatedly through the fabric and grasping it on opposite sides of the fabric, forming loops extending from said point of insertion of the thread to or beyond the edge of the fabric, connecting or interlooping the outer ends of said loops to form a continuous margin for the group, and subsequently passing the thread through the fabric at another point, drawing loops therefrom and connecting or interlooping said loops to the loops of the preceding group or cluster to spread and retain the latter.

4. The herein-described improvement in the art of producing a border upon fabrics, the same consisting in passing the thread repeatedly through the fabric at or near the same place and from one side, grasping the thread alternately on opposite sides of the fabric to form and draw the loops beyond the edge of the latter, and interlooping or interlocking the loops so formed by drawing a loop from the top through the two preceding loops, the one from below and the other from on top, repeating this operation until the requisite number of stitches have been formed, and then carrying the thread through the fabric at a remote point, while the top loop is held preparatory to the formation of the next bottom loop, where the branches of said top loop are separated and carried through the fabric at different points.

5. The improvement in the art of finishing fabrics, which consists in carrying the thread through the fabric, grasping said thread below the fabric, carrying the thread beyond the edge of the fabric below and above the latter, enchaining or interlooping said thread beyond the edge of the fabric, repeating said operations several times at one point, and subsequently repeating the operation one or more times at a point suitably distant, substantially as described.

402,469. CONVERTIBLE HAMMOCK AND CHAIR. REESE W. MIMMOUGH, Washington Court-House, Ohio, assignor of one-half to Jas. F. Dennis, same place. Filed Aug. 22, 1888. Serial No. 283,474. (No model.)

Claim.—1. The convertible hammock and chair, consisting of the rigid frame-work, the netting secured to the same at both the ends and sides, the suspending-ropes secured to each end of the frame, one of which ropes is provided with loops 11 and with a ring or loop, 9, for adjusting the inclination of the hammock, and a ring or loop, 6, through which the suspending-ropes are passed, substantially as specified.



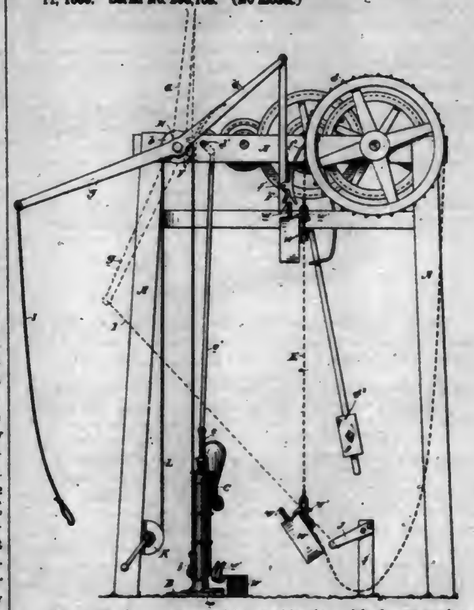
2. In a hammock, the rigid frame, the netting attached thereto, suspending-cords fastened around the frame-work connections at the corners of the frame, one of which is provided with a hook and loops or rings 11, and a supporting-rope, 5, substantially as specified, whereby the cords that suspend the frame serve to strengthen it at its corners, and whereby the hammock is made adjustable and suspended from a single point.

3. In a hammock, the rigid frame having the ends of the front end bar projecting from the sides thereof, the suspending cords or ropes secured to the frame at the front, the cord attached to the opposite end of the frame, provided with a hook and rings, a suspending loop or ring, and the foot-rest supported by cords attached to the front suspending-ropes and adapted to hang outside the hammock-frame, all combined substantially as specified, whereby the foot-rest may be arranged to hang over and rest upon an end bar of the frame, or may be dropped beneath it and be suspended directly from the main suspending-cords by simply manipulating said foot-rest-supporting cords.

4. In a convertible hammock and chair having a rigid frame having the ends of the front end bar projecting from the sides thereof, a single support, as cord 5, the several suspending-cords, and the foot-rest supported by cords attached to two of said suspending-cords at a point above the frame, all combined substantially as specified, whereby the foot-rest cords can be made to depend either from the frame-bars, so as to conveniently receive the feet of an occupant, or directly from the points of suspension above the frame, so as to hang beneath the hammock, substantially as specified.

5. In a convertible hammock and chair, the several suspending-cords and the supporting loop or ring 6, in combination with an adjustable suspending-cord, 10, provided with loops or rings 11, and a hook, 9, said hook being secured to a transverse suspending-cord, as 8, and to an end of the adjustable cord having the rings by a part of said cord, substantially as specified.

402,470. STREET-RAILROAD CROSSING. ARTHUR J. MOXHAM, Johnstown, Pa. Filed Sept. 15, 1888. Serial No. 285,546. (No model.)



Claim.—1. A girder crossing-rail for a railroad-crossing, having a head of any desired section and a vertical web, and flanges for its support, said crossing-rail being provided with bearings for the crossed rails and for locking-blocks, and with pockets for the connecting crossing track-rails, substantially as set forth.

2. A tie-rod for a railroad-crossing, having at its end a pocket to receive a connecting-rail, and a protrusion for fitting into the crossed rail, substantially as set forth.

3. A tie-rod for a railroad-crossing, having at its end a lifting-block provided with flanges, as *f*, to fit over a seat or bearing in a crossing-rail, substantially as set forth.

4. A lifting-block for a railroad-crossing, provided with a flange, as K, for lapping over its bearing on the crossing-rail, substantially as set forth.

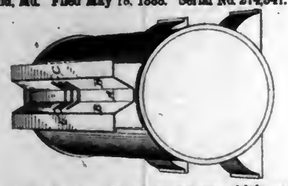
402,471. MOTOR. HANS M. OLSEN, Sacramento, Cal. Filed Jan. 11, 1888. Serial No. 260,102. (No model.)

Claim.—1. In a motor, and in combination with the operating-chain E, the mechanism for connecting a weight with the chain, con-

sisting of a grip for engaging the weight, a swinging arm by which said grip is suspended, and connections for holding the arm and relieving it to cause the weight to swing over toward and engage the operating-chain, substantially as described.

2. In a motor, and in combination with its operating-chain and a weight connected therewith, a second weight, a grip for hanging up said second weight, a swinging arm suspending the grip, and trip-connections for holding the swinging arm, adapted to be released by the descending first weight, whereby the second weight is swung over to and engages the operating-chain, substantially as herein described.

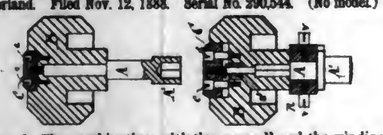
3. In a motor, and in combination with the operating-chain and a weight connected therewith, a second weight, a grip for hanging up said second weight, a swinging arm suspending the grip, a cord or rope connected with the arm for holding it in position, and a fixed piece for holding the cord or rope, said cord or rope being in the vertical plane of the descending first weight, whereby it is released from the fixed piece by the contact of said weight, to relieve the swinging arm and carry the second weight over to and connect it with the operating-chain, substantially as herein described.



4. In a motor, the chain or sprocket pulley of a gear-train, and a chain, E, operating it, in combination with the suspended grip having the pivoted jaw, with an extension, f^3, said grip being adapted to receive and hang up a weight, the swinging arm suspending the grip, and connections with said arm for holding it in position and relieving it, whereby the weight and grip are swung over toward the chain E, to connect said weight therewith and to release it from the grip by the contact of its pivoted arm-extension f^3 with the sprocket-pulley, substantially as described.

5. In a motor, the sprocket-pulley of the gear-train, and the chain E engaging it, in combination with a weight having a forked catch, w', for readily engaging the links of said chain, whereby said weight is suspended therefrom, and the swinging grip and arm for temporarily suspending the weight and throwing it over to engage the chain, substantially as described.

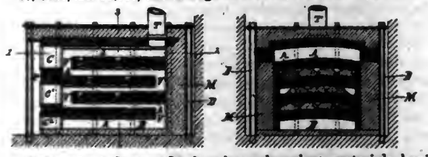
6. In a motor, the combination of the gear-train and the sprocket-pulley thereof, the endless chain E, engaging the pulley, and the two weights with forked hooks w', for engaging the chain successively, said weights having loops w, the swinging arm G, the cord or rope I, for holding said arm, the inclined piece J below for engaging the said cord or rope and holding it in the vertical plane of the descending weight, and the grip suspended from the upper end of the arm G and adapted to engage the loops w of the weights, whereby they are temporarily hung up and swung over to engage the chain E, all arranged and adapted to operate substantially as herein described.



7. In a motor, the gear-train having the sprocket-pulley and the endless chain engaging it, in combination with a weight having a forked catch, w', for engaging the chain, and a loop, w, in its top, whereby it is suspended, a pivoted swinging arm, G, above, and a trip-rope, I, for holding the said arm and releasing it, as described, the grip carried by the arm and adapted to engage and temporarily suspend the weight, and the windlass and hoisting-rope for raising the weight to the grip, substantially as described.

402,472. STEAM-ENGINE VALVE AND SEAT. ROBERT G. PAUL, Cumberland, Md. Filed May 18, 1888. Serial No. 274,347. (No model.)

Claim.—Cyliuder-ports in steam-engines which open from the bottom and sides of a depressed or trough-shaped valve-seat, in combination with said seat and its valve, substantially as set forth.

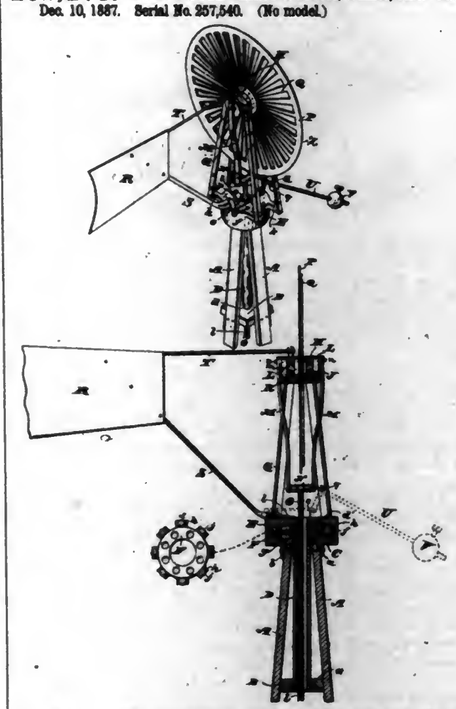


402,473. WATCH-PENDANT. PAUL PERRET, Chaux-de-Fonds, Switzerland. Filed Nov. 12, 1888. Serial No. 290,544. (No model.)

Claim.—1. The combination, with the crown B and the winding-stem A, passing through the said crown, of the nut C, screwed upon the end of the stem, and the small screws c, for preventing the nut becoming unscrewed, substantially as set forth.

2. The crown B, having a central hole and recessed for the end of the pendant, in combination with the stem A, having a socket, A', at one end, the nut C, screwed upon the other end of the stem and occupying a recess in the crown, the screws c, passing through the nut into the crown, and a spring between the nut and the crown, substantially as set forth.

402,474. FURNACE. MICHEL PERRET, Paris, France. Filed Nov. 9, 1888. Serial No. 290,389. (No model.) Patented in France Feb. 17, 1887, No. 181,623; in Denmark Apr. 24, 1887, No. 641; in Belgium Dec. 23, 1887, No. 80,069, and in England Dec. 29, 1887, No. 17,899.



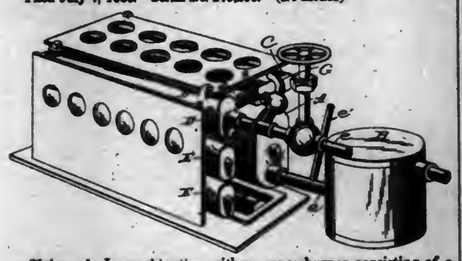
Claim.—1. A furnace for burning pulverulent materials, having shelves provided with perforations, whereby the combustible matter is caused to descend and arrange itself automatically in the form of a series of independent conical heaps arranged in such a manner that the gaseous agent supporting combustion is compelled to circulate around and impinge against the said heaps, all substantially as described.

2. A furnace provided with a series of perforated shelves for the fuel, the perforations in one shelf being opposite the solid parts in the next shelf, all substantially as described.

3. A furnace with perforated shelves placed nearer together at the lower than at the upper part of the furnace and presenting perforations regularly distributed quincuncially, in combination with an ash-pit for the admission of air, and passages for the circulation of the gases, substantially as and for the purpose described.

4. In a furnace, the shelves provided with perforations, in combination with a projecting or raised part or bench, an ash-pit, openings, passages, and a brick-work or other casing, substantially as described.

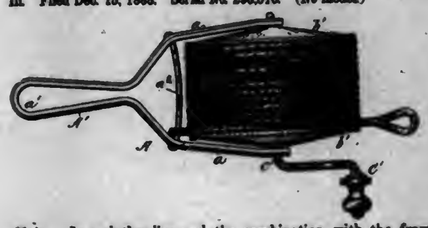
402,475. WIND-WHEEL. LEROY S. PROUTY, Wilmot, Ohio. Filed Dec. 10, 1887. Serial No. 257,540. (No model.)



Claim.—1. The combination, with the wind-wheel centrally supported on the turn-table, of a vane hinged to said turn-table by the diagonal and horizontal rods S and T, respectively, said rods connected with the said turn-table at one side of the axis of the wheel-shaft, the diagonal rod connected to the turn-table at the base and the horizontal rod at a point above the base, the diagonal rod being provided with a bend terminating in a laterally-projecting arm,

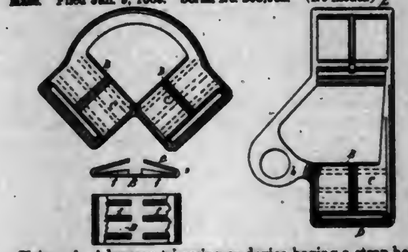
thereby providing a firm bearing for said brace, the shaft g, pivoted to the wind-wheel support, the cranked lever U, fixed to said shaft, a link, p, connected at one end to the crank-arm of the lever U and connected at its opposite end to the laterally-projecting arm of the rod S, substantially as set forth.

2. The combination, with a wind-wheel and its supporting-frame G, of a turn-table to which the said supporting-frame is secured, the said turn-table consisting of the top central apertured plate provided with annular flanges g and f, the latter flange having a greater diameter than the former flange, an annular supporting-head, C, provided with a central aperture coincident with the aperture of the top plate, the short annular flange of said top plate turning upon the upper face of said head, while the longer annular flange engages the periphery of said head, thereby forming a closed chamber, the circular plate inclosed within said chamber and provided with a central aperture through which the short annular flange projects, said plate further provided with radial spindles upon which rollers are journaled, and a tube-spindle, D, projecting through the aperture of the turn-table journaled at its lower end in stationary bearings and secured at its upper end to the said turn-table, substantially as set forth.



402,476. BURNER. EDWARD POLLARD, East Cambridge, Mass. Filed July 7, 1888. Serial No. 279,290. (No model.)

Claim.—1. In combination with a vapor-burner consisting of a generator, a superheater above the generator, a vaporizer in connection with said superheater, a burner arranged below the vaporizer and generator, so as to heat both, and an open vent in connection with the generator for preventing the extinguishment of the flame, substantially as described.



2. In combination with a vapor-burner, a generator, a superheater above the same, a vaporizer in connection with the superheater, a burner and pipe connections from the vaporizer, whereby a vapor of mixed steam and carbon is fed to the burner, and an open vent-pipe in the water-feed pipe to the generator, substantially as described.

402,477. CLOTHES-LINE REEL. HERMAN C. PRIEBE, Englewood, Ill. Filed Dec. 13, 1888. Serial No. 293,510. (No model.)

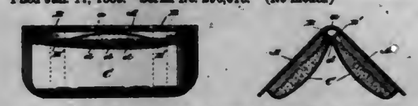
Claim.—In a clothes-line reel, the combination, with the frame A, consisting of arms a, handle A', with space a' and rod a^3, of the reel B and the shaft C, mounted in the arms a and provided with crank-handle C', substantially as and for the purposes specified.

402,478. HARNESS-TRIMMING. DENNIS J. REGAN, Agawam, Mass. Filed Jan. 9, 1889. Serial No. 295,902. (No model.)

Claim.—1. A harness trimming or device having a strap-holding part consisting of a plate, B, provided with overhanging wing C and holding-ribs shallow toward the bent-over edges and deeper toward the center, substantially as shown.

2. A harness-trimming, substantially as shown, consisting of a plate, B, having overhanging wings C, one or both being provided with holding-ribs, in combination with a ring, A, formed at one side, and a buckle-frame, E, formed by the projecting side parts, as shown, united by cross-bars, all being made integral and provided with a tongue pivotally secured in position, substantially as set forth.

402,479. VARIABLE EXCENTRIC. DE LA FAYETTE REMINGTON, San Leandro, Cal. Filed Jan. 19, 1889. Serial No. 296,910. (No model.)



Claim.—1. In a variable excentric, the combination of a fixed disk, an excentric connected with and adapted to slide on the fixed disk, whereby its position may be varied, said excentric having an arm projecting from its face at an angle, a sliding disk having a hole through which the inclined arm of the excentric passes, and connections for moving the sliding disk, whereby it moves the inclined arm and varies the position of the excentric on the fixed disk, substantially as herein described.

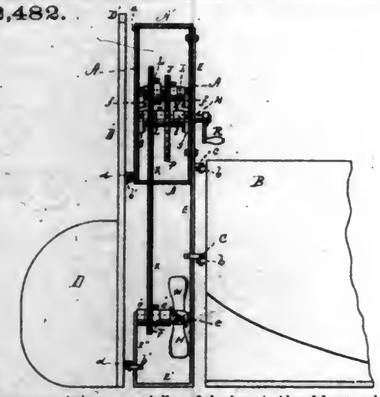
2. In a variable excentric, the combination of the fixed disk having the elongated slots, the excentric having guides seated in the slots, whereby it is adapted to be moved on said disk, the inclined arm of the excentric, the sliding disk having a hole receiving and moving the inclined arm, and connections for moving the sliding disk, substantially as described.

3. In a variable excentric, the combination of the fixed disk having the elongated slots, the excentric having the cross rib or bar with guide-flanges and screw-bolts with nuts and washers for fitting it to the slotted disk, whereby it is movable thereon, the inclined arm projecting from the excentric, the sliding disk having a hole receiving and moving the inclined arm of the excentric, and connections for moving the sliding disk, substantially as herein described.

402,480. HARNESS-PAD. WILLIAM G. ROBBINS, Bromfield, Nebr. Filed Jan. 17, 1889. Serial No. 296,618. (No model.)

Claim.—A harness-pad consisting of two rigid blocks having their inner meeting edges cut away, bent spring-metal bands for connecting the cut-away edges of the blocks, a single cushion covering the inner faces of both blocks, and provided at the center with ventilating-openings, and a cover secured to the outer faces of the blocks and provided at the center with ventilating-openings aligned with the openings in the cushion and space between the blocks, substantially as described.

402,481. INCANDESCENT-LAMP SOCKET. FREDERICK C. ROCKWELL, Hartford, Conn. Filed Jan. 24, 1889. Serial No. 297,453. (No model.)



Claim.—1. The herein-described shell for incandescent electric lamp sockets, formed of paper the surfaces of which are provided with a coating of insulating material of higher resistance than the paper, substantially as described, and for the purpose set forth.

2. The herein-described shell for incandescent electric-lamp sockets, formed from a sheet of paper the surfaces of which are provided with a coating of gum and an earthy material hardened by heat and pressure, whereby the shell is stiffened and rendered water-proof, fire-proof, and insulating, substantially as described, and for the purpose set forth.

402,482. HAND-PROPELLER FOR SMALL BOATS. EDWIN W. SCHILDKNECHT, Boston, Mass. Filed Jan. 24, 1889. Serial No. 297,495. (No model.)

Claim.—The herein-described improved propelling device for

402,482.

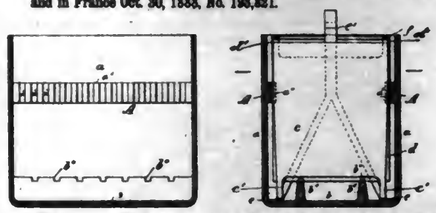
small boats, consisting, essentially, of the box A A' and bent rod E E' E", supporting the same and provided with the pintles C and eyebolts b', the shaft c, supported by said bent rod and carrying the propeller H and sprocket-wheel F, chain K, shaft I, supported within the box and provided with the sprocket-wheel L and pinion J, and shaft N, supported by the box and provided with the gear-wheel P and crank R, substantially as and for the purpose set forth.

402,483. DEVICE FOR GUIDING THE EDGES OF FABRICS. JOS. J. SCHOLFIELD, Providence, R. I. Filed Mar. 19, 1888. Serial No. 267,787. (No model.)

Brief.—Whenever the edge of the fabric varies from the correct line it engages a pivoted detector-plate, causing the latter to engage an edge of an oppositely-notched ratchet-bar carried by a segmental rack frictionally held in a reciprocating slide, thus changing the relative movement of the slide and rack and consequently that of a pivoted guide-roller in gear with said rack. Connected with the segmental rack is another guide-roller capable of endwise movement, and a fixed guide is placed beyond the automatic devices.

Claim.—1. In a cloth-guiding machine, the combination, with the ratchet member adapted for reverse movement, the friction-slide, and reciprocating means therefor, which together constitute a power-dispensing mechanical movement, as set forth, of a detector which engages frictionally with the running web, so as to move therewith when in engagement, a guide-roller held upon a pivoted head or frame, and the pivoted head or frame supporting the guide-roller and geared with the ratchet member, substantially as described.

2. In a cloth-guiding machine, the combination, with the ratchet member adapted for reverse movement, the friction-slide, and reciprocating means therefor, which together constitute a power-dispensing mechanical movement, as set forth, of a detector which engages frictionally with the running web, so as to move therewith when in engagement, a guide-roller held upon a pivoted head or frame, the pivoted head or frame supporting the guide-roller and geared with the ratchet member, and the guide for holding the edge of the web back to the true line after the said edge passes the frictionally-engaged detector, substantially as described.

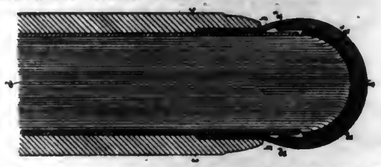


3. In a cloth-guiding machine, the combination, with the ratchet member, the friction-slide, and reciprocating means therefor, which together constitute a power-dispensing mechanical movement, as set forth, of a detector the movement of which serves to direct the required movement of the ratchet member, and an endwise-moving guide-roller connected with the ratchet member, so as to move in opposition to the in-and-out varying movement of the edge of the web, substantially as described.

4. In a cloth-guiding machine, the combination, with the ratchet member, the friction-slide, and reciprocating means therefor, which together constitute a power-dispensing mechanical movement, as set forth, of a detector which serves to direct the required movement of the ratchet member, a guide-roller held upon a pivoted head or frame, the pivoted head or frame supporting the guide-roller and geared with the ratchet member, and an endwise-moving guide-roller connected with the ratchet members, so as to move in opposition to the in-and-out varying movement of the edge of the web, substantially as described.

5. In a cloth-guiding machine, the combination, with the guide-roller and its pivoted head or frame, of the oppositely-notched sliding bar, the intermediate gearing between the pivoted head or frame and the notched sliding bar, the reciprocated slide which frictionally holds the notched sliding bar, means for reciprocating the said slide, and the overbalanced detector adapted for frictional engagement with the running edge of the web, substantially as and for the purpose specified.

6. In a cloth-guiding machine, the combination, with the ratchet member, the friction-slide, and reciprocating means therefor, which together constitute a power-dispensing mechanical movement, as set forth, of a detector which engages frictionally with the running web, a guide-roller held in a pivoted head or frame, the pivoted head or frame supporting the guide-roller and geared with the ratchet member, the curved guide-plate for guiding the edges of the web to the detector, and the rollers at opposite sides of the curved guide-plate, substantially as described.



402,484. CONTAINING-CELL FOR SECONDARY BATTERIES. PAUL SCHOOP, Zurich, Switzerland. Filed Dec. 19, 1888. Serial No. 294,073. (No model.) Patented in England Oct. 30, 1888, No. 15,626, and in France Oct. 30, 1888, No. 193,821.

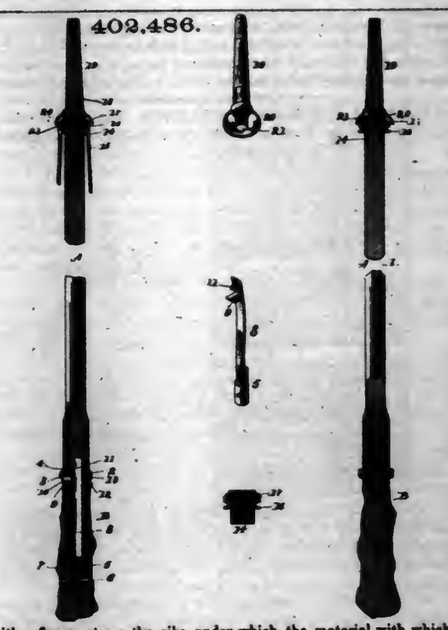
Claim.—1. The rectangular cell-body for secondary batteries, provided on its inner sides and bottom with parallel notched side racks and parallel upwardly-extending bottom racks, substantially as described.

2. The combination, in an element for secondary batteries, of the cell-body provided on its inner sides and bottom with the parallel side racks, A, and bottom racks, b', the positive electrode-plates having upwardly-projecting arms and resting with their lower edges in the notches of the bottom racks, the negative electrode-plates having legs or supports straddling the bottom racks, and the strips *f* and *e*, whereby the positive and negative electrodes are respectively connected to one another and to their respective poles *f"* and *e'*, substantially as and for the purpose set forth.

402,485. SPRING-BACK FOR BOOKS. FRITZ E. SCHUBERT, Zurich, Switzerland, assignor to Carl Freidrick Schubert, same place. Filed Dec. 26, 1888. Serial No. 294,632. (No model.)

Claim.—1. A spring-back for books, having an inner layer or core consisting in a resilient piece of untanned hide formed in an arc of a circle, substantially as described.

2. An article of manufacture consisting in a resilient piece of untanned hide formed in an arc of a circle and adapted to be used as core for the spring-back of a book, substantially as set forth.

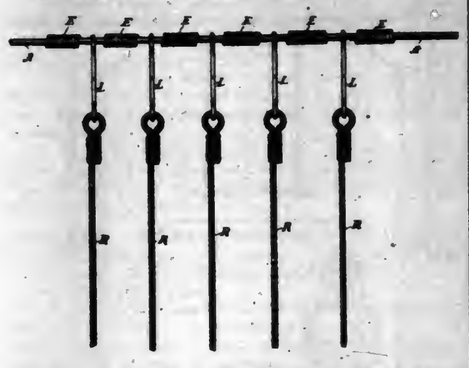


402,486. UMBRELLA. SIMON SCHWARTZ, Joplin, Mo. Filed Dec. 22, 1888. Serial No. 294,374. (No model.)

Claim.—1. The combination, with the handle of an umbrella, one portion of which is made hollow, of a plug fitting in the said hollow portion and held there by means of a pin, the end of the said plug being cut away to form a shoulder, to which is secured a curved spring or springs carrying a pin or pins for engaging openings in a ferrule on the stick, to hold the said handle in place thereon, substantially as described.

2. The combination, with the spring mounted upon the plug secured within the handle and carrying a pin for engaging an opening in the ferrule secured to the stick, of a catch designed to engage a recess formed in the edge of the ferrule, whereby the pin may be pressed down and out of contact with the opening in the ferrule, and thus release the handle, substantially as described.

3. The combination, with an umbrella-stick having a hollow handle provided with a spring carrying a pin for engaging an opening in the ferrule secured upon the stick to hold the said handle in place thereon, of a thimble screwed upon the opposite end and provided

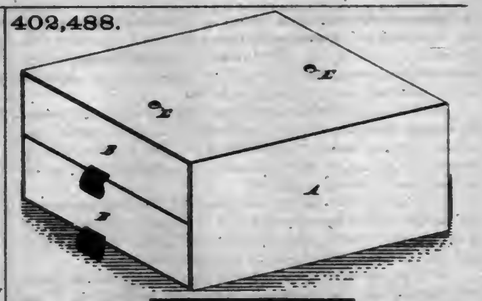


402,486.

with a flange above the ribs, under which the material with which the umbrella is covered is secured, substantially as described.

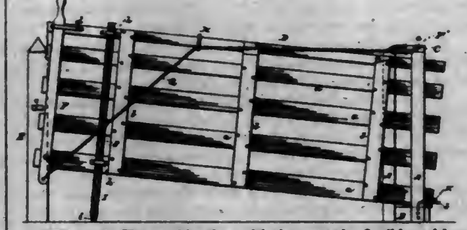
4. The combination, with a thimble provided with a flange under which the material covering the umbrella is secured, of a drip-cup provided with a screw-threaded projection designed to engage the threaded opening within the said thimble, and carrying on its outer ends a tip, whereby the said tip may be removed when the umbrella is to be packed, substantially as described.

402,487. RAILWAY-BRIDGE GUARD. STEPHEN G. SCOTT, Plainwell, Mich., and WILLIAM O'HERN, Fort Wayne, Ind., assignors of one-half to John H. P. Hughart, Grand Rapids, Mich., and Patrick H. O'Rourke, Fort Wayne, Ind. Filed Jan. 23, 1889. Serial No. 297,275. (No model.)



Claim.—1. In a bridge-guard, the combination of a wire support, a series of links, and a series of ropes or cords, one end of each of said links loosely surrounding the supporting-wire and the other end attached to one of the cords, substantially as and for the purpose described.

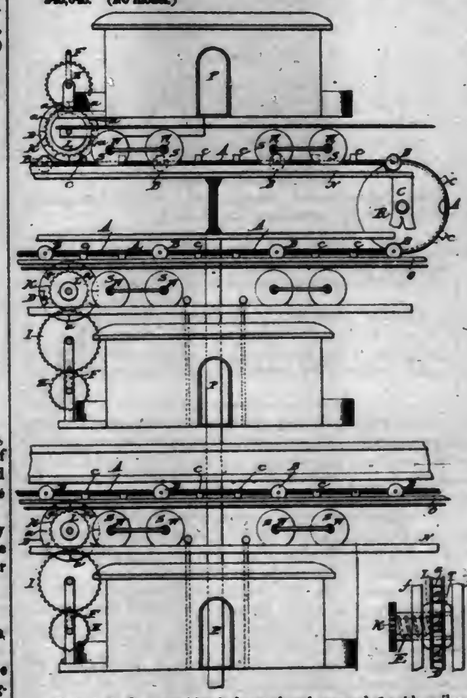
2. In a bridge-guard, the combination of the cord supported by the connecting-link, the connecting-link constructed of a bent wire or rod having a loop at each end, one for holding the rope and one for loosely encircling the supporting-wire, all substantially as described.



402,488. PRESCRIPTION-FILE. ALBERT J. SHAUL, Long Pine, Nebr. Filed July 31, 1888. Serial No. 281,580. (No model.)

Claim.—The box or case A, provided with the holes E E, the drawers B, having open ends and slanting sides, the straight filing-needle C, and keeper D, in combination with the bolts F and the washers G G, whereby the boxes or cases A may be fastened to a base and to each other to form a continuous cabinet of drawers.

402,488.



402,489. FARM-GATE. SAMUEL S. SHERMAN and JEREMIAH G. SHERMAN, West Mollenry, Ill. Filed July 24, 1888. Serial No. 281,331. (No model.)

Claim.—1. The combination, with the gate, the flexible rod having the hook, the posts, and the cross-bar B, of the yielding pivot or hinge having the hook ends engaging, respectively, the end of the lower bar and the cross-bar B, substantially as specified.

2. The combination, with the gate, the posts, and the cross-bar B, of the yielding pivot having the hooks at right angles to each other, engaging, respectively, in an opening in the cross-bar and with the end of the lower gate-bar, and the supporting-pin, substantially as specified.

402,490. ELEVATED AND SUSPENDED CABLE RAILWAY. GEORGE R. TAYLOR, Louisville, Ky. Filed July 29, 1887. Serial No. 245,645. (No model.)

Claim.—1. In a combined elevated and suspended cable-railroad system, a threefold combination, to wit: one elevated and two suspended cable railroads constructed on a double set of posts connected

by transverse and longitudinal girders, in combination with tracks O and N, standards C, supporting driving-wheel R, and the endless driving-cable A, provided with clips C, trucks B, and axle-boxing *h h*, the said cable being arranged to propel one upper and one suspended line, as described, and for purposes specified.

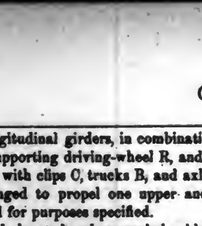
2. In a combined elevated and suspended cable-railroad system, the capstan or friction-wheel D, provided with a groove and steel pins or bars *a*, in combination with the shoulder T, disk L, axle or shaft E, frames *f f*, and cogged screw and nut K, to regulate friction, as described, and for purposes specified.

3. In a combined elevated and suspended cable-railroad system, the capstan or friction-wheels D and D′ in frame *f f*, in combination with shoulder T, disk L, cog-screw and nut K, with cable A, clips C, and trucks B, as described, and for purposes specified.

4. In a combined elevated and suspended cable-railroad system, the wheels H and I, in combination with cog-screw and nut K and capstan-wheel D, as described, and for purposes specified.

5. In a combined elevated and suspended cable-railroad system, the conduit with closed sides and top and open bottom, in combination with cable-track O and car-track N, with groove M in each, and braces Q Q, as described, and for purposes specified.

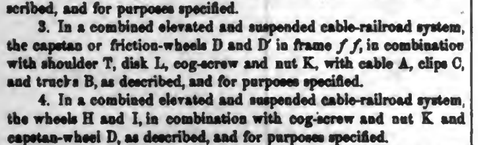
6. In a combined elevated and suspended cable-railroad system, the half-springs Z Z, in combination with the iron rods Y V Y, axle W, and car, as described, and for purposes specified.



7. In a combined elevated and suspended cable-railroad system, a railroad and cable track grooved, beveled, and filled with composition or concrete composed of sand, coal-ashes, gas-house lime, and Liverpool tar, as described, and for purposes specified.

8. In a combined elevated and suspended cable-railroad system, a grooved railroad and cable track inlaid with composition, in combination with leather or rubber, as described, and for purposes specified.

9. In a combined elevated and suspended cable-railroad system, braces Q Q, in combination with conduit or tramway, car-wheels S S, and suspended cars, as described, and for purposes specified.



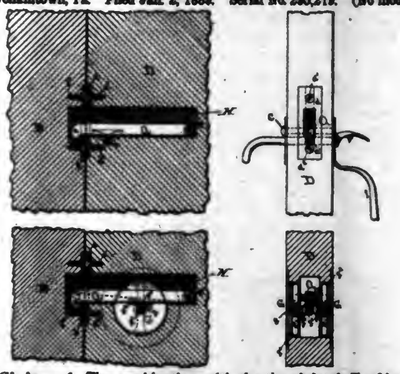
10. In a combined elevated and suspended cable-railroad system, iron bands or rods X X, passing around the frame of the suspended car and up between and over the rails of the suspended track, in combination with the elbows and small wheels *b b*, as described, and for purposes specified.

402,491. MAGNETIC POCKET-BOOK. BENJAMIN F. THOMAS, Denver, Colo. Filed Dec. 27, 1888. Serial No. 294,750. (No model.)

Claim.—A pocket-book provided with a flap, and a magnet secured in the said flap, substantially as described.

402,492. ATTACHMENT FOR BOLTS. WILLIAM H. THOMAS, Jenkintown, Pa. Filed Dec. 26, 1888. Serial No. 294,670. (No model.)

Claim.—1. The combination, with a shutter or other bolt, of a latch provided with a head thereon and pivoted to the base-plate of said bolt, said head normally resting on the edge of the bolt and automatically dropping back of the rear end of the said bolt when the same is in its locked position, substantially as shown and described.



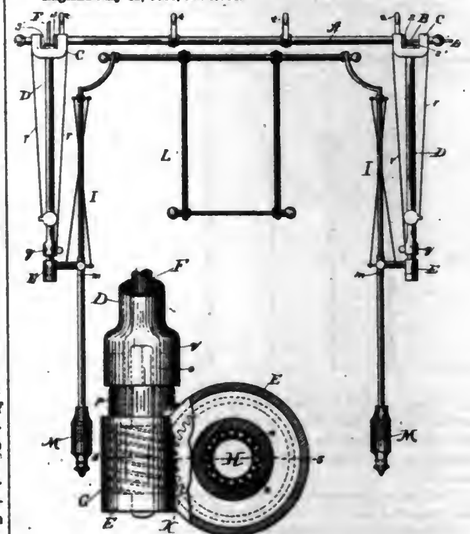
2. The combination, with a shutter or other bolt having a pivoted latch on the base-plate thereof, of a curved spring loosely secured to one of the keepers of said bolt and resting in a notch in the head of said latch, as and for the purpose set forth.

3. The combination, with a shutter or other bolt, of a latch pivoted to the base-plate thereof, the head of said latch being provided with an elastic cushion and forced into operative relation with said bolt by a curved spring, as and for the purpose set forth.

4. The combination, with a shutter or other bolt, of a latch pivoted to the base-plate thereof and actuated by a curved spring, the head of said latch being provided with a notch in its under edge for grasping said bolt, as and for the purpose set forth.

5. The combination, with the bolt A, of a latch, D, pivoted on screw *d* in base-plate B, and actuated by a spring, C, secured to one of the keepers *b′* in a hole, *b²*, and resting at its other end in a notch, *d²*, in the head *d′* of said latch, said head having a notch, *d³*, in its lower edge and a cushion, *d⁴*, thereon, as and for the purpose set forth.

402,493. LATCH FOR SLIDING DOORS. WILLIAM H. THOMAS, Jenkintown, Pa. Filed Jan. 2, 1889. Serial No. 295,219. (No model.)



Claim.—1. The combination, with the thumb-latch F, of latch-arm A, having its bearing on screw C, said arm being actuated by spring E, which spring is secured in place between plate *d* and the edge of door D by screw *d′*, passing through said plate and spring and into said door, as and for the purpose set forth.

2. The combination, with latch-bar A, actuated by spring E and having its bearing on screw C, of the cam-plate *g⁴*, adjustably secured to shaft *g* of handles G by screw *g³*, as and for the purpose set forth.

402,494. SERUM-ALBUMEN PEPTONE. SABBATI E. ULLMAN, New York, N. Y. Filed Aug. 31, 1888. Serial No. 284,248. (No specimens.)

Claim.—A peptone or peptone-pepsin composed of the peptonized albumen of blood-serum, substantially as herein set forth.

402,495. REVOLVING TRAPEZE. LOUIS A. VAIDA, Chicago, Ill. Filed Jan. 8, 1889. Serial No. 295,781. (No model.) Patented in England July 12, 1886, No. 9,061.

Claim.—1. In a revolving trapeze, the combination, with the frame I, having journals H, each provided with a worm gear-wheel, K, of vertical shafts F, each having at its lower end a worm, *g*, meshing with the worm-wheel K, and toward its upper end with a beveled wheel, *f′*, horizontal shaft B, having beveled wheels *e*, meshing with the beveled wheels *f′*, and means, substantially as described, for supporting said shafts, whereby power applied to the turning of either of said shafts acts simultaneously upon both journals of the frame, substantially as described.

2. In a revolving trapeze, the combination, with the supported tube A and yokes C, of shaft B, passing through the tube A and having the beveled gear-wheels *e*, pendent tubes D, carrying the housings E and supported from the yokes C, vertical shafts F, having the beveled gear-wheels *f′* toward their upper ends and carrying the worms G at their lower ends, frames I, having the journals H resting in anti-friction bearings in the housings E, and worm-wheels K on the journals H, meshing with the worm *g*, substantially as described.

3. In a revolving trapeze, the combination of the pendent vertical tubes D, carrying the housings E, separable toward their lower ends by means of a screw-connection, *q*, and the pendent shafts F, inclosed in said tubes and carrying the worms *g*, and made separable within the inclosing-tubes by means of the angular socket and stem-connection *o*, substantially as described.

4. In a revolving trapeze, the side bars of the revolving frame I thereof, made separable toward their centers by screw-connections *m*, whereby an entire end may be omitted and weighted bars M substituted in lieu thereof, substantially as described.

5. In a revolving trapeze, the revolving frame thereof mounted in pendent bearings, in combination with housed worm-gear mechanism and a housed driving-shaft therefor, whereby motion is transmitted to the revolving frame through means invisible to the general spectators, substantially as described.

6. In a revolving trapeze, the combination, with the tube A, provided with the slot *h*, shaft B, having the fixed collars *l*, a vertical shaft, F, connected through beveled gearing *e f′* with the shaft B, and having at its lower end mechanism for imparting motion to the revolving frame of the trapeze, of the fork or collar *k*, provided with the stem *i*, extending up through the slot *h*, whereby the shaft B may be thrown into and out of gear with the shaft F, substantially as described.

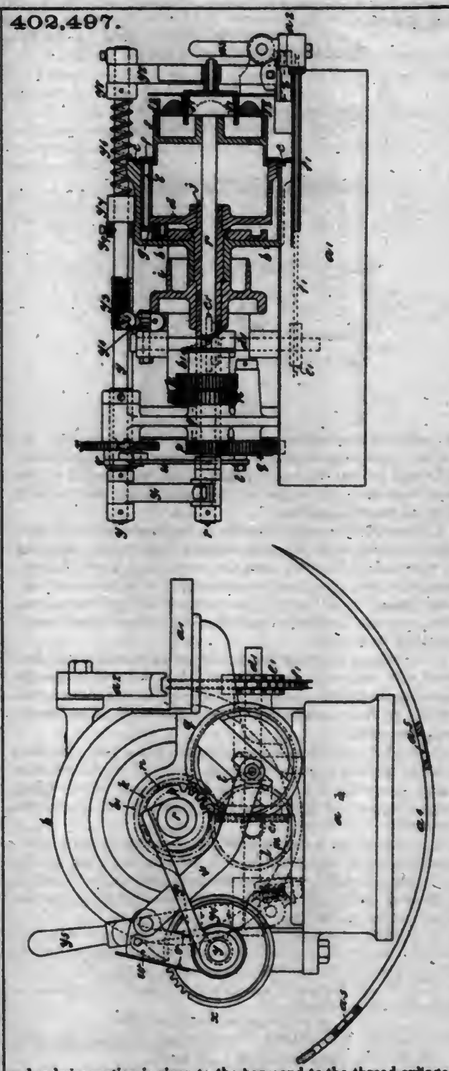
7. In a revolving trapeze, the combination, with the journal H, of the revolving frame and tubular bar D, of the housing E, forming a bearing for the journal and provided with the hollow extension *p*, constituting the lower portion of the tubular bar D, which incloses the driving-shaft, anti-friction rollers *n*, worm-wheel K, mounted upon the journal, and driving-shaft F, carrying the worm G, meshing with the worm-wheel K, substantially as described.

402,496. TENSIONAL SOUND-BOARD. CHARLES S. WEBER, San José, Cal. Filed Mar. 3, 1887. Serial No. 229,555. (No model.)

Claim.—1. The combination, with the frame and the sound-board, of the clamps adjustably connecting the sound-board with the frame, whereby the linear tension upon the fibers composing the sound-board can be varied, substantially as set forth.

2. The combination, with the frame and the sound-board having its ends thickened, as shown, of the clamps having bifurcated ends conforming to and embracing the thickened ends of the boards, substantially as set forth.

3. The combination, with the frame and the sound-board having thickened ends, of the clamp fitted to the thickened ends, and the threaded shank passed through the frame, and the nut mounted upon the threaded end, substantially as specified.



402,497. OVEREDGE SEWING-MACHINE. WILLIAM WEBSTER, Armley, Leeds, County of York, England. Filed Apr. 26, 1887. Serial No. 236,261. (Model.) Patented in England Sept. 15, 1880, No. 3,725 and Apr. 15, 1887, No. 5,031.

Brief.—The stitch formed is the ordinary hand overedge stitch. The thread is carried by a hook in the rear end of the needle, which is of the shape of an arc of a circle and is positively rotated in a circular groove in the head.

Claim.—1. In an overedge sewing-machine, the combination, with a fixed head-stock, such as *b*, provided with a needle race or groove, a curved needle traveling in said groove, the driving-arms *f f*, having axles *e e*, a carriage, *d*, that rotates within the fixed head-stock, a fixed cam, *h*, attached to said head-stock, and arms *g g*, (on said axles,) the ends of which take into and are controlled by said fixed cam, substantially as and for the purposes described.

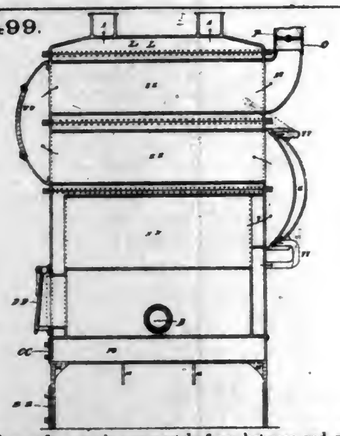
2. In combination with the take-up-thread cylinder *s* and its shaft *r*, the wheel *n*, provided with an internal feather to engage with a groove in said shaft, the crank-wheel *q*, provided with the stud *t* to drive said cylinder, the bar *y*, provided with the screw y^3, the link *u* and the lever *v*, by which the said bar is connected to the said stud and crank-wheel, the arm y', connecting the bar *y* and the shaft *r*, the ratchet-wheel *x′*, and pawl *w*, to which motion is imparted through link *u* and lever *v* to bar *y*, the nut-segment y^4, engaging with the screw y^3, the traveling guide-rest *z*, the arm y^5, connecting said guide-rest and the bar *y*, and handle y^6, whereby an intermittent rotating

402,497.

and endwise motion is given to the bar *y* and to the thread-cylinder *s*, substantially as described.

3. In an overedge sewing-machine, the traveling guide-rest *z*, provided with a rounded part, *z′*, to raise the edges of the seam, in combination with the shaft *r*, connecting-arms, and a take-up on said shaft, the said parts traveling in unison with each other, substantially as described.

402,498. THREAD HOLDER AND CUTTER. MARY E. WEST, Binghamton, N. Y. Filed Oct. 5, 1888. Serial No. 287,268. (No model.)



Claim.—The combination, with a spool and a thread wound thereon, of a metallic plate secured to the spool and provided with a slit in its outer end and a knife upon its inner end, and a slitted rubber secured between the knife and slit, substantially as described.

402,499. WATER-HEATER. WILLIAM A. WHITE, Stanisburg, N. Y. Filed Oct. 24, 1888. Serial No. 289,063. (No model.)

Claim.—1. In a sectional hot-water heater or low-pressure steam-

402,499.

boiler, a flue or flues passing separately from between and near the top of the water-cells and extending by means of outside smoke-bonnets through between the water-spaces in each upper section to give a direct draft along the surfaces of the upper-section water-cells, as and for the purpose described.

2. A sectional hot-water heater or low-pressure steam-boiler having the water-cells in all the upper sections, K K, directly above the deep water-cells H H, which form the crown-sheet of the fire-box, thus giving a clear open water-space vertically from the arch of the fire-box through and to the top of the boiler, including all the sections, for the purpose of facilitating rapid circulation of the heated water, substantially as described.

3. A sectional hot-water heater or low-pressure steam-boiler constructed with continuous separate flues T T between the water-cells and running lengthwise of each of the upper sections and connected by outside smoke-bonnets to make a continuous draft, as and for the purpose described.

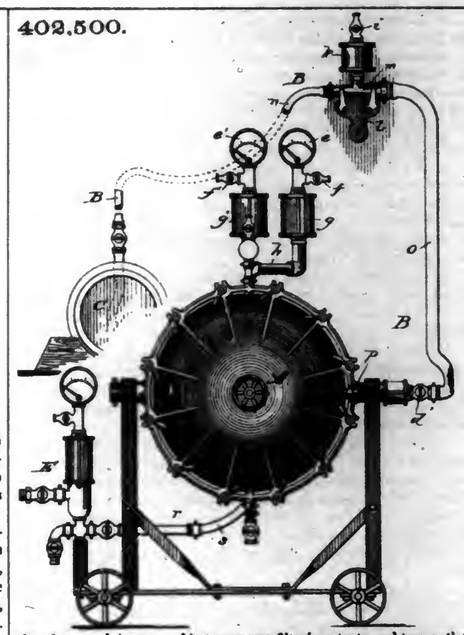
4. In a hot-water heater or low-pressure steam-boiler, the combination of the deep water-cells forming the top of the fire-box with the short smoke-flues F F, passing only from the back of the fire-box through the water-leg to the outside continuous flue or smoke-bonnet, substantially as described.

5. In a sectional hot-water heater or low-pressure steam-boiler, the combination of the water-cells H H, forming the arch of the fire-box, the short flues F F, leading to the smoke-bonnet, the flues T T, and the smoke-bonnet W W, all for the purpose of securing economical combustion, as described.

6. A sectional hot-water heater or low-pressure steam-boiler consisting of a fire-box having an arch formed by deep water-cells H H, the short flues F F, and the flues of the upper sections, T T, smoke-bonnet W W, and the water-hubs A A and B B; all substantially as and for the purpose described.

402,500. BEER-FILTER. OTTO SWIETUSCH, Milwaukee, Wis. Filed Aug. 22, 1888. Serial No. 283,466. (No model.)

Claim.—1. In combination with an apparatus for filtering gaseous liquids under pressure, provided with a discharge-valve, d', the discharge-conduit B, comprising the ascending part o, leading from the valve b', and the descending part n, of smaller diameter than the part o and terminating in a discharge-valve, d^3, of smaller discharging capacity than the valve d', substantially as described.



2. In combination with a beer-filter having a discharge-valve, d', the discharge-conduit B, comprising the part o, leading from the valve d', and part n, of smaller diameter than the part o and terminating in a discharge-valve, d^3, of smaller discharging capacity than the valve d', and intermediate tapering connection, m, substantially as described.

3. In combination with a beer-filter having a discharge-valve, d', the discharge-conduit B, comprising the ascending part o, leading from the valve d', descending part n, of smaller diameter than the part o and terminating in a discharge-valve, d^3, of smaller discharging capacity than the valve d' and a controllable vent upon the highest part of the discharge-conduit, substantially as described.

4. The combination, with a filter, A, having a discharge-valve, d', of the discharge-conduit B, supported as at l, and comprising the ascending part o, leading from the valve d', descending part n, of smaller diameter than the part o and terminating in a discharge-valve, d^3, of smaller discharging capacity than the valve d', and the tapering connection m, provided with a controllable vent, substantially as described.

5. In combination with a beer-filter having a plurality of inlet-chambers each interposed between two filtering strata and two outlet-chambers, as set forth, pipes h h, leading from the tops of the several inlet-chambers and converging together and terminating in a single controllable vent common to all, substantially as described.

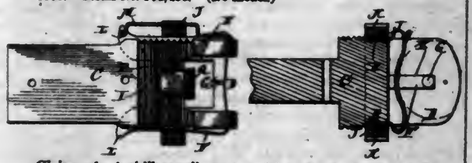
402,500.

6. The combination, with a beer-filter having a plurality of outlet-chambers, of a tube, D, above the filter, having a discharge-cock, d, at one end, transparent section b, and a controllable vent, and pipes h', connecting the tube D with the upper parts of the several outlet-chambers, substantially as described.

7. The combination, with a beer-filter having a plurality of outlet-chambers, of a tube, D, above the filter, having a discharge-cock, d, at one end, a transparent section, b, a controllable vent and a pressure-gage, and pipes h', connecting the tube D with the upper parts of the several outlet-chambers, substantially as described.

8. The combination, with a beer-filter having a plurality of outlet-chambers, of the tube D, having the discharge-cock d, transparent section b, and vent-cock c, pipes h', connecting the tube D with the upper parts of the several outlet-chambers, and receiver g', cock f', and pressure-gage e', surmounting the tube D, substantially as described.

402,501. GATE. WILLIAM BALL, Lynchburg, Ohio. Filed Aug. 14, 1888. Serial No. 282,714. (No model.)



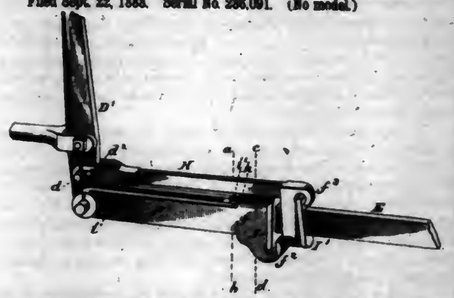
Claim.—1. The combination, with the gate-support, the gate hinged to the support, and the connection interposed between the gate and the said gate-support, of the swinging arm G, adjustably interposed between the said support and the said connection, whereby the height of the gate can be varied as desired, substantially as and for the purpose described.

2. The combination, with the gate-support, of the gate hinged to the said support, the plate D, the turn-table on the plate D, and the arm hinged to the turn-table and having connection with the gate and with the gate-support, substantially as described.

3. The combination, with the gate-support, the gate, and the hinged arm, of the yoke adjustable on the arm, the link I between one end of the yoke and the gate-support, and the rods J J' between the gate and the other end of the yoke, substantially as described.

4. The combination, with the gate-support and the gate, of the plate D, having a cam on a portion of its upper surface, the turn-table, the arm hinged to said turn-table, and a connection between the gate and the gate-support, said connection being fastened to the said arm, substantially as described.

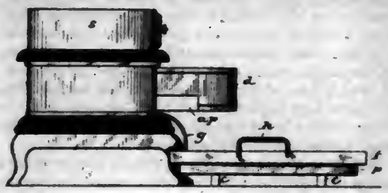
402,502. THILL-COUPLING. WILLIAM B. BRADSBY, Greenville, Ill., assignor of one-half to Charles Stewart, same place. Filed Feb. 28, 1889. Serial No. 301,486. (No model.)



Claim.—1. A thill-coupling comprising the body, the coupling-arms pivoted thereto and having inwardly-projection pivot-pins at their front ends adapted to engage the eye of the thill-iron, and the sliding collar acting on the said arms to force them into engagement with the eye of the thill-iron, as set forth.

2. The combination of the body, the coupling-arms pivoted thereto and adapted to engage the eye of the thill-iron, the collar mounted on the body and acting on the coupling-arms to force them into engagement with the eye of the thill-iron, and the locking-spring secured on the body and engaging the said collar, as set forth.

3. The combination of the body, the coupling-arms pivoted thereto and having inclined outer surfaces and provided at their front ends with inwardly-projecting pivot-pins adapted to engage the eye of the thill-irons, the collar mounted on the body and acting on the inclined surfaces of the coupling-arms and provided in its outer side with a series of longitudinal notches, and a locking-spring secured to the body and engaging one of the notches of the collar, as set forth.

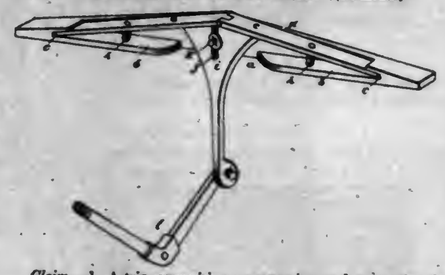


4. The combination of the body, the coupling-arms pivoted thereto, the anti-rattling spring fitted on the body and passing vertically across the end of the same, the collar mounted on the body and acting on the coupling-arms, and the locking-spring secured on the body and engaging the collar, as set forth.

402,503. AUTOMATIC BRAKE-ADJUSTER. JOHN B. BURNS, Indianapolis, Ind., assignor of one-half to Elisha D. Barnes, Watertown, N. Y. Filed Sept. 22, 1888. Serial No. 286,091. (No model.)

Claim.—In a brake mechanism, a brake-lever, a short connection pivoted thereto, a brake-rod adapted to slide upon the short connection, a rod pivoted by means of a slot and pin to the brake-lever, and having at its inner end a strap or shackle, combined with a link surrounding the brake-rod and in loose engagement at its upper end with said shackle, and a second similar link also surrounding the brake-rod, but in loose engagement with the inner end of the short connection, substantially as set forth, the first link being adapted to grip the brake-rod as the brake-lever is moved to shorten said rod and the second link to detain the brake-rod and prevent its return movement upon the opposite motion of the brake-lever, as described.

402,504. CARPET-PROTECTOR. GEORGE S. BURRELL, Kalamazoo Mich., assignor to Fletcher E. Marsh, Indianapolis, Ind. Filed Feb. 11 1889. Serial No. 299,545. (No model.)

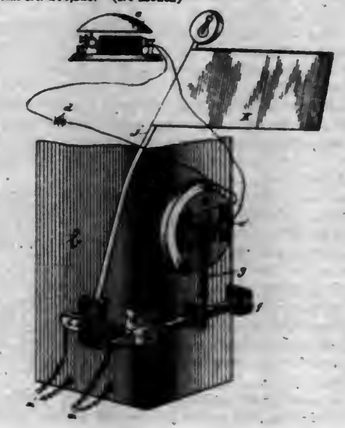


1. *Claim.*—The pan p, provided with curved front piece, g, substantially as shown and described.

2. The pan p, having the curved front piece, g, connected with the frame-work f, and having handles h at the sides of such frame, substantially as shown and described.

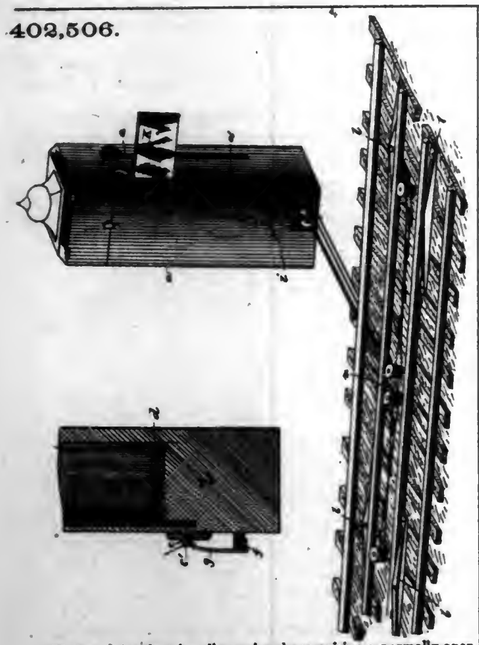
3. The pan p, having curved front piece, g, the frame-work f, surrounding the pan, handles h, also connected to such frame, and cleats c beneath the bottom of the pan, all combined substantially as shown and described.

402,505. TRIPPING DEVICE FOR RAILWAY-SIGNALS. JOHN T. CARTER, Baltimore, Md., assignor of one-half to Frank J. Hilbert, same place. Filed Jan. 22, 1889. Serial No. 297,294. (No model.)



Claim.—1. A trip comprising a supporting and protecting frog adapted to be secured beside a railroad-rail and provided with an upwardly-extending flange on its outer side and horizontal bottom bearing-flanges, a pair of levers longitudinally located on said frog with their upper ends hinged together and their opposite free ends confined and movable on said bottom flanges, a head loosely secured to the frog to allow vertical movement and having a rounded upper end upon which the hinged ends of the levers rest, and an elbow-lever pivotally secured to the lower end of said head, substantially as described.

2. A trip comprising a supporting and protecting frog adapted to be secured beside a rail and provided with an upwardly-extending flange at its outer side and with bottom bearing-flanges, the ends of the frog having sockets open on their inner sides, a pair of levers longitudinally located on the frog hinged together at their upper adjoining ends and having their opposite ends loosely extending into said sockets, stops or guides for said levers, and a head operated by the levers, substantially as described.



3. A trip comprising a frog adapted to be secured beside a rail and open on its inner side and top, one or more levers in the same adapted to be depressed by the wheels of a passing car, and a head upon which said lever or levers rest and adapted to be vertically moved by the same, said head having a vertical slot, and a headed pin secured to the frog and extending loosely through the slot, substantially as described.

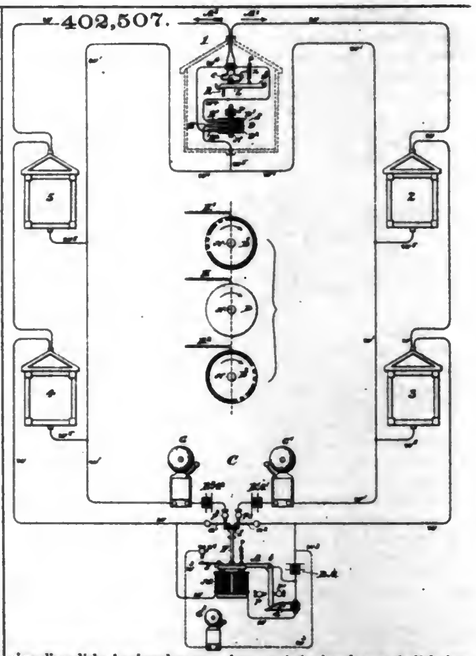
4. A trip comprising a frog having bottom bearing-flanges and sockets, levers movably located in the frog with their ends in the sockets and bearing on the flanges, guiding-pins for the same, and a head upon which the levers rest loosely secured to the frog by a pin and slot, substantially as described.

402,506. ELECTRIC SIGNAL. JOHN T. CARTER, Baltimore, Md. assignor of one-half to Frank J. Hilbert, same place. Filed Jan. 22, 1889. Serial No. 297,295. (No model.)

402,506.

Claim.—An electric railway-signal comprising a normally-open circuit, a gong included in the same and located at or near a crossing, a support located at or near the crossing, a circuit-closer on the same, a rock-shaft mounted on the support and provided with an arm to engage the circuit-closer and close the circuit when the shaft is swung in one direction, said shaft being provided with a toe at one end, a lever pivoted to the support to swing in a horizontal plane and engage said toe to rock the shaft to close the circuit when swung in one direction, a pair of trips located on the track on opposite sides of the crossing, and each connected with an opposite end of said lever, whereby when one trip is operated one end of the lever is drawn down and the circuit closed, and when the other trip is depressed the opposite arm of the lever is drawn down and the circuit opened.

402,507. DUPLEX FIRE-ALARM TELEGRAPH. SIDNEY A. CHASE, Evart, Mich., assignor of one-half to William R. Mapes, same place. Filed Apr. 9, 1888. Serial No. 270,114. (No model.)



Claim.—1. In a system of fire-alarm telegraphs or signals, the combination of a normally-closed main circuit, including circuit-breakers in each of a series of signaling-boxes and an electro-magnet at the central station, with an additional divided circuit, including two independent normally-open batteries, located also at the central station, and signal-transmitters at each box, divided into two parts, the central-station magnet having an armature-lever-carrying circuit, and controlling devices for keeping the main circuit normally closed, and also for closing the divided circuits when the main circuit is broken, whereby independent signals are transmitted by different routes, substantially as described.

2. In a system of fire-alarms or telegraphs, a main circuit including a series of circuit-breakers, one in each box, and an electro-magnet located at the central station, having an armature-lever carrying a circuit-controlling device adapted to hold the main circuit closed so long as the line is intact, with an additional circuit-controlling device on said armature-lever for closing a second or independent circuit when the main circuit is broken, and signal-transmitters, located one in each box, for sending signals over the two circuits conjointly, substantially as described.

3. In a non-interfering system of fire-alarms or telegraphs, the combination of a normally-closed main-line circuit, including circuit-breakers, one in each box, and an electro-magnet at the central station, with two signal-circuits, each normally open at one point in the central station, a three-part signal-transmitter in each box, one part of which is connected continuously with both of said open circuits, while the other parts are connected successively to different portions of the main-line wire, and a circuit-controlling armature-lever for said magnet, which in its normal position holds the main line closed, but when the main line is broken closes the normally-open circuits, substantially as described.

4. In a system of fire-alarm signals or telegraphs, a duplex signal-transmitter consisting of a central metallic disk and two independent

402,507.

signaling-disks having the same characteristic signal on each disk, but located at points diametrically opposite each other, in combination with contact-springs and circuit-connections, whereby the same signal may be sent twice in one revolution of the signal-wheel, substantially as described.

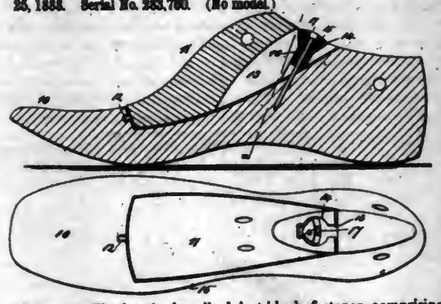
5. In a system of fire-alarm telegraphs or analogous signaling apparatus, the combination of a two-way signal composed of a continuity-preserving disk, and two independent transmitting-disks having the same characteristic signal arranged at different radial portions of their circumference, and a two-way signaling circuit running to the central station, including two independent gongs or signal-receiving apparatus, whereby the same signal is transmitted to the central station by different routes and sounded on independent alarm apparatus, substantially as described.

6. In a system of fire-alarm telegraphs or analogous signaling apparatus, the combination of a two-way signal-transmitter connected to two circuits running in opposite directions to a central station and through two normally-open batteries, and also connected to an additional circuit running to the central station, normally closed at circuit breaking contacts in outlying signal-boxes and at the central station, where it includes an electro-magnet having a circuit-controlling armature adapted to control said circuit-breaking contacts at the central station, substantially as described.

7. In a fire-alarm or analogous system, the combination of the following elements: a normally-charged main line, a series of signal-transmitters located one at each of a series of outlying stations, a series of circuit-breakers similarly located, an electro-magnet located at the central station and included in said main-line circuit, a normally-closed circuit-closer held closed by the armature of said magnet so long as the main circuit remains intact, a preliminary signal-receiver located in a normally-open shunt from the main-line battery around said magnet, and one or more signaling-receivers located in one or more normally-open independent battery-circuits, substantially as described.

8. In a fire-alarm or analogous system of signals, the combination of the following elements: a two-way signal-transmitter located at a signaling-station connected to two circuits running by different routes to a central station, a circuit-breaker at said signaling-station, which normally shunts said signal-transmitter through both of said circuits, and an electro-magnet located in a central or receiving station and having an armature-lever which acts upon a circuit-closer, also located at said central station, and holds it closed so long as the main line remains intact, and two normally-open independent circuits open at back-stops of the armature while said magnet is energized, said circuits including independent signal-receivers and running by different routes to the double signal-transmitter located at the signal-station, substantially as described.

9. In a system of fire-alarm telegraphs or analogous signals, a duplex signal-transmitter composed of two independent signaling-disks having the same characteristic signal arranged on the surface of each disk, in combination with open-circuit contact-springs and circuit-connections, and a ground-circuit conducting part having a continually-closed earth-connection, and an automatic circuit-changer at the central station, and circuit-connections, whereby the same signal may be sent to the central station in opposite directions at every revolution of the circuit-wheel, substantially as described.



10. In a duplex system of fire-alarms or analogous signaling, the combination of a normally-closed main circuit, a series of circuit-breakers, one in each signal-box, and one in the central station, and a main-line battery and an electro-magnet circuit-changer at the central station, the circuit-changer controlling divided open-circuit signaling-circuits, including normally-open batteries and visual or audible signal-receiving apparatus, a duplex signal-transmitter in each signal-box, having a continuous electric connection with the divided circuits, and open-circuit electrical-signaling contact-springs connected to opposite portions of the normally-closed main-line wire running to the central station, a circuit-controlling armature-lever for said circuit-changer, which in its operation breaks the main-line circuit and closes the divided circuits, whereby two different signals may be sent at the same time in opposite directions, substantially as described.

402,508. MOLDING-MACHINE. THOMAS A. COMMERFORD, Chicago, Ill. Filed Feb. 26, 1889. Serial No. 301,187. (No model.)

Claim.—In a molding-machine, the combination, with a revoluble mold-board, of the crank-shafts H H', having pulleys and sprocket-wheels arranged thereon, the straps A^2 A^2 in operative connection with the mold-board shaft, shaft J, sprocket-wheels j' j', and chains j, substantially as shown and described.

402,509. LAST-BLOCK FASTENER. WILLIAM COOK, New York, N. Y., assignor of one-fourth to Paul D. Reed, same place. Filed Aug. 25, 1888. Serial No. 283,760. (No model.)

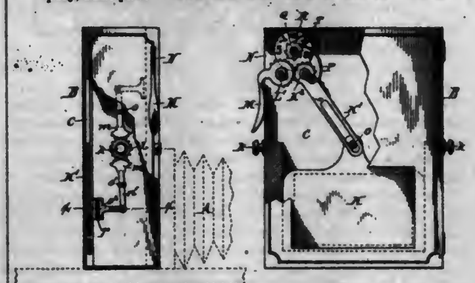
Claim.—1. The herein-described last-block fastener, comprising a shank and a flattened head thereon and axially bored through said shank and head, substantially as described.

2. The combination, with a last-body, of a last-block having a longitudinal slot and a countersink at the outer end of said slot, and the flattened head held to the last-body by a fixed nail or screw, the said head being adapted to be turned independently of the nail or screw to bring it wholly within the longitudinal slot of the last-block or transversely thereto, substantially as described.

402,510. VALVE-OPERATING MECHANISM FOR GRAIN-SCALES. CHARLES H. COOLEY, Hartford, Conn., assignor to The Pratt & Whitney Company, same place. Filed Nov. 12, 1888. Serial No. 290,635. (No model.)

Claim.—1. In a grain-scale, the combination, with a stop-cam controlling the closing of the valves, of a cam-stop carried on the scale-beam and acting on said cam, and a stop connected to said cam and located to limit the first downward movement of the beam, all organized and coacting substantially as described.

2. The combination of the scale-beam having stop M, the valve-shaft carrying cam K^3, and the hook 4, movably connected to said cam and having the stop-face 5, substantially as described.



402,511. CEMENT. URIAH CUMMINGS, New Haven, Conn. Filed Jan. 26, 1889. Serial No. 297,673. (No specimens.)

Claim.—1. As a new article of manufacture, a hydraulic cement consisting of silicate of magnesia calcined and pulverized, substantially as set forth.

2. As a new article of manufacture, a hydraulic cement containing, principally, a single silicate of magnesia calcined and pulverized, substantially as set forth.

3. As a new article of manufacture, a hydraulic cement consisting of silicate of magnesia and lime calcined and pulverized, substantially as set forth.

402,512. PHOTOGRAPHIC-PLATE-HOLDING APPARATUS. JACOB P. DECKER, New York, N. Y., assignor to E. & H. T. Anthony & Company, same place. Filed Dec. 3, 1888. Serial No. 292,453. (No model.)

Claim.—1. A plate-holding box provided with exposure-apertures at opposite ends and on opposite sides, a light-excluding shutter for each aperture, and a partition across the box having openings therein for the passage of the carriers, substantially as set forth.

2. A plate-holding box having exposure-apertures at opposite ends and on opposite sides, a light-excluding shutter for each aperture, a partition across the box having openings therein for the passage of the carriers, and an index operated at the same time with the shutter, substantially as set forth.

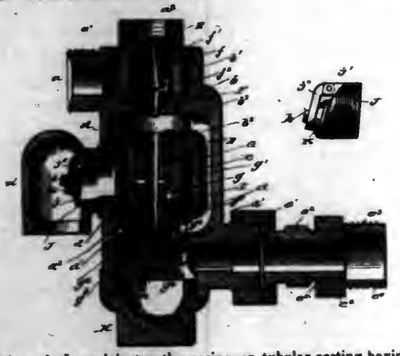
3. A plate-holding box having exposure-apertures at opposite ends and on opposite sides, a light-excluding shutter for each aperture, a partition across the box having openings therein for the passage of the carriers, and means, substantially as described, to secure the proper focal position of the surface about to be exposed, substantially as set forth.

4. A plate-holding box having exposure-apertures at opposite ends and on opposite sides, a light-excluding shutter for each aperture, a partition across the box having openings therein for the passage of the carriers, an index operated at the same time with the shutters, and means, substantially as described, to secure the proper focal position of the sensitive surface about to be exposed, substantially as set forth.

5. A plate-holding box having exposure-apertures at opposite ends and on opposite sides thereof, in combination with dual series of sensitive surfaces, one series presented to one of said exposure-apertures and the other to the other, substantially as set forth.

6. The combination of a plate-holding box having exposure-apertures on opposite sides and opposite ends with a dual series of sensitive surfaces, one series presented to one of said apertures and the other to the other one of said series, exceeding by one the number of the other series, substantially as set forth.

7. A plate-holding box having double sides and edges and provided with exposure-apertures at opposite ends and on opposite sides, shutters for the said apertures, and shutter-operating mechanism, substantially as described, and focusing mechanism, substantially as described, both plates between the double walls of the box, substantially as set forth.



8. A plate-holding box having double walled sides and provided with exposure-apertures at opposite ends and on opposite sides, shutters for the said apertures, and shutter-operating mechanism, substantially as described, placed between the double walls, substantially as set forth.

9. A plate-holding box having double walled sides and exposure-apertures at opposite ends and on opposite sides, shutters for the said

apertures, and shutter-operating and exposure-indicating mechanism, substantially as set forth.

10. A plate-holding box having double walls and edges, exposure-apertures at opposite ends and opposite sides, shutters to the said apertures, and focusing mechanism, substantially as described, placed between the double walls of the box, substantially as set forth.

402,513. STEAM-INJECTOR. JOHN DESMOND, Wadsworth, Ohio, assignor to the Garfield Injector Company, same place. Filed June 20, 1888. Serial No. 277,635. (Model.)

Claim.—1. In an injector, the casing or tubular casting having the upper, primary, and lower auxiliary overflow-chambers and the single duct or passage-way formed in the outside of said casing and connecting said upper and lower overflow-chambers at its ends independent of the main overflow-chamber, substantially as described.

2. In an injector having the single casing or tubular casting, the main central overflow-chamber formed by said casing and having the outlet arm or branch, the upper, primary, and lower auxiliary overflow-chambers formed, respectively, above and below said main central overflow-chamber, and the duct or passage-way connecting said upper and lower overflow-chambers independent of said main overflow-chamber, substantially as described.

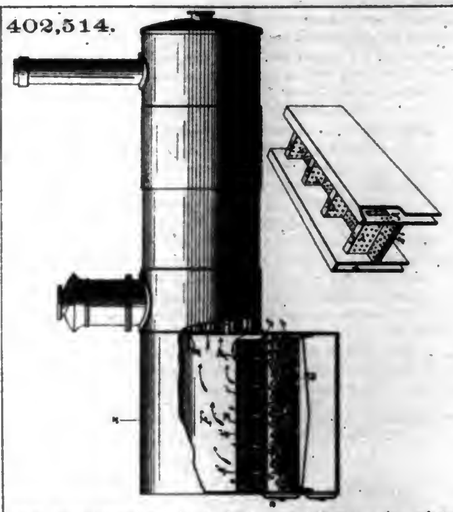
3. In an injector, the apertured inclosing-ring, the delivery and combining tubes, and the check-valve moving on said delivery-tube and designed to rest on the upper end of said ring, substantially as described.

4. The combination, with the casing having the circular flanges and the central and lower auxiliary overflow-chambers, of the apertured inclosing-ring designed to bear against said flanges, the delivery and combining tubes, and the check-valve designed to move on said delivery-tube and to rest upon said ring, substantially as described.

5. As an improvement in injectors, the steam-inlet jet or tube having a covering and the lifting-tube having an upper cylindrical extension surrounding said covering, whereby the water is not affected by the heat of said jet or tube, substantially as described.

6. As an improvement in steam-injectors, the steam-inlet jet or tube, the hardened or vulcanized rubber sleeve or jacket surrounding the inner portion thereof, and the lifting-tube having an upper cylindrical extension surrounding said rubber sleeve or jacket and provided with a series of holes or apertures, substantially as described.

402,514. FURNACE. ELLIS F. EDGAR, Woodbridge, N. J. Filed Jan. 12, 1888. Serial No. 296,130. (No model.)



Claim.—1. The combination, in a furnace for burning carbonaceous material, of a chamber subdivided by perforated hollow partitions, whereby the air is finely divided and heated, the chamber formed by the hollow perforated partitions having a perforated bottom adapted to hold incombustible refractory material, and means for heating, conveying, and distributing air to the same, as set forth.

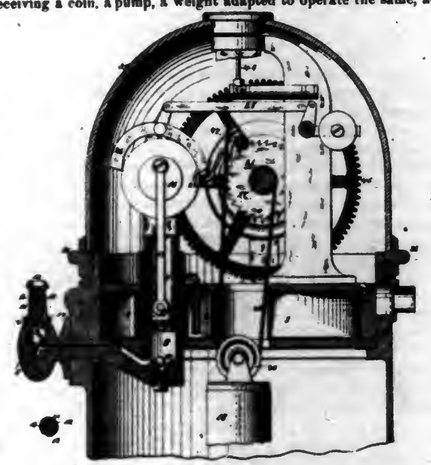
2. The combination, in a furnace for burning carbonaceous material, of a mass of refractory incombustible material, perforated air-chambers located within the body of said material, a support for the refractory material, and means for supplying air thereto and evenly distributing the same, substantially as described.

3. The combination, in a furnace, of a perforated plate over the fuel, a mass of refractory incombustible material supported by said perforated plate, an air-passage interposed between the perforated plate and the refractory material, and side air-passages opening into said air-passage, substantially as described.

4. The combination, in a furnace for burning carbonaceous material, of the perforated plate over the fuel in the furnace, a mass of refractory incombustible material located on said plate, a second perforated plate over the refractory mass, and means for supplying air and evenly distributing the same through said mass, whereby all the

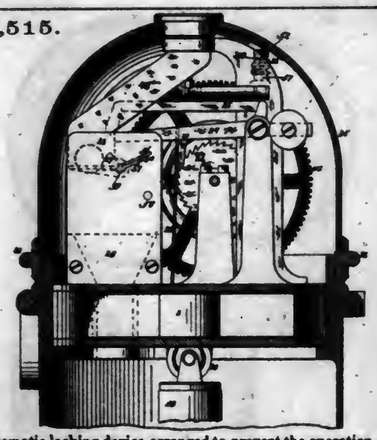
402,514.

gases are consumed and the sparks prevented from escaping, substantially as described.



5. The combination, in a furnace for burning carbonaceous material, of a mass of refractory incombustible material located in the line of draft, whereby the products of combustion, &c., pass through the same, means for supporting said refractory material, and air-supply chambers located within the incombustible material for evenly distributing air thereto, substantially as described.

6. In a heating apparatus, the combination of the coal-space, the grate therefor, and opening into said coal-space, whereby coal may be introduced into the same, apertures for the introduction of air to said coal-space, a combining-chamber beyond said coal-space in the line of draft of the apparatus partially filled with incombustible matter in pieces with interstices between them, into which the gases from the coal are adapted to pass, supports for said incombustible matter, air-inlets leading into the space occupied by said incombustible matter and adapted to supply air into said spaces separately from the gases, and a draft-passage beyond said matter, substantially as set forth.



7. In a furnace for burning carbonaceous material, the combination of a mass of refractory incombustible material having interstices therethrough, and located in the line of draft, whereby the gases, products of combustion, &c., pass into said interstices, a support for said material, and means for supplying and evenly distributing air into the interstices of the same, substantially as described.

402,515. VENDING-MACHINE. PERCIVAL EVERITT, London, England, assignor to the Automatic Perfume Fountain Company, of New Jersey. Filed June 13, 1888. Serial No. 276,961. (No model.) Patented in England July 21, 1887, No. 10,232.

Claim.—1. In a liquid-vending machine having an aperture for receiving a coin, a pump, a weight adapted to operate the same, and

402,515.

an automatic locking device arranged to prevent the operation of the pump.

2. In a liquid-vending machine having a coin-aperture, a pump operated by a weight, an escapement engaging the same, a lever arranged to release and to reset the escapement, and a coin-receptacle attached to said lever which is depressed by the weight of a coin passed through the coin-aperture.

3. The combination of the pump 7, the weight 18, and cord 29, operating the same, the crank-disk 16, the escapement 26, the levers 24 and 25, and the coin-bucket 23.

4. In combination with a case provided with a coin-aperture, a pump operated by a weight, a disk and escapement arranged to be released by placing a coin in the coin-aperture, and a projection on the disk, whereby the escapement is returned to its position and the escapement reattached to the disk, substantially as described.

5. In a liquid-vending machine having an aperture for receiving a coin, a pump, a weight adapted to operate the same, and a coin-receiver arranged so that when a coin is placed within the receiver it shall release the weight and permit the pump to be operated.

6. The combination of a case provided with a coin-aperture, a pump, a tank so placed that the liquid therein flows by gravity into the chamber of the pump, a crank-disk connected with the pump, a weight and cord actuating the crank-disk, a coin-bucket, and suitable levers connected with an eccentric and escapement on the crank-disk, as and for the purpose set forth.

7. In a liquid-vending machine, the combination of a case provided with a coin-aperture, mechanism adapted to be operated by a weight, a coin-receptacle arranged so that when a coin is placed within the receptacle it shall release the weight and permit the device to be operated, and a closing device adapted to shut the coin-aperture when the weight has ceased to act, substantially as described.

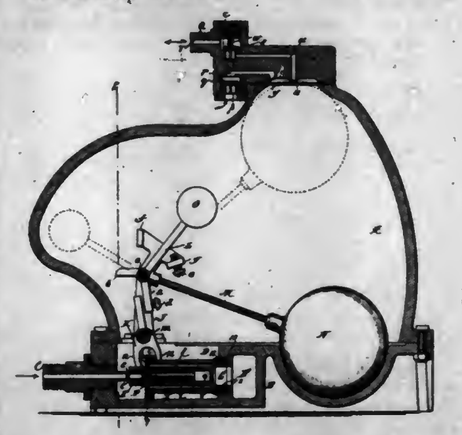
8. The combination of a case provided with the coin-aperture 32, the shutter 31, closing the same, the spring 33, connected with the shutter by suitable levers, and the weight and cord 29, attached to the lever 34, as and for the purpose set forth.

9. In a liquid-vending machine, the nozzle 11, provided with an opening, 12, for the ejection of liquid, and the air-passages 13 13 around the opening, as and for the purpose set forth.

402,516. STEAM-TRAP. BARRENT W. FELTHOUSEN, Milwaukee, Wis., assignor to the Albany Steam Trap Company, of New York. Filed July 30, 1888. Serial No. 281,470. (No model.)

Claim.—1. The combination, in a steam-trap, of a valve-case having a steam-connection and relief-opening, steam and relief valves seated in said case and having depending stems, a rock-shaft extending through said valve-case and provided on the outside with a V-lever and on the inside with a cross-head, which is arranged to engage said valve-stems, a weighted lever fulcrumed to said valve-case and working with said V-lever, a lever fulcrumed concentrically with said weighted lever and having projections working therewith, and a float having an external connection with said last-named lever, substantially as and for the purposes set forth.

402,516.

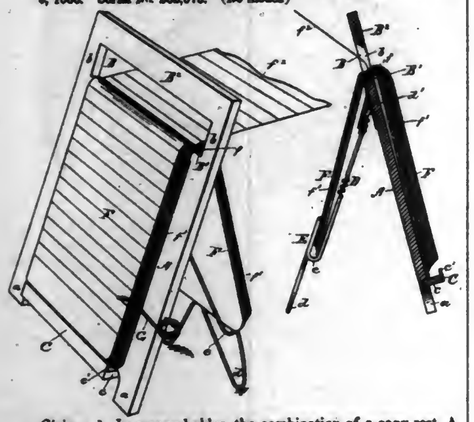


2. The combination, in a steam-trap with steam and relief valves having depending stems, of a rock-shaft provided with inclined wings working with said valve-stems, whereby the valves are slightly turned each time they are opened and closed, and thus caused to wear evenly on their seats, substantially as and for the purposes set forth.

3. The combination, in a steam-trap with the steam and relief valves having downwardly-projecting stems, of a rock-shaft provided with a cross-head working with said valve-stems, and a V-lever, a weighted lever fulcrumed between the limbs of said V-lever and arranged to operate the same, and a lever connected with a float which operates to carry said weighted lever in opposite directions past its center of gravity, substantially as and for the purposes set forth.

4. The combination, in a steam-trap with steam and relief valves, of a rock-shaft provided with a cross-head arranged to open said valves alternately, and with a V-lever and a weighted lever fulcrumed between the limbs of said V-lever, and provided with inclined sides working therewith, and a float connected with a lever which is arranged to move said weighted lever past its center of gravity, substantially as and for the purposes set forth.

402,517. AIR-COMPRESSOR. HUGH F. FITZPATRICK, New York, N. Y., assignor to Edwin K. Conover, Newark, N. J. Filed Aug. 9, 1888. Serial No. 282,348. (No model.)



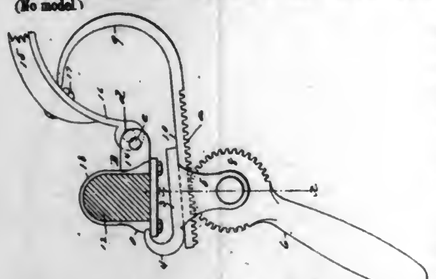
Claim.—1. The combination, with the chamber A, having the water inlet and discharge ports c G, of the valve I, controlling the port G, an auxiliary discharge-port, *l*, communicating with the chamber A and the discharge-outlet, and the valve H, controlling the ports *l c*, substantially as described.

2. The combination, with the chamber A, having the water inlet and discharge ports *c* G, of the valve I, sliding on the spindle P and controlling the port G, and having a port, *l*, communicating with the port G and the chamber, the valve H also sliding on said spindle and controlling the ports *l c*, the lever K, operating said valves with lost motion between the two, the weighted lever L, having tappets engaging with the lever K, and the lever M, operated by a float and having tappets engaging with the lever L, substantially as described.

3. The combination, with the chamber A and float N, of the air-outlet duct *u*, and valve *s* and the diaphragm *x*, extending across the air-duct and arranged to be pressed against the opening of the duct to close the same by the float N, substantially as described.

402,518. COPY-HOLDER OR EASEL FOR USE WITH TYPE-WRITING MACHINES. NATHANIEL C. FOWLER, Jr., Winthrop, Mass., assignor to the Pope Manufacturing Company, Portland, Me. Filed Aug. 6, 1888. Serial No. 282,078. (No model.)

Claim.—1. In a copy-holder, the combination of a copy-rest, A, a back-rest, B', a brace, D, and leaf-holders E and G, constructed to operate essentially as set forth.



2. In a copy-holder, the combination of a copy-rest, A, a back-rest, B', a brace, D, foot-ledges *c c*, and leaf-holders G E, constructed to operate essentially as set forth.

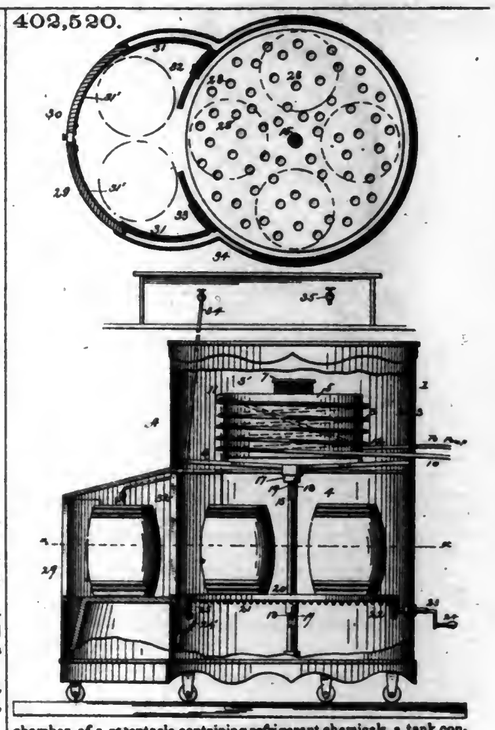
3. In a copy-holder, the combination of a copy-rest, A, a back-rest, B', a leaf-space, B, a leaf-detainer, B^3, above the copy-rest, and the back-rest, with the brace D, constructed to operate essentially as set forth.

4. In a copy-holder, the combination of a copy-rest, a back-rest, a leaf-space, a leaf-detainer, B^3, a brace, and a front leaf-holder, G, constructed to operate essentially as set forth.

5. In a copy-holder, the combination of a copy-rest, a leaf-space, a leaf-detainer, a brace, and a leaf foot-holder, C, having a ledge, *c*, and a trip, *c'*, constructed to operate essentially as set forth.

402,519. THILL-JACK. JACOB FULLER, Florence, and JAMES MORRISON, Easthampton, Mass. Filed Sept. 3, 1888. Serial No. 284,418. (No model.)

Claim.—A thill-jack consisting of a frame-plate, 3, a hook, 4, and the opposing ear-pieces 5 5, formed thereon, a pinion-headed lever pivoted by its toothed end in said ear-pieces, and the shank-bar 10, provided with the hook 9, formed integrally therewith, said bar being provided with rack-teeth on its outer side, engaged by said pinion, and constrained thereby against outward movement from the said frame-plate and held by said ear-pieces against lateral movement thereon, as shown and described.



402,520. REFRIGERATING APPARATUS. ROBERT R. GRAY, Baltimore, Md., assignor to Henry C. Turnbull, Jr., trustee, same place. Filed Oct. 3, 1888. Serial No. 287,463. (No model.)

Claim.—1. In a refrigerator, the combination of a receptacle containing refrigerant chemicals, and a liquid-containing pipe surrounding the exterior and extending through the interior of the receptacle, substantially as described.

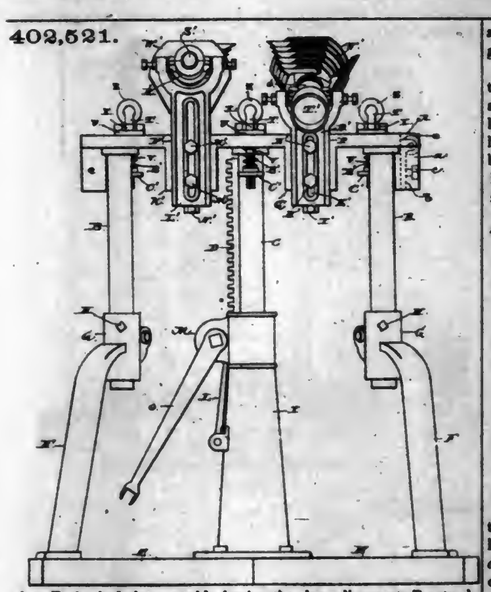
2. In a refrigerator, the combination of a receptacle containing refrigerant chemicals, a liquid-containing pipe coiled around the exterior and within the interior of the receptacle, and a pump connecting with the ends of the pipe to force a liquid through the same, substantially as described.

3. In a refrigerator, the combination, with the refrigerating-

402,520.

chamber, of a receptacle containing refrigerant chemicals, a tank containing brine, a pump on the tank, and a pipe coiled around the exterior and within the interior of the receptacle, the ends of which pipe connect with the pump, substantially as and for the purpose specified.

4. The combination, with a refrigerator having a cylindrical form and constructed with an inner and an outer wall, of curved doors sliding between the said walls, a semi-cylindrical auxiliary chamber on the refrigerator, curved sliding doors between the walls of the said chamber moving on the same horizontal plane as the doors of the refrigerator, and flexible metallic strips confined between the walls of the refrigerator and auxiliary chamber and connecting the two sets of doors, whereby when one set is opened the other set will be closed, substantially as described.



402,521. MACHINE FOR GROOVING LUMBER. JULIAN T. GREYDOWENI, Grand Rapids, Mich., assignor of one-half to R. E. Butterworth and James Lowe, same place. Filed Nov. 1, 1887. Serial No. 253,989. (No model.)

Claim.—1. In a grooving-machine, the combination, with the bed or table having the vertical notches in its sides, of the vertical standards fitting in said notches and having the vertical slots and the inwardly-extending lugs F' at their lower ends, the vertical adjusting-screws extending through the lugs and engaging threaded openings in the lower side of the table, and clamping-bolts extending transversely through the slots in the standards and engaging threaded openings in the sides of the table, the bearings R' O', pivoted in the upper ends of the standards, and the oppositely-inclined shafts journaled in said pivoted bearings and having the cutter-heads, substantially as described.

2. In a grooving-machine, the combination of the movable base, the hollow central standard, I, and the legs F, arranged around the standard, all resting on and permanently and rigidly secured to the base, said legs F being solid and having at their upper ends cylindrical sockets or sleeves G, open at both ends, the bed-plate or table having the cylindrical posts B, to work through the sleeves G, and the post C, to work into the standard I, the set-screws for the sleeves G, the rack on the post C, the pinion journaled in the standard I and engaging the rack, and the pawl, also engaging the rack, as set forth.

3. The combination of the movable supporting-base, the vertical standard I, resting on and permanently secured to the center of the base, the legs F, arranged around the leg I and resting and permanently secured on the base, whereby said legs or standards I and F are rigidly connected, the sockets or sleeves G at the upper ends of

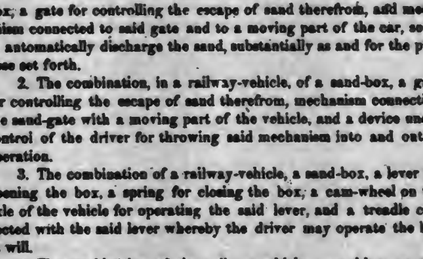
402,521.

legs F, the bed-plate or table having the depending posts B extending through and working in the sockets or sleeves, and the depending post C, working in the standard I and having the rack and the pinion journaled on the standard I and engaging the rack to lift or lower the bed-plate or table, substantially as described.

4. The combination of the crossed timbers E, forming the supporting-base, the standard I, having its lower end bolted on the center of the base, the legs F, having their lower ends secured on the ends of the crossed timbers and provided at their upper ends with the sockets or sleeves G, the table or bed-plate having the central depending post, C, working in standard I, and the depending corner-posts B, working in the sockets or sleeves, and means, substantially as set forth, to lift and lower the bed-plate or table, substantially as described.

5. The combination, in a grooving-machine, of the bed-plate or table having the slots R, the laterally-adjustable posts T, having the stems extending through the said slots and depending from the table or plate, said posts being adjustable independently of each other, the rollers Z, journaled to the said posts, and the springs bearing downward on the said posts, for the purpose set forth, substantially as described.

6. The combination, in a grooving-machine, of the bed-plate or table having the slots R and the grooves S on its under side and communicating with said slots, the laterally-movable posts T, having the depending studs fitted in the slots, the rollers Z, journaled to the said posts, the base-plates U, bearing on the bed-plate or table, having the openings to receive the lower ends of the posts, and the bolts W, having their heads fitted in the grooves S, the said bolts extending upward through the slots R and through the openings in the base-plate, and provided with clamping-nuts X, bearing on the upper side of the base-plate, for the purpose set forth, substantially as described.



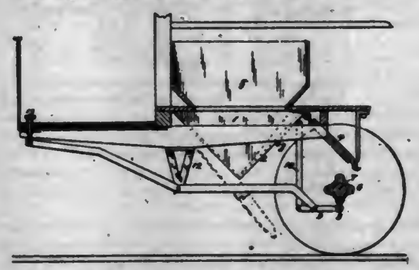
7. In a grooving-machine, the table or bed-plate, the hangers or standards having the slot E' and provided with the lugs F', which engage under the table, the bolts extending through the slots E' and entering the table or bed-plate, and thereby securing the hangers thereto, the bearing-boxes pivoted to the said hangers or standards, and the oppositely-inclined shafts journaled in the said bearing-boxes and having the cutter-heads, substantially as described.

8. In a grooving-machine, the table or bed-plate having the guide-boxes G', the hangers or standards having their upper ends bifurcated to form diverging arms and having the slots E' and provided with the lugs F', which engage under the table, the adjusting-screws I', extending through the said lugs and engaging the guide-boxes, the bolts extending through the slots E' and entering the guide-boxes, and bearing-boxes pivoted to said hangers or standard, and the oppositely-inclined shafts journaled in the said bearing-boxes and having the cutter-heads, substantially as described.

9. The combination, in a grooving-machine, of the vertically-adjustable bed-plate, the grooving mechanism supported above the bed-plate and vertically adjustable, and the vertically-adjustable standards *b*, secured to the bed-plate and having the rollers *c* at their upper ends, whereby, when the bed and grooving mechanism are lowered and the standard raised, the rollers serve to direct the board over the grooving mechanism, substantially as described.

10. The combination, in a grooving-machine, of the bed-plate or table having the vertical guide-boxes formed in its sides, the vertically-adjustable hangers or standards secured in the guiding-boxes and having the lugs F', the adjusting-screws I', extending through the said lugs and engaging the lower ends of the guiding-boxes, the bearing-boxes pivoted to the said standards or hangers, and the oppositely-inclined shafts journaled in said bearings and having the cutter-heads, substantially as described.

402,522. ELEVATOR FOR GRAIN-SEPARATORS. STACY R. HART, Peoria, Ill. Filed Sept. 10, 1888. Serial No. 285,000. (No model.)



Claim.—1. An elevator-tube, A, made in sections *a a'*, adapted to telescope, in combination with a contained partition made in overlapping sections *d d'* and with means by which the sections *a a'* and *d d'* may be fastened in their adjusted positions with relation to each other, substantially as described.

2. An elevator-tube, A, having a semi-annular flange, *i*, around the lower edge of the grain-receiving opening A, provided with holes *i'* to receive the screws or rivets by which the grain-chute is attached to the elevator, substantially as described.

3. The combination of the elevator-tube A, having the semi-annular flange *i* arranged around the lower edge of the grain-opening A, provided with holes *i'* and permanently connected to the elevator-tube, and a rectangular piece of sheet metal adapted to be folded and applied, substantially as and for the purpose described.

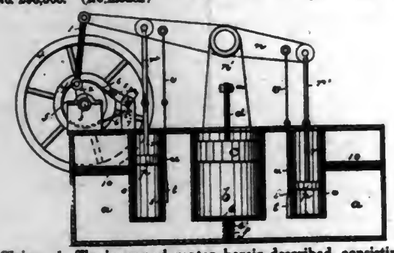
402,523. SAND-BOX FOR STREET-CARS. GEORGE H. HATHAWAY, Boston, assignor of one-half to William A. Perry, Winchester, Mass. Filed Aug. 22, 1888. Serial No. 283,424. (No model.)

Claim.—1. The combination, in a wheeled vehicle, of a sand-box, a gate for controlling the escape of sand therefrom, and mechanism connected to said gate and to a moving part of the car, so as to automatically discharge the sand, substantially as and for the purpose set forth.

2. The combination, in a railway-vehicle, of a sand-box, a gate for controlling the escape of sand therefrom, mechanism connecting the sand-gate with a moving part of the vehicle, and a device under control of the driver for throwing said mechanism into and out of operation.

3. The combination of a railway-vehicle, a sand-box, a lever for opening the box, a spring for closing the box, a cam-wheel on the axle of the vehicle for operating the said lever, and a treadle connected with the said lever whereby the driver may operate the box at will.

4. The combination of the railway-vehicle, a sand-box carried thereby under the floor, and an auxiliary sand-reservoir above the floor and opening through the floor into the sand-box below.



5. The combination of a railway-vehicle with a sand-box, a sand-box lever for operating the same, a cam-wheel driven by the car, and a treadle under control of the driver and connected by a lever with the fulcrum of the sand-box lever, so that when the treadle is depressed the cam-wheel will operate the sand-box lever and automatically operate the sand-box.

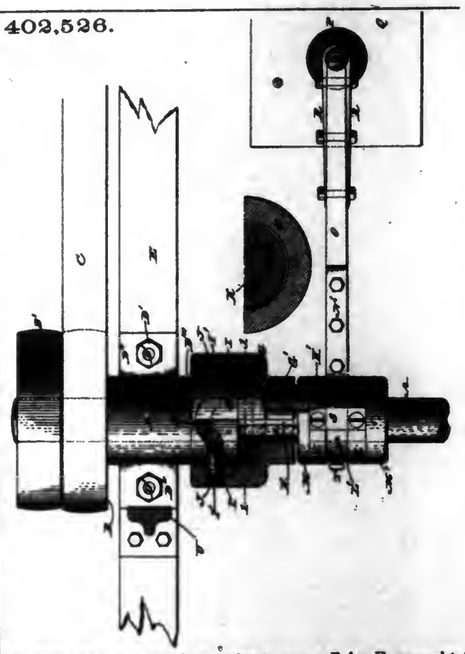
402,524. TRAVELING-CRANE. GEORGE H. HELVEY, Hamilton, Ohio, assignor to the Hooven, Owens & Rentschler Company, same place. Filed Feb. 15, 1889. Serial No. 300,072. (No model.)

Claim.—In a traveling crane, the combination, substantially as set forth, of a pair of track-rails, a crane-bridge arranged for travel thereon, a trolley arranged to travel along the crane-bridge, an air-cylinder suspended from the trolley and having an attaching device—as a crane-hook—upon the lower end of its piston-rod, an air-reservoir adapted for connection with a source of supply or production of air under pressure, a header-pipe connected with said reservoir and disposed parallel to said track-rails, a series of branch pipes connected with said header-pipe and provided each with a coupling part and with a valve, a swing-pipe connected with said air-cylinder and provided at its free end with a coupling part adapted to engage the coupling part of any one of said branch pipes, a valve in said swing-pipe adapted for manipulation to open or close said pipe, and an outlet valve or cock communicating with said swing-pipe between said valve therein and said air-cylinder.

402,525. AIR-MOTOR. SAMUEL C. HILL, Newark, N. J., assignor of one-half to Albert A. Schmidt, same place. Filed Feb. 4, 1889. Serial No. 298,565. (No model.)

Claim.—1. The improved motor herein described, consisting of a compressed-air reservoir containing therein an air-pump, cylinders with motor-pistons, and operating-valves, and outlet-pipes, as shown, said pistons being connected outwardly with a beam oscillating in a frame secured to the top of said reservoir and pivotally connected with the driving mechanism, as described, and for the purpose set forth.

2. In an air-motor, the combination, with a compressed-air reservoir and air-pump, of a cylinder, motor-piston working in said cylinder, automatic air-valves in said piston, rods connecting said piston with an oscillating beam pivoted to a frame secured on said reservoir, a driving mechanism pivoted to said beam, and a spring-brake, 6, adapted to bear on a wheel of said driving mechanism, all as shown, and for the purpose set forth.



402,526. GOLD-BEATER'S HAMMER. HENRY B. HOUSER, Philadelphia, Pa. Filed Jan. 31, 1889. Serial No. 298,300. (No model.)

Claim.—1. The combination of shaft A, elongated bearing D", provided with sinuous groove F, sleeve G, the said shaft being provided with a feather, K, setting in a corresponding groove in sleeve G, to revolve the latter, pin I, engaging a groove, F, lug H, secured to sleeve G, a loose sleeve, L, and hammer-handle O, and hammer P, secured rigidly to sleeve L, and block S, secured to sleeve L, all combined and operated substantially as described.

2. The combination of shaft A, elongated bearing D", provided with sinuous groove F, sleeve G, the said shaft being provided with a feather, K, setting in a corresponding groove in sleeve G, to revolve the latter, pin I in sleeve G, engaging in groove F, lug H, secured to sleeve G, a loose sleeve, L, and hammer-handle O, and hammer P, secured rigidly to sleeve L, block S, secured to sleeve L, and cushion X, adapted to receive the hammer in its upward throw and to cause its rebound, substantially as described.

3. The combination of shaft A, elongated bearing D", provided with sinuous groove F, sleeve G, the said shaft being provided with a feather, K, setting in a corresponding groove in sleeve G, to revolve

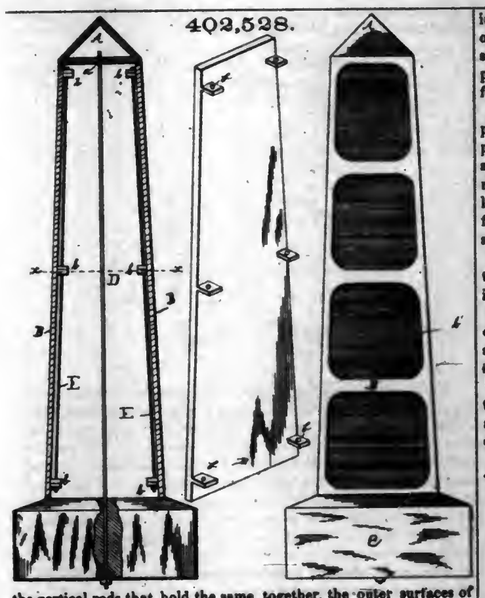
402,526.

the latter, pin I in sleeve G, engaging in groove F, lug H, secured to sleeve G, a loose sleeve, L, and hammer-handle O, and hammer P, secured rigidly and adjustably by set-screw T to loose sleeve L, and block S, secured to sleeve L, all combined and operating substantially as described.

402,527. THILL-COUPLING. GEORGE H. HUTTON, Baltimore, Md. Filed Mar. 5, 1889. Serial No. 301,899. (No model.)

Claim.—1. In a thill or pole coupling, the combination of the clip having two ears, *c*, a bolt, *d*, the iron provided with a downward-projecting hook, *f*, a presser-plate, G, loosely attached to the clip-ears and having a beak or boss, *h*, which bears against the said hook, and a spring, I, between the clip and presser-plate.

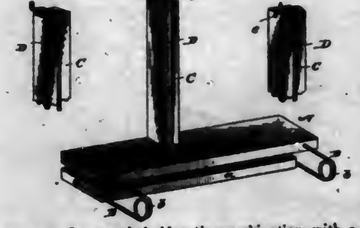
2. In a thill or pole coupling, the combination of the clip having two ears, *c*, a bolt, *d*, the iron provided with a downward-projecting hook, *f*, a presser-plate, G, loosely attached to the clip-ears and having a beak or boss, *h*, which bears against the said hook, a yoke-plate uniting the two ends of the clip and having one end projected forward and holding the lower part of the presser-plate, and a spring between the clip and presser-plate.



3. In a thill or pole coupling, the combination of the clip having two ears, *c*, and a socket in the front part, a bolt, *d*, the iron provided with a downward-projecting hook, *f*, a presser-plate, G, loosely attached to the clip-ears and having in its back a socket, *i*, and a spiral spring having one end in the clip-socket and the other end in the plate-socket.

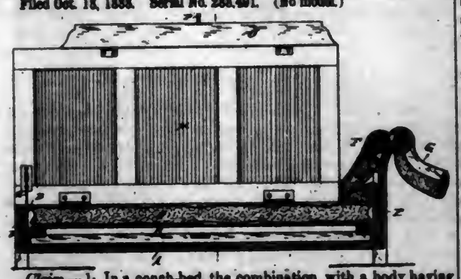
402,528. MONUMENT. MARK D. JUDKINS, Osakis, Minn. Filed May 26, 1888. Serial No. 275,142. (No model.)

Claim.—A hollow monument, the shaft of same being composed of four pieces having on their inner edges lugs, through which pass



402,528.

the vertical rods that hold the same together, the outer surfaces of said shaft having recesses adapted to receive and hold the inscription-plates, in combination with the inscription-plates, and a suitable base and cap, which are held in position by means of the central rod, D, substantially as described.



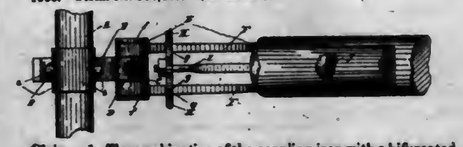
402,529. MUSIC-HOLDER. GUSTMAN H. KOEHER, New Orleans, La. Filed Oct. 1, 1888. Serial No. 286,885. (No model.)

Claim.—1. In a music-holder, the combination, with a spring-clamp adapted to be applied to the leaf of a piano or the like and having its upper portion composed of the bar to serve as a support for music or books, of an upright bar or support and an upright rod or holder secured to the clamp and adapted to confine music in an open position against the bar, substantially as specified.

2. A music-holder comprising two spring-actuated clamping-jaws, a bar secured to the upper side of the upper jaw in an approximately upright position, and a rod adapted to confine sheets of music against said bar, substantially as specified.

402,530. COUCH-BED. FREDERICK KRUEDELBACH, Winfield, N. Y. Filed Oct. 18, 1888. Serial No. 288,491. (No model.)

Claim.—1. In a couch-bed, the combination, with a body having a rigid foot end piece, an end piece at the head end, the outer wall of said head-piece forming the head end of the body, and rigid wings at the front and rear edges of said head-piece, of a head-rest pivoted between the wings of said head end piece, a removable seat extending from the bottom edge of said head-rest to the rigid foot end piece of the body, and a removable mattress and spring bed-frame below said seat, said mattress and spring bed-frame extending from the foot-piece to the inner surface of the head end piece, substantially as set forth.



2. In a couch-bed, the combination, with a body, of a rigid foot-piece and a rigid head end piece, the outer wall of said head end piece forming the head end of the body and forming an uninterrupted space for a mattress in said body of the entire length of said body, rigid wings at the front and rear edges of said head end piece, a hollow head-rest hinged to said wings, and a removable seat extending from the foot end piece to the swinging end of the hinged head-rest, substantially as set forth.

3. The combination, with a couch-frame having a recess in the top edge of one side piece, of a removable seat having a wing fitting into said recess, substantially as herein shown and described.

4. The combination of a couch-frame having a recess in the top edge of one side piece with a removable seat and a wing fitting in said recess of the side piece and hinged to the bottom edge of one side piece of the seat, substantially as set forth.

5. The combination, with a couch-frame having a recess in the top edge of one side piece, of a hinged seat, a wing fitting in said recess and hinged to the said seat, a hook on said wing, and a catch in the couch-frame, substantially as herein shown and described.

402,531. THILL-COUPLING. GEORGE W. LEE, Homeworth, Ohio, assignor to himself and Herbert T. Gould, Perry, N. Y. Filed Feb. 16, 1889. Serial No. 300,373. (No model.)

Claim.—1. The combination of the coupling-iron with a bifurcated thill-iron and a locking-plate placed in the bifurcation of said thill-iron and engaging the arms thereof, substantially as and for the purpose specified.

2. The combination of the coupling-iron and the bifurcated thill-iron with a locking-plate in the bifurcation of said thill-iron and the spring-bar connected to the plate and controlling the same, constructed and arranged substantially as specified.

3. The combination of the coupling-iron and the stub-shaft with a bifurcated thill-iron embracing said shaft, and a locking-plate placed in the bifurcation of said thill-iron and engaging the arms thereof, all substantially as set forth

4. The combination of the coupling-iron and a bifurcated thill-iron with a locking and spreading plate, G, for said thill-iron, constructed and arranged substantially as specified.

5. The combination of the coupling-iron, the bifurcated thill-iron, and the locking and distending plate with the key for operating said plate to distend the thill-iron, substantially as and for the purpose specified.

6. The combination of the coupling-iron, the stub-shaft secured thereto, and the bifurcated thill-iron engaging said stub-shaft with the locking-plate for said thill-iron and its controlling spring-bar, substantially as specified.

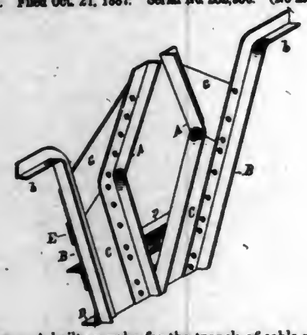
7. The combination of the stub-shaft having concentric corrugations in its ends with a bifurcated thill-iron having heads recessed to embrace the ends of said shaft, said recesses being concentrically corrugated at bottom, substantially as specified.

8. The combination of the coupling-iron having a sleeve and set-screw with a stub-shaft perforated, as described, and secured in said sleeve, and a bifurcated thill-iron engaging said stub-shaft, substantially as and for the purpose set forth.

9. In a thill-coupling, the combination of the coupling-iron, the stub-shaft, and the bifurcated thill-iron engaging said shaft, with the locking and distending plate in the bifurcation of said shaft, the spring engaging the same, and the releasing-key, all substantially as described.

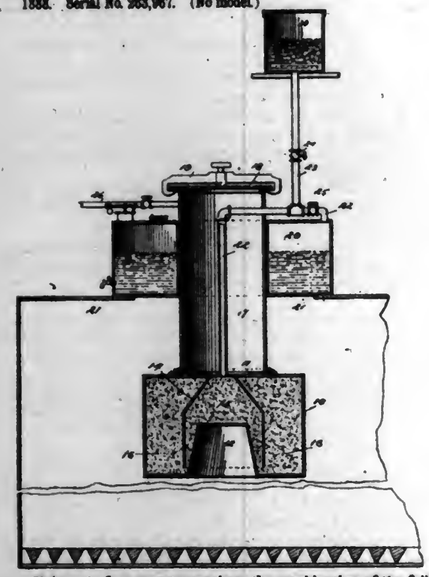
10. The combination of the coupling-iron, the stub-shaft secured to a sleeve of said iron, and a bifurcated thill-iron having recessed heads on its arms engaging said sleeve, with a plate placed between the arms of the thill-iron and engaging the same, and the spring-bar seated in a recess in the shank of the thill-iron and engaging said plate, all substantially as described.

402,532. DUMPING-WAGON. CHARLES LEE and ANDREW B. LEE, Sioux City, Iowa. Filed Aug. 23, 1888. Serial No. 283,516. (No model.)



Claim.—The combination with the wagon-body, of a bottom consisting of hinged wings, a shaft to which the wings are connected, a collar, *c*, secured upon the front end of the shaft, and an arm, *d*, secured to the collar, a ratchet-plate, E, a bell-crank lever, F, one arm

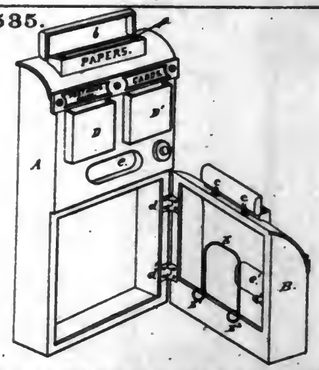
402,532.



of which is arranged behind the arm *d*, and a spring, *e*, arranged below the short arm of the bell-crank lever, substantially as set forth.

402,533. TUNNEL-YOKE FOR CABLE RAILWAYS. CHARLES A. MARSHALL, Johnstown, Pa., assignor to The Johnson Company, of Kentucky. Filed Oct. 21, 1887. Serial No. 252,956. (No model.)

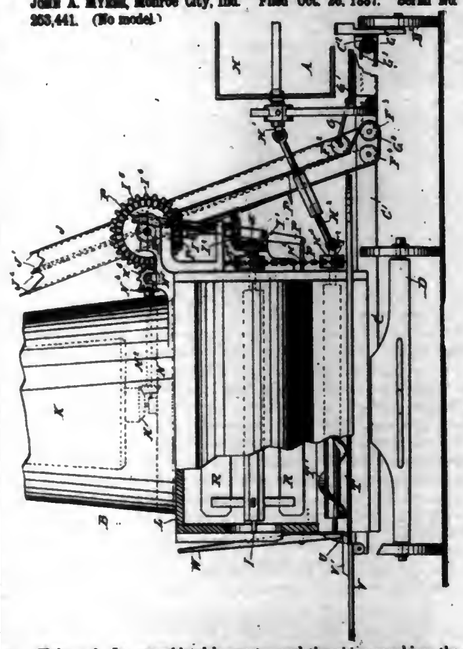
Claim.—A built-up yoke for the tunnels of cable railways constructed entirely of angle metal and plate metal, so that said yoke presents a channel-section viewed either through its side walls or through the center of its bottom binders or brace, substantially as set forth.



402,534. GAS-GENERATOR. SAMUEL MCILVAINE, Oakwood, Ontario, assignor to Catharine McIlvaine, Toronto, Canada. Filed Feb. 14, 1888. Serial No. 263,967. (No model.)

Claim.—1. In a retort-vaporizer, the combination of the following parts: a retort having an open top and a central bottom elevation, a vertical cylinder set on said retort and having a gas-exit pipe, and a steam and oil pipe passing down through the cylinder and connecting with a funnel which partly incloses the aforesaid elevation, all as shown and described.

2. In a retort-vaporizer, the combination, with a vertical cylinder and a retort below the same, of an annular steam-generator surrounding the cylinder, a steam-pipe connecting with the generator, and an oil-pipe joined with said steam-pipe and extending down through the cylinder, and a funnel connected with said pipe, as shown and described.

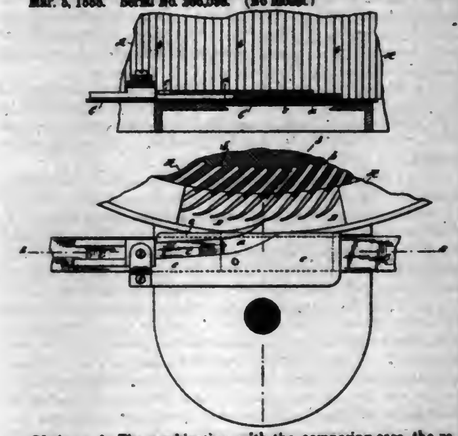


402,535. LETTER-BOX. JONATHAN R. MOREN, Hyde Park, Ill. Filed Sept. 2, 1887. Serial No. 248,397. (No model.)

Claim.—1. In mail-boxes designed to be used on residences, public buildings, and offices, the combination of the receptacle for periodicals, provided with an opening through which they may be introduced from the outside, and a receptacle for letters provided with an opening through which they may be introduced from the outside, said receptacles being hinged together and so constructed that one forms a door to the other, openable to permit access to both the periodicals and the letters, substantially as described, and for the purpose set forth.

2. In mail-boxes having a periodical-receptacle and a receptacle for letters hinged together, so that one forms a door for the other, the combination, with the letter-receptacle, of the guard E, substantially as and for the purposes described.

402,536. COMBINED HARVESTER AND THRASHING-MACHINE. JOHN A. MYERS, Monroe City, Ind. Filed Oct. 26, 1887. Serial No. 253,441. (No model.)



Claim.—1. In a combined harvester and thrashing-machine, the combination of the main driving-shaft E, provided with the pulley F, the pulleys F^3 F^4, the belt F', actuating the pulleys F^3 and F^4, the knife-bar G', the pitman G, connecting the knife-bar to a pin on the pulley F^3, the rollers G^2 and G^3, the roller G^3 being on the shaft of the pulley F^3, and the apron G^4, passing over said rollers, substantially as herein shown and described.

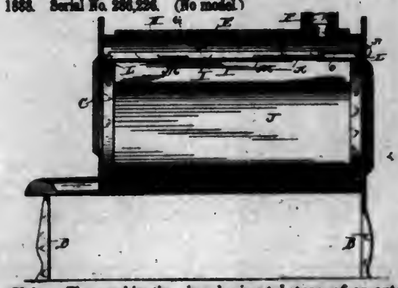
2. In a combined harvester and thrashing-machine, the combination of the main driving-shaft E, provided with the pulley F, the pulleys F^3 F^4, the belt F', actuating the pulleys F^3 and F^4, the knife-bar G', the pitman G, connecting the knife-bar with a pin on the pulley F^3, and the elevator-belts J' J^3, driven from the pulleys F^3 and F^4, substantially as herein shown and described.

3. The main shaft E, the pulley F, mounted on the said shaft, the endless belt or chain F', and the pulleys F^3, F^4, and F^4, actuated by the said belt or chain F', in combination with the pitman G, connecting the knife-bar G' with the pulley F^3, the endless apron or belt G^3 operated by the pulley F^3, and the endless belts J' and J^3, operated from the pulleys F^3 and F^4, substantially as shown and described.

402,537. TYPE-SETTING MACHINE. ROBERT W. NELSON, Hartford, Conn., assignor to the Thorne Machine Company, same place. Filed Mar. 8, 1888. Serial No. 266,592. (No model.)

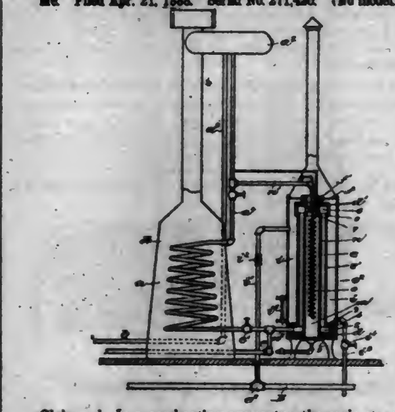
Claim.—1. The combination, with the composing-case, the revolving type-carrying table, and the type-conveying belt, of the bridge-plate *a*, forming a continuation of the table and extending above the belt, substantially as described.

2. The combination, with the type-conveying belt C and the side guides, *c*, of the bridge-plate *a*, extending over the belt between the guides, substantially as described.



402,538. TOOL-DRIVER. CHRISTOPHER H. OLSON, Decatur, Ill., assignor to the Decatur Coffin Company, same place. Filed June 8, 1888. Serial No. 276,508. (No model.)

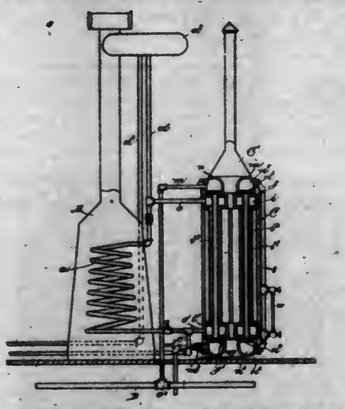
Claim.—1. A tool-driver comprising the spiral shaft, the handle adapted to rotate the shaft by longitudinal reciprocation, the coupling-sleeve secured to the shaft and having the square recess, the securing-screw in the sleeve, and the tool having the square portion, the round bearing, and the diminished portion adapted to the securing-screw, as set forth.



2. A tool-driver comprising the spiral shaft having guide-collar *g*, the handle adapted to rotate the shaft by longitudinal reciprocation and having the bearing *d'* for the guide-collar, the coupling-sleeve secured to the shaft and having the square recess, the securing-screw in the sleeve, and the tool having the square portion, the round bearing, and the diminished portion adapted to the securing-screw, as set forth.

402,539. STOVE. WILLIAM H. OWEN, Onarga, Ill., ARTHUR C. BOSWELL, Fowler, Ind., and JOHN J. CARLOCK, Watseka, Ill. Filed Sept. 24, 1888. Serial No. 286,226. (No model.)

Claim.—The combination, in a horizontal stove, of an outer cylindrical casing formed with a longitudinal bulge at its top, having apertures for cooking utensils and for the stove-pipe, with an inner casing opening at the top of the stove into the fire-place, passing around the inside of the outer casing parallel to the same, and a longitudinal soot and drip receptacle or trough secured with one of its edges to the outer cylindrical casing at its top in the interior thereof, and secured with its opposite edge to the upper edge of the inner casing, the said trough or receptacle being formed at one end with a draft-opening and a damper sliding over the same, substantially as set forth.



402,540. CAR-HEATING APPARATUS. JOHN R. PORTER, New York, N. Y., assignor to the Sewall Safety Heating Company, Portland, Me. Filed Apr. 21, 1888. Serial No. 271,420. (No model.)

Claim.—1. In a car-heating apparatus, the main steam-pipe and the pipe *i'* leading therefrom to the steam-chamber, combined with the main heater comprising the closed steam jacket or chamber *i*, the water-chamber *n*, contained concentrically and entirely within it, the open-end heating-chamber *m*, contained within the water-chamber, the grooved heads *d d'*, through which the chamber *m* is continued, and the circulating-pipes opening into said heads, substantially as described.

2. In a car-heating apparatus, the heater consisting of the vertical annular water-chamber *n* and the vertical annular steam or heating chamber *i*, parallel to and surrounding it and attached at its lower end to the head *d*, the annularly-grooved heads *d d'*, which form the ends of the chamber *n*, and the diaphragm *f*, closing the upper end the chamber *i*, substantially as described.

402,541. CAR-HEATING APPARATUS. JOHN R. PORTER, New York, N. Y., assignor to the Sewall Safety Heating Company, Portland, Me. Filed Apr. 21, 1888. Serial No. 271,421. (No model.)

Claim.—1. In a car-heating apparatus, the combination, with the main steam-pipe and a system of warming-pipes, of several vertical water-reservoirs connected to each other at their ends by the chambered heads *i i'*, and in communication thereby with the warming-pipes, that the water may circulate freely therethrough, and several steam-reservoirs, i^2, passing entirely through said chambered heads, in communication with the main steam-pipe and with each other by the chambers n^2 n^2 and extended through the said water-

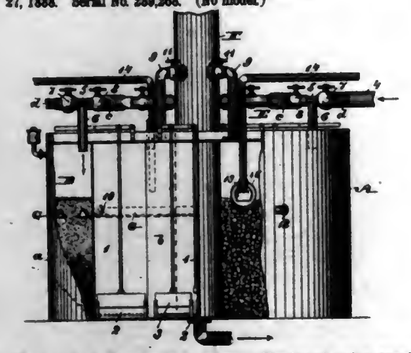
reservoirs and surrounded throughout their length by the water contained therein, substantially as described.

2. In a car-heating apparatus, the main steam-pipe and warming-pipes, combined with the water-chambers *f f'*, connected by two or more pipes, i^3, attached to the under and upper side, respectively, of the said chambers, and the steam-chambers n^2 n^3, secured and adjacent to said chambers *f f'*, respectively, and connected by two or more pipes, i^3, arranged within, parallel and concentric with relation to the water-pipes and passing completely through, but not communicating with, said water-chambers, substantially as described.

3. In a car-heating apparatus, the heater herein described, comprising the chambered heads *i i'*, joined by the pipes i^3, attached to the under and upper sides, respectively, of the said heads, and the chambered heads *n n'*, joined by the pipes i^3, which pass through the chambered heads *i i'* and concentrically through the pipes i^3, substantially as described.

4. In a car-heating apparatus, the heater comprising several vertical water-reservoirs, i^3, completely inclosed in a drum or casing, C, open at its ends and adapted to be heated externally by a flame in said drum, combined with the warming-pipes attached to said reservoirs at the end thereof, substantially as described.

402,542. CHURN. JOHN J. PURSLEY, Hubbell, Nebr. Filed Sept. 26, 1888. Serial No. 286,447. (No model.)



Claim.—1. A churn-body provided with outwardly-bulging pockets near its upper portion opening into the interior of the body, in combination with ducts longitudinally located upon the exterior of the body, the lower ends thereof opening into the lower portion of the body, and their upper ends opening into said pockets and extending up through and above the bottom of the same, as set forth.

2. A churn-body provided with pockets at its upper portion opening into the interior of the body, ducts opening into the body at or near its bottom and extending upwardly into said pockets, and deflectors upon the upper open ends of said ducts to throw the liquid passing from the same against the walls of the pockets, in combination with a reciprocating dasher in the body to force the liquid through the ducts, substantially as described.

3. A churn-body having longitudinal communicating ducts, in combination with a reciprocating dasher in the same, composed of a head snugly fitting in the body and provided with an aperture, a closed vertical rod to reciprocate the head, a valve to close the head when the same is pushed down and force the liquid through the ducts and open the aperture for the passage of liquid when the head moves up, and an open frame loosely confining the valve to the head, substantially as described.

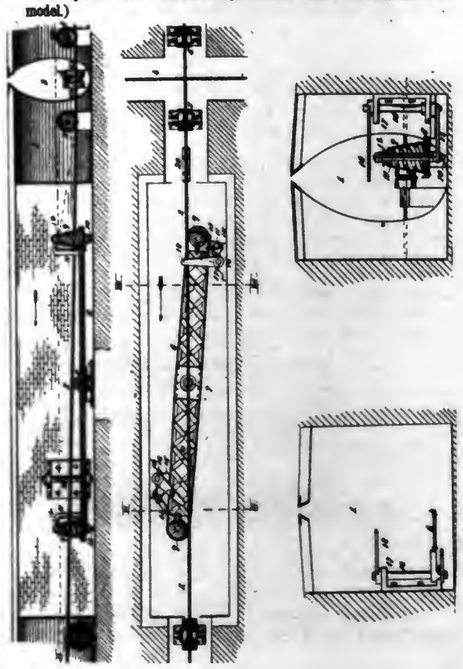
402,543. FILTER. HENRY ROEMER, Philadelphia, Pa. Filed Oct. 27, 1888. Serial No. 289,268. (No model.)

Claim.—1. A filter having a primary filtering-chamber provided with partitions forming compartments, valves at or near the lower portions of said partitions, a secondary chamber in communication with the primary chamber, valves between said chambers, and discharge-pipes connected with the secondary chamber, substantially as described.

2. A filter having an outer and an inner chamber, each divided into compartments, valves affording communication between said compartments, a stand-pipe with pipes leading from each of said inner compartments, and a supply-pipe with branch pipes leading into each of said outer compartments, said parts being combined substantially as described.

3. A filter having primary and secondary chambers, a supply-pipe, a distributing-pipe, a branch pipe connected with said distributing-pipe and primary chamber, two valves connected with the branch pipe, and a discharge-pipe with a valve connected with the secondary chamber, the parts named being combined substantially as described.

4. In a filter having a chamber with filtering material therein, a flue having a peaked closed roof and perforated bottom located in said filtering material and connecting with a plug on the outer wall of the outer chamber, said parts being combined substantially as described.



5. A filter having a partitioned chamber and a flue or canal within the filter-bed thereof, said flue being closed at top, perforated at bottom, and open at its ends, one end communicating with the atmosphere through an opening in the outer wall of the chamber and the other end communicating with a partition of the chamber, the opening in said wall being provided with a closing cap or plug, the parts enumerated being combined substantially as described.

6. A filter having primary and secondary chambers, with means of communication between the same, a supply-pipe, a distributing-pipe, with a branch pipe connected with the primary chamber, two valves on the branch pipe, partitions in the primary chamber forming compartments, with valves between the same, a discharge-pipe connected with the secondary chamber, and flues or canals within the filter-bed of the primary chamber communicating with said chamber, the partition thereof, and the atmosphere, the several parts being combined substantially as described.

7. The distributing-pipe E, in combination with the branch pipe 5, attached thereto, having a conveying-pipe, 6, leading into the filtering-chamber, said branch pipe having valves 7 8, of different capacities, and said conveying-pipe and the outlet end *d* of the branch pipe being of greater diameters than the inlet ends *e* of said branch pipe, substantially as described.

8. A filter having a filtering-chamber with partitions therein, the latter having ports affording communication between adjacent compartments, and channels leading from said ports to the atmosphere outside of said chamber, said parts combined substantially as and for the purpose set forth.

402,544. CABLE-LIFTER FOR RAILWAY-CARS. DANIEL W. SMITH, St. Louis, Mo., assignor of one-half to Elias E. Wilson, same place. Filed Sept. 15, 1888. Renewed Apr. 4, 1889. Serial No. 306,028. (No model.)

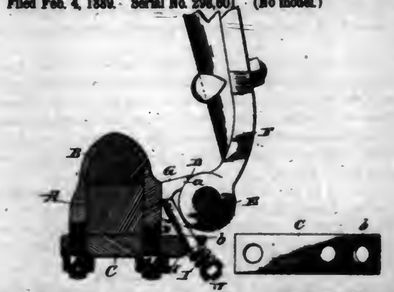
Claim.—1. In a cable-lifter, the combination of a pivoted beam, rollers on the beam for elevating the cable, and mechanism for operating the beam automatically through means of the grip, substantially as set forth.

2. In a cable-lifter, the combination of a pivoted beam, rollers secured to the opposite ends of the beam, a cable passing on opposite sides of said rollers, and mechanism for moving the beam automatically through means of the grip, substantially as set forth.

3. In a cable-lifter, the combination of the pivoted beam, conical rollers secured to the opposite ends of the beam, a cable passing on the opposite sides of said rollers, and mechanism for moving the beam automatically through means of the grip, substantially as set forth.

4. In a cable-lifter, the combination of the pivoted beam, rollers mounted on opposite ends of the beam and having threaded peripheries, a cable passing on opposite sides of the rollers, and mechanism for moving the beam automatically through means of the grip, substantially as set forth.

5. In a cable-lifter, the combination of the pivoted beam, rollers mounted on opposite ends of the beam, grooved pulleys on top of the rollers, a cable passing on opposite sides of the rollers, and mechanism for moving the beam automatically through means of the grip, substantially as set forth.

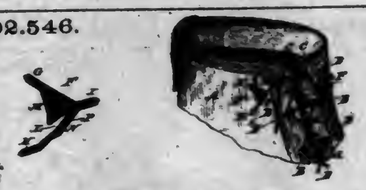


6. In a cable-lifter, the combination of the pivoted beam, rollers mounted on opposite ends of the beam, clevises securing the rollers to the beam, a cable passing on opposite sides of the rollers, and mechanism for moving the beam automatically through means of the grip, substantially as set forth.

7. In a cable-lifter, the combination of the pivoted beam, rollers mounted on opposite ends of the beam, and mechanism for moving the beam automatically through means of the grip, said mechanism consisting of rock-shafts, levers secured to the rock-shafts, segments or arms secured to the rock-shafts, and links connecting the segments or arms to the respective ends of the beam, substantially as and for the purpose set forth.

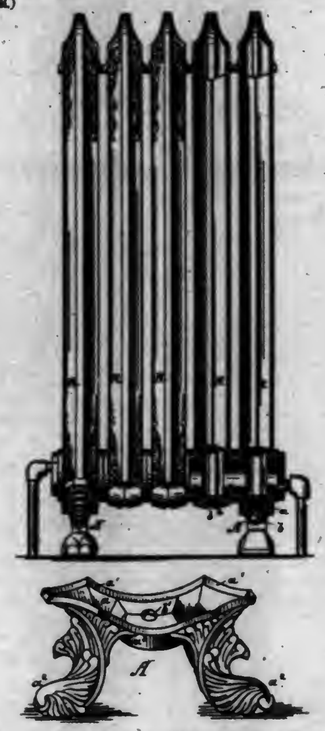
8. In a cable-lifter, the combination of the pivoted beam, rollers secured to the opposite ends of the beam, mechanism for moving the beam automatically through means of the grip, said mechanism consisting of rock-shafts, levers secured to the rock-shafts, arms or segments secured to the rock-shafts, and links connecting the arms or segments with the beam, said links having slot-and-pin connection with said segments, substantially as set forth.

9. In a cable-lifter, the combination of the beam, rollers, and mechanism for moving the beam, said beam consisting of channel-bars connected by crossing-strips, substantially as set forth.



402,545. THILL-COUPLING. STEPHEN G. SMITH, Hannibal, Mo. Filed Feb. 4, 1889. Serial No. 298,901. (No model.)

Claim.—1. In a thill-coupling, the combination, with a clip, a thill-iron having an eye, and a bolt passing through the clip and eye, of a non-yielding block located between the clip and adjacent end of the thill-iron and provided with a flat face which bears against the front face of the clip, and with a forwardly-projecting lip which overhangs and rests on the thill-iron, an arm depending from the lower face of the block, a spring encircling said arm and bearing against a rigid support, and a nut secured on the arm and forming a bearing for the spring, substantially as set forth.

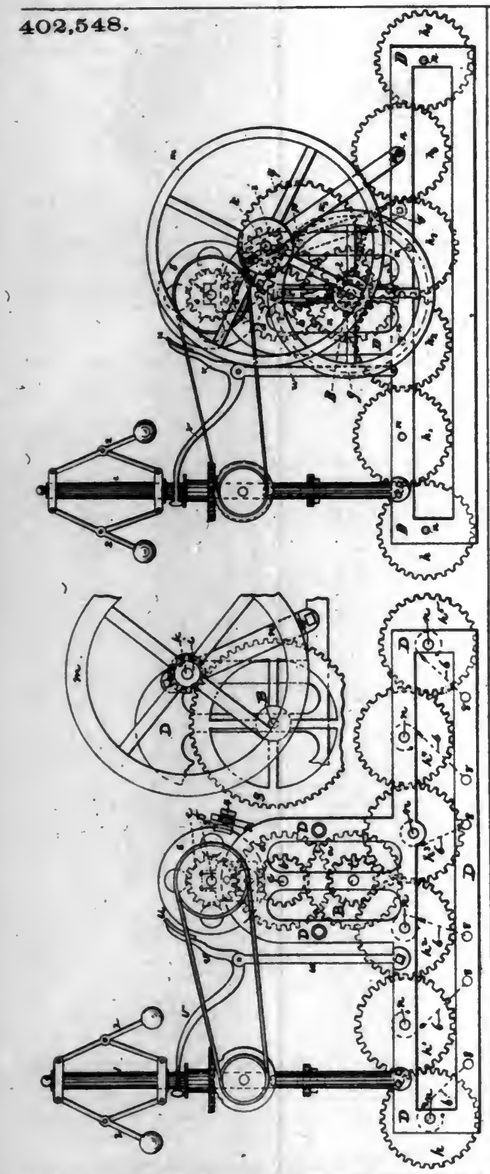


2. In a thill-coupling, the combination, with a clip, a thill-iron, and a securing-bolt, of the securing-bar provided with a beveled front end, and an oblique opening through said front end, a non-yielding block located between the clip and eye of the thill-iron and having a beveled lip which rests on or against the head of the thill-iron, a forwardly-curved arm depending from the block and passing through the oblique slot in the bar, a spring encircling the arm and resting against the inclined or beveled end of the bar, and a nut for locking the spring in position, substantially as set forth.

402,546. SHOE-LACE FASTENER. IRA R. STOFFEL, Hatboro, and CHARLES R. CUTHBERT, Pittsburg, Pa. Filed Sept. 3, 1888. Serial No. 284,436. (No model.)

Claim.—A shoe-fastening provided with two sector-shaped portions, M N, disposed one above the other and separated by a slit or opening, L, the lower laterally-projecting portion, N, being provided with an upwardly-projecting flange or lip, P, substantially as specified.

402,547. RADIATOR. SAMUEL D. TOMPKINS and THOMAS H. WILLIAMS, Jersey City, N. J. Filed Feb. 27, 1888. Serial No. 301,349. (No model.)



Claim.—The combination, with a radiator composed of interchangeable sections, each having a convex lower end, of interchangeable leg-arches for the sections, having concave upper surfaces to receive the convex lower ends of the radiator-sections, secured by a bolt or other locking device to hold the leg-arches in position on any section, substantially as described.

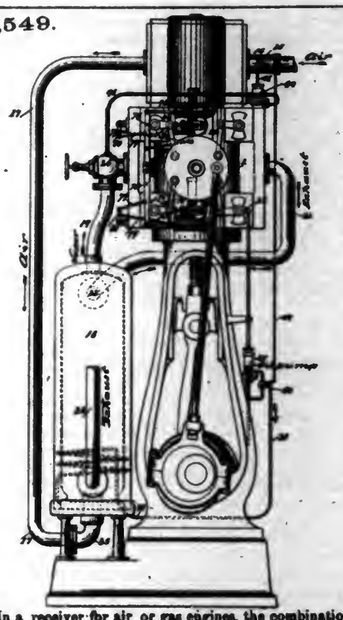
402,548. SPRING-MOTOR. BENJAMIN TURTON, Newark, N. J., assignor of three-fourths to Joseph L. Doremus, John Turton, and Harry Turton, all of same place. Filed Mar. 23, 1888. Serial No. 268,217. (Model.)

Claim.—1. In a spring-motor, the combination, with the main frame and driving-shaft of the machine, of a supplemental frame, *o*, shaft *p*, journaled in said frame *o*, spring 9, auxiliary gear-wheel *q*, independent of but connected with the spring driving mechanism, and pinion *r*, connecting said auxiliary gear-wheel with the driving-shaft of the machine, substantially as shown, and for the purposes set forth.

2. In a spring-motor, an auxiliary spring driving mechanism consisting of a supplemental frame, *o*, shaft *p*, journaled in said frame *o*, spring 9, auxiliary gear-wheel *q*, independent of but connected with the spring driving mechanism, and pinion *r*, connecting said auxiliary gear-wheel *q* with the main driving-shaft of the machine, in combination with the main spring driving mechanism consisting of a series of spring-bearing shafts, *n*, gear-wheel h^3, revolving on one of said shafts *n* and meshing into pinion *t* on main shaft, a series of gear-wheels revolving on similar shafts, *n*, and arranged to transmit their united

402,548.

power to gear-wheel A^2, and pawl-and-ratchet devices connecting said gear-wheels with their respective shafts, all as shown and described, and for the purposes set forth.



402,549. GAS OR AIR ENGINE. STEPHEN WILCOX, Brooklyn, N. Y. Filed Mar. 21, 1887. Renewed Feb. 7, 1889. Serial No. 299,067. (No model.)

Claim.—1. The combination, with a gas-engine receiver having its induction-port at the bottom and eduction-port at the top, of a pulverizer, through which the induction passes thereto, and a deflector, around which the eduction escapes therefrom, as set forth.

2. A gas-engine receiver having a surrounding jacket enveloping a heating-coil, one end of said coil connecting with the oil-pump and its opposite end with the pulverizer, as set forth.

3. In a gas-engine having a compressed-air receiver and air and fuel pumps, a pressure-regulator for controlling the effective capacity of both the air and fuel pumps to determine the amount each shall furnish to maintain a uniform pressure and to supply the cylinder with charges of maximum efficiency.

402,549.

4. In a receiver for air or gas engines, the combination, with a compressed-air-inlet pipe entering said receiver and provided with a porous diaphragm intercepting its aperture, of an inflammable fluid-chamber surrounding the margins of said diaphragm and so located that the portions of the inflammable fluid not effectually pulverized by the action of the air in the manner described shall be returned by gravity to said chamber and repulverized.

5. In an air or gas engine in which combustible gases are fired in the working-cylinder, the combination of a heat-transmitting igniter-tube, the same being exposed to an exterior flame and communicating at its inner end with the working-cylinder, at its outer end with an exterior chamber, with an interposed controlling-valve between the igniter-tube and the exterior chamber, whereby the explosive mixture within said cylinder is admitted to said tube and fired at the moment of opening said controlling-valve, substantially as described.

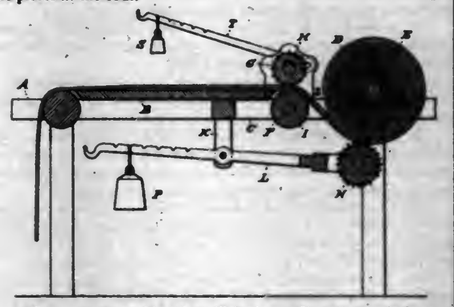
6. In air or gas engine in which combustible gases are fired in the working-cylinder, the combination of a heat-transmitting igniter-tube and exterior chamber, substantially as shown, with an interposed controlling-valve between the firing-tube and the exterior chamber, the same being actuated simultaneously with the variable cut-off movement of the cylinder induction-valve, so as to fire the cylinder-charge at the moment of cut off.

7. In an air or gas engine, an air-pump cylinder constructed with valve-boxes, substantially as described, covered by the working-cylinder head and opposite extended pump-cylinder head and side bonnets, whereby the valve-seats are made accessible and the examination and removal of the valves facilitated.

402,550. SURGICAL-NEEDLE CASE. EMIL WILLBRANDT, Indianapolis, Ind. Filed Feb. 5, 1889. Serial No. 298,763. (No model.)

Claim.—1. A case for containing surgical needles, composed of metal and having a metallic part formed with depressions in its surface to receive the needles, and means, substantially as described, for holding said needles in place, substantially as set forth.

2. A case for containing surgical needles, having a diaphragm arranged centrally therein and formed with corrugations in both its sides to receive said needles, substantially as set forth.



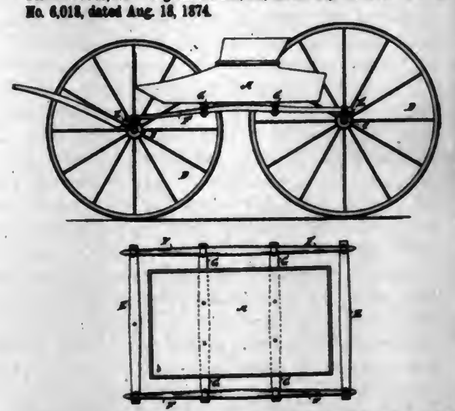
3. In a case for surgical needles, a diaphragm corrugated to receive said needles and formed with slots transversely of said corrugations, substantially as set forth.

4. The combination of the two-part case A and diaphragm B, hinged together at one edge and provided with a catch at the other, the springs A', secured to said case A, and the slots b, formed in said diaphragm at the points where said springs close against it, substantially as set forth.

5. A needle-case formed of metal and provided with slots, whereby boiling water may be allowed to flow into and escape from said case, substantially as described, and for the purposes specified.

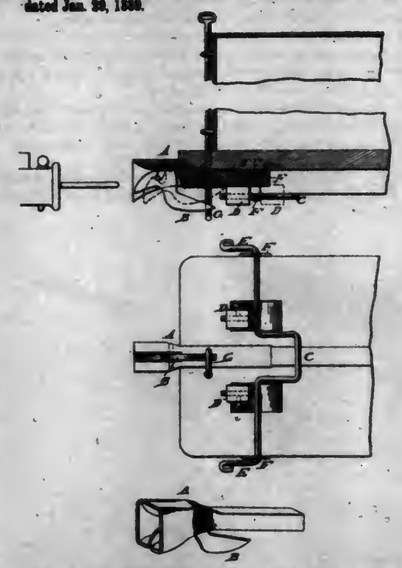
402,551. MACHINE FOR WINDING BAGGING, &c., IN PIECES. DAVID J. WIER, Sumter, S. C. Filed Dec. 12, 1888. Serial No. 293,390. (No model.)

Brief.—The object of the machine is to form a roll out of pieces of bagging, &c., so that each piece shall follow the preceding one in stretched and even shape and without the necessity of first connecting the pieces at the ends.



Claim.—1. A machine for rolling pieces of bagging or cloth, consisting of the feed-table and the rollers I G thereon, the roll-shaft, under lever, L, spur-roller N, and weight P, substantially as specified.

2. A machine for rolling pieces of bagging or cloth, the combination, with the table having an opening at one end and the roll-shaft in bearings at the outer end of said opening, of the rollers I G at the inner end of said opening, the under lever, L, spur-roller N, and weight P, substantially as specified.

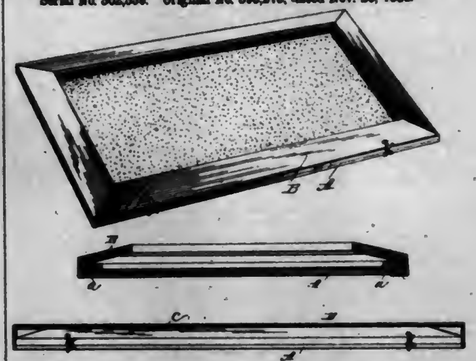


REISSUES.

10,998. LIGHT CARRIAGE. J. R. BREWSTER & COMPANY, New York, N. Y., assignees of THOMAS H. WOOD, deceased. Filed Mar. 15, 1888. Serial No. 268,500. Original No. 139,248, dated May 27, 1873. Reissue No. 6,018, dated Aug. 14, 1874.

Claim.—A frame consisting of the longitudinal side bars, P P, downwardly-bowed end springs, E E, and upwardly-bowed middle springs, G G, constructed, arranged, and applied as and for the purpose described, each middle spring being connected to the under side of the body and to the under side of each side bar.

10,999. CAR-COUPLING. FREDERICK J. HUSBER, Watford, Ontario, Canada. Filed Apr. 6, 1889. Serial No. 306,285. Original No. 307,053, dated Jan. 28, 1889.



Claim.—1. The combination of the draw-head A, having a solid top for the exclusion of snow and ice, with the counterweighted dog B, having the bottom of its hook below the level of the pivot, so as to permit of an upward pull by the link and an easy disengagement thereof, substantially as shown and described.

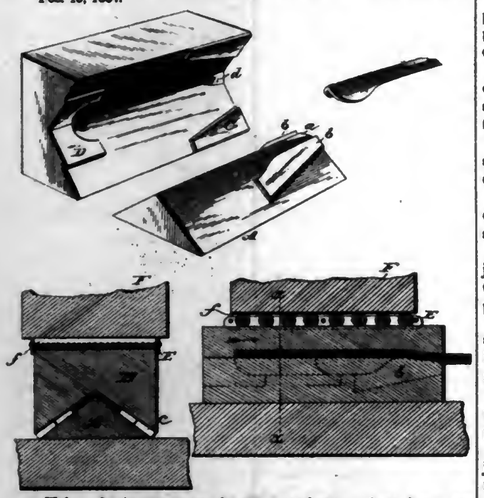
2. In combination with dog E, under shaft with cranks E E bent at each end, with bent center C and adjustable weights D D opposite, which move in a half-circle when uncoupling from side of car, and journals F F, which carry said under shaft, as shown and described.

3. In combination with dog B, upright rod G, passing down end of car, with hand-hold at top, with bottom end turned at right angles, which acts on dog for uncoupling from top of car.

4. The combination of the draw-head A, having a beveled mouth or link-guide, and the counterweighted dog B, with inclined curve, as stated above, on the top or part that engages link, with the bottom of its hook below the level of the pivot and coming even with front part of draw-head and projecting upward and forward of beveled mouth of draw-head, substantially as set forth.

11,000. COMBINED STICKY FLY-PAPER HOLDER AND TRAP. OTTO THUM and WILLIAM THUM, Grand Rapids, Mich. Filed Mar. 8, 1889. Serial No. 302,539. Original No. 300,273, dated Nov. 20, 1883.

Claim.—1. A combined holder and trap consisting of a support for the fly-paper, and an open frame or holding-rim above the paper, said rim being extended upwardly and inwardly, substantially as described.



2. A combined holder and trap consisting of a support for the fly-paper, and an open frame or holding-rim above the paper, the said rim being inclined inwardly and upwardly, substantially as described.

3. A holder for fly-paper consisting of a base-plate to support the paper, and a hinged open frame or rim for clamping the paper to the base-plate, said rim extending inwardly and upwardly, so that its inner edge is above the fly-paper, substantially as described.

4. A combined holder and trap consisting of a base-plate, a rim inclined inwardly and upwardly, having its inner edges above the surface of the fly-paper, said rim being hinged to the base-plate, and a cover for the holder, substantially as described.

5. A combined holder and trap consisting of the base-plate and rim hinged thereto having a clamping-frame, *a*, and a fastening for holding the rim and base-plate together, substantially as described.

11,001. DIE FOR MAKING EYE-BARS. JOHN F. KINSLEY, Athens, Pa. Filed Feb. 11, 1889. Serial No. 299,526. Original No. 357,333, dated Feb. 15, 1887.

Claim.—1. An apparatus for the manufacture of eye-bars, consisting of upper and lower die-sections, as A B, means for moving one of said sections vertically in relation to the other and longitudinally over the face of the other, and an upsetting projection, D, on the face of the moving section, substantially as described.

2. An apparatus for the manufacture of eye-bars, consisting of a lower die-section, A, angular in cross-section, an upper die-section, B, corresponding thereto, a projection, D, on the face of one of said sections, and means for moving one of said sections vertically and longitudinally, substantially as described.

3. A pair of dies for forming eye-bars and the like, one of said dies having a projection, D, at one end, and the other having projections *b b* at the opposite end, with a space between the projections *b b*, substantially as described.

4. In the manufacture of eye-bars, a pair of dies having forming projections upon each die extending above the level of the die-surface proper, substantially as described.

5. In the manufacture of eye-bars, a pair of dies having forming projections upon each die extending above the level of the die-surface proper, one of said dies having longitudinal movement over the face of the other to upset the bar, substantially as described.

6. In combination, a pair of dies having forming projections upon each die extending above the level of the die-surface proper, one of said dies being stationary and the other having vertical and longitudinal movement, substantially as described.

7. In combination, the upper and lower dies, angular in cross-section, the surfaces of said dies diverging from each other from the center outward, substantially as described.

8. A pair of dies having projections upon their faces, having a cut-away portion, *a*, on one die and a projection, *d*, on the other die, substantially as described.

9. A pair of dies, one movable over the face of the other, a projection on one at one end and a pair of projections with a space between them on the other at the opposite end, the inner ends of the pair of projections being cut away, substantially as described.

10. The combination of upper and lower dies, triangular in cross-section, as shown, and having projections upon their inner or meeting faces, the upper one of said dies being adapted to move vertically and longitudinally over the lower die, substantially as described.

11. The combination, with a lower die and a vertically-moving upper die, of a former-head and a frame provided with rollers supported upon the upper die, substantially as described.

12. The combination, with an upper and a lower die having projections, as thus described, of the roller-frame, substantially as and for the purpose set forth.

13. The combination, with a lower die-section and a vertical movable upper die-section, of a former-head, and rollers interposed between the said head and die, substantially as described.

PHOTO LITH. NORRIS PETERS WASHINGTON D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

BALLARD *v.* SEARLS.

Decided March 5, 1889.

PRACTICE IN THE COURTS.

The facts are set forth in the statement below. The Court held that the whole basis and foundation of the present suit had disappeared by reason of its decree in a former case, and that the cause should be remanded to the circuit court with instructions to allow the appellant, defendant below, to file such supplemental bill as he may be advised, in the nature of a bill of review, or for the purpose of suspending or avoiding the decree, upon the new matter arising from the reversal of the decree in the former case.

APPEAL from the Circuit Court of the United States for the Eastern District of Michigan. On motion of the appellant for a reversal of the decree upon matters shown to the court.

Mr. Charles J. Hunt for the appellant.
Mr. A. G. N. Vermilya for the appellee.

Mr. Justice BRADLEY delivered the opinion of the Court.

The appellant has made a motion that the decree appealed from in this case, so far as it affects the said appellant, be reversed, and that the cause may be remanded to the circuit court with direction to dismiss the bill. This motion proposes that the decree be reversed without argument of the cause in view of extrinsic facts, which are made to appear by the records of this Court and of the circuit court, and by affidavits. If such a course can be properly taken in any case, we think it would be improper in the present, since the decree may be perfectly correct and free from objection on the facts of the case as they appear upon the record, and it is possible to be correct, notwithstanding the facts alleged by the appellant. These facts, however, are of such a character that the appellant may be subjected to great injustice if the cause should go to hearing on the appeal in the present condition of the record; and, as they have occurred since the appeal was taken, there seems to be no mode of affording relief to the appellant except by sending the cause back to the circuit court for the purpose of allowing supplementary proceedings to be had in that court.

The facts as stated by the appellant, and not denied by the appellee, are as follows:

On the 12th day of July, 1880, Anson Searls, the appellee in this cause, filed in the Circuit Court of the United States for the Eastern District of Michigan his bill of complaint against Alva Worden and John S. Worden, for the infringement of a patent, and such proceedings were had in the cause that on the 5th day of September, 1883, a decree was entered in said cause in said circuit court, whereby it was decreed that the said Alva Worden and John S. Worden infringed the patent, and should pay over to the said Anson Searls $24,960.31.

That upon the entry of said decree the defendants appealed the case to this Court. But the defendants, Alva Worden and John S. Worden, were unable to give the necessary bond to operate as a supersedeas bond upon said appeal.

On the 17th of September, 1883, the complainant issued an execution on his decree, and placed it in the hands of the marshal of said district.

On the 18th of September, 1883, the marshal, under the execution, levied upon certain lots in the city of Ypsilanti, county of Washtenaw, and upon certain lands in the town of Sumpter, county of Wayne, all in the State of Michigan, in the eastern district thereof, the property of the said appellant, Harrison H. Ballard; and on other lands in the said city of Ypsilanti, belonging to the said Alva Worden and John S. Worden, but which were mortgaged to Mary Ann Andrews, Henry M. Curtis, Henry Van Tuyl, and Charles King.

That, on the 10th day of October, 1883, the said Anson Searls, in aid of his execution against the Wordens, filed in the said Circuit Court of the United States for the Eastern District of Michigan, his bill of complaint against Harrison H. Ballard, Mary A. Andrews, Henry M. Curtis, Henry Van Tuyl, Charles King, Alva Worden, and John S. Worden, to set aside as fraudulent and void, as to the creditors of the said Alva Worden and John S. Worden, the conveyances under which the said Harrison H. Ballard held the lands so levied upon; and also the mortgages given by the said Alva Worden and John S. Worden on the said lands belonging to them to the said Mary Ann Andrews, Henry M. Curtis, Henry Van Tuyl, and Charles King. That such proceedings were had in said last-mentioned cause; that the cause was brought to a final hearing, and a decree entered on the 24th day of November, A. D. 1884, in which it was decreed that the mortgages given by the said defendants Alva Worden and John S. Worden to the said defendants Mary A. Andrews, Henry M. Curtis, Henry Van Tuyl, and Charles King, were good and valid liens upon the lands mentioned therein, and that the several conveyances to Harrison H. Ballard were fraudulent and void as against the creditors of the said Alva Worden and John S. Worden.

Thereupon the said defendant Harrison H. Ballard prayed an appeal to the Supreme Court of the United States to reverse the said decree, as far as it related to him.

That the said appeal was allowed and the amount of the appeal bond was fixed at the sum of $8,500. That the said bond was duly executed and approved by one of the judges of the said circuit court, and filed in the office of the clerk of said circuit court. That on the 8th day of October, 1885, the clerk of the said Circuit Court of the United States for the Eastern District of Michigan transmitted the transcript of the record in the case of *Anson Searls* v. *Harrison H. Ballard et al.* to the clerk of the Supreme Court of the United States, and that the said transcript was filed in the office of the clerk of this Court on the 13th day of October, 1885, and now stands on the docket for the October term, 1888, as No. 144.

That since the appeal in this case, the appeal in the original case of *Alva Worden and John S. Worden, Appellants* v. *Anson Searls* has been heard in this Court, and a decree entered thereon on the 27th of March, 1887, wherein and whereby it was, among other things, ordered, adjudged, and decreed that the final decree of the said circuit court in this cause be, and the same is hereby, reversed with costs, and that the same be remanded to the said circuit court with a direction to dismiss the bill with costs.

That on the 8th day of August, 1887, this Court issued its mandate in the said case of *Alva Worden et al., Appellants* v. *Anson Searls* to the said circuit court, in which, among other things, the said Circuit Court of the United States for the Eastern District of Michigan was directed to dismiss the bill with costs.

That said mandate was filed in the said circuit court on the 3d day of October, 1887.

That on the 3d day of September, 1888, a decree was entered in pursuance of said mandate in the case of *Anson Searls* v. *Alva Worden and John S. Worden* (the original case) dismissing the bill of complaint with costs.

It is apparent from this statement that the whole basis and foundation of the present suit has disap-

peared by the decree rendered in the former case of *Worden and others* v. *Searle*, reported in 121 U. S., 14. Surely there ought to be some mode of relieving a party in such a case. The appellee is endeavoring to collect the amount recovered by a decree which has been reversed, and in a case in which his bill has been dismissed on the merits. The object of the present suit is to aid the execution of that former decree by having declared void certain conveyances of property by the defendants, which the appellee has caused to be levied on for the satisfaction of the decree. If the former decree had been reversed before the taking of the present appeal, the appellant could have instituted supplementary proceedings in the circuit court for obtaining the benefit of that reversal. The conveyances sought to be set aside were good as between the parties, and only void as to creditors: and as the appellee, by the reversal of his decree, ceased to be a creditor, his bill to have the conveyances set aside had no longer any ground to stand on. A supplemental proceeding of some kind, therefore, would have been the right of the defendant, the present appellant. But as the case had been removed to this Court by appeal before that decree of reversal was rendered, such a proceeding was out of his power. Nor could it be taken in this Court, where the case was pending on appeal, for this Court cannot entertain proceedings that require the exercise of original jurisdiction, except in the few cases pointed out in the Constitution.

The only course which can be properly pursued is to remand the cause to the circuit court, with instructions to allow the appellant to file a supplemental bill, in the nature of a bill of review, or a bill to suspend or avoid the operation of the decree, according to the mode pointed out by Lord Redesdale in his work on Equity Pleading. He says, on page [86]:

> But if a case were to arise in which the new matter discovered could not be evidence of any matter in issue in the original cause, and yet clearly demonstrated error in the decree, it should seem that it might be used as ground for a bill of review, if relief could not otherwise be obtained.

And on page [95] he says:

> 5. The operation of a decree signed and enrolled has been suspended in special circumstances, or avoided by matter subsequent to the decree, upon a new bill for that purpose—

and he gives an instance occurring in the time of Charles II. These views are adopted by Mr. Justice Story in his work on Equity Pleading. (See sections 415 and note, 428.) We do not decide what precise form such a proceeding should take: the appellant will be advised by his counsel in this regard.

The appellee, in opposition to the appellant's motion, has produced the certificates of the marshal of the United States for the Eastern District of Michigan, showing that, on the 10th day of December, 1884, he sold the property in dispute, or some part thereof, to certain persons, under the execution issued upon the decree in the case of *Anson Searls* v. *Alva Worden and John Worden*, (which was reversed by this Court, as before stated,) and that the purchasers would be entitled to a deed of said lands, and the sales would become absolute at the expiration of fifteen months, unless previously redeemed as prescribed by the statute of Michigan.

It is possible that these sales may complicate the inquiry to be made by the Court upon the supplemental proceedings of the appellant; but we do not see that they can preclude such proceedings. It is not shown that the purchasers have advanced any money on the faith of the purchases; and it is possible that the appellant can show that they were made for the benefit of the appellee; in either case the sales would be liable to be set aside on the reversal of the decree. Should the circuit court deem it proper to require that the purchasers be made parties to the supplemental proceedings, the facts of the case could be fully elicited, and right could be done without prejudice to any of the parties.

Our decision is that the cause be remanded to the circuit court with instructions to allow the appellant, defendant below, to file such supplemental bill as he may be advised, in the nature of a bill of review, or for the purpose of suspending or avoiding the decree, upon the new matter arising from the reversal of the decree in the former case of *Anson Searls* v. *Alva Worden and John Worden*, and that such proceedings be had thereon as justice and equity may require, and it is so ordered.

Supreme Court of the United States.

THOMPSON *v.* HALL *et al.*

Decided March 18, 1889.

JOHNSON—CUTTING-PLIERS.

The conclusion of the circuit court (33 O. G., 1140,) that Moses C. Johnson was not the first and original inventor of the improvements claimed in Letters Patent No. 232,975, granted October 5, 1880, to Henry G. Thompson, as assignee of said Moses C. Johnson, for cutting-pliers, sustained and decree affirmed.

APPEAL from the Circuit Court of the United States for the Eastern District of New York.

Mr. Horace Barnard for the appellant.
Mr. Amos Broadnax for the appellees.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought in the Circuit Court of the United States for the Eastern District of New York, by Henry G. Thompson against Thomas G. Hall, J. F. Oliver, Samuel Leopold, and David L. Harris, for the alleged infringement of Letters Patent No. 232,975, granted October 5, 1880, to the plaintiff, as assignee of the inventor, Moses C. Johnson, for an improvement in cutting-pliers, on an application filed June 2, 1880.

The specification, drawings, and claim of the patent are as follows:

This invention relates to cutting-pliers, and is an improvement on that class of pliers represented in United States Patent No. 209,677, dated November 5, 1878, granted to T. G. Hall, to which reference may be had. In that invention either of the two hand-levers may be turned on its pivot without turning the other, and the tool-body formed by the face or covering plates is permitted to vibrate or turns more or less with relation to the handles, and the central space between the cutting-faces of the jaw-levers, when the pliers are taken in the hand to be used, drops more or less out of line with the central line of the handles, making, as it were, a loose joint midway between the ends of the pliers.

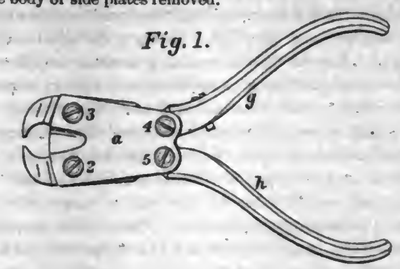
One of the objects of my invention is to construct a stiff pair of pliers, or pliers in which the hand and jaw levers shall each be compelled to move positively in an opposite direction to the movement of its fellow, or a pair of pliers in which the tool-body shall not of itself swing or vibrate upon the pins or studs holding the hand-levers.

In the patent above referred to the end of wire or other thing cut off by the cutters drops into and injures the spring that opens the jaw-levers. This I obviate by providing each jaw-lever with a lip to cover or bridge the space between the jaws as the jaw-levers are closed.

My invention consists in the combination and arrangement of parts for effecting these ends, as hereinafter specified and claimed.

Figure 1 represents, in side elevation, a pair of cutting-pliers containing my improvements; and Fig. 2, a like view with one of the body or side plates removed.

Fig. 1.



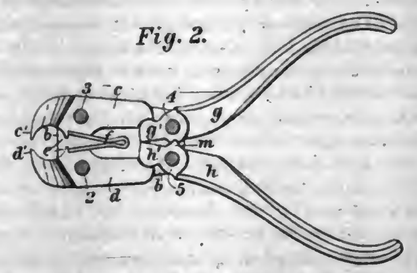


Fig. 2.

The body of the pliers is composed of two side plates, *a b*. These side plates are fixed together by the screws 2 3 4 5. Of these screws, those 2 3 serve as the fulcra of the jaw-levers *c d*, having at their ends the usual cutters or cutting-surfaces *c' d'*. Each of these jaw-levers has a lip, *l*, and the end of one meets the end of the other lip just as or just before the two cutting-edges *c' d'* separate the wire or other metal end to be cut off by them, thus closing the space between the said jaw-levers and side plates, in which is placed the spring *f*, and preventing the entrance into said space of hard pieces of wire or other articles that would clog the pliers. These lips also serve another essential purpose—viz., that of holding the ends of the spring from displacement and obviating the employment of a separate pin or stud to hold the said spring at one end, as heretofore common.

The screws 4 5 serve as the fulcra for the hand-levers *g h*, having short arms *g' h'*, to act upon the ends of the longer arms of the jaw-levers and turn them on their fulcra to close the jaws and bring the cutting-edges together. The spring *f* opens the jaws the instant the clasping pressure on the hand-levers is relaxed.

In order to move the jaw-levers equally at all times and prevent the jaw-levers and body of the pliers turning on the handles, I have provided one hand-lever with a prong, *m*, having a rounded end that enters a rounded notch in the opposite lever. This one prong and its notch are always in engagement, and so connect the two levers that the body of the pliers cannot vibrate on the screws 4 5, but, on the contrary, the two levers may turn each on its own pivot, both levers always turning the same distance, but in exactly opposite directions. This connection between the two hand-levers, as described, insures a stiff pair of pliers, that can be handled more readily and accurately than the old form of cutting-pliers referred to, and which are more positive as to the movement of the cutting-jaws.

I am aware, in bolt-cutters, where the short ends of the hand-levers are jointed with the long ends of the cutting jaw-levers, that a series of teeth or cogs have been interposed to cause the hand-levers to be geared together; but in such bolt-cutters one single tooth and notch would not operate to always keep the two hand-levers locked together as to their movement in unison, as is the case with my one prong, *m*, rounded at its end and inserted within a rounded notch.

I claim—

The body composed of the side plates, *a b*, the independent fulcra 2 3 4 5 for the jaw-levers and hand-levers, the jaw-levers provided with cutting-edges and with lips *c*, and the hand-levers having short arms *g' h'*, and a prong and notch always in engagement, as described, combined with the V-shaped spring, held, as described, by the lips of the jaw-levers, all as and for the purpose set forth.

One of the defenses set up in the answer is, that Johnson and Thompson surreptitiously obtained the patent in fraud of the rights of the defendants; that the defendants are trustees and directors of a New York corporation, known as the Interchangeable Tool Company; that that corporation was organized in August, 1878, for the purpose of manufacturing cutting-pliers or nippers, under Letters Patent No. 209,077, granted to the defendant Hall, November 5, 1878; that Hall invented certain improvements upon such pliers, and immediately described and explained them to the officers of the company; that the company thereupon caused a model of them to be made, embracing such improvements; that Johnson was employed to make such model pliers for the company, and made them for the company while in its employ, and under the direction of Hall; that Johnson was in the employ of the company, in making such pliers, from April 20, 1879, until May 1, 1880, during which time the company made and sold upward of 30,000 of such pliers, with the knowledge and consent of Johnson, and without any objection on his part, and without notice that he claimed to be the inventor of the whole or any part of such pliers, or intended to apply for a patent for the same; that Hall was the first and original inventor of said original cutting-pliers and of said improvements thereon, and assigned to the company the whole of the patent of November 5, 1878, immediately on its issue, and also the whole of said improvements upon such cutting-pliers; that Johnson, after so being in the employ of the company for one year, was dismissed from its service, and thereupon, as the result of a conspiracy between Thompson, Johnson, and one Gustam, Johnson falsely claimed that he was the first and original inventor of said improvements, and applied for a patent therefor, and sold his pretended claim to the invention to Thompson; and that Johnson, without the knowledge of Hall, or of the other defendants, or of the company, applied for a patent for said improvements, falsely alleging that he was their first and original inventor, and surreptitiously obtained said patent, No. 232,975, for said invention of Hall, and for an improvement upon the pliers so patented November 5, 1878. There was a replication to this answer, proofs were taken, and the circuit court entered a decree dismissing the bill, from which the plaintiff has appealed. In its opinion (33 O. G., 1140; 25 Fed. Rep., 906) the circuit court stated, that the question at issue was whether the combination covered by the claim of the plaintiff's patent was invented by Johnson while he was an employé of the corporation; that the plaintiff had sought to prove that a model produced by him, known as Exhibit C, was made by Johnson while he was in the employ of the company; that, on the other hand, the defendants had sought to prove that that model was not made by Johnson while he was employed by the company, but after he had been discharged from its employ, and for the purpose of supporting a fraudulent claim to an invention really made by Hall, and which claim had been put forth by Johnson for the first time after he had been discharged from the service of the company; and that, upon a full consideration of all the evidence, the conclusion of the court was, that Exhibit C was not made while Johnson was a workman for the company, but was made subsequently to his leaving its employment, and that he was not the first inventor of the combination claimed in the patent issued to the plaintiff.

The testimony is voluminous and contradictory, and, without discussing it, it is sufficient to say that we are of opinion that the evidence establishes the conclusion reached by the circuit court, and that the decree must be affirmed; and it is so ordered.

U. S. Circuit Court—Eastern District of Michigan.

RODEBAUGH *et al. v.* JACKSON *et al.*

Decided February 25, 1889.

1. RODEBAUGH—SAW-MILL DOG—INVALID PATENT.
The first claim of Letters Patent No. 196,102, granted October 16, 1877, to George W. Rodebaugh, for an improvement in saw-mill dogs, is anticipated by the patent of Craney, No. 150,534, dated May 5, 1874.

2. LIMITATION IMPOSED BY PATENT OFFICE.
The intimation in *Sargeant* v. *Hall* (114 U. S., 38) that the limitations introduced into an application after it was persistently rejected must be strictly construed against the inventor and in favor of the public, and looked upon as in the nature of disclaimers, means no more than that when under the state of the art and the action of the Office a patentee of a combination has modified and limited his claim he shall be held strictly to the combination as he has described it. It does not debar the patentee from the benefit of the doctrine of equivalents.

3. SAME—MECHANICAL EQUIVALENT.
In such a case, where an infringer has attempted to avoid the patent by the use of a well-recognized mechanical equivalent, the court is bound to look to the state of the art at the time the patent was applied for to determine the limitations of the claim.

4. ANTICIPATION—EQUIVALENT.
When a T-lever had already been used for operating a saw-mill dog, there was no invention in the substitution of an eccentric-lever which was used to perform the same function in a no more effectual manner.

5. SAME—REARRANGEMENT.
The rearrangement of an old combination, where each element of the combination operates practically as before, is not patentable unless a new or greatly-improved result is gained.

6. SAME—NON-INFRINGEMENT.
Where the claim is limited to a lever locking in vertical position, and defendants' lever, like a prior patented lever, locked in a horizontal position, *Held* that the claim is either anticipated or not infringed.

IN equity.

STATEMENT OF THE CASE.

This was a bill in equity to recover damages for the infringement of the first claim of Letters Patent No. 196,102, issued October 16, 1877, to George W. Rodebaugh, for an improvement in saw-mill dogs. The claim alleged to be an infringement read as follows:

1. The combination of the eccentric-lever E E', pivoted to the standard B at O, with the connecting-strap F, articulated to the arm G of the reciprocatory shaft D, carrying the dog-head, the parts being so arranged that a downward movement of the lever will embed the dog into the log and lock it there, the lever assuming a perpendicular position against the standard out of the way, substantially as described.

The defense was anticipation and non-infringement.

Mr. Charles J. Hunt for the plaintiffs.

Messrs. Coulter & Griffin and *Mr. Harry E. Knight* for the defendants.

BROWN, *J.:*

A dog is an instrument for holding a log in position while it is being sawed into boards or planks. Formerly the log was supported on the ends of the carriage and was held firmly down and secured against lateral displacement by iron dogs hinged to the carriage and having teeth which were driven into the ends of the log. When the circular saw came into use, the form of the carriage was changed. Instead of supporting the log at the end, it was laid so its side rested on the side rail of the carriage, and was supported its entire length. To hold it in position, two or more movable supports, called "knees," were placed upon the carriage behind the log. To prevent the rolling of the log, two or more pieces of iron were hinged or hung to the cross-pieces of the carriage, having at their free ends a right-angled hook, which was driven into the log. These were also called "dogs." After a time this arrangement was followed by teeth attached to the knees and operated in various ways. Some were driven down into the timber by blows and some by means of levers of various shapes. In some cases the teeth moved simultaneously in an upward and downward direction—that is, into the upper and under sides of the log or cant—and in others the action was separate. These teeth were not often locked in place; but in a few cases the adjustment of the lever locked them in position. These teeth were also called "dogs;" but the term was also applied to the whole device, which was placed on the knee of the carriage, and included all the mechanism for protruding and retracting the teeth. Under this state of the art the patent in this suit was issued. The patentee Rodebaugh claims an improvement in these dogs, consisting of an eccentric-lever pivoted to the standard upon which the dog slides, the office of which is to raise and lower the reciprocating shaft, which carries the dog-head, by means of a connecting-strap between the eccentric and reciprocating shaft. By the use of this device the teeth of the dog are forced into and withdrawn from the log at pleasure.

In order to ascertain the full scope of Rodebaugh's invention it is necessary to advert for a moment to the first claim of his original application. It read as follows:

1. The eccentric-lever E E, connecting-strap F, combined with the vertical shaft or bar D, carrying the dog-head, substantially as described, for the purpose specified.

This was a broad claim for the use of an eccentric-lever and connecting-strap combined with a shaft carrying the dog-head for the purpose of raising and lowering the teeth, and was rejected by the Patent Office upon the ground that it had been substantially anticipated by Patent No. 163,309, issued to C. R. Ely, for a head-block. This was a combination of a lever working with a cam, the object of which was to elevate and depress the dog-head, which was carried upon a cylinder in much the same manner as Rodebaugh's. The ground of the rejection is not stated; but it is obvious that it must have been upon the theory that the eccentric-lever of Rodebaugh was a substantial equivalent for the weighted lever and cam of the Ely patent. The operation of the two is admitted to be substantially identical, and, in our opinion, the action of the examiner in holding that there was no invention in substituting the one for the other was correct. Upon this intimation from the Patent Office Rodebaugh thereupon amended his claim and restricted himself to the combination of the eccentric-lever pivoted to a standard, with a connecting-strap articulated to an arm of the reciprocating shaft carrying the dog-head, the parts being so arranged that a downward movement of the lever will embed the dog into the log and lock it there, the lever assuming a perpendicular position against the standard, out of the way. Defendants' theory is that Rodebaugh, having assented to the rejection of his original claim and having substituted another, is bound by the literalism

of his new claim; and inasmuch as in the defendants' device the lever when locked does not assume a perpendicular position, as required by Rodebaugh's claim, there is no infringement. If it be broadly true that a patentee who has re-formed his claim under instructions from the Patent Office is thereby debarred from the benefit of the doctrine of equivalents, his position is correct. It is true there is an intimation in the case of *Sargeant* v. *Hall* (114 U. S., 86) that the limitations introduced into an application after it was persistently rejected must be strictly construed against the inventor and in favor of the public, and looked upon as in the nature of disclaimers; but on a careful consideration of this and other cases we think nothing more is meant than that where, under the state of the art and the action of the Office, a patentee of the combination has modified and limited his claim he shall be held strictly to the combination as he has described it. Thus in *Leggett* v. *Avery* (101 U. S., 259) it is intimated that if an applicant, in order to obtain the issue of a patent, acquiesces in the rejection of a claim thereto, a reissue containing such claim is invalid; but there is no suggestion that the patentee of such reissue is not entitled to the benefit of the doctrine of equivalents. So, in the *Goodyear Dental Vulcanite Company* v. *Davis*, (102 U. S., 222-227,) after disclaiming an assertion that the correspondence between the applicant for a patent and the Commissioner of Patents can be allowed to enlarge, diminish, or vary the language of a patent after it is issued, it is said that a patent, like any other written instrument, is to be interpreted by its own terms.

But when a patent bears on its face a particular construction, inasmuch as the specification and claim are in the words of the patentee, it is reasonable to hold that such a construction may be confirmed by what the patentee said when he was making his application. The understanding of the party to a contract has always been regarded as of some importance in its interpretation.

So all that was said in *Fay* v. *Cordesman* (109 U. S., 420) is that if the patentee specified any element as entering into the combination, he makes such element material, and the court cannot declare it to be immaterial. It is his province to make his own claim and his privilege to restrict it. If it be a claim to a combination and be restricted to specified elements, all must be regarded as material, leaving open only the question whether an omitted part is filled by an equivalent device or instrumentality. There is nothing in any of these cases inconsistent with what had been previously regarded as well settled, or to lead one to believe that it was the intention of the court to debar the patentee from his right to pursue an infringer who has endeavored to avoid his patent by the use of a well-recognized mechanical equivalent. We think, therefore, that we are bound to look to the state of the art at the time this patent was applied for to determine the limitations upon the clause in question.

Under the first clause of plaintiffs' patent as amended there are none of the so-called anticipations which are worthy of serious consideration except that of Craney, which undoubtedly resembles Rodebaugh's device in all its important particulars. There is a fixed standard, A, corresponding to plaintiffs' standard B, a guide-bar, B, answering to the reciprocating shaft D, and the same lever E, though in one it is a T-lever and in the other an eccentric, a connecting-bar, D, performing substantially the same functions as the connecting-strap F of the Rodebaugh patent, and a projecting or horizontal arm, C, which answers the purpose of plaintiffs' arm G, projecting from the upper end of the reciprocating shaft. All these elements perform substantially the same functions as the corresponding elements of the Rodebaugh patent. There are, however, three distinctions in the two devices, which it becomes necessary to notice before determining finally the question of anticipation.

First, in the use of a T-lever instead of an eccentric. This fact is relied upon by the plaintiffs as constituting the improvement which distinguishes the Rodebaugh patent not only from that of Craney, but from all the others which are claimed as anticipations. But the testimony, even of plaintiffs' experts, indicates very strongly that for the purpose of driving the teeth of the dog into the log a T-lever performs the same function and in as effectual a manner as an eccentric. The operation of the two is precisely the same. Indeed, a model was exhibited in which an eccentric and a T lever were used to move coincidently the same connecting-rod, and their operation was shown to be practically identical. The one difference suggested is that eccentrics are not affected by back-pressure—a distinction which is strenuously denied by defendants' experts—while the lever may be moved backward and forward unless it is locked. This, however, is of no importance, as it is always intended that the lever operating the dog shall either be locked or held in place by a weight upon the end of the lever. We are clear in our opinion that there is no invention in substituting one for the other.

Second, there is in the Rodebaugh patent a rearrangement of the entire combination of the Craney patent by placing the lever and locking device midway between the upper and lower ends of the standard, instead of at the bottom, and using it to depress the upper dog, instead of raising the lower dog into the log. We do not understand that the rearrangement of an old combination, where each element of the combination operates practically as before, is patentable unless a new or greatly-improved result is gained. (*Woodward* v *Dinsmore*, 4 Fish., 163, 169.) The variations of the Rodebaugh patent from that of Craney are scarcely greater than those of defendants' device from that of Rodebaugh, and it is entirely clear to our mind that defendants' device differs from that of Rodebaugh only in the rearrangement of the combination, by which a connecting-rod operated by a thrust and articulating with the movable shaft at the bottom is substituted for a connecting-strap, F, operating by tension and articulated with the reciprocating shaft at the top by means of the arm G. In this particular the case is much like that of *Ives* v. *Hamilton*, (92 U. S., 426.)

Third, the feature of the Rodebaugh patent by which the lever when the dog is locked assumes a perpendicular position against the standard out of the way, is not found in the Craney patent, and is probably the novel arrangement which obtained from the Patent Office the allowance of his first claim as amended. Now, this is either a mechanical equivalent for a lever which locks horizontally, or it is not. If it be such an equivalent, then it is anticipated by the Craney patent; but if it be not such equivalent

and be a patentable improvement upon the Craney patent, then it is not infringed by the defendants, since they do not use this feature of the claim.

There was undoubtedly considerable mechanical ingenuity shown by Rodebaugh in readjusting the various elements of the Craney combination, and perhaps some improvement in its mechanical operation, and we think his device approaches very near the border line of invention; but upon the point which has been most earnestly pressed upon our attention, that the eccentric is a patentable improvement over the T-lever—and the plaintiffs' case was practically put upon this ground—we have not been able to adopt their view.

U. S. Circuit Court—Eastern District of Michigan.

RODEBAUGH *et al. v.* JACKSON *et al.*

Decided March 13, 1889.

1. RODEBAUGH—SAW-MILL DOG—INVALID PATENT.
The first claim of Letters Patent No. 196,102, granted October 16, 1877, to George W. Rodebaugh, for an improvement in saw-mill dogs, is anticipated both by the patent of Craney, No. 150,534, dated May 5, 1874, and the patent of Ely, No. 163,309, dated May 18, 1875.

2. LIMITATION IMPOSED BY PATENT OFFICE.
Where a claim in complainants' application broad enough to cover the machine used by defendants was rejected on reference to a prior patent, and the applicant was compelled to present a new claim having a limitation not found in the claim first presented, the new claim cannot be enlarged to cover what was first rejected.

3. SAME—NON-INFRINGEMENT.
Where after official rejection a patentee's claim was limited to the specific device described, in which the lever for operating the dog-bar locked when in vertical position, and the defendant's lever was so arranged as not to lock in that position, *Held* to be no infringement.

ON application for rehearing.

Mr. Charles J. Hunt for the complainants.

Messrs. Coulter & Griffin and *Mr. Harry E. Knight* for the defendants.

JACKSON, *J.:*

I concur fully in the conclusion reached by the district judge that the Rodebaugh patent of October 16, 1877, Letters Patent No. 196,102, was anticipated by the patent issued to Thomas Craney, No. 150,534, dated May 5, 1874; that in so far as the Rodebaugh improvement differs from that of the Craney patent nothing more than mechanical skill was involved and exercised. I am further of the opinion that said Rodebaugh patent was anticipated by the patent of Ely, No. 163,309, dated May 18, 1875. Secondly, if the Rodebaugh patent could be held valid, it would, in view of the action of the department as shown by the file-wrapper and contents, have to be limited to the precise mechanism and construction therein described, and that as thus limited it is not infringed by the machine used by the defendants. Rodebaugh's original claim was broad enough to have covered the machine as used by defendants. It was:

1. The eccentric-lever E E, and connecting-strap F, combined with the vertical shaft or bar D, carrying the dog-head, substantially as described, and for the purpose specified.

This claim was rejected by the Patent Office in reference to said Ely patent, No. 163,309, in which is found an eccentric-lever operating on the vertically-reciprocating bar which carries the dog and capable of locking the bar in any position it may be set. Upon the rejection of this broad claim Rodebaugh was compelled to present the new claim now shown in claim 1 of the Letters Patent issued to him, which cannot by any construction or under any rule or doctrine of equivalents be enlarged so as to cover or embrace what was previously rejected. It must manifestly be limited to the specific device therein described, in which the dog-head is locked when the eccentric-lever has been moved through the half-circle, or 180 degrees of the circle of its action, and brought into a perpendicular position with the standard or shaft. The defendants' lever is differently constructed, having its greatest locking capacity when in a horizontal position and losing this locking capacity entirely when carried to the position of the perpendicular, at which the Rodebaugh lever makes its most effective lock.

I am clearly of the opinion that the application for rehearing should be denied, and that complainants' bill should be dismissed, with costs.

U. S. Circuit Court—Northern District of Illinois.

LYMAN *v.* BURNS.

Decided April 15, 1889.

INJUNCTION.
Injunction under Trade-Mark No. 16,473, registered April 9, 1889, by Moses Lyman, for a game, "Pigs in Clover."

BLODGETT, *J.:*

Now come the parties by their solicitors, and the complainant's motion for a preliminary injunction now comes on to be heard, and after hearing the arguments of counsel the court sustains said motion. Thereupon it is ordered that said defendant, his agents, servants, and workmen be, and they are hereby, enjoined and restrained, until the further order of this court, from marking, stamping, or designating in any manner games, toys, or any article of manufacture with the words "Pigs in Clover," or any material part thereof, or any word or designation that can be mistaken therefor, and from making games, toys, or puzzles of the size, shape, or appearance of "Exhibit A" which may in any manner be mistaken therefor, and that a writ of injunction issue accordingly.
